ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac. , acre(s).	lat. , latitude.
agric. , agricultural.	lb. , pound(s).
ambas. , ambassador(s).	l. b. , left bank.
Amer. , American.	long. , longitude.
ant. , ancient.	m. , mile(s).
ann. , annual.	manuf. , manufacture(d).
arron. , arrondissement.	M.E. , Middle English.
A.-S. , Anglo-Saxon.	min. , minute(s).
A.V. , Authorised Version.	Mod. E. , Modern English.
b. , born.	m.p.h. , miles per hour.
Biog. Dic. , Biographical Dictionary.	mrkt tn. , market town.
bor. , borough.	MS. , MSS. , manuscript(s).
bp. , birthplace.	mt. , mts, mount, mountain(s).
Brit. , British.	N. , north; northern.
c. , about.	N.T. , New Testament.
C. , Centigrade.	O.E. , Old English.
cap. , capital.	O.F. , Old French.
cent. , century (7th cent.).	O.T. , Old Testament.
chem. , chemistry.	oz. , ounce(s).
co. , county.	par. , parish.
com. , commune.	parl. , parliamentary.
cub. ft. , cubic feet.	pop. , population.
d. , died.	prin. , principal.
Dan. , Danish.	prof. , professor.
dept. , department.	prov. , province; provincial.
dimin. , diminutive.	pub. , published; publication.
dist. , district.	R. , riv., river.
div. , division.	R.A.F. , Royal Air Force.
E. , east; eastern.	r. b. , right bank.
eccles. , ecclesiastical.	rep. , republic.
ed. , edition; edited.	Rep. of Ireland , Eire.
educ. , educated.	R.N. , Royal Navy.
e.g. , for example.	Rom. , Roman.
Ency. Brit. , <i>Encyclopædia Britannica</i> .	r.p.m. , revolutions per minute.
Eng. , English.	R.V. , Revised Version.
estab. , established; establishment.	S. , south; southern.
fl. , flourished.	sec. , second(s).
Flem. , Flemish.	sev. , several.
fort. tn. , fortified town.	Sp. , Spanish.
Fr. , French.	sp. gr. , specific gravity.
ft. , feet.	sq. m. , square miles.
Ger. , German.	temp. , temperature.
Gk. , Greek.	ter. , territory.
gov. , government.	tn. , town.
Heb. , Hebrew.	trans. , translated; translation.
hist. , history.	trib. , tributary.
horticult. , horticultural.	U.K. , United Kingdom.
h.p. , horse-power.	U.N. , United Nations.
H.Q. , headquarters.	univ. , university.
hr(s) , hour(s).	U.N.O. , United Nations Organisation.
in. , inch(es).	urb. , urban.
inhab. , inhabitant(s).	U.S.A. , United States of America.
is. , island(s).	vil. , village.
It. , Italian.	vol. , volume.
Jap. , Japanese.	W. , west; western.
jour. , journal.	Wm. , William.
Lat. , Latin.	yd(s) , yard(s).

Canal of Galilee, i.e., of Palestine, the traditional scene of Christ's first miracle (John ii). Now called Kefr Kenna.

Canaan, 'low lands'; according to Numbers xlii. 29, a name applied to the low coastland of Palestine, on the Mediterranean, as opposed to the mt. lands. It is first met in the 14th-cent. Amarna Tablets designating Phenicia and Palestine. But in the Bible it generally indicates Palestine W. of Jordan.

Canada. The dominion of C. was constituted by the British North America Act of 1867, which united the various colonies of Brit. N. America. The first colonies to unite were upper and lower C., Nova Scotia, and New Brunswick; what had formerly been the Hudson's Bay Co. ter. was bought by the dominion and formed into the provs. of Manitoba and the NW. Ter. These were admitted into the confederation in 1870. In the following year Brit. Columbia joined the union, and in 1873 Prince Edward Is. Out of the NW. Ters. in 1905 were carved the 2 new provs. of Saskatchewan and Alberta, leaving under dominion administration the dists. of Mackenzie, Keewatin, and Ungava. Newfoundland joined C. as the tenth prov. in 1949. C., as now formed, is bounded on the N. by the Arctic Ocean, on the W. by the Pacific Ocean and Alaska, on the E. by the Atlantic, and on the S. by the U.S.A.

The dividing line between C. and the U.S.A. is the middle line of Lakes Superior, Huron, Erie, and Ontario, and to the W. of the Lake of the Woods the parallel of 49° N. lat. The middle line of the St. Lawrence as far as the parallel of 45° N. forms the boundary E. of the Great Lakes; then the boundary line runs by that parallel to Hall's Stream, the most westerly of the headwaters of the Connecticut R., and by that stream to its head. The water-parting of the St. Lawrence basin is the continuation of the

CHIEF CITIES OF CANADA

<i>City</i>	<i>Pop. 1951</i>

St John's, Newfoundland	67,749

boundary to about 46° N., when it is continued by arbitrary straight lines between the St John R., the Grand Lake, and the Croix R. as far as Passamaquoddy Bay on the Atlantic. The whole of the N. part of the continent, including the Arctic Is. W. of Greenland, is Canadian ter., with the exception of Alaska, which belongs to the U.S.A.

Physical features. The is. of the Arctic Archipelago, through which a NW. passage to the E. of Asia was vainly sought for many years, have gained new importance in the air age. The Atlantic and the Pacific shores are well supplied with deep bays which form magnificent harbours. On the Atlantic coast the chief indentations are the Bay of Fundy, which is remarkable for its high tides and 'bores,' the Gulf of St. Lawrence, and Hudson Bay, which has an area of over 350,000 sq. m. The Pacific coast has no such vast bays, and is smaller in extent than the Atlantic coast, but it is broken up in a noteworthy manner by fjords.

LAND AND WATER AREA OF CANADA, BY PROVINCES

Canada	3,562,857	282,917	3,845,774

There are a good number of is. off the coasts. Vancouver Is. and Queen Charlotte Is. are the most noteworthy off the Pacific coast; Prince Edward Is., Cape Breton Is., and Anticosti on the Atlantic side. Of the 10 provs. only Saskatchewan and Alberta have no outlet on the oceans. Plains and undulating lowlands make up the surface to the E. of the Rocky Mts. Large tracts in the N. are composed of tundras similar to those of N. Russia and Siberia; these descend as far as the 58th parallel on the W. shore of Hudson Bay, and extend still further E. along the whole coast of Labrador. The whole of the dominion E. of Lake Winnipeg, except the area mentioned above and the portions

(10,000 sq. m.), Lake Ontario (7260 sq. m.). The prin. rivs. are St Lawrence (1900 m.), flowing into the Atlantic; Saguenay (405 m.) and Ottawa (685 m.), its tribs. Hamilton (600 m.) in Labrador, which also flows into the Atlantic; Dubawni (580 m.), Severn (420 m.), Attawapiskat (465 m.), Albany (610 m.), Big (520 m.), Nottaway (400 m.), Koksoak (535 m.), Kaniapiskau (445 m.), flowing into Hudson Bay; Columbia (465 m. in Canada), Fraser (695 m.), Yukon (1765 m.), flowing into Pacific Ocean; Mackenzie (2525 m.), Liard (550 m.), Athabasca (765 m.), Peace (1065 m.), Coppermine (525 m.), Back's (605 m.). The prin. mts are (1) in the Yukon dist.: Mts Logan

Canadian Government

BOW RIVER VALLEY, BANFF

cleared for agriculture, is covered with forests of pines and firs. The prairie lands succeed this region in the W. of the dominion; these are of greatest extent on the tablelands immediately to the E. of the Rocky Mts. The prairie region rises in what are known as the 3 prairie steps from E. to W. The Red R. valley is the lowest level, with an altitude of about 750 ft; the surface rises to 1500 ft W. of that valley, and then extends westwards, forming a terrace of about 250 m. in extent; after that the ground rises rapidly to 2000 ft, then rises in a more gradual slope to the foothills of the Rockies. All the land forming these prairies is of the highest importance from an agric. point of view, as the soil is fertile and the climate is favourable for agriculture. To the E. of the Great Lakes no outstanding physical features are to be found. The Laurentian Mts skirt the St Lawrence on the N.; the S. range terminates in the cliffs of Gaspé.

Lakes, rivers, and mountains. The prin. lakes are Lake Superior (area 31,800 sq. m.), Lake Michigan (22,400 sq. m.), Lake Huron (23,200 sq. m.), Lake Erie

(19,850 ft), Lucania (17,150 ft), Steele (16,644 ft), Wood (15,855 ft); (2) in Brit. Columbia: Mts Waddington (13,280 ft), Wilfrid Laurier (11,750 ft), Sir Sandford (11,634 ft); (3) in Alberta: Mts Robson (12,972 ft), Columbia (12,294 ft). See also ROCKY MOUNTAINS.

Geological formation. The geological structure of C. is of very great physical features. Archaean and other crystalline rocks extend over very large continuous areas, and where such rocks prevail the earth covering is as a rule only a thin layer spread over a hard foundation. Over this thin earth many rivs. flow with innumerable turns and windings, and there are a number of lakes of varying sizes, some joined together, others isolated. The whole area from the lower St Lawrence to the shores of Lake Winnipeg is composed almost entirely of Archaean rocks. The surface features of this region are similar to those of the unorganised ter. of the NW., where granite is known to prevail over very large areas. Silurian rocks succeed the Archaean in the E. of the dominion, with one or two patches of Cambrian; these formations extend along

a narrow piece of land bordering the St Lawrence from a little below Quebec and occupying the whole area between the St Lawrence and lower Ottawa. The area between Lake Ontario and Georgian Bay, together with the N. part of Lake Huron, extending nearly as far N. as the Madawaska R., is composed of the same class of rocks; the SW. part of the lake peninsula between Lake Erie and Lake Huron is composed of rocks of the Devonian period. Lakes Manitoba and Winnipegosis are also almost surrounded by Devonian

healthy on the whole. E. of the Rocky Mts the climate of the dominion has those extremes of temp. which are prevalent all over the N. hemisphere in the same lats., save in those regions which are exposed to S.-westerly winds from the sea. The difference in the climates of W. C. and Europe is mainly due to the fact that the area between the Rocky Mts and the Pacific is mountainous in character, and the mts extend at right angles to the prevailing winds and parallel with the coast. For this reason great

Alberta Government Photograph

FRANK SLIDE, ALBERTA

rocks. The Archaean rocks near Lake Winnipeg are succeeded by Silurian and Devonian strata, which stretch westwards in strips running parallel with Lake Winnipeg and Lake Manitoba. To the W. of these formations a vast area of Cretaceous deposits is found, of which the precise limits have not yet been determined. Tertiary rocks are found here and there to the westward of the above area, and the geology of the mountainous tract in the W. is much too complicated to be dealt with in detail. Over almost the whole of the dominion glacial deposits are found, and in some places there are aqueous deposits; the rich soil of the Red R. valley in Manitoba is formed by aqueous deposits.

Climate. The climate of C. is characterised by greater extremes of heat and cold than that of Great Britain, but is

contrasts both of rainfall and temp. are found close to the Pacific. The total precipitation is very scanty to the E. of the Rocky Mts as far as E. Assiniboia, when it begins to increase again. Since the future of the Canadian W. still depends largely on its cultivation of wheat, the peculiarities of the climate as affecting this industry must be borne in mind. Most of the total precipitation takes place during the summer months; a considerable proportion of the precipitation is in the form of snow. This is the case throughout the dominion of C., but in a much greater degree in the E. than in the W. From this snowfall springs in each part of the country a different advantage for the cultivation of wheat. The great advantage of the snow in the E. region, where the precipitation is distributed more equally throughout the year, is that it

protects the ground against the severe frosts. Therefore in those regions 'fall' or winter wheat can be grown. In Manitoba, Saskatchewan, and Alberta the frost precedes snow, and spring wheat only can be grown. But the melting of the frozen water in the spring furnishes moisture at the time when it is wanted, save in the very dry parts of this region, where irrigation is receiving the attention of the gov. as well as of private individuals. The rainfall does not determine the amount of the produce so much as whether or not frost occurs before harvest. The risk of crops being ruined in this manner is being lessened by the careful choice and cultivation of hardy varieties of wheat, which ripen quickly. Spring in C. commences in April, 2 or 3 weeks later than in England, but by the middle of July the crops of the latter country can claim no advantage in their condition. June, July, Aug., and Sept. may be said to constitute the summer, and from Oct. to the middle of Nov. is the autumn. The remaining portion of the year, from the middle of Nov. to the end of March, is the winter. Although cold temps. are frequently found, the Canadian air is generally dry and exhilarating, and the climate in consequence salubrious. The temp. in the winter in dists. near to the mts is mitigated by warm winds, which blow from the SE., S., or SW. on the westward side of the Rocky Mts, and from the SW., W., or NW. on the E. side. These winds are known as chinook winds, and they account for stock-raising being an important industry in Alberta, as these winds cause the cold of winter to alternate with periods of warm weather when the ground is cleared of snow and the grasses flourish.

Canals and waterways. Canals were the earliest large transportation works in C. One of the first locks was a small one constructed by the Hudson's Bay Co. at Sault Ste Marie, which was destroyed by U.S. troops in 1814. Another was built at the Lachine rapids in the St Lawrence above Montreal in 1825, followed by the Welland Canal in 1829 to overcome the obstacle of Niagara Falls. The Rideau Canal between Kingston and Ottawa (then Bytown) was built 1826-1832 for defence purposes. The locks at Sault Ste Marie were built 1887-95, and the St Lawrence system from 1884 to 1914. In modern times the Great Lakes-St Lawrence system has become one of the busiest waterways in the world; more traffic passes through the locks at Sault Ste Marie (mostly iron ore from Duluth for the U.S. ports on Lake Erie) than through the Suez and Panama Canals combined. The grain and ore carriers which operate on the upper lakes run to 715 ft in length and carry up to 22,500 long tons, in sharp contrast to the small vessels of about 2500 tons deadweight which are able to navigate the old 14-ft canals on the St Lawrence below Prescott. Vast works now under way, said to be the greatest single construction project in hist. (see ST LAWRENCE SEAWAY), will open up that riv. to ocean-going ships of 25-ft

draught by 1959. This is the navigable depth of the upper lake system, the Welland Canal locks being 30 ft deep. It is 2200 m. from the Atlantic to the head of the lakes. Traffic through the locks at Sault Ste Marie in 1953 comprised 25,604 ships and 128,489,170 net tons of cargo; through the Welland Canal, 19,542,150 tons; and through the St Lawrence canals, 10,081,992 tons.

Railways. See CANADIAN RAILWAYS.

Highways. Canadians own more motor vehicles (1 to every 4 persons) than any other nation in the world except the U.S.A. The registration in 1954 counted 2,688,465 passenger cars, 856,851 trucks, 9860 buses, 37,665 motor-cycles, and 51,748 other vehicles; total, 3,644,589. Ontario had 1,489,980 of these registrations, Quebec 674,114, and Newfoundland only 34,423. Most of these vehicles were made in C. 1953 production reaching 373,072 units. Although over \$1 billion were spent on new highways during 1946-53, the density of vehicles per mile of surfaced road increased in this time from 11.6 to 18.0. In 1954 total expenditure by federal, prov., and municipal govts. on highway building and maintenance reached \$600 million. Roads are a prov. responsibility, and it has not yet been possible to secure the co-operation of all the provs. in completing a Trans-C. highway (q.v.) of high standard, although the federal gov. offered in 1949 to pay half the cost. Quebec has refused its co-operation, and there is also a gap of 180 m. in N. Ontario. Of the total mileage, 4580, outside of Quebec, 2853 was paved by the end of 1953. The total of paved highways in C. was 30,731, gravelled 160,265, and unsurfaced 326,812 m. in 1953. New 4-lane highways, such as the one being completed across Ontario, from Windsor to Montreal, are of a very high standard. So far none of these charges tolls.

Airways. Airline traffic between large centres has developed in C., much as in many other countries, but 'bush flying,' freighting to the mines and outlying communities of the N., has always been very important too. Also aerial surveying and forest patrolling have been very highly developed in C. Trans-C. Air Lines (T.C.A.), a publicly owned company organised in 1937, holds a monopoly in transcontinental traffic, and also in Canadian air traffic across the Atlantic and to the W. Indies. Canadian Pacific Air Lines (C.P.A.), formed in 1942 by an amalgamation of most of the small 'bush' operators, is allowed to operate 'feeder' lines, mostly running northward from the transcontinental system. C.P.A. also operates transpacific lines from Vancouver to New Zealand and Australia, China, and Japan, a line from Toronto to Mexico City, and one across the N. Pole from Vancouver to Amsterdam. In 1954 T.C.A. flew 852,475.532 passenger m., and C.P.A. flew 198,803,192 passenger m. Non-scheduled air services play a big role in mineral exploration and development, and in the Mackenzie region offer the chief means of transport of freight as

well as passengers and mail. Those 198 operators carried 340,347 passengers and 27,855 tons of freight in the year ended 31 Mar. 1955. Other operations which they carry out are crop-dusting, patrolling power-lines, estimating timber, planning pipelines, policing the N., providing ambulance service, and carrying missionaries. The International Civil Aviation Organisation (I.C.A.O.) of the U.N. has its permanent H.Q. in Montreal.

Pipelines. With the rapid exploitation after the Second World War of the oil-fields of Alberta, and to a lesser extent Saskatchewan, a number of notable pipelines have been constructed in C. The Interprovincial Pipeline carries oil 1765 m. from Edmonton to Sarnia, Ontario (980 m. being through the U.S.A.), with a capacity of 250,000 barrels per day. The Transmountain Pipeline runs from Edmonton to Vancouver (718 m.), and has a branch crossing into the state of Washington. A pipeline from Portland, Maine, U.S.A., carries Venezuela crude oil to refineries in Montreal. Construction began in 1955 on the Trans-C. Pipeline, to carry gas from Alberta to industrial E. C.; it will be the longest pipeline in the world.

Telephones and telegraphs. The telephone was invented in C. by Alexander Graham Bell of Brantford, Ontario, and C. ranks only behind the U.S.A. and Sweden in the number of telephones: 25 per 100 pop., or 3,860,269 telephones, in 1954. It was estimated in that year that there were 1644 calls per telephone, or 418 per head of pop. Although the Bell system in Ontario and Quebec covers 60 per cent of all the telephones in C., there are 2787 other telephone companies, including the provincially owned systems serving the 4 W. provs. All companies combine to give very efficient long-distance service, and 138 million long-distance calls were placed in 1954, inside C. or to the U.S.A. Facilities are already being introduced in Toronto and Montreal which will enable long-distance calls to be dialled direct to many points in N. America. A submarine cable laid in 1956 between Nova Scotia and Scotland will allow more reliable transatlantic telephone service. Six transoceanic telegraph cables also terminate in C., 4 on the Atlantic coast and 2 on the Pacific. A micro-wave radio relay system for telephone use is being built across C., to be completed in 1958.

Postal service. The first exclusively Canadian postal service was estab. in 1788, consisting of a monthly courier route from Halifax to Quebec. The letter rate, which was 5c. in 1851, was reduced to 3c. at Confederation, and to 2c. in 1897; in 1956 it was back at 5c. The railways are still the chief mail carriers, but all first-class mail which will go faster by air is sent that way without extra charge.

Radio and television. Radio broadcasting in C. is under the control of the Canadian Broadcasting Corporation (C.B.C.), which is run on lines similar to the Brit. Broadcasting Corporation.

The C.B.C. has a monopoly of network broadcasting, but permits private stations to operate on a local basis under its regulation. A publicly owned corporation, it is subsidised by the gov., the receiver licensing system having been dropped in 1952. C.B.C. policy is determined by a board of 11 governors whose role is to guard the national interest. C.B.C. operates 22 standard-band AM stations, 5 FM stations, and 54 small 'repeater' transmitters which work automatically and serve sparsely settled areas. There were 157 privately owned radio stations in 1955. More than a million school-children listen regularly to the C.B.C.'s Friday school broadcast. A Fr. language service is operated in Quebec prov., and at some points in W. C. C.B.C. also operates an International Service for the Dept of External Affairs. Many programmes on the C.B.C., and almost all programmes on the private stations, carry advertising, in the Amer. manner. Television was introduced into C. in 1952. Although many Canadians along the border were watching U.S. programmes before that, C.B.C. policy reserves the larger cities for itself, but permits private television stations in the smaller centres. By 1956 there were 8 C.B.C. and 28 private stations operating. All private stations are required to carry 10½ hours of C.B.C. programmes per week. The coast-to-coast network is expected to be completed in 1958. Already television was said to be available to 75 per cent of the pop. by 1956, with 1,900,000 receivers in use.

Shipping. While Canadian foreign trade has increased steadily until it is now exceeded only by that of the U.S.A., the U.K., and W. Germany, Canadian shipbuilding has fluctuated enormously. In the mid 19th cent. wooden shipbuilding flourished in the Maritimes, but a decline set in which continued until 1914. After a spurt during the First World War shipbuilding became almost dormant, until only 9 borths were available for large ships. The Second World War brought a big expansion: 345 cargo vessels of 3,392,700 tons were built, 454 naval escort vessels, and 2882 other vessels and special purpose craft. At the peak, in 1943, 75,000 workers were employed in 90 large and small yards. Since the Second World War the industry has again declined sharply, failing to attract foreign orders. By 1954 only 24 ocean ships remained in Canadian registry. In trade with countries other than the U.S.A., Canadian ships carried only 1,202,938 out of a total of 26,734,184 tons. Trade with the U.S.A., totalling 36,270,337 tons, reflected the much healthier position of Canadian shipbuilding and operation on the Great Lakes and in the coastal trade. Canadian vessels carried 55.7 per cent of this commerce.

Fisheries. C.'s fishing-grounds are perhaps the most extensive in the world. They comprise the Bay of Fundy, 8000 sq. m. in extent; the Gulf of St. Lawrence, over 10 times that size; and other ocean waters, of a total area of 200,000 sq. m.,

or four-fifths of the fishing area of the Atlantic. In addition, there are 15,000 sq. m. of Atlantic inshore waters controlled entirely by the dominion, Hudson Bay, and the Pacific coast. The quality of the product is yet more important than the extent of the grounds, owing to the purity and coldness of the waters. Canadian cod, halibut, herring, mackerel, whitefish, and salmon are the equal of any in the world. Fishing is C.'s oldest industry, but it is only in the past 60 or 70 years that it has become a big one. The advent of the steam trawler greatly

mechanised curing; 82,000 Canadians now find their livelihood in fishing, and in 1954 they landed an estimated 2,000,000,000 lb. of fish. The figures for 1953 were 1,845,500,000 lb. with a marketed value of \$174,227,000, of which 499,200,000 lb. were landed in Newfoundland. Lobster, cod, and haddock are the chief fish caught on the Atlantic coast, in that order of value, but salmon caught on the Pacific coast is by far the most valuable catch. The salmon catch in 1954 was the heaviest since 1913. Halibut was also a record. The figures for

Nova Scotia Bureau of Information
TUNA FISHING NEAR YARMOUTH, NOVA SCOTIA

increased the fish haul in the 1890's, and also brought a serious threat of depletion. To combat this C. has entered into numerous international treaties to protect the halibut and salmon of the Pacific coast, the fisheries of the NW. Atlantic, and, more lately, to combat the predatory lamprey in the Great Lakes. There have been 2 outstanding events in the Canadian fishery world in recent years—the union of Newfoundland with C., which added about one-third to the Canadian fish catch, and the success with fish ladders on the Fraser R., Brit. Columbia, in gradually restoring the immensely valuable salmon run on this stream. There has also been a technological revolution in this ancient occupation. Larger sea-going vessels with modern navigational and fish-finding devices are coming into use, and filleting and quick freezing plants prepare much of the catch for the fresh fish market. At the same time, home-curing is giving way to

1953 show a salmon catch of 186,914,000 lb. with a value of \$47,936,000; lobster, 41,920,000 lb., value \$19,718,000; cod 189,206,000 lb., value \$13,597,000, all exclusive of Newfoundland.

The dominion dept. of fisheries, estab. on a separate basis in 1928, controls the tidal waters of the maritime provs., and Brit. Columbia the fisheries of the 3 prairie provs. and the fisheries of the Magdalen Is. in Quebec prov. The non-tidal fisheries of the maritime provs. and Ontario, and both the tidal and non-tidal fisheries of Quebec (except the Magdalen Is.) are controlled by the respective provs., but the right of fisheries legislation for all provs. rests with the dominion gov. The main object of legislation has been the prevention of depletion, the enforcement of close seasons, the forbidding of pollutions and obstructions, and the regulation of nets, gear, and of fishing operations generally.

Minerals and mining. Something of C.'s

riches in minerals was revealed when blasting for the Canadian Pacific Railroad near Sudbury, Ontario, in 1883 disclosed the nickel deposit which still to-day supplies 83 per cent of the free world's needs; and similar blasting near Cobalt, Ontario, for the N. Ontario Railroad in 1903 uncovered the largest silver deposit in the world. In the 3 decades that followed, gold discoveries in this same area made C. the second gold producer in the world. In 1939 gold production was valued at \$184,000,000 and was greater than all base metals combined, and equal to 40 per cent of all mineral production. To give some measure of the vast exploration and development effort which has been going on, although gold production was \$157,000,000 in 1955 it was in fourth place behind petroleum, copper, and nickel, and closely followed by zinc, iron, and asbestos (also aluminium, which, because the bauxite is imported, is ranked as a manufacturing rather than a mining industry in C.). Metal output tripled during 1939-55, from \$344,000,000 to \$1,001,513,368, and the total of all minerals and structural materials increased from \$475,000,000 to \$1,778,398,272. Metals mined in quantity are, in order of value, copper, nickel, gold, zinc, iron, lead, silver, pitchblende, platinum, palladium, cobalt, tungsten, magnesium, cadmium, and selenium.

Coal has also been mined since the earliest times in C., the mines of Cape Breton, which now project under the sea, being the first worked in America. There is no coal in central C., where industry (largely powered by hydro-electricity) is mainly located, but in Alberta there are immense deposits of bituminous coal. It is in this remarkable region that numerous oilfields have been brought into production since the Second World War; and the same area has also the vast Athabasca tar sands, still unexploited, and said by some to be the largest single oil reserve in the world. In 1955 280 companies spent \$400,000,000 in developing prairie oilfields. Oil production was 129,000,000 barrels in 1955, and reserves were placed at over 2,500,000,000 barrels, 33 times the estimate of 1946. Natural gas reserves were estimated at 20 trillion cub. ft. The second great development of recent years is the opening up of great high-grade iron ore deposits in Ungava. A 360-m. railway has been built into the heart of this once impenetrable ter. as far as Knob Lake, and in 1956 work started on a 43-m. branch line to Wabush Lake, where low-grade iron has been found. Further extensive deposits have been located S. of Ungava Bay. Knob Lake output jumped from 2,240,000 tons in 1954 to 9,520,000 tons in 1955, and reached 12,155,000 long tons in 1956. On completion of the St Lawrence Seaway it may reach more than 20,000,000 tons. With Steep Rock, Ontario, mines scheduled to produce 11,000,000 tons by 1960, and Wabana's Bell Is., Newfoundland, production now stepped up to 3,900,000 tons, the prospect is that C. will

be producing 35 million tons of iron ore per year by 1960. Actual 1955 output was 17,377,000 tons.

Recent years have seen great excitement over uranium, which has been found in rich deposits at Beaverlodge, on Lake Athabasca, and in huge low-grade deposits at Blind R., Ontario. Sev. of the world's largest reduction mills have been installed at these places. Other important new mining discoveries or developments are nickel at Lynn Lake, Manitoba; copper in NW. Brit. Columbia, at Manitouwadge, Ontario, Chibougamau

International Nickel Co.
A CONCRETE HEADFRAME OF THE INTERNATIONAL NICKEL CO. OF CANADA, NEAR SUDBURY, ONTARIO

and Gaspé, Quebec, and in Newfoundland; lead-zinc at Bathurst, New Brunswick, and at Pine Point, Great Slave Lake. The 1955 output of minerals was as follows: crude petroleum \$303,561,100, copper \$239,394,952, nickel \$216,433,694, gold \$157,305,152, zinc \$116,425,122, iron ore \$113,385,503, asbestos \$98,690,514, lead \$55,786,929, silver \$24,625,797, pitchblende \$23,000,000, platinum \$14,715,000, salt \$10,286,210, gypsum \$8,455,173, palladium \$8,118,000, cobalt \$7,723,500, tungsten \$6,465,638, sulphur \$5,560,800, titanium dioxide \$5,091,000. Coal production in 1955 was down somewhat at 14,578,821 tons, worth \$92,227,211. Cement production was 25,860,103 barrels at \$64,363,165. C. ranks first in the world in the production of nickel, second in aluminium and zinc, and fourth in copper and lead. The explanation for all

this mineral development is quite simple, and may be found in the U.S.A. *Paley Report* describing the rapid depletion of that country's mineral resources and its need for developing other sources.

<i>Cash Income from Farm Products—1954</i>

Agriculture. Nothing shows the change that has been going on in C. since the Second World War better than the decline in importance of agriculture's share of the national production and income. Until the First World War it was pre-eminent. Manufacturing passed it in importance in the early 1920's, and by 1939 income from manufacturing was double that from agriculture (the latter having suffered heavily from the depression). This ratio was maintained in 1946, agriculture having regained prosperity. But by 1953 income from manufacturing was 3 times that from farming, and this trend continues. Farm income is now exceeded by that from the forest industries (lumbering and pulp and paper), and is only a shade ahead of income from mineral production. Farm production has nevertheless continued to increase

all this time, and to become more diversified, though the number of people earning their livelihood on farms dropped from 1,364,000 in 1939 to 889,000 in 1954; 2,800,000 Canadians live on 623,000 farms, with a total acreage of 174,000,000, or an average of 275 ac. per farm. Farming is carried on in every prov., though 83 per cent of the total farm produce is grown in the 4 provs. of Quebec, Ontario, Saskatchewan, and Alberta. The special crop of the Maritimes is potatoes. In Quebec dairy farming, fruit, and tobacco growing and market gardening thrive, as well as the tapping of maple trees for their sweet syrup—a \$10,000,000 ann. crop.

Ontario farming, concentrated in the triangle between Lakes Huron, Erie, and Ontario, is more productive than that of the broad reaches of Saskatchewan, partly because of its S. location, in the same latitude as N. California. Here sufficient tobacco is grown to cover all Canadian requirements; soybeans, hybrid corn, sugar beets, vegetables for packing, quick freezing, or immediate consumption in the cities; most of the grapes used in the Canadian wine industry; and many other kinds of fruits and berries. There is also a flourishing dairying industry. In the prairie provs., besides the vast dry areas under wheat, oats, barley, and flax, there are nearly a million ac. under irrigation. Cattle and sheep ranching dominates in the foothills. Beyond the Rockies, in Brit. Columbia, are the lush Kootenay, Okanagan, and coastal valleys, and Vancouver Is., famous for fruit and potatoes. Farm techniques have been changing in C. with the introduction of more and more machinery which intensifies the trend towards specialisation, because certain machines are better suited to certain crops. Three-quarters of Canadian farms are electrified; and in Ontario their consumption of electricity per farm more than doubled in the decade 1944-54. In this same prov. the number

PRINCIPAL FIELD CROPS—1955

of tractors increased 3 times and combine harvesters 13 times in the period 1941-51. In consequence 27 per cent fewer workers grew 28 per cent more farm produce, an increase in productivity per worker of 75 per cent since 1939.

With the increased ease of work has come greater ease of living on the farm, so that in the better farming areas of E. C. farm people live in much the same style as city dwellers, with automobiles, television, fur coats, oil heating, and all manner of electrical appliances, including the 'deep-freeze' in which fresh-frozen

Price Support legislation of 1944 it estabs. and supports the price of various commodities, notably butter and pork (wheat is handled separately).

All grains are marketed by the Canadian Wheat Board, a federal gov. agency, the Winnipeg Wheat Exchange having been closed down during the Second World War. There is a delivery quota for each farmer based upon bushels per 'specified' ac., the 'specified' acreage consisting of each permit holder's acreage seeded to wheat (other than durums), oats, barley, or rye, plus his acreage in summer fallow.

Manitoba Travel and Publicity Bureau
GRAIN ELEVATORS AT CHURCHILL, MANITOBA

vegetables, fruit, fish, meat, and ice-cream can be kept. They have their bread delivered at the door, do their shopping at a super-market, and never think of making butter or slaughtering a pig. The farmers' prosperity, which reached its post-war peak in 1951-2, in which year Canadian farmers had a gross income of over \$3,500,000,000, as against \$2,624,732,000 in 1954 and about the same in 1955, has mainly derived from the general prosperity of the country, but much credit must also be given to the federal and prov. depts. of agriculture. These carry on extensive experimental and research work, and operate schools of agriculture at univ. level. A very large part of the biological research in C. is carried on under their auspices. The federal gov. also controls marketing, including grading and inspection. Under

This system does not satisfy everyone, but few are eager to take back from the gov. the problem of marketing the large surplus of grain which has accumulated during the 1950's. The Canadian wheat crop has been little larger in the decade following the Second World War than it was in the decade following the First World War, but it has proved much harder to dispose of. Briefly, the story runs thus: the first 100,000,000 bushel wheat crop was raised in 1905. Within 10 years a crop almost 4 times as great was raised, the 393,000,000 bushels of 1915. During the 1920's the average was 400,000,000 bushels, topped by 566,000,000 bushels in 1928. In the 1930's the average fell to 300,000,000, with a low yield of 182,000,000 in 1937. For the war years the average was 400,000,000, and in the crop years 1946-

1955 it was 465,000,000 bushels. Two tremendous crops, in 1952 and 1953, of 701,000,000 and 613,000,000 bushels, glutted all storage facilities.

Forestry and forest industries. From earliest days lumbering has been one of C.'s chief occupations, but a far-reaching change has come over this industry in the past generation. For over 30 years the output of 5,000,000,000 ft board measure of sawn lumber in 1911 stood as the record, under the old, ruthless type of exploitation of the 'inexhaustible' forests. With

The forests consist of 8 main regions, by far the largest being the Boreal, which sweeps across mid C. from the Atlantic to the Rockies and forms 82 per cent of the total. This is the pulpwood stand, notably spruce, but also tamarack, balsam fir, and jackpine, with deciduous poplar and birch in large numbers. The other regions are the Coast (of Brit. Columbia), where the giant Douglas fir, red cedar, and hemlock cedar grow, the Montane (Columbia), Subalpine (on the E. slopes of the Rockies), Aspen Grove (N.

Alberta Government Photograph

RANCH LAND IN ALBERTA

forest management now firmly estab. as the national policy, the output of sawn lumber reached 7,305,958,000 ft board measure in 1953, in addition to a record cut of pulpwood. Most provs. now require timber operators on Crown lands to submit inventories of their cutting area and plans for managing and renewing the forest; and the Crown holds 93 per cent of C.'s forests. These forests stretch across the entire country, from the Maritimes to Brit. Columbia and the Yukon, covering 44 per cent of the land area, or 1,568,000 sq. m. The productive forest area is estimated at 828,000 sq. m., and the part of this which is accessible to transport and market is 582,000 sq. m. Of this 380,000 sq. m. is at present occupied. In addition there are 22,780,000 ac. of farm woodlots.

of the prairies), Deciduous (S. Ontario), Great Lakes-St Lawrence (area of the first great logging era; its rich stands of red and white pine are now cleaned out), and Acadia (Maritimes). The finest stands on the Brit. Columbia Coast will produce up to 100,000 ft board measure per ac., and big mills there can cut 500,000 ft board measure in a day. Of 150 tree species, only a score are commercially important, chief of these being spruce, with Douglas fir a close second, then hemlock cedar, white pine, jack pine, balsam, yellow birch, and maple. Forest protection services, despite great developments in fire-fighting equipment and aerial transport, still have to deal with many fires. In 1954 an estimated 81,000,000 cu. ft of standing merchantable timber was burned (as against a

Compagnie Aérienne Franco-Canadienne

QUEBEC: DOCKS AND GRAIN ELEVATORS AT THE MOUTH OF THE
ST CHARLES RIVER

Paul Popper

VANCOUVER ISLAND: A LOGGING TRAIN

total cut that year of 3½ billion cu. ft). Another type of protective operation is the spraying of large areas to combat the spruce budworm. In 1956 2 million ac. in N. New Brunswick was sprayed by 70 aircraft, operating from 12 airfields.

Research has developed rapidly in recent years on the growth and management of the forests and new uses for forest products. The list of the latter now includes tars, oils, chemicals, wood and ethyl alcohol, acetic acid, acetone, formaldehyde, vanillin, wood flour, wall boards, insulating boards, veneers and plywood, laminated beams, rayon, linoleum, imitation leather, cellophane, gramophone records, plastics, surgical dressings, yeast cakes, gun-cotton, and photographic film. The output of the forest industries now exceeds that of agriculture, and represents one-quarter of all Canadian manufs. Net value of production in 1953 was \$1,987,974,000. Just under half of the lumber cut in 1953 was exported, to a value of \$283,000,000. The pulp and paper industry ranks as the greatest single industry in C., in production and in wages paid. In 1954 its output reached a record \$1,241,558,451, over 4 times the 1940 value. Newsprint exports reached \$635,669,692, covering half of the world's needs.

Energy resources. There are few, if any, countries so blessed with energy resources as C. Cheap and abundant hydro-electric power has been the key to her rapid development in the 20th cent. Only Norway offers cheaper electric power. From 173,000 installed h.p. in 1900, hydro-electric capacity rose to 2,515,000 h.p. in 1920; 6,125,000 h.p. in 1930; 13,750,000 h.p. in 1950; and with projects under way will reach 23,550,000 h.p. in 1958. Large resources remain to be developed in Quebec, which already has half of C.'s hydro power; Labrador, where a huge potential on the Hamilton R. is being surveyed; Brit. Columbia, which is preparing to develop the Columbia and Fraser R.s.; and Manitoba, which will turn next to the Saskatchewan and the Nelson R.s. Other parts of the country, notably Ontario, are turning to steam stations to bridge the gap until atomic power becomes economical. C. has very large resources of coal, but in most cases of the wrong kind in the wrong place, such as the one-seventh of the world's bituminous coal in Alberta. Hard coal is found in the Crow's Nest Pass region of the Rockies and on the is. of Cape Breton. In Saskatchewan a steam power station is being erected on a surface coalfield which, it is estimated, will last for the life of the machinery; the coal is presently being mined for \$1 per ton. Meanwhile the Crown company Atomic Energy of C. Ltd. is co-operating with Ontario Hydro-Electric Power Commission in building C.'s first experimental atomic power station, alongside the Des Joachim's hydro on the upper Ottawa R. The country has abundant uranium. Ontario Hydro estimates that its water power costs 0.35c. per kilowatt-hour, its steam power 0.70c., and

its first atomic power (in 1959) will cost 1.3c. Ontario power sells at an average of 0.80c. Quebec power, all hydro, sells at an average of 0.45c., but the aluminium industry pays only 0.21c.

Foreign trade. C. is the fourth trading nation in the world, following the U.S.A., U.K., and W. Germany, which passed it in 1954, when it was also passed by New Zealand as the leading nation in *per capita* exports. C. does about 6 per cent of total world trade. The rise since pre-war has been spectacular, from just over \$1 billion in 1939 to over \$9 billions in 1955. The pattern of trade has also changed considerably. In the 1920's wheat was the leading export; in 1955 it was third, after newsprint and lumber. Wheat exports in that year amounted to only one-quarter of all forest products and less than half of all mineral exports. Leading exports in 1955, in millions of dollars, were newsprint 685, lumber 385, wheat 338, wood pulp 297, nickel 215, aluminium 210, copper 163, iron ore 99, asbestos 94, barley 76, flour 74, farm implements 72, zinc 70, whisky 60, fertilisers 56, fish 55, pulpwood 48, lead 37, petroleum 36, non-farm machinery 35. Imports continued to be dominated very heavily by manuf. goods and machinery, which amounted to 73 per cent of the total in 1955. Prin. imports, in millions of dollars, in 1955 were non-farm machinery 445, auto parts 246, petroleum

229, electrical apparatus 226, aircraft 138, steel products 129, tractors 115, engines 100, autos 83, fuel oil 77, coal 74, farm implements 62, raw cotton 61, chemicals 57, coffee 57.

A few feature of C.'s trade in the 1950's was the development of a substantial unfavourable balance, reaching \$361,100,000 in 1955. This is ascribed to the heavy upswing in imports from the U.S.A., such as machinery for Canadian industrial development and appliances for Canadian homes, as well as expenditure by Canadian tourists in the U.S.A., which was greater than expenditure by Amer. tourists in C. The trade deficit has been more than compensated for by inflow of U.S. capital, around \$500 million per year since the Second World War. Total U.S. investment in C. exceeded \$10 billions in 1955, out of a total of \$14 billions of foreign investment. U.S. investors owned over half of all Canadian manufacturing plant, most of this in the form of wholly U.S.-owned subsidiaries which sell no stock to Canadians: 98 per cent of the automobile industry, 78 per cent of rubber, 70 per cent of non-ferrous smelting, 68 per cent of petroleum, 50 per cent of electrical manuf., 39 per cent of pulp and paper were U.S.-owned in 1953. This trend towards Amer. ownership of industry, and even more Amer. exploitation of oil and minerals, have combined with the influence of Amer. magazine, radio, and television advertising and Canadian travel in the U.S.A. to swing Canadian trade away from the U.K. towards the U.S.A. In 1896 imports from the U.S.A. first exceeded those from the U.K.; they have done so ever since, but as late as 1938 exports to the U.K. were greater than those to the U.S.A. The Second World War, and the ensuing inconvertibility of sterling, however, brought an overwhelming shift in C.'s trading pattern. She now buys (1955 figures) 73 per cent of her imports from the U.S.A. and only 9 per cent from the U.K.; sells 60 per cent of her exports to the U.S.A. and only 18 per cent to the U.K.

The 1932 Ottawa agreements providing a Commonwealth tariff preference, which supported trade with the U.K. during the depression years, have had a more permanent effect in increasing Canadian trade with other countries of the Commonwealth, which is now half as much as that with the U.K. Debate over the tariff has been a feature in Canadian political life ever since Macdonald introduced the 'national policy' in 1879, raising the average percentage of duty from 13 per cent to 20 per cent, as a protection for infant Canadian industry. Duties were lowered before the First World War and raised afterwards, reaching a peak of 32.9 per cent average *ad valorem* duty on total dutiable imports in 1933-4. This rate dropped, with the negotiation of the 1938 trade treaty with the U.S.A., to 24.3 per cent, then in 1947 to 20.8 per cent, and with the G.A.T.T. agreements to 17.1 per cent in 1950.

Such low tariff rates tend to favour the export of Canadian raw materials, but facilitate the import of manuf. goods into C. in competition with Canadian manufs.

Manufactures. The rapid development of industry during and since the Second World War has placed C. among the leading half-dozen industrial nations of the world. At the turn of the cent. a third of a million employees earned an average of \$333 each, turning out less than half a billion dollars' worth of goods. By 1920 600,000 employees were earning \$1200 each, turning out \$3.7 billions. There was but little advance during the next 2 decades, but by 1946 just over 1 million employees earned an average of \$1640 each, turning out a gross product of \$8 billions. In 1953 the number of employees in manufacturing had reached 1,327,451, their average earnings \$2981, and the gross value of production \$17,785,417,000. In terms of volume, the index of manufacturing (1935-9 = 100) was 189.9 in 1946 and 263.0 in 1953. This tremendous development may be attributed to rich resources of cheap electric power, great discoveries in minerals, of which the U.S.A. is running short, and vast forests; but also to stable gov., which provided a climate favourable to heavy capital investment, and eager adoption of the latest inventions and processes. It is not only mines, pulp mills, and aluminium smelters which have seen a vast development, but also the automobile, aviation, electronic, tool-making, and petro-chemical industries.

Pulp and paper remains the leading industry, with an output of newsprint 5 times greater than its next world competitor. In the 6 years 1948-53 over \$600,000,000 of new capital was invested in it. Its shipments were \$1,180,000,000 in 1953. Next was non-ferrous metal smelting and refining, with an output of \$871,000,000. Aluminium production exceeded 500,000 tons. Motor vehicles were third, up 333 per cent since 1946 to an output of 360,385 passenger cars. Automobile parts was in eleventh place and rubber manufacturing twelfth, both dependent on motor vehicles. The fourth industry was slaughtering and meat packing, and among other food industries butter and cheese was ninth, miscellaneous foods thirteenth, and bread and baking fourteenth. Petroleum products were fifth, and with development of W. oilfields and completion of pipelines to the E., the proportion of Canadian crude oil used by refineries rose to 46 per cent in 1953. Other industries, in order: sawmills; primary iron and steel, with capacity doubled 1946-53; aircraft and parts, at \$399,000,000; and railway rolling stock. All manufacturing contributed 3 times as much to the national income in 1953 as agriculture.

The leading industrial prov. is Ontario, with half of the total manufs., notably all of the motor vehicles and over 90 per cent of the heavy electrical machinery, farm implements, and machine tools. Ontario also has most of the rubber, steel, and radio-television industries. Quebec

follows with 30 per cent of C.'s industrial output, leading in pulp and paper, aluminium, asbestos, tobacco, and cotton production. Brit. Columbia is third, with sawmilling, pulp and paper, and fish processing, and a great new aluminium smelter at Kitimat (q.v.). The leading manufacturing centres are Montreal, Toronto, Hamilton, Windsor, Vancouver, Winnipeg, Sarnia, London, Kitchener, Edmonton, Quebec, and Calgary, in that order (1953).

Population and immigration. The pop. of C. is distributed across the S. part of the country, in the main within 200 m.

immigration has been of Brit. stock. After an almost complete stoppage of immigration for a decade and a half, 1,112,373 immigrants arrived in the 9 years following the Second World War. This falls far short, however, of the scale of immigration before the First World War, when in the 7 years 1907-13 2,000,000 people arrived in C. Many of these people got off the trains on the prairies where there were neither stations nor tns nor farm buildings. They received free land and expected to create overvthing else with their hands. Now immigrants are carefully checked and

Canadian Pacific Railway

DOMINION SQUARE, MONTREAL

of the U.S. border. The prin. origins are British, French, German, Ukrainian, Scandinavian, Netherlands, Polish, Jewish, native Indian and Eskimo, Italian, and Asiatic, in that order. English is the general language of C. though in some parts of Quebec French is the only language understood. French is the language of Quebec and enjoys equal status with English in the federal parliament. The 60,000 French who lived in Quebec prov. at the time of the Brit. conquest in 1759 have proved one of the most fecund peoples in hist. In the 1951 census they numbered 4,309,326, and it is reckoned that a further 14 million have emigrated to New England (where they have lost their language and much of their cultural attachment to the Fr. Canadian community). The part of the pop. of Brit. origin remains much the largest element, though it forms a steadily shrinking proportion of the total (see tables). Only one-third of the recent

medically tested overseas, brought in only in the most favourable season, and may be provided with food and shelter for a certain period while seeking work.

While immigration is one of the leading topics in Canadian public life, emigration has been a very large factor in holding down the growth of the pop. The dominion statistician has estimated that, in the period 1851-1941, while 64 million people were coming into C., 6 million left for the U.S.A. The decade 1911-21, for example, showed a net loss of pop., some of the immigrants and the entire natural increase of a median pop. of 8 million having left the country. This period, however, is over. Pop. is now growing at a rate of 21 per cent per year, which brought an increase of 2,000,000 in 1951-6. Chief factors in this are a steady immigration of about 150,000 per year, a 40 per cent increase in the birth rate from its low point of 20.5 in the depression to 28.7 in 1954, and a sharp

¹ Revised in accordance with the Labrador award of the Privy Council, 1 Mar. 1927.

² The decreases shown in the pop. of the NW. Ters. since 1891 are due to the separation therefrom of vast areas to form Alberta, Saskatchewan, and Yukon, and to extend the boundaries of Quebec, Ontario, and Manitoba.

³ The estimated pop. of Newfoundland (exclusive of Labrador) at 31 Dec. 1945 was 312,899; (including Labrador), 318,177.

slackening off in the outflow to the U.S.A. It is estimated some 250,000 Canadians, including some recent immigrants, went to the U.S.A. in the period 1945-55, while about 50,000 Canadians returned from the U.S.A., and as many Americans came to C. Most of the latter are posted on business and, while some remain many years, few take out Canadian citizenship.

The native Indians of C. still live in the main on reserves, as wards of the federal gov. While some go out into the stream of normal Canadian life, very few give up their special tax-free status and elect to take on the full duties and rights of citizenship. These numbered only 789 in the year 1954, out of a total Indian pop. of 151,558. The new Indian Act of 1951 has encouraged more Indians to build their own homes, repair the roads on the reservations, and increase their land under cultivation; 1853 Indians attended secondary schools, colleges, or special courses in 1954-5. The number of Eskimos is estimated at 9600; all live N. of the tree line and most of them on the N. coast or is. The decline in fur prices after the Second World War brought hardship to the Eskimos, but this was relieved by extending to them the family allowances of \$5-\$8 per child paid by the federal gov. to the rest of the pop. since 1945. More recently, many Eskimos have been employed in the building of the Arctic radar stations of the Distant Early Warning line (see DEW SYSTEM). They are good mechanics, and some are being trained to maintain the stations, operate motor transport, and service airfields.

Religion. Complete religious tolerance is observed in C. There is no estab. church for the whole country, although the Rom. Catholic Church is in effect the estab. church of Quebec. The proportion of the nation adhering to the Rom. Catholic faith has remained constant at about 40 per cent since Confederation, and in 1951 was 43.3 per cent. Second largest denomination is the United Church, formed in 1925 of a union of all the Methodists and Congregationalists and most of the Presbyterians, with 20.5 per cent. The Anglican Church of C. has 14.7 per cent; the Presbyterians 5.6 per cent; Baptists 3.7 per cent; Lutherans 3.2 per cent; Jewish 1.5 per cent; Gk Catholic, Gk Orthodox, Mennonite, and all others 7.5 per cent.

Education. Control of education falls under the provs. in the Canadian constitution, and the system is therefore quite diverse. There are, however, tax-supported public schools in all the provs., and in most provs. a prov. univ. Quebec has a dual system of public schools—Rom. Catholic and Protestant—and of the former there are both Fr.-speaking and Eng.-speaking institutions. Ontario has a public school system, mainly for non-Catholics, and separate schools for Rom. Catholics, in both languages. Manitoba closed its separate schools in 1890, but Saskatchewan and Alberta still maintain them. Newfoundland is unique in having public schools run by 6 different de-

nominations: Anglican, Pentecostal, Rom. Catholic, Salvation Army, Seventh Day Adventist (Mormon), and United Church. There has been much experimentation in secular school education, with a broad development of vocational schools, and even in Quebec the firm mould of the *collèges classiques* has been dented. These are private 8-year schools for boys, leading to a baccalaureate degree, and operated by Rom. Catholic communities. Many tax-supported, co-educational high schools are being opened up by the Quebec gov. to serve families which cannot afford private schools. Where before this generation secondary education in C. was regarded mainly as a preparation for univ., and was pursued by a small part of the elementary pupils, it is now taken by the great majority of young people. In Ontario, while the pop. was doubling during 1914-54 secondary school enrolment increased 5 times.

C. has 32 degree-granting univs., almost half of them being small institutions in the Atlantic provs. In 1955, 66,000 full-time students were enrolled, one-fifth of them being at the univ. of Toronto, largest in the Commonwealth. The percentage of college-age youth attending univ. (7½ per cent) is nearly twice as great as in the U.K., but still far below the U.S.A. (30 per cent). Most of the early Canadian univs. were founded by the Anglican Church, with strong Oxford or Cambridge influences: King's College, Windsor, Nova Scotia (1788); King's College, Fredericton, New Brunswick (1800); King's College, Toronto, Ontario (1828); Bishop's College, Lennoxville, Quebec (1843); Trinity College, Toronto (1852); Huron College, London, Ontario (1863); and St John's College, Winnipeg, Manitoba (1871). The Presbyterians founded Dalhousie, Halifax, Nova Scotia (1818); Queen's Univ., Kingston, Ontario (1841); and Manitoba College, Winnipeg, with univ. of Edinburgh influence. The Methodists founded Victoria Univ., Cobourg, Ontario (1836), now part of the univ. of Toronto; Mt Allison Univ., Sackville, New Brunswick (1858); and Wesley (now United) College, Winnipeg, Manitoba. The Baptists founded Queen's College (now Acadia Univ.), Wolfville, Nova Scotia (1838), and McMaster Univ., Toronto (1887), moved in 1930 to Hamilton, Ontario.

The beginnings of Rom. Catholic higher education go back to the founding of the Collège des Jésuits, Quebec (1635). Laval Univ. (charter 1852) grew out of the Grand Séminaire de Québec (1663), and the univ. of Montreal (charter 1920) from the branch of Laval Univ. estab. in Montreal in 1878. Both teach in French and are controlled by the Bishops of Quebec and Montreal respectively. The univ. of Ottawa (1849) is unique in being bilingual, while the tradition of the Rom. Catholic St Francis Xavier Univ. at Antigonish, Nova Scotia (1866), is highland Scots. St Michael's College (1852), federated in the univ. of Toronto;

Assumption College, Windsor, Ontario (1857), chartered in 1953; St Mary's College and Mt St Vincent College, Halifax, are Irish Catholic foundations. The first non-denominational private univ. in C. was McGill, Montreal (1821). The King's Colleges of Fredericton and Toronto were made non-denominational prov. univs., and prov. univs. have been estab. in Manitoba, Saskatchewan, Alberta, and Brit. Columbia. The last is now second largest in C. Other univs. are Carleton College, Ottawa, and W. Ontario, London. For all its diversity, Canadian higher education maintains a quite uniformly high standard. The National Research Council, estab. 1916 in Ottawa, has done a great deal to raise the level of research, in its own laboratories and by grants to the univs. The Royal Commission under Mr (later Governor-General) Massey recommended in 1951 the estab. of a C. Council to give similar support and encouragement to letters and the theatre. Many foreign students enrol in Canadian univs., principally McGill, Toronto, and the univ. of Brit. Columbia.

Banking and Finance. The distinctive feature of banking in C. is the small number of banks (9) and the large number of their branch offices (4246 in 1955, an increase of 1000 in 10 years). Canadian banks have been notably sound in modern times, the last failure having been in 1923 and none occurring during the depression. The banks are privately owned (75 per cent of the shares being in Canadian hands) but operate on charters granted by Parliament, and subject to revision every 10 years. An Inspector of the Ministry of Finance inspects the books at least once a year. The banks issued their own notes until 1935, when the Bank of C. took over this function. The latter, estab. as a bank of issue in 1934, was privately owned at first, and nationalised in 1938. The Bank of C. must maintain a gold reserve equal to 25 per cent of its note and deposit liability. The chartered banks are required to maintain a reserve by way of deposit with the Bank of C. Canadian currency was changed from a sterling to a dollar basis in 1853, and has coins of 5, 10, 25, and 50 cents, also the now rare silver dollar. Bills are 1, 2, 5, 10, 20, 50, and 100 dollars, up to a size of 50,000. The chartered banks extend much short-term credit to Canadian businesses and householders; their role is that of providing working capital rather than fixed capital. They have also a considerable business abroad, with 123 branches. Large and small personal loan companies are a mushroom and less pleasant growth of recent years. The 9 chartered banks, in order of size, with assets in 1955, are: Royal Bank, \$3,237,637,000; Bank of Montreal, first to be estab., in 1817, \$2,726,318,000; Canadian Bank of Commerce, \$2,281,098,000; Toronto-Dominion Bank, \$1,264,345,000; Bank of Nova Scotia, \$1,143,995,000; Imperial Bank, \$787,757,000; Banque Canadienne Nationale, \$609,482,000; Banque Provinciale,

\$246,350,000; and Mercantile Bank, \$12,450,000.

Public finance is in C. a divided and much disputed field. The British North America Act assigned to the provs. general control of, and financial responsibility for, education, justice, hospitals, and highways, while all financial matters of so designated fell to the dominion gov. The greatly increased outlays which modern life required in these 4 chief prov. fields, and, on the other hand, the rapid development of the income tax as the chief source of all public revenue, have combined to produce great strain in federal-prov. relations. The Rowell-Sirois Royal Commission (1937-40) sought to estab. a new basis for div. of tax powers and financial responsibility, but no final agreement on its proposals or any others has ever been secured. An emergency wartime agreement of 1942 provided for the vacation of the income tax, corporation tax, and succession duty fields by the provs. in return for 'rentals' paid to them by the federal gov. Ontario and Quebec refused to join in the renewal of this agreement in 1947, but in 1952 Ontario accepted most of the provisions. These payments now make up 30 per cent of the total receipts of the prov. govts. Most of the remainder they gather from taxes on gasoline, profit on liquor sales, licences on automobiles, and permits derived from natural resources.

Income tax is much the largest source of federal gov. revenue, collections being 17 times as great in 1955 as in 1939. In that year income tax, at \$142,000,000, was less than sales and excise taxes at \$161,000,000, and less than one-third of total revenue, \$502,000,000. The 1955 figures were: income tax, \$2,265,000,000; sales and excise taxes, \$824,000,000; and total revenue, \$4,123,513,300. For 8 consecutive years after the Second World War the federal gov. budgeted for a surplus, which it applied towards reducing the national debt from its peak of \$13,421,000,000 in 1946 to \$11,116,000,000 in 1954. Among the leading federal expenditures in 1955 were: national defence, \$1,665,000,000; family allowances, \$378,000,000; old age pensions, \$360,000,000; war veterans, \$240,000,000. The relative wealth of the provs. is indicated by these personal income tax collections for 1953: Ontario, \$535,000,000; Quebec, \$248,000,000; Brit. Columbia, \$126,000,000; Alberta, \$77,000,000; Manitoba, \$50,000,000; Saskatchewan, \$46,000,000; Nova Scotia, \$24,000,000; New Brunswick, \$16,000,000; Newfoundland, \$12,000,000; Prince Edward Is., \$1,620,000; and Yukon Ter., \$1,488,000.

Social services. There is as yet in C. no complete cradle-to-grave system of social security such as prevails, for example, in Great Britain. C. has been too recently a pioneer country, where everyone expected to take care of himself, for such a development. Nevertheless the ever-increasing complexity of modern industrial society has made itself felt here, as elsewhere. One has only to compare the public expenditure on welfare in 1913

(\$15,000,000) or 1937 (\$236,000,000), largely in relief payments to the unemployed or to distressed W. farmers, with the 1955 rate of \$1,000,000,000 a year. There is a system of family allowances, estab. in 1945, under which the federal gov. pays mothers (including new immigrants) an average of \$6 per child per month, which dispensed \$378,000,000 to 2,213,000 families in 1955. There is an old age pension scheme introduced in 1952, under which all persons aged 70 or over, who have been 20 years in C., receive \$40 per month. \$360,000,000 was dispensed in such pensions to 754,000 persons in 1955. In addition the federal and prov. govts. join in providing \$40 a month assistance to persons over 65 in needy circumstances. Needy blind persons over 18 receive up to \$40 a month, as do totally and permanently disabled civilians. War veterans are treated separately, and in 1955 some 160,000 veterans and 33,000 dependants received pensions. Allowances for needy mothers and their dependent children are provided by all provs., and Alberta has widows' pensions for women aged 60. Federal and prov. govts. join in providing unemployment assistance according to a variable scale. This is in addition to the contributory scheme of unemployment insurance.

A comprehensive national health service is one of the most discussed topics in the country, and was taken up at the federal-prov. conference of 1955. It would be contributory and would cover, in the first phase, hospitalisation for everyone, and in the second phase medical care and surgery. At present about 20 per cent of Canadians are covered by publicly operated hospitalisation plans, as in Saskatchewan, and another 40 per cent by private plans such as the Blue Cross. This latter service is available for a small monthly fee to most factory and office workers. It is estimated that the Canadian people now spend \$1 billion per year on health care.

Immunisation against communicable diseases is very far advanced in C., so that diphtheria, smallpox, typhus, tetanus, and whooping-cough have been virtually eliminated. In 1954 a nation-wide campaign against infantile paralysis was launched, through the Salk vaccine, provided free. There is a constantly growing effort in cancer research. The number of mental patients continues to increase, with an average of 60,111 in hospital in 1955; but the tuberculosis hospitals are no longer filled.

Defence. The traditional Canadian military force has been the militia, and it was typical that an officer of the militia and not of the permanent force, Gen. (later Sir Arthur) Currie, should have become commander of the Canadian Corps in France in 1917. There were 60,000 men in the militia at the outbreak of the Second World War, and only 4500 in the permanent force. With 5000 in the navy and 8000 in the air force, the total was 76,352, including 140 women. By 1943 the army had reached a peak strength of 481,500, the air force

206,350, and the navy 75,354 (its peak was 92,880 in 1944). Over a million Canadians entered the forces during the war, including 50,000 women. One of the outstanding Canadian achievements was the operation of the Brit. Commonwealth Air Training Plan, which graduated 131,500 air crew, including 40,000 R.A.F., and 106,000 ground crew. The first Canadian troops to go into action were 2 battalions which arrived in Hong Kong just before the Jap. attack in Dec. 1941; 5000 Canadian soldiers participated in the Dieppe raid of Aug. 1942. Two divs. and an armoured brigade fought in Sicily and Italy, 1943-5, as a Canadian corps, with the Brit. 8th Army. Three further divs. and an armoured brigade formed the core of the First Canadian Army in the Normandy invasion, 1944. In early 1945 the Canadian troops in Italy were secretly moved to Holland, and the 2 parts of the army joined for the remainder of the war. This move arose quite as much from national feeling about Canadian troops fighting under non-Canadian command as from strategic reasons.

The Royal Canadian Air Force placed 48 squadrons in service overseas, including many heavy-bomber squadrons, and had thousands of its personnel attached to the R.A.F. The Royal Canadian Navy, expanding from a force of half a dozen destroyers and as many smaller ships to a fleet of 404 combat ships, including 254 corvettes and frigates, played an important role in escorting convoys across the N. Atlantic, fierce battleground of the U-boats. Altogether the Royal Canadian Navy convoyed 23,000 merchant ships, including the war's largest convoy of 167 ships. Some 10 per cent of the Canadian forces became casualties, or 103,000, although fortunately this was only half of the number in the First World War. 41,000 were killed, no fewer than 17,000 of these being from the Royal Canadian Air Force. On the material side the war cost C. an estimated \$15,000,000,000, two-thirds of this met by taxation, income tax receipts being increased by 11½ times during 1939-44. C.'s economic controls were, however, considered a model among the allied nations; living costs went up only 18 per cent during the war, as compared with 74 per cent in the First World War. Industrial production expanded enormously, so as to achieve a permanent change in the country's economy. Among the munitions produced were 16,000 aircraft, 6500 tanks and self-propelled guns, 391 cargo ships and 486 escort vessels, 244,000 machine guns, and 800,000 trucks and other motor vehicles.

After the end of the war demobilisation was swift. Much larger permanent forces have been maintained than before the war, but various plans for maintaining large and effective reserve forces have come to little. Since Korea the armed forces have been stabilised at around 100,000 men, something less than half being in the army. The air force

maintains 12 squadrons of jet fighters in Europe and 20 other squadrons of all kinds at home. The navy includes a cruiser and an aircraft-carrier, and is building 14 of the most modern type of destroyer-escort craft. The estab. of Canadian Arsenals Ltd. to keep gov. and private ordnance factories in a state of readiness, and the Defence Research Board, to develop new weapons, is an earnest that 'defence is here to stay.' In particular very large sums are being spent on the maintenance of a modern

of 1840, and the British North America Act, 1867. The first of these estab. the Fr. civil law throughout what then constituted the prov. of Quebec; the second divided the country into the Fr.-speaking prov. of Lower C. and the Eng.-speaking prov. of Upper C., and conceded representative gov. through an elective legislative assembly, but without executive control except in so far as it could refuse to vote taxes; the third reunited the 2 C.s under a single legislature and conceded the principle of responsible gov., the

Dept of National Defence, Canada

aircraft industry in C., and on the building of radar warning lines across the middle and the N. of C. (Mid-C. and Distant Early Warning Lines).

Constitution and government. The constitution of C. is not an imitation of the constitution of the U.S.A., but is the Brit. constitution federalised. The many unwritten conventions of the Brit. constitution are also recognised in the Canadian constitution; the British North America Act, 1867, which defines the internal constitution of C., contains really a written delimitation of the respective powers of the dominion and prov. govts. Down to the time of the Confederation, C.'s constitutional development was based mainly upon 4 Acts of the Brit. Parliament: the Quebec Act of 1774, the Constitutional Act of 1791, the Act of Union

executive administration being from that time dependent on the legislature; the fourth separated the 2 C.s from their existing legislative union to make them provs., each controlling its own local affairs, in a wider confederation, which within a short period so extended its boundaries as to embrace the whole of Brit. N. America. Until the end of the First World War C. really remained a colony. She had no representation of her own abroad, and all treaties were negotiated and signed for her by the Brit. Gov., which authority also appointed the Governor-General. Discontent with this situation had long been growing, and had been sharply stimulated by the Alaska boundary award of 1903. On this occasion the Brit. member of the tribunal sided with the 3 Americans

against the 2 Canadian members. So in 1909, when the Boundary Waters treaty, negotiated by Britain and the U.S.A., set up the International Joint Commission to deal with problems and disputes concerning the boundary waters of C. and the U.S.A., C. insisted on occupying all the seats on her side of the table. The first major development towards autonomy came after the First World War, when C. secured separate representation at the Versailles conference and membership of the League of Nations. At the same time she estab. a High Commissioner in London, and secured the consent of the U.K. to the attachment of a Canadian minister to the Brit. Embassy in Washington—though she did not carry this through, but waited to estab. a separate Canadian mission in 1927. Another milestone was C.'s negotiation of a treaty, for the first time, directly with the U.S.A., the Halibut Treaty of 1923.

A constitutional crisis arose in C. in 1926 over the imbroglio between the Governor-General, Baron Byng of Vinny, Mr. King, the Liberal leader, and Mr. Meighen, the Conservative leader. The Governor-General, acting, as most constitutional authorities have since agreed, quite properly, gave Mr. Meighen the chance to form a gov. when Mr. King no longer held a majority, and then granted to Mr. Meighen the dissolution which he had refused. Mr. King. But Mr. King fought and won an election on the issue of ending C.'s 'Colonial' status. Out of the ensuing Imperial Conference of 1926 came the declaration, later formalised in the Statute of Westminster 1931, stating that Great Britain and C. were 'autonomous communities within the British Empire, equal in status, in no way subordinate one to another in any respect of their domestic or external affairs, though united by a common allegiance to the Crown, and freely associated as members of the British Commonwealth of Nations.' One immediate consequence was that the Governor-General became the representative of the Crown in C., and not of the Brit. Gov.

This was autonomy at last. The following year a Canadian minister was sent to Washington. In 1928 a legation was opened in Paris and in 1929 in Tokyo. After this there was no further extension of external relations, possibly for reasons of economy in view of the depression, until the outbreak of the Second World War. Offices were then opened throughout the Commonwealth and, so far as circumstances permitted, in many foreign countries. It should be mentioned also that C. allowed a full week to pass, in Sept. 1939, before declaring war on Germany, just to underline her independence. During the war Mr. King sharply vetoed the proposal made by Lord Halifax while on a visit to Toronto that the Commonwealth should estab. a permanent secretariat to pull it more closely together. After the war was over many further constitutional changes were carried through. In 1947 residents of C. became 'Canadian citizens'

as well as Brit. subjects; a Canadian woman marrying a non-Canadian could decide which citizenship she wished to hold. The Dominions Office of the Brit. Gov. was changed to the Commonwealth Relations Office, and C. was declared to be 'an oversea dominion of the King, in exactly the same position as Great Britain, the Metropolitan Dominion of His Majesty.' It was decided that there would be no further appeals from the Supreme Court of C. to the Privy Council in London. And the Governor-General was authorised to sign treaties and letters of credence for ambas. on the advice of the gov. of C. and without consulting the king. In 1949 the power to amend the Canadian constitution in matters lying solely within federal jurisdiction was transferred from the Brit. Parliament to the Canadian Parliament. And in 1952 a Canadian, Mr. Vincent Massey, was for the first time named governor-general. Only 1 major constitutional question remains unsettled: a means of amending the constitution in respect to prov. powers. And only 1 main attribute of sovereignty is lacking: a Canadian flag. The red ensign of the Brit. merchant marine, with the Canadian coat of arms in the fly, has served as what Mr. St. Laurent calls the 'distinctive' Canadian flag for 2 generations. A joint committee of the House and Senate approved this ensign, with a golden maple leaf in the fly, as the most acceptable flag design in 1946. But Quebec holds out for the *fleur de lis*, and opposes the union flag, and so C. remains without an official flag.

(i) *The dominion government.* The British North America Act declares that the executive gov. of C. shall continue to be vested in the sovereign of the U.K., represented for dominion purposes by the Governor-General, and, for prov. purposes, by the Lieutenant-Governor. The Governor-General is advised by the queen's Privy Council for C., a committee of which constitutes the ministry of the day. The dominion Parliament consists of the queen, the Senate, and the House of Commons. It must meet at least once a year, so that 12 months do not elapse between the last meeting in one session and the first meeting in the next. Senators, 102 in number, are appointed for life by the Governor-General under the great seal of C. The senatorial representation is as follows: Ontario, 24; Quebec, 24; Nova Scotia, 10; New Brunswick, 10; Prince Edward Is., 4; Manitoba, 6; Brit. Columbia, 6; Alberta, 6; Saskatchewan, 6; and Newfoundland, 6. They must be 30 years of age, Brit. subjects, residents of the prov. for which they are appointed, and possess £4000 over and above their liabilities. Members of the Lower House or House of Commons (who number 265) are elected by the people for the duration of the Parliament, which may not be longer than 5 years. They receive £10,000 a year.

The first dominion Parliament of 1867 consisted at its commencement of 181 members, 82 for Ontario, 65 for Quebec, 19 for Nova Scotia, and 15 for New

Brunswick. To this number were added, under the Manitoba Act of 1870, 4 members to represent the then newly created prov. of Manitoba; also, according to the agreement under which Brit. Columbia entered the Confederation, 6 were added to represent that prov., making 191 at the end of the first Parliament of C. In 1874, when Prince Edward Is. entered the Confederation, 6 members were added for that prov. In 1886 4 members were added to represent the NW. Ters. (2 for Assiniboia and 1 each for the provisional dists. of Alberta and Saskatchewan), the total then being 215. There have since that time been many readjustments, required with every decennial census.

the Governor-General in council, and who governs with the advice and assistance of his ministry or executive council. The council is responsible to the legislature and resigns when it no longer has the confidence of that body. The legislatures have only 1 chamber, consisting of a legislative assembly elected by the people—except in Quebec, where there is also a legislative council. The legislature in each prov. may exclusively make laws in relation to the following matters: amendment of the constitution of the prov., except as regards the Lieutenant-Governor; direct taxation within the prov.; borrowing money on the credit of the prov.; public lands belonging to the prov.;

Canadian Air Board

OTTAWA: THE PARLIAMENT BUILDINGS

After the census of 1951 members were fixed at: Newfoundland, 7; Prince Edward Is., 4; Nova Scotia, 12; New Brunswick, 10; Quebec, 75; Ontario, 85; Manitoba, 14; Saskatchewan, 17; Alberta, 17; Brit. Columbia, 22; Yukon, 1; NW. Ters., 1; total 265. The only qualification necessary for the Commons is that the members must be 'Canadian citizens or British subjects,' and the same applies to the franchise. Voters must have been resident in C. for a year.

The dominion Parliament has exclusive legislative authority in all matters relating to the following: public debt and property; regulating of trade and commerce; taxation; loans on public credit; postal service; census; defence; navigation and shipping; lighthouses; quarantine; fisheries; ferries on frontiers; banking and issue of paper money; Indians, and lands reserved for Indians; naturalisation and aliens; and a number of other lesser topics. In short, it has exclusive legislative power in all matters except those specifically delegated by the constitution to the prov. legislatures.

(ii) *The provincial governments.* In each prov. the queen is represented by a Lieutenant-Governor, who is appointed by

prisons, hospitals, charities, etc.; municipal institutions; shop, saloon, etc., licences issued for revenue purposes; local works and undertakings other than inter-prov. or international communications; companies having prov. objects; property and civil rights within the prov.; administration of justice within the prov.; generally all matters of a merely local or private nature in the prov.

Dominion-provincial relations. The Canadian constitution was remarkably successful for a period of 50 years, while it was adapted to the conditions in C.; but since then conditions have changed so markedly that the constitution is no longer suited to the age. For when the constitution was framed it was a compromise between those who wanted a strong federal authority and those who thought that it was essential to the success of confederation that Quebec should have control of all those matters in which that prov. differed (as indeed it still differs) from the others, and that consideration should be given to the fears of the remaining provs. lest they should lose their powers. Hence certain specified powers were assigned to the federal gov., certain other specified powers to the

provs., and all residuary powers were left to the federal gov. In this cent. the tendency has been to interpret the constitution in such a way as to strengthen the authority of the federal or central gov.; this being in accord with the movement of public opinion which, since the first decade, has been shifting the emphasis from liberty to power. Again, in 1864, when the constitution came into being, trade in C. was mainly local; to-day it is dominion wide. The power of the dominion gov. is no longer adequate for the effective control of trade and industrial activities, or for the carrying out of international agreements. Conversely,

between the financial powers and the obligations and functions of each governing body, and conduce to a more efficient, independent, and economical discharge of governmental responsibilities in C.

The commission's report was pub. in May 1940 and the ensuing federal-prov. conference to discuss the recommendations dispersed in violent disagreement. During the war C.'s problems grew in intensity and importance, and were met by a temporary agreement on the part of the provs. to 'rent' their portion of the income, corporation, and succession duty tax fields to the federal gov., in return for payments of so much per head of pop.

the development of the social services, which appertain to the prov. authorities, has been so great that the financial provisions made for the provs. at the time of confederation have become quite inadequate. By the close of the inter-world-war period the need for a change in the relations between the central and prov. govts., especially in relation to the div. of taxing powers, was generally recognised. In 1937 the federal gov. appointed a commission, known as the Rowell-Sirois commission, to report on conditions and make recommendations. Its terms of reference were to make 'a re-examination of the economic and financial basis of confederation and of the distribution of legislative powers in the light of the economic and social developments of the last 70 years,' and 'to express what, in their opinion, subject to the retention of the distribution of legislative powers essential to a proper carrying out of the federal system in harmony with national needs and the promotion of national unity, will best effect a balanced relationship

As soon as the war was over efforts were renewed to reach a broader and more lasting agreement on reallocation of taxing powers. One of the chief claims raised by the federal gov. for a larger share of taxation was its plan to institute a national health service and old age pensions on a uniform national basis. (It had already introduced unemployment insurance in 1942, by agreement with the provs., although legislation which had been put through by the Bennett gov. during the depression to do this had been declared *ultra vires* by the courts.) Dominion-prov. discussions continued, with increasing acrimony, until they broke down in May 1940. The federal gov. then proceeded to sign separate agreements with the various provs.; naturally the neediest signed first while the wealthiest, Ontario and Quebec, who considered they had the most to lose, refused to go along with the others. In 1950 the Supreme Court ruled that the federal and prov. govts. could not legally exchange their legislative powers.

Another problem which became intensified during this period was that of a trans-C. highway, which the federal gov. wished to subsidise in order to bring it to completion and assure a national standard. Highways, however, come within prov. jurisdiction, and Quebec has steadfastly refused to co-operate in this national project. In 1952 the federal-prov. agreements of 1947 were renewed, and Ontario joined in, leaving the Quebec premier, Maurice Duplessis, to carry on alone the battle against '*les centralisateurs*' of Ottawa.

It has been a most interesting characteristic of Canadian politics in recent years that, voting federally, the people returned the Liberal gov., which had been in office with only a five-year break from 1921-57, until the success of Mr Diefenbaker and the Progressive Conservatives at the polls, while voting provincially they had elected govts. opposed to the Liberals. This is strikingly true in the most economically important provs. Quebec has a *Union Nationale* gov., Ontario a Conservative gov., Brit. Columbia and Alberta have Social Credit govts., and Saskatchewan a Co-operative Commonwealth Federation (nominally socialist) gov. Of the small provs., New Brunswick has a Conservative gov. and the others Liberal govts.

History. John Cabot had reached the shores of C. in 1497, but in 1534 Jacques Cartier, a Frenchman, undertook a voyage of discovery along the coasts of Newfoundland and Labrador, and on his second voyage (1536-7) discovered the St Lawrence R. and travelled as far as the Indian cap., Hochelaga. Some small settlements were made by the French, but abandoned after 2 years, and it was not till 1608 that Samuel de Champlain, who had visited the country in 1603 and subsequent years, founded the city of Quebec. The St Lawrence region formed a Fr. colony under the name of C. for the next cent. and a half, but the Eng. Hudson's Bay Co. was formed in 1670, and began to carry on trade with the Indians in the NW. Ter. Halifax in Nova Scotia was founded in 1749, and a Brit. governor was set over a number of British who had emigrated thither. The struggle between the French and the English for the possession of the N. Amer. continent was lengthy and determined, but the momentous struggle with the French came to a victorious end with the battle of the Heights of Abraham, in which both the Eng. General Wolfe and the Fr. General Montcalm were killed. By the treaty of Paris of 1763, C. and the disputed lands between the Ohio and Mississippi passed into the hands of the British. The Fr. colonists were allowed to sell their property and return to France if they wished, but above all they were granted complete freedom of worship, and on the whole C. remained satisfied. During the Amer. war the Fr. colonists remained loyal, owing principally to the fact that the Quebec Act of 1774 confirmed their right of worship in their old Catholic faith, and they were also allowed to hold land

according to the system of ancient France. Thus pacified, they gave no help to the rebels, and rather regarded the possible inclusion of C. with the revolting colonies as a misfortune which was to be avoided at all costs. The settlement of what is now the prov. of New Brunswick took place about this time as a result of the driving of the loyalists from America (U.S.A.). The colonists, loyal though they were, however, insisted upon a recognition of their constitutional rights, and they demanded self-gov. in local affairs. This they were granted by the Constitutional Act of 1791, which divided C. into an upper and a lower prov., both of which had a representative assembly.

During the war of 1812-14 both provs. remained loyal and helped to repel the invasions of the Americans. The boundary between C. and the U.S.A. was first defined by another treaty of Paris in 1783 at the end of the Amer. War of Independence. But after the war of 1812 we find a state of affairs which boded ill for the mother country. The colonists were discontented and aggressive; their discontent showed itself in the rebellions of Papineau and Mackenzie, both of which were futile. But the opening of the reign of Queen Victoria did not give prospect of an immediate relief of the situation. Bloodshed and discontent were rife; something must be done which would help in the settlement of C. Lord Durham, who was sent out to investigate matters, suggested that the colony should be granted responsible gov., and a legislative union of Upper and Lower C. took place. The Fr. party for some considerable time held the balance of power, and the rioting at Montreal in 1849 led to the removal of the legislature, first to Toronto and Quebec alternately, and finally to Ottawa. For some time there was a considerable movement in favour of union with the U.S.A., but a reciprocity treaty with U.S.A. in 1854 put an end to this movement. After many difficulties and many deadlocks between the great political parties, the British North America Act was passed by the Brit. Parliament in 1867, and the dominion of C., consisting of Upper and Lower C., New Brunswick, and Nova Scotia, came into being. Prince Edward Is. and Newfoundland dropped out of the scheme at the last moment. There were many reasons for this federation, the chief perhaps being that the fear of Amer. aggression made the colonists feel that united action would safeguard the interests of them all. The new additions were of great value to the colonists of Upper and Lower C., and the federation went far to establish a really strong Brit. dominion in N. America. After the confederation, the Canadian Gov. obtained in 1879 the right to give a preference in tariffs to another colony (or dominion), in 1881 the right of representation when treaties concerning her interests are being discussed, and in 1897 the right to demand that a treaty which she considers inimical to her interests shall be abrogated. In the meantime occurred 2 rebellions of the half-breeds

led by Riel, one in 1869 and the other in 1885; the second was the more dangerous, but was put down, and Riel was executed. Again, since the confederation, in face of many difficulties, the dominion has gone on incorporating new provs. and stretching her boundaries to the N. and to the W. The Hudson Bay ter. was incorporated. Brit. Columbia joined the dominion, and step by step the whole of the present ter. of the dominion was incorporated.

Between the years 1881 and 1885, in spite of opposition and in the face of the greatest difficulties, the Canadian Pacific Railway was built, and amongst the names which stand out above all others at this time are to be remembered those of Lord Strathcona, Lord Mount Stephen, and Sir John Macdonald. The latter, after leading the Conservative party in C. successfully for many years, *d.* in 1891. He had faced many critical movements, but he had been true to his policy of faith in C. and the Brit. Empire. His death broke up the Conservative party, and in 1896 Sir Wilfrid Laurier and the Liberals were returned to power. They remained in office until 1911, when their policy of reciprocity was defeated and the Conservatives under Mr (later Sir Robert) Borden were returned. C. sent a contingent to the S. African war, and in the First World War landed its first contingent in Britain on 16 Oct. 1914. Canadian troops fought in the second battle of Ypres, at St Julien, Festubert, Vimy Ridge, Hill 70, Passchendaele, the Somme, and Cambrai (q.v.), among other engagements. During the period of the war the Houses of Parliament at Ottawa were destroyed by fire (Feb. 1916), and there was a disastrous explosion of munitions at Halifax, N. Nova Scotia (Dec. 1917). In the year following the war, the Prince of Wales made an official tour of C., opening Quebec Bridge on 22 Aug. and laying the foundation-stone of the tower of the new Parliament buildings at Ottawa. In the same year the Canadian National Railways were organised. Sir Robert Borden was succeeded by Mr Arthur Meighen as Premier in 1920, but his Conservative ministry soon fell, and Mr W. L. Mackenzie King, Liberal, became Premier (Dec. 1921), and held office till 1926, during which period there were 2 Imperial Conferences (1923, 1926) at which he represented C.; a trade agreement was signed between C. and the Brit. W. Indies (1925), and Baron Byng of Vinny (q.v.) was made Governor-General, 1921. In 1926 Mr Meighen once again became Premier, but was defeated in the House immediately and resigned. The taxation issue and that of protective tariffs remained the dominant note in Canadian politics, neither party having any very clear advantage in majority, but in 1930 Mr King was severely defeated at the general elections; Mr (later Lord) Bennett (q.v.) became Prime Minister at a time of somewhat serious unemployment and was pledged to an upward revision of tariffs, to exclude, especially, imports of manufs. from the U.S.A. In Oct. 1930 Mr Bennett came to London at the head of

the Canadian delegation to the Imperial Conference, the prin. issues being economic and constitutional (inter-imperial relations).

C. suffered with other countries in the world economic crisis which began in 1929. Factories closed, the wheat market collapsed, and the demand for manuf. and agric. products fell to disastrous levels. The prairie farmers were especially hard hit and the wheat pools faced great losses. The prov. govts. came to their aid and by 1932 they were operating again as co-operative elevator companies. After the depression a drought set in, bringing 8 years of successive crop failures, while soil erosion aggravated the loss, high winds blowing the scorched and crumbled earth for great distances. By 1933 thousands of farmers were on relief, their savings wiped out, and innumerable farms were abandoned. The year 1930 marked the end of the era of the rise of the wheat empire, which had begun with the construction of the railways, and though grain must continue to be important, the W. had other resources awaiting development. It was in this year, too, that the natural resources, which hitherto had been kept under the control of the dominion gov., were transferred to the prairie provs. The depression also encouraged new political movements. In Alberta the Social Credit party (q.v., and see also ALBERTA) advocated drastic changes in the control of banking and money and gained control of the prov. legislature. The Co-operative Commonwealth Federation, organised in 1933, advocated a wide extension of public ownership and a great extension of the social services. Despite the depressing features of the economic crisis these years were not devoid of substantial achievements: the Prairie Farm Rehabilitation Act of 1935, passed by the Conservative Gov., provided for a programme of research through the co-operation of dominion and prov. govts. Through the efforts of farmers and scientists, the line of agriculture was extended gradually further N. in Saskatchewan and Alberta. Radio and flying, too, helped in the expansion northward, freight being carried through the NW. Ters. and even to the Arctic Is. McMurray, at the end of the railway, 300 m. N. of Edmonton, became the gateway to the Mackenzie, and from there the airline reached N. 1600 in. to Aklavik on the Arctic shore; but the full effects of this expansion northward have not yet been realised. The overwhelming Liberal victory in the prov. elections of 1934 was followed by Mr Bennett's heavy defeat in the general election of 1935, when Mr Mackenzie King once more became Premier. Lord Willingdon succeeded Baron Byng as Governor-General in 1926 and was himself succeeded by Lord Bessborough in 1931. In 1935 Lord Tweedsmuir (John Buchan) became Governor-General, one of the most popular in the country's hist. This was also the period of constitutional development in C., as in the other dominions affected by the Statute of

Westminster passed in 1931 (q.v.). In the case of C., and at the express wish of the Canadian Gov., 2 limitations with regard to the British North America Act, that is, with regard to the Canadian constitution, remained despite the Statute: (a) amendments were still to be made by the Brit. Parliament, which, however, would act only at the request of the Canadian Gov.; (b) legal cases involving the interpretation of the British North America Act could still be taken on appeal to the judicial committee of the Privy Council as the highest court of the empire. These limitations were to be removed whenever C. wished, and were retained because no method of amending the constitution had been found which was approved by all the provs. As the Statute of Westminster, by repeating the principle of the Crown as the symbol of the free association of members of the Brit. Commonwealth, demonstrated that the Crown was the only legal link binding the members together, it was as King of C. that George VI made his royal tour in 1939 and addressed the Canadian Parliament in Ottawa. In this transformation from Empire to Commonwealth C. has always played a leading part.

The royal tour of King George and Queen Elizabeth in N. America in 1939 was a striking sign of the new spirit of understanding among the nations of the Brit. Commonwealth and between Britain and the U.S.A. This better understanding, however, did not manifest itself so much in common policies as in the tacit recognition of common interests which in the long run went deeper. On 10 Sept. 1939 the Canadian Parliament resolved that the king should declare a state of war between C. and Germany. A landmark in Canadian hist. was the creation on 18 Aug. 1940, by C. and the U.S.A., of the Permanent Joint Board of Defence, through an agreement signed at Ogdensburg by Mr Mackenzie King and President Roosevelt. By this agreement the signatories in effect declared their determination to co-operate fully 'in the defence of the northern half of the Western Hemisphere.' The Ogdensburg agreement marked a new stage not only in the relations of C. and the U.S.A., but in the relations of the U.S.A. with the Brit. Commonwealth. For the first time in her hist. the U.S.A. had signed a permanent military agreement with a member of the Commonwealth, and had recognised C. as her closest friend and associate. For the first time, too, C. had shown that she was bound to join with her neighbour in defence of the common continent while she was free also to stand by other Brit. nations overseas.

Early in 1946 public confidence in Russian integrity was shaken by the 'Soviet spy case.' The gov. appointed Justices Taschereau and Kellock of the Supreme Court as royal commissioners to investigate the evidence brought out of the Soviet Embassy by a cipher clerk, Igor Gouzenko, of the extent of Soviet spying in C. The most prominent of those exposed were Fred Rose, Communist

M.P. for Montreal-Cartier; Sam Carr, organiser of the Communist party; Dr Raymond Boyer of McGill Univ.; and the Brit. atomic scientist, Allan Nunn May. They were convicted of passing atomic secrets to the Soviets (see *Report of the Royal Commission*, 27 July 1946. Queen's Printer, Ottawa). The warning contained in the Gouzenko case no doubt helped to make C. one of the leaders in proposing the N. Atlantic Alliance in 1947. The threatening Soviet attitude, which led to the blockade of Berlin (June 1948), stimulated the Atlantic nations to press on with this project, and C. joined the other 11 signatories of the N. Atlantic Treaty in Washington, 4 April 1949. A domestic event of great importance occurred at the same time, Newfoundland joining the Canadian confederation on 31 Mar. 1949. Achieved at the time by only a small majority in a referendum (see NEWFOUNDLAND), this step led to a considerable improvement in the economic welfare of the former colony, and is now widely approved by the Newfoundland pop.

The 2 events, the one foreign and the other domestic, launched the remarkable political career of Louis St. Laurent as Prime Minister of C. Mr Mackenzie King (q.v.) had retired in Nov. 1948 after holding office for a total of 23 years since 1921, thus achieving his ambition of surpassing Walpole's term. His successor, a Quebec lawyer who had never been in politics until persuaded in Dec. 1941 to fill the place of the deceased Ernest Lapointe as Minister of Justice and leader of the Quebec wing of the Liberal party, proceeded in 1949 to win the greatest electoral victory in Canadian hist. Mr King had won an overall majority in June 1945, with 125 Liberal seats against 68 Conservative, 29 Co-operative Commonwealth Federation, 13 Social Credit, and 1 Communist, out of a house of 245. Mr St. Laurent won a landslide election in June 1949: 193 Liberal to 41 Conservative, 13 Co-operative Commonwealth Federation, and 10 Social Credit, out of a house of 265. The Korean war of the following year had a great impact on C., which had fairly promptly supported the U.N. effort by sending an army brigade, 3 destroyers, and an air transport squadron, all of which it maintained in the field throughout the war. The hostilities in Korea brought a sharp increase in Canadian defence spending, reversing the post-war trend towards lower budgets and reduced taxes. An ambitious and expensive aircraft production programme was launched, to produce 2 types of jet fighter and the Orenda engine. Many of these fighters were given to the European members of N.A.T.O. as mutual aid; and the maintenance of 12 fighter squadrons in Europe, along with a brigade of troops, became C.'s chief contribution to N.A.T.O. Nevertheless the Korean war gave a further spur to C.'s industrial and mineral development, which began at this time to gather real momentum.

Despite a fresh round of inflation the country was so prosperous that in 1953 the St. Laurent gov. achieved another great electoral sweep. This long-sustained Liberal popularity was strained somewhat by the acrimonious debate of 1955 over the gas pipeline from Alberta to the E. industrial areas. Conservatives and Socialists (C.C.F.) joined for once in opposing the plan of the Minister of Trade and Commerce, Mr. Howe, to loan money to U.S. interests to build the line, and called for a publicly owned project. In 1957, following a general election, the St. Laurent gov. was defeated, and J. G. Diefenbaker (q.v.), leader of the Progressive Conservative party, was appointed Prime Minister. Final results showed that the Progressive Conservatives held 110 seats in the new parliament, Liberals 105, Commonwealth Co-operative Federation (C.C.F.) 25, Social Credit 19, Independents 2, Independent Liberal 1, Liberal-Labour 1, Independent Progressive Conservative 1, and there is 1 vacancy, making a full complement of 265 seats.

Art. Art in C. began in the colony of New France about 1670 when the sojourning artist, Frère Luc (Claude François), transplanted the European style of religious painting into C. Shortly afterwards sculpture in wood was introduced by Jacques Leblond de Latour and other carvers who came as masters to Bishop Laval's school of arts and crafts near Quebec. Though painting was for a cent. to remain in the thrall of folk art or the imitation of Europe, the carving of statues and of decorative work in churches developed freely, reflecting but not imitating the Fr. style in its unfolding from the Louis XIV to the Louis XVI. The Levasseur family in Quebec were the prin. exponents of this art during the era of relative isolation from France in the earlier 18th cent. The art of embroidery flourished under the nuns and often showed considerable originality.

The Brit. conquest of 1759 restored contacts with Europe to a limited extent. A reflection of Chardin and Fragonard is seen in François Beaucourt, the first Canadian painter to study abroad. Later, in the first half of the 19th cent., the portraits of Antoine Plamondon and Théophile Hamel combined the simplicity of folk art with the influence of the Fr. classicists. The Brit. tradition by this time had also begun to play its important part in the formation of Canadian art. In Nova Scotia Robert Field carried the methods of 18th-cent. Brit. portraiture into the early 19th cent. In Quebec the carvers of the *Baillairgé atelier* and the silversmiths combined Eng. neo-classic motifs with their traditional Baroque elements to produce an original and splendid style.

Landscape painting was, however, the most important legacy of Brit. art. A considerable number of topographical artists visited the colony and recorded the Canadian scene. The best of them was Thomas Davies, whose sense of pattern,

colour, and the mystery of the wilderness is only equalled by Rousseau le Douanier. These inspired resident artists such as Paul Kane (1810-71), whose study of the landscape and Indian life took him from Toronto to the W. coast and back again between 1846 and 1848, Cornelius Krieghoff (1815-72), who was in C. between 1840 and 1866, painted the Fr. Canadian scene in the picturesque manner of Düsseldorf, but he also recognised the broad patterns and bold colours which belong to the Canadian landscape. Robert Whale (1805-87) painted landscapes in the manner of Wilson, often including such interesting details as early railway trains and bridges.

About 1870 the romantic picturesqueness of Kane and Krieghoff gave way to a naturalistic treatment of the Canadian scene. This is evident in the landscapes of John A. Fraser, Allan Edson, Henry Sandham, and Lucius O'Brien, and in the realistic genre and portraits of Robert Harris (1849-1919), painter of the first Canadian mural picture, 'The Fathers of Confederation,' in 1881. This movement coincided with the founding of the first official art organisations, the Royal Canadian Academy and the National Gallery of C. (1880). In the nineties realism yielded to a richer, more poetic mode which is apparent in the work of Horatio Walker (1858-1938), the painter of *habitant* genre, who was the most extreme exponent of the Barbizon style; Homer Watson (1855-1936), a landscape painter, the directness of whose early style was later swamped by his imitation of Constable; and Wm Brymner (1855-1925), the painter of dream-like landscapes with a kinship to Inness in the U.S.A. Realistic sculpture, as practised by Hamilton MacCarthy, also gave way to the elegance of monuments of Louis-Philippe Hébert (1850-1917).

A younger generation of painters who saw in Fr. impressionism a new approach to the Canadian landscape played an important part in launching the modern Canadian school. Maurice Cullen (1866-1934) painted atmospheric scenes of Quebec and Montreal; in his later landscapes he eliminated the European haze of atmosphere in order to express the emphatic contours and colour patterns of the N. landscape. James Wilson Morrice (1865-1924), who lived most of his life in Paris in contact with all movements from Whistler to Matisse, had the immediate effect in his native country of encouraging the flat pattern and the further-reaching one of establishing the idea of 'pure' painting.

But the first movement in Canadian art which is to be identified as 'national' was begun by a group of painters in Toronto in the years following 1910. A. Y. Jackson brought from Montreal the influence of Morrice as well as his own passion for discovery. The untrained Tom Thomson (1877-1917) contributed a native understanding of the N. woods; Arthur Lismer and Franklin Carmichael (1890-1945) had a feeling for rhythmic movement; F. H. Varley, a mastery of paint; J. E. H.

MacDonald (1873-1932), a poetry of interpretation; Lawren Harris, a dynamic vision of the forces of nature. The Group of Seven (including the foregoing with the exception of Thomson, and with the addition of sev. others at different times between 1920 and 1933) felt the impact of impressionism, *Art Nouveau*, and Scandinavian expressionism, but national feeling was paramount and fused these influences into a new style, austere, unquiet, and uncompromisingly regional, which was hailed in Europe during the twenties before it was accepted at home. Contemporaries of the group in other parts of C. included Albert Robinson and Clarence Gagnon. Two other artists of the same generation developed individual styles of a high order. David Milne's (1882-1953) delicate, imaginative, quiet manner depends on patterns of a simple and exquisite sort, and elusive colour harmonies as personal as handwriting. Emily Carr (1871-1945), who painted all her life in Brit. Columbia, underwent an astonishing expressionist development after brief contact with the Group of Seven. Her canvases and spontaneous large 'sketches' in oil on paper are expressions of her enthusiastic response to the stylised forms of the Indian totems and her excited reaction to the luxuriant growth of the W. forests.

Recent trends include a further development of the style of the Group of Seven along broader and more varied and personal lines on the part of one important group, L. L. Fitzgerald (1890-1956), with his linear definition of Winnipeg backyards. Charles Comfort with his simplified landscapes of the thirties, Carl Schaefer with his subtlety and intimacy in water-colour, Wm Ogilvie with his delicate, stylised figures, Jack Nichols with his delicate and pathetic ones, and Edwin Holgate, with his powerful ones, all stem from the 'austere' school. A number of *genre* painters have moved somewhat away from this sphere of influence, yet are bound to it by their attachment to the Canadian scene: these include Henri Masson, André Biéler, and Pegi Nicol MacLeod. Some, including Jean-Paul Lemieux, Edward J. Hughes, and Alexander Colville, approach the simplicity and intensity of the folk artist. Jack Humphrey, Marian Scott, and Fritz Brandtner are inspired by abstract movements in France, England, and Germany respectively. Jean Dallaire and Kenneth Lockhead are surrealists. A Montreal group which has grown up since 1939 looks to Morrice and to John Lyman as the patron saints of non-particular art and has been deeply influenced by contemporary European schools of 'pure' painting, abstraction, and expressionism, particularly the school of Paris. It includes among others Goodridge Roberts, Stanley Cosgrove, Alfred Pellán, and Jacques de Tonnancour; also Paul Émile Borduas (leader of the *Automatistes*) and his pupil, Jean Paul Riopelle, the internationally famous *tachiste*.

New schools of painting have recently

appeared in 2 cities. Vancouver has seen the greatest development and the greatest variety of styles, including the decorative abstractions of B. C. Binning and the 'animist' compositions of J. L. Shadbolt and Gordon Smith; A new Toronto group, 'Painters Eleven', includes the vigorous non-figurative painters, Wm Ronald and Harold Town.

Sculpture has followed the same general pattern of development as painting. Perhaps the only significant influence between 1900 and 1940 was the dubious one of *Art Nouveau* (Walter Allward: Vimy Memorial, 1924). The animal and landscape reliefs of Emanuel Hahn and Elizabeth Wyn Wood paralleled the work of the Group of Seven in painting. The influence of European monumental sculptors like Mestrovic and Milles was the inspiration of sev. sculptors like Suzor-Côté, Frances Loring, et al. Louis Archambault, whose 'Iron Bird' caused a sensation in 1950, stands out among younger sculptors.

Some of the most recent endeavours of Canadian artists have been in the realm of the film (Norman McLaren) and industrial design. Art societies, which have grown greatly in numbers and effectiveness during the past 25 years, have played an important part in the stimulation of Canadian art. The work of the National Gallery of C., which for many years has carried on a nation-wide programme of travelling exhibitions, is now supplemented by a growing number of museums, galleries, and community centres.

Hubbard, 'A Period of Growth in Canadian Art,' in *The Culture of Contemporary Canada*, 1957, and *Canadian Works of Art in the National Gallery of Canada*, 1947; see also *Canadian Art* (a quarterly periodical).

Canada Balsam, see ADHESIVES.

Canada Goose, *Bernicla canadensis*, species of the Anatidae or duck family which is common to N. America. It is a wild goose which sometimes breeds in Europe, and it is closely related to the Barnacle Goose (q.v.).

Canadian Architecture. Architecture in Canada had its beginnings in the first dwellings built by Fr. settlers on the St. Lawrence in the 17th cent. Unlike the wooden houses of New England, those in Canada were built of stone. At the outset they resembled buildings in Normandy, but during the 18th cent. there appeared certain native features, the most noticeable

of which was an upward tilt of the eaves. In only a few buildings of the Fr. regime, designed by clerical amateurs or Fr. military architects, were there traces of the classicism of Paris; otherwise churches, religious houses, and dwellings alike shared a common simplicity of design.

The 18th-cent. Eng. settlements in the Maritime provs. followed a version of the Georgian similar to that found in New England, and Eng. influences mingled with local traditions in Fr. Canada after 1759. The end of the 18th cent. and the earlier 19th cent. saw the introduction of the log cabin on the frontier, but in architecture reflected the Regency styles, with the Palladian being the favourite for larger buildings (Province House, Halifax, by John Merrick, 1811). Many buildings of this period show evidence of the austere, handsome work of Scottish stonemasons. The architects of this time were often Eng. military engineers (Quebec Anglican cathedral by Maj. Robt. and Capt. Hall, 1804), but during the first half of the 19th cent. the Gk revival (q.v.) spread into Canada from the U.S.A.

The Gothic revival (q.v.) began with Notre-Dame in Montreal, designed in 1824 by James O'Donnell with Gothic details and Georgian proportions, and an elaborate carpenter's Gothic sprang up at the same time. But later architects such as Wm Thomas (St Paul's, Hamilton, 1857) based their work on a closer study of Gothic monuments, while Frank Wills approached true medieval proportions in the cathedrals of Fredericton (1845) and Montreal (1857). The most imposing monuments of the revival were Univ. College, Toronto (by F. W. Cumberland, 1856), built in the Norman style which was then considered a variety of Gothic, and the Parliament Buildings at Ottawa, which show Ruskin's influence (1859 ff.); the central block, destroyed by fire in 1916, by Thomas Fuller, and the surviving E. and W. blocks by Frederick Stent). In the sixties and seventies the Renaissance style was also revived, particularly for office buildings. The influence until this time were predominantly British, but in the eighties the sturdy, sombre Richardsonian Romanesque from the U.S.A. (see RICHARDSON, HENRY HOBSON) had a considerable effect in Canada, though it was often modified by the addition of features which lent a Scottish baronial air to office buildings, parliaments, etc. (cf. Ontario Legislature, Toronto, by R. A. Waite, 1890).

At the turn of the century the naïveté of earlier decades was replaced by a studied correctness of design. The architects, who about 1900 founded their professional schools and societies, became conversant with a variety of styles, applying their Renaissance to office and legislative buildings (Saskatchewan Parliament, Regina, E. & W. S. Maxwell, 1910), their learned Gothic to churches and parliament buildings (new central block, Ottawa, John A. Pearson, 1919), their Classic to banks and railway stations (Union Station, Toronto, 1919. Ross &

MacDonald, Hugh Jones, and J. M. Lyle), their Georgian and Tudor to villas, and the now familiar Fr. 'château' style to hotels—as site or function seemed to demand. They found a new idea in the 'château' style which was intended to give an old Fr. air to such buildings as railway hotels (Château Laurier, Ottawa, by D. H. MacFarlane, 1910).

Skyscrapers—the *Daily Star* Building, Toronto (Chapman & Oxley, 1928); the Aldred Building, Montreal (Barott & Blackader, 1930); and the Canadian Bank of Commerce, Toronto (Darling & Pearson, 1930) are among the largest examples—which depended on structural steel and reinforced concrete, sometimes had the exterior of a cathedral or palace.

The first evidences of a new style, which frankly acknowledged the new materials and techniques and expressed new functions, appeared early in the present century in utilitarian structures such as factories and grain elevators. But the development of contemporary architecture has been made difficult by the continuing 'battle of the styles.' This is seen to good advantage in Ottawa, where the forces of conservatism have kept official architecture in bondage to the 'château' style; but non-official buildings have offered a challenge in the form of steel-and-glass structures like the Commonwealth Building (Alra & Balharrie, 1954). The newer movements are better able to make their way in the central and W. cities. John B. Parkin Associates in Toronto, and Green, Blankstein, Russell & Associates of Winnipeg (new National Gallery design, 1954), are among the leaders. But in Vancouver the architect seems to have the greatest freedom. Firms such as Sharp & Thompson, Berwick Pratt (Grauer Hydro-electric Station, 1953, with colour design by the painter B. C. Binning), and Semmens & Simpson (St. Anselm's Church, etc.) are leaders in this vigorous movement. Vancouver's recent competition for a civic auditorium was, however, won with a striking design by a group of Montreal architects (Guy Desbarats and others). See R. Traquair, *The Old Architecture of Quebec*, 1947; G. Morisset, *L'Architecture en Nouvelle-France*, 1949; A. Gowers, *Church Architecture in New France*, 1955.

Canadian Literature (English). Canada has produced little that would rank as great literature, and Canadians are first to admit this. But the time has passed when either Canadians or Britons would say that the country had no distinctive culture of its own. Desmond Pacey, in one of the most recent studies of Canadian literature, claims it 'has a distinctive conception of man's lot on the earth, a conception engendered by the peculiar features of the Canadian terrain. . . . In it man is dwarfed by an immensely powerful physical environment which is at once forbidding and fascinating.'

Canadian culture had its beginnings in Halifax, Nova Scotia, a prov. which became British some 40 years before the rest of Canada. Henry Alline (1748-84), an immigrant from New England, may

be said to have been the first Canadian writer. His *Life and Journals* have been compared to the works of Bunyan. The first book-length poem was written by a Canadian-born Oliver Goldsmith who was a descendant of the Brit. Oliver Goldsmith, its title, *The Rising Village*, being reminiscent of *The Deserted Village*. Similarly, the first Canadian novelist, Thomas Haliburton (1796-1865), was a distant relative of Sir Walter Scott. His Sam Slick of *The Clockmaker* is still a memorable character, and was perhaps the model of Dickens's Sam Weller, as his squire might have suggested Pickwick.

The central figure in Canadian colonial literature was Joseph Howe (1804-73), who was also Nova Scotia's leading politician in his day. An early poet, then an outstanding journalist, he left a number of books of travel sketches, including *Western Rambles*, 1828, and *Eastern Rambles*, 1830; as well as his *Letters to Lord John Russell* and his *Collected Poems and Essays*.

Among the Loyalists, who came to Canada after the Amer. Revolution, there were many educated people who played the main role in founding the early univs. of Canada. The chief record of their experience is the *Journal* of Jacob Bailey (1731-1808); their leading poet was Jonathan Odell (1737-1818). Writers of the colonial period in Upper and Lower Canada (Ontario and Quebec) include the Scots immigrant Alex. McLachlan (1818-1896) with his *Young Canada, or Jack's as Good as My Master*, and the first part of a projected epic, *The Emigrant*, very much in the Burns style. An account of pioneer life which is still read is that of Susanna Moodie (1803-85), *Roughing It in the Bush*. A more far-ranging account of life in Canada during this same period, recently reprinted, is that of Mrs Anna Jameson, a visiting Irishwoman, an altogether remarkable person, *Winter Studies and Summer Rambles in Canada*, 1838.

The leading poet of this era was John Richardson (1796-1852), whose long narrative poem, *Tecumseh*, on the war of 1812, and novel, *Wacousta*, have remained in print for over a century. Richardson is also of some note as the first talented Canadian writer to starve to death, not for lack of trying but for lack of an adequate book market in Canada: the relatively small pop. of the country is divided between 2 main language groups, a large part of its people came to Canada as barely literate peasants, and Brit. and Amer. pubs. have always dominated the market. Charles Sangster (1822-93) might have succeeded to Richardson's dubious honour, but avoided starvation by working in the post office for the last 25 years of his life. His pub. poems are *The St Lawrence and the Saguenay*, *Hesperus*, and *Our Norland*. Charles Heavyside (1816-76) produced the only outstanding Canadian drama, *Saul*.

In the latter part of the 19th cent. there were more and more works by native-born and univ. educ. Canadians, although brilliant newcomers like Goldwin Smith of Toronto often dominated the scene. The

literary jour., *The Week*, which he and Charles G. D. Roberts ed. in 1883-96, provided the best opportunity for pub. which new Canadian writers had enjoyed up to that time. Canada's best poets stem from this period: Roberts himself (1860-1943), later knighted; Charles Mair (1838-1927); Archibald Lampman (1861-1899); Duncan Campbell Scott (1862-1947); Bliss Carman (1861-1929), perhaps the best-known of all Canadian poets; Wilfred Campbell (1861-1918); and W. H. Drummond (1854-1907), who wrote charming poems of the Fr. inhab. On the distaff side there was Isabella Crawford (1850-87), whose work, when pub. by J. W. Garvin, brought recognition only after her death; and Pauline Johnson, a full-blooded Iroquois princess, whose patriotic verse was widely read.

The outstanding novels of the 19th cent. were historical: Wm Kirby's *The Golden Dog*, 1877, and Gilbert Parker's *The Seats of the Mighty*, 1896. The former must be ranked as one of the finest pieces of Canadian writing. A number of novels of Fr. Canada, written in this period by Eng.-speaking authors anxious to help explain the older branch of the Canadian nation to the younger one, deserve mention. They include T. G. Marquis's *Marguerite de Roberval*, 1899, a story of the times of Jacques Cartier; W. D. Lighthall's *The Young Seigneur*, 1888; and Agnes Laut's *Lords of the North*, 1900, and *Heralds of Empire*, 1902, which deal with the early fur traders and explorers of the W.

Novelists of the early 20th cent. include sev. who, varying the usual Canadian story, enjoyed great success through large sales of their novels abroad. 'Ralph Connor' (the Rev. Charles W. Gordon) sold five million copies of his *Black Rock*, 1897, *The Sky Pilot*, 1898, *The Man From Glengarry*, 1901, and other novels, read to-day only for their historical interest. Arthur Stringer made a long and successful career in the U.S., but used Canadian material in his books (*Lonely O'Malley*, 1901, *Prairie Wife*, *Prairie Mother*, and *Prairie Child*, 1916-21). L. M. Montgomery enjoyed a huge success with her *Anne of Green Gables* series; as did Marshall Saunders with *Beautiful Joe*. Marian Keith's *Gentleman Adventurer* is an excellent historical novel of the Riel Rebellion. Three others whose works are still known around the world are Robert W. Service, with his *Songs of a Sourdough* and other sagas of the Yukon Gold Rush; Mazo de la Roche with her *Jalna* series, which has run into a score of vols.; and Stephen Leacock, the beloved humorist and sage of *Sunshine Sketches of a Little Town* and many other works. Quite different is the story of Canada's leading realistic novelist, Frederick Philip Grove, a well-educ. and travelled Anglo-Swede who seemed to love Canada more passionately as he became embittered with Canadians as readers. His *Over Prairie Trails*, 1922, *The Turn of the Year*, 1923, *Settlers of the Marsh*, 1925, and *Our Daily Bread*, 1928, somewhat in the style of Knut Hamsun, have been called the

truest accounts of life on the Canadian prairies and the most powerful novels in Canadian literature. The other outstanding Canadian realist of the period was also of Scandinavian (Icelandic) extraction: Laura Salverson, who wrote *The Viking Heart*, 1923. Nellie McClung's stories of pioneer days in the W., such as *Sowing Seeds in Danny*, are of a much milder nature. Poetesses of this period were Marjorie Pickthall and Audrey Alexandra Brown; poets, John McCall, *In Flanders Fields*, and Wilson Macdonald, *Out of the Wilderness*.

Among the best-known Canadian writers of recent years are F. E. D. McDowell, *The Champlain Road*, 1939, and Philip Child, *The Village of Souls*, 1933, both novels set in the 17th cent. There are also Will Bird, *Here Stays Good Yorkshire*, 1945; Thomas H. Raddall, *Pride's Fancy*, 1946; Kathleen Coburn, *The Grandmothers*, 1949; and Ethel Wilson, *The Innocent Traveller*, 1949. Morley Callaghan, *They Shall Inherit the Earth*, 1935, and others; Hugh MacLennan, *Two Solitudes*, 1945; Gabrielle Roy, *The Tin Flute*, 1948; Roger Lemelin, *The Town Below*, 1948; and Germaine Guèvremont, *The Outlander*, 1950, are leading contemporary novelists. Another novel, set in Soviet Russia but written in Canada and much noticed around the world, is Igor Gouzenko's *The Fall of the Titan*, 1954. The most important contemporary poet is E. J. Pratt; others are Earle Birney, A. M. Klein, L. A. Mackay, Dorothy Livesay, Anne Marriott, and James Wreford.

Canadian Railways. Railways in Canada have always represented something more than mere transportation. In essence, they have represented nation-building. The early projects, such as the Grand Trunk, the Intercolonial, and the Canadian Pacific, now seem to have been ambitious beyond young Canada's strength; but they were undertaken in furious competition with the extension of canals and railways on the Amer. side of the border, in a determination to hold the N. half of the continent for Brit. settlement. The first railway in Canada was a 15-m. line between Laprairie, opposite Montreal, and St John's, at the head of Lake Champlain, in 1836. The first big project was the St Lawrence and Atlantic, which linked Montreal with Portland, Maine, as a winter port. With the 1850's came the first great railway building boom, the Grand Trunk being

pushed through from Montreal to Sarnia, Ontario (and later to Chicago), the lines of the Great Western spreading out from the Toronto-Niagara area, and the N. railroad running from Toronto up to Collingwood, on the Georgian Bay. This latter line formed a link between Lakes Ontario and Huron, and handled much trade for Chicago. It is estimated that \$100 millions were poured into railway building in Canada in the 1850's.

Confederation brought the compact to build the long-discussed Inter-Colonial Rail Road, along the S. shore of the St Lawrence, from Montreal to Halifax, linking the Maritimes with what was then called 'Canada.' It was completed in 1876. Partly strategic (it was launched at the time of the Amer. Civil War) and partly political, it failed then to give Halifax the traffic it expected; but it has fully justified itself in 2 world wars. The 1870's and '80's were dominated by the great project of a railway to the Pacific. This too had been part of a political compact, promised to bring Brit. Columbia into the union. With 1000 m. of rocky wasteland in N. Ontario, 1000 m. of empty prairie beyond Winnipeg, and then the mighty Rockies, it was a formidable project. The infant Canadian nation of 4 million was setting out to do what the powerful U.S.A. of 40 million had just achieved, in completing the Union Pacific Rail Road in 1869. Canada's decision, or at least John A. Macdonald's decision, was made in 1871. But in 1873 Macdonald's gov. was turned out of office through the 'Pacific scandal,' by which the chief financier of the new railway was shown to have heavily supported Macdonald's successful election campaign of 1872. The next gov. was an exceedingly honest and cautious one, and advanced the railway scheme very little. It took Macdonald's return to power in 1878 to fire the boiler; a new syndicate of Montreal financiers was formed, led by George Stephen (later Lord Mount Stephen), Donald Smith (later Lord Strathcona and Mount Royal), and R. B. Angus, with the energetic American, Wm Van Horne (later Sir Wm), as president, and the steel was laid to the Pacific by 1885. The Canadian Pacific Railway (C.P.R.) then set out to bring in settlers for the 25,000,000 choice ac. it had received from the gov., and the colonisation of the W. was under way. As this proceeded, the promoters of the Canadian Northern Rail Road, Mackenzie and Mann, began to string their grain-collecting roads across the prairies, feeding into the C.P.R. for the E. haul. As the development fever mounted, the Grand Trunk Rail Road plunged into a project for an extension to the Pacific. The logical development would have been amalgamation with the Canadian Northern Rail Road. But the Liberal gov. of Laurier, irritated for many years by Conservative boasts that they had built the C.P.R., galled as much by C.P.R. support for the Conservative party, and anxious to counter the vast power wielded by the C.P.R., came out with a scheme for a National Transcontinental

Rail Road. This was to take a more northerly route across Ontario, the prairies, and Brit. Columbia, with its Pacific terminus at Prince Rupert. The gov. would build the E. section, the Grand Trunk Pacific (G.T.P.) the W., and the G.T.P. would operate the line. (This is almost exactly the formula advanced by a Liberal gov., in 1956, for building the Trans-Canada Pipeline.) This second transcontinental line, which in its long section across N. Ontario was already one too many, was no sooner under construction than the Canadian Northern started to build a third. When the First World War suddenly checked the colonisation of the country, it was soon discovered that the railways had been over-built. In 1922 the bankrupt Canadian Northern and G.T.P. were reorganised and amalgamated into the nationally owned Canadian National Railways (C.N.R.) at a great loss to many Brit. and Canadian investors. Its first president, Sir Henry Thornton, made every effort to weld the C.N.R. into a real system and to build up its morale until it could compete with the C.P.R. (which also had a notable president in that era, Sir Edward Beatty). The C.P.R. has never relished a situation in which its competitor's losses are covered from the public treasury; but it had vast subsidies itself from the gov. in the beginning, and undoubtedly the country's interest is better served through the 2 railway systems, rather than 1 privately-owned leviathan. It was for the latter reason that the proposal for amalgamation of the railways, urged by the C.P.R. on a Royal Commission in 1931, was turned down.

The C.N.R., with 23,763 m. of track, is now the greatest railway system of N. America. It includes the Quebec Bridge (central span, 1800 ft), next to Sydney Bridge the longest in the Commonwealth. The C.P.R. has 17,153 m. of track, and with subsidiary steamship lines and air-lines is the greatest travel system in the world. These 2 railways jointly operate the N. Alberta, running up to the Athabasca and Peace R.s., with 923 m. of road; and on main E. Canada runs they operate 'pool' trains over each other's tracks. The C.N.R. operates the Hudson's Bay Rail Road, completed in 1931, to the port of Churchill. It has also taken over operation of the 700 m. of railway in Newfoundland, much of which is narrow gauge. The only other considerable railways in Canada are provincially owned, the Northern Ontario, running from N. Bay to Moosonee on James Bay; and the Pacific Great Eastern in Brit. Columbia. The latter is now being linked for the first time with Vancouver at its S. end, and extended N. to the Peace R. country. The first extensive railway-building period in a quarter cent. has lately pushed steel into a number of new mining areas. A 360-m. line has been built from Seven Is. on the N. shore of the Gulf of St. Lawrence to open up rich iron ore deposits in the heart of Ungava. Another new line in Quebec runs to Chibougamau, lines in Ontario to Geco

and Manitowadge, in Manitoba to Lynn Lake, and in Brit. Columbia from Terrace to the great new aluminium smelter at Kitimat. Under discussion is a 500-m. railway from the Peace R. northward to Pine Point on Great Slave Lake, where one of the richest lead and zinc deposits in the world has been discovered. All freight and passenger rates, and many other matters concerning the railways, come under the jurisdiction of the Transport Commission. U.S.A. railways operate 863 m. of line in Canada. C. R. are being rapidly dieselised and re-equipped with the most modern coaches. See H. A. Innis, *History of the Canadian Pacific Railway*, 1923, and d'A. C. Coleman, *Mount Stephen and the C.P.R.*, 1945.

Canadian Sea, see HUDSON BAY.

Canakkale, seaport and il of the same name in Asiatic Turkey, on the Dardanelles. The allied fleet attacked it in 1915, but without success. In 1922 it was occupied by Brit. forces in order to arrest the advance of Kemal's army. This nearly resulted in war with Turkey—or the resumption of war, for as yet peace had not been officially concluded—but the contretemps was avoided by the tact of Sir Charles Harington, the Brit. Commander-in-Chief in the Black Sea area. Pop. (il) 312,679, (tn) 11,633 (1950).

Canal (Lat. *canalis*, a channel), artificial water-course serving the purpose of drainage or irrigation, or more frequently for the transportation of merchandise in boats, barges, or ships. C.s have undoubtedly been in existence since very early times. Herodotus and Strabo both speak of a C. across the isthmus of Suez which was begun in 616 BC by Necho and completed by the year 521 BC. In Egypt the Nile has from time immemorial been noted for its irrigation C.s; traces of waterways which the anc. Egyptians constructed still remain. The Imperial or Grand C. of China is of great antiquity; it commences at Hang-chau, near the mouth of the Tsientangkiang R., and crossing the Yangtsekiang at Chinkiang terminates at Tientsin. The total length is about 650 m., but the depth is seldom more than 6 ft. C.s were probably first built for irrigation, but, especially after the invention of locks, they acquired importance for navigation. A lock chamber enclosed by a pair of gates was said to have been constructed by 2 brothers Domenico in 1481, and Leonardo da Vinci 6 years afterwards completed 6 locks which united the C.s of Milan. A C. can rarely be built on one level and usually consists of a series of level reaches at varying heights above a datum line; each reach is closed by locks. The bases of the hills and the winding of the valleys must provide the general route for these reaches. The channel of the C. has a flat bottom and sides which slope outwards from the bottom. In dists. where the soil cannot withstand the erosion of the water, the sides should be lined with 'puddle,' a compound of tempered clay mixed with water, which is worked into the sides to a distance of 2 or 3 ft. Sometimes the sides are faced with stonework or concrete

where there is much traffic. The breadth of the C. bottom should be at least twice the greatest breadth of the boat using the C.; the depth of the water should be at least $1\frac{1}{2}$ times the draught of the boat; and the area of the waterway should be 6 times the greatest midship section of the boat. The width of an ordinary inland C. in this country is 25–30 ft at the bottom, and 40–50 ft at the level of the water. The depth is about 4–5 ft. To maintain the level of water in a C., it may be necessary to provide storage in a reservoir; surplus water may be discharged over waste weirs to lay dry a portion of the C. for carrying out repairs. Stop-gates are necessary at short intervals.

Locks are chambers made of wood, brickwork, etc., and provided with gates at each end. The lock is of sufficient size to take the largest vessels which use the C.; it is placed at the termination of the lower reach, and rises to a slightly greater height than that of the water in the upper reach. The gates of the lock, which are very strongly made, open against the direction of the current, and are slightly more than half the width of the lock chamber, so that they meet before they form a straight line, and are kept firmly in place by the pressure of the water. Sluices are placed in each gate near the bottom, and can be worked from the top of the lock independently of the gates themselves. When a boat is about to ascend from a lower to a higher reach of the C., the upper gates and sluices, commanding the flow from the upper reach, are closed. The sluices at the lower end of the lock are opened, and when the level of the water in the lock chamber is the same as that of the lower reach, the boat enters the lock. The lower gates and sluices are then closed, whilst the sluices only in the upper gate are opened. The water in the lock then gradually rises until it reaches the level of the upper reach, when the upper gates can be opened and the boat passes out of the lock into the higher reach. When a boat descends from a higher reach to a lower, the procedure is reversed. In large locks the sluices may be carried through the walls instead of being in the gates. The material of which the gates are composed is generally hardened oak; in small narrow locks a single gate at each end is sufficient. The gates are opened and closed by balance beams projecting over the lock side, which are worked either by gearing or by a hydraulic ram. The locks are not much larger than the vessels they are required to take. The Eng. C. boat is from 70 to 75 ft long and 7 or 8 ft wide; a barge is the same length, but double the width, i.e. from 14 to 15 ft. The average lift of a C. lock is from 8 to 9 ft, sometimes as little as $1\frac{1}{4}$ ft. In Belgium, on the Canal du Centre, the locks have a lift of 17 ft, whilst 1 lock on the Saint-Denis C. has a lift of 32½ ft. When there is a very big difference in the levels of the 2 reaches of the C., it is sometimes overcome by a flight of locks, in which the lower gates of one lock form the higher gates of the one below it. On many of the Eng. C.s an inclined plane is

placed at the side of the lock for the use of pleasure boats; the boats are placed on the rollers which form the plane, and hauled over by hand. The same principle is sometimes used for barges, but as such a method is liable to strain the timbers, etc., of large vessels, a more common arrangement is for 2 counter-balancing tanks to be used. Each of the tanks holds sufficient water to float a boat, 2 lines of rail are used, on which the tanks run, and they are connected by chains running on pulleys in such a way that as one ascends the other descends. Vertical lifts are also employed on some C.s; they are only used where the difference in the levels of the reaches occurs in a short length of C. to obviate the construction of embankments, etc. At Anderton there is such a lift, which deals with barges of as much as 100 tons burden and has a lift of 50 ft. The horse is still used for haulage on the small C.s. Steam towage was first introduced about the beginning of the 19th cent., but tug-towing a string of barges are only practicable when there are no locks on the C., or when the locks can take the tug and all the barges at the same time. Barges having a steam or oil engine of their own are now utilised; on a portion of the Tetlow C., in Germany, an electric system of traction was put into use. The ordinary speed of a horse-drawn C. boat is from 2 to 3 m.p.h.; if an excessive speed is attempted, the wave raised washes away the sides of the C. much more quickly, and the water is disturbed for a long distance along the C.

Canals in the United Kingdom. Great Britain was one of the last nations to make any use of C.s. The first C. was Bridgewater C. (q.v.). The successful accomplishment of this work encouraged others, and before the introduction of the railways the length of the navigable C.s in Great Britain was estimated at 3000 m. The largest C.s in Great Britain are the Caledonian C. (q.v.), the Crinan C., the Forth and Clyde C. in Scotland, and the Gloucester and Berkeley Ship C. (17 m.) in England. Other main C.s in England and Wales are the Manchester Ship C. (35 m.) (q.v.), the Grand Union (280 m.), the Birmingham (160 m.), the Leeds and Liverpool (190 m.), the Aire and Calder (90 m.), the Trent Navigation System (120 m.). The first C. to be modernised in England was the Grand Union, which links London with Nottingham and Birmingham. The work of dredging and deepening was completed in 1934, and the C. can now carry motor-driven barges at greater speed. The Nene R. was also canalised with locks to take ships of 15-ft beam, and linked with the Grand Union, thus providing a through waterway from the Wash to the Bristol Channel, and, at the same time, joining Birmingham and Manchester with London. There are in all 3641 m. of waterway in England and Wales, 184 m. in Scotland, and 848 m. in Ireland. The total extent of C.s in use in Great Britain is about 2500 m. In 1948 most of the important inland waterways (2000 m.) in Great Britain were taken over under the Transport Act, 1947,

by the Brit. Transport Commission, placed in the charge of the Docks and Inland Waterways Executive, and organized into 5 areas with H.Q. in Leeds, Northwich, Nottingham, Gloucester, and London; ann. tonnage about 10 million. The Bridgewater, Manchester Ship, and Thames Conservancy are not included in these arrangements, and the ann. tonnage carried by them is nearly 20 million. The C. Association and the Inland Waterways Association have done much to obviate neglect of Brit. waterways. Some C.s are choked with weeds and mud, rendering navigation impossible; often the lack of adequate dredging, together with leaky locks, greatly delays traffic.

THE CANAL SYSTEM OF ENGLAND

Continental canals. Belgium occupies a foremost place in inland navigation; it had, before the First World War, a length of C.s amounting to 1360 m., which is 1 m. of waterway to every 8½ sq. m. of ter. Today, the total length of C.s and navigable rivs. is still over 1000 m. The Albert C., connecting Antwerp and Liège, a distance of some 80 m., was completed just before the outbreak of the Second World War. It can carry barges up to a burden of 2000 tons, and is over 80 ft wide at its narrowest, with a depth of 16 ft. Work was also carried out to widen and deepen the Charleroi-Brussels C. In the Netherlands, the Princess Juliana Ship C. was opened in 1935, 20 m. in length with a depth of 16 ft and a width of 50 ft. Another modern C. is the Twente C. from Zutphen to Enschede, opened in 1936. Since the days of the first C. in France, which was constructed between 1605 and 1641, the French have on the whole been keenly alive to the advantages of this method of transport. The Languedoc C., or C. du Midi, connects the Bay of Biscay with the Mediterranean; it is 148 m. long and has

119 locks, but is only 6½ ft deep. The Fr. Gov., whilst developing the railways of the country, did not overlook the C.s, and there are 6000 m. of navigable waterways with a total traffic of about 40,000,000 tons. Many of these waterways are maintained entirely by the State, and no tolls are levied. The Fr. Gov. in 1879 passed a law to secure uniformity in the dimensions, etc., of the prin. C.s. By the above law all C.s must have a depth of 6½ ft, locks must measure 126½ ft by 17 ft, and a space must be left under bridges of 12 ft, thus enabling boats of about 300 tons burden to travel along all the prin. Fr. C.s. Prior to the outbreak of war in 1939, considerable work was carried out in improving the existing waterways and in installing electrical machinery at many of the locks on, for example, the Rhine-Rhône C. and elsewhere. In Germany, between the 2 world wars, an ambitious scheme was launched for joining, by canal, the R.s Oder, Elbe, Weser, and Rhine, extending to nearly 7000 m. of C. The last link in this chain was completed in 1938, the Mittel-land C. from Magdeburg through Brunswick and Münster to the Rhine, joining with the Dortmund-Ems C. The Soviet Gov. has aimed at making Moscow an important inland port, linking it with the Volga and thence with the White Sea, the Baltic, the Black Sea, and the Caspian. The Moscow-Volga C. was completed in 1937, giving about 80 m. of navigable waterway, and work was then begun on the Volga-Don C. between Stalingrad and Rostov. In Sweden, the Göta C. system links the Cattegat, through the lakes, with the Bothnian Bay.

Canals in the U.S.A. and Canada. In America there are numerous C.s which connect the separate riv. navigations. The St. Lawrence C.s, between Lake Ontario and Montreal, and the Welland C. join Lake Erie and Montreal; the last-named is nearly 27 m. long and rises by means of locks to over 320 ft (see WELLAND). The size of these C.s has been increased, and now the locks are 270 ft in length, 45 ft in width, and 14 ft in depth. A C. at Sault Sainte Marie connects Lake Superior with Lake Huron to avoid riv. rapids. The Chesapeake and Ohio C. was begun in 1828, and by 1850 extended from Georgetown on the Potomac to Cumberland. This C. connects Maryland with Washington, D.C., thus enabling coal to be brought from the Cumberland region to the Potomac R. It is 184 m. long and has 73 locks. The Erie C., which connects Lake Erie with the Hudson R., is 365½ m. in length; the width at the bottom varies from 53 to 79 ft, that at the surface from 70 to 98 ft, whilst the depth ranges between 7½ and 9½ ft. The Delaware at Phillipsburg and the Hudson R. at Jersey City are connected by the Morris C., which crosses a spur of the Alleghenies by a system of inclines; it is 102 m. in length. The Chesapeake and Delaware C., a part of the toll-free Atlantic inland waterway, was taken over by the State in 1919. The Dallas and Celilo C., completed in 1915, allows of riv. navigation up the Columbia

and Snake R.s for nearly 600 m. from the ocean. The ship C.s generally of the U.S.A. are of great economic importance, but the same cannot be said of the inland C. system. One fairly recent experiment is the State Barge C., New York, which connects New York city with Buffalo by a deep-water route of 790 m. and has a minimum depth of 12 ft. but it costs the taxpayers of the state \$7,000,000 annually, and only a negligible fraction of the expected traffic passes over it. It was, however, deepened in 1941 to a depth of 14 ft between the Hudson R. and Lake Ontario. The Cape Cod C.,

were too shallow. Only a narrow strip of land had to be excavated between Velsen and the N. Sea, as the direct route passed through Lake Y and Wijker Meer. Banks were formed along the C. by the soil which was dredged from the bottom in order to deepen the C. and by this means a considerable extent of ter. was reclaimed from the sea, and so a portion of the cost was realised. The C. is suited for large vessels, having a bottom width of 88 ft. a width at the water level of 186 ft. and a depth of 23 ft.; it is 16½ m. in length. The level of the C. is kept only 14 in. above low water in the N. Sea in order to maintain

Canadian Government

LOCKS AT SAULT SAINTÉ MARIE, ONTARIO

built in 1914, to connect Buzzard's Bay with Massachusetts Bay, was taken over by the State in 1928 to become a toll-free section of the Atlantic inland waterway, and it has since been deepened and widened. Work on the canalisation of the Ohio R. was undertaken to provide a greater depth for the whole 1000-m. length. The Chicago Drainage C., constructed to discharge the Chicago drainage into the Upper Mississippi Valley instead of into Lake Michigan, has now, through the construction of a connecting Illinois waterway, become a link in a waterway from the Great Lakes to the Mississippi.

Ship Canals. C.s designed to admit large ocean-going vessels are constructed either to place inland tns in communication with the sea, or to shorten the distance by sea between 2 points by cutting across an isthmus. The Amsterdam Ship C. severs the peninsula of N. Holland and unites the IJssel Meer (Zuider Zee) with the N. Sea, but its real object is to allow the trade of Amsterdam a more direct outlet, as the N. Holland C. and the IJssel Meer

the drainage of the reclaimed lands. The inflowing water from these lands and from the branch C.s is pumped into the IJssel Meer by pumps situated in the dam which shuts off the C. from the IJssel Meer. The entrance channel is protected by 2 converging concrete breakwaters, and the C. is controlled by locks near each end with gates pointing both ways. The C. was begun in 1865, and finished in 1876, at a cost of about £2,600,000. (See also MANCHESTER SHIP CANAL.) Among other C.s of this nature may be mentioned the Bruges Ship C., which renders Bruges a seaport; the Ghent-Terneuzen C., which provided an outlet for Ghent by a C. joining the estuary of the Scheldt at Terneuzen, enlarged and deepened in 1870 so that vessels of 1400 to 1700 tons can reach Ghent; and the Leningrad and Kronstadt Ship C., which enables sea-going vessels to reach Leningrad. This C. starts from the Neva and goes SW. for about 2 m., when it curves and proceeds in a straight line to Kronstadt. It was begun in 1877 and finished in 1884, at a

cost of £1,240,000. The first C. which cut across an isthmus to enable ocean-going ships to use a shorter route was the Suez C. (q.v.). (See also PANAMA CANAL.) In very early times it was proposed to build a C. across the isthmus of Corinth, and traces are found of works for such an undertaking begun in the time of the Emperor Nero. The C. was begun in 1882 and finished in 1893, at a cost of between £1,000,000 and £2,000,000. It is 4 m. in length, with a bottom width of 72 ft. and a depth of 26½ ft; the entrances at each end are protected by solid jetties built out into the sea. The Holstein C. connects the R. Eider with the Baltic near Kiel, but is only 51½ ft wide at the bottom, and 9½ ft deep, being only useful for small vessels. The Baltic Ship (Kiel) C. was therefore built between the Baltic and N. seas, starting from Holtenau near Kiel, and joining the Elbe at Brunsbüttel. The length of the C. is 60 m., width at the bottom 85 ft, 190 ft at the top, and depth 28 ft. The C., which saves the vessels using it a distance of 237 m., was begun in 1887 and finished in 1895, at a cost of about £8,000,000. See S. Smiles, *Lives of the Engineers*, 1864; R. C. R. Minikin, *River and Canal Engineering*, 1920; H. R. de Salis, *Bradshaw's Guide to the Canals and Navigable Rivers of England and Wales*, 1928; G. Cadbury and S. P. Dobbs, *Canals and Inland Waterways*, 1929; A. Wilson, *The Suez Canal: its Past, Present, and Future*, 1939; L. T. C. Rolt, *Narrow Boat*, 1944; F. Eyre and C. Hadfield, *English Rivers and Canals*, 1945.

Canale, Antonio, called **Canaletto** (1697-1768), Venetian painter, trained under his father Bernardo C., a scene painter; first distinguished himself by painting decorations for theatres. In 1719 he went to Rome to study the works of the old masters; and on his return to Venice painted many views of that city. Smith, the Brit. Consul in Venice, bought many of his works, a number of which passed into the collection of George III, and are at Windsor Castle. He worked much in London between 1746 and 1755, painting some excellent views of the Thames and the well-known 'Interior of the Rotunda, Ranelagh' (1754). The Louvre has 6 of his pictures, the National Gallery 11. He was a prolific artist and his pupil and nephew Bernardo Bellotto (c. 1724-80) added to his many Venetian views similar in style. C.'s topographical drawings had their influence on such Eng. water-colourists as Girtin. See K. T. Parker, *The Drawings of Antonio Canaletto in the Collection of H.M. The King at Windsor Castle*, 1948.

Canaleto, see CANALE, ANTONIO.

Canalgre (*Rumex hymenosepalus*), plant of the S. U.S.A. A tanning substance is obtained from the rootstock, which gives a rich orange colour and imparts softness of touch to hard leather.

Cañar, see AZOGUES.

Canara, see KANARA.

Canard, archaic French for broadsheet, deteriorated in meaning to false report or hoax.

Canaris, Constantine, see KANARIS.

Canary Bird, or **Canary Finch** (*Serinus canarius*), passerine bird of the family of Fringillidae or Finches. It is found in large numbers in the Canary Is., Madeira, and the Azores, but has been domesticated in Europe since the 16th cent., and is one of the most common of cage-birds. In its wild state the plumage is green, sometimes streaked with brown, and resembling that of a linnet or siskin, the prevalent yellow of the domestic species being the result of artificial selection for breeding purposes. The artificial selection has also resulted in increasing the average size of the bird, the domestic variety being from 6 to 8 in. in length, while the wild variety is only from 4 to 5 in. long. The wild C. builds its nest of moss, feathers, and hair, in thick high shrubs or trees, and produces 2 to 4 broods in a season, but it breeds readily in confinement, sometimes laying from 4 to 6 eggs, pale blue in colour, 4 times a year. The work of building the nest and of incubation is generally the part of the female, while the cock-bird usually feeds the young. The natural song of the C. is loud and clear, and during the mating season the males seem to compete with one another in the ardour and beauty of their melody. It can be taught various notes, and readily imitates the notes of other birds. Their chief foods are canary and millet seeds; groundsel, chickweed, and sugar are appreciated luxuries. Cs mate readily with siskins, goldfinches, greenfinches, and linnets; the cross-breeding of Cs is a favourite occupation in the Tyrol. The chief varieties of the domesticated C. are the Norwich, which is the hardest, and of a very rich colour; the Belgian Fancy, the most beautiful and costly; the Lizard, so called from its spotted back; the Cinnamon, so named from its colour; the Yorkshire, a long, thin, closely feathered bird; the Lancashire Cobby, the largest variety, with a crest of feathers on its head; the London Fancy, a little yellow or biscuit-coloured bird with black wings and tail; the Scotch Fancy, a large imposing variety, bred largely in Scotland; and the Roller C., a very small bird, bred chiefly for its unusually beautiful song. There are sev. varieties of finches very closely allied to the C. and often sold as such, but they are generally very inferior as song birds. See F. J. Chatterton, *Canaries and how to keep them*, 1924; C. B. Upton, *The Breeding and Management of Canaries*, 1934.

Canary Islands (Sp. *Islas Canarias*), group of Sp. is. in the Atlantic, lying 60 m. off the NW. coast of Africa, W. of Rio de Oro (q.v.). They consist of 7 main is., Gran Canaria, Fuerteventura, Lanzarote, Tenerife, La Palma, Gomera, and Hierro (qq.v.), and 6 small is., Graciosa, Rocca, Allegranza, Santa Clara, Inferno, and Lobos, and they are grouped into 2 provs., Las Palmas and Santa Cruz de Tenerife (qq.v.). The aboriginal inhab. were called *Guanches* (q.v.), and the is. were known to the Phoenicians and the Romans. In 1402 a Norman, Jean de

Béthencourt, subdued some of the is. By the end of the 15th cent. the whole archipelago had been joined by Ferdinand II (q.v.) of Aragón to the new Sp. kingdom. The is. are all rugged, mountainous, and volcanic, but the soil, where irrigated, is very fertile. Bananas, tomatoes, and potatoes are the prin. exports. Cochineal was an important manuf. until the discovery of aniline dyes. Canary wine was celebrated until the vines were attacked by phylloxera in the 19th cent. There is a considerable tourist industry, and the is. are popular with invalids during the winter months. Pop. 824,500. See D. A. Bannerman, *The Canary Islands*, 1922.

Canary Wood, timber of 2 trees of the Canary and Madeira Is., *Persea indica* and *P. canariensis* respectively, belonging to the Lauraceae family.

Canasta, card game, a development of Rummy, originating in Montevideo and growing enormously popular in the U.S.A. and Britain after 1948. It is normally played by four people, two a side, with two full packs plus jokers. The four jokers and the eight deuces are 'wild'—that is, may be named as any other card. Each player receives eleven cards; the next is turned up beside the stock pile, which is placed in the centre of the table. If the turn-up card is a joker, a two, a black or a red three, the next card is turned up to cover it, and so on. Each player in turn draws the top card of stock or of the discard pile, 'melds' (places face-up in front of him) any cards he is able and willing to declare, and then discards. A meld is compulsory if the top card of the discard pile has been taken. A meld consists of three or more cards of the same rank and must contain at least two 'natural' and not more than three 'wild' cards. The first meld may be made only when the cards declared score a minimum which varies according to the points previously scored by the partnership. From 0 to 1500 points the minimum meld is 50; 1500 to 3000—90; 3000 or over—120; a minus score—15. Only the top card from the discard pile may be counted towards the minimum score. A melded joker scores 50 points, aces and deuces—20; K to eight—10; seven to four and black three—5 points. A player may meld three or four black threes from his hand only when melding out at that turn. A C. is a meld of seven or more cards of the same rank whether declared at once or built up gradually, and must contain four or more natural cards. A natural C. scores a bonus of 500 points over and above the points scored by the cards taken individually, and a 'mixed' C. 300 points. A player cannot 'meld out'—that is, lay down the last cards in his hand—until the partnership has declared a C. For melding out he receives 100 points, for melding out a complete hand at one turn without having previously melded, 200 points.

A player may in his turn add cards from his hand to previous melds of the partnership. Except when melding out a player must both discard and keep one card in his

hand. If in drawing a player lifts and melds the top of the discard pile he must take the whole pile. If he wants the discard pile for the partnership's first meld he must lay down two cards of the same rank as the top card. After the first meld either partner may take the discard pile by laying down one wild card and one of the same rank as the top card or by adding the top card to a meld already made. This last right lapses if the pile contains a red three or a wild card; the pile is then 'frozen.' A discarded black three is a 'stop' card and may not be taken by the next player at that turn, but the pile is not frozen.

If a player is dealt red threes on his first turn he declares them and replenishes his hand from stock. If the round ends before he has done so the partnership is penalised 500 points for each red three in the hand. When a player draws a red three he must declare it and draw again. For each declared red three a partnership scores 100 points.

As soon as one player melds out play stops. All cards unmelded at the end of a round count against the partnership. The full game is played up to 5000 points.

Canberra, federal cap. of Australia (q.v.), 204 m. from Sydney and 429 m. from Melbourne, situated 2000 ft above sea level. The Australian Capital Ter., which includes 28 sq. m. at Jervis Bay, is 939 sq. m. in area and contains a cluster of peaks 5000 ft in height. The Commonwealth has set out to make C. one of the most beautiful cities in the world; parks have been made, fine roads constructed, and trees planted. A temporary Parliament House was opened by the Duke of York on 9 May 1927, 26 years after the opening at Melbourne of the first federal Parliament by his royal father, King George V. As well as the research schools at the Australian National Univ., there are sev. centres for scientific research, the more important being the Australian Institute of Anatomy, the Plant Industry and Entomological laboratories of the Commonwealth Scientific and Industrial Research Organisation, the Australian Forestry School, and the Commonwealth Observatory at Mt Stromlo. Pop. of ter. 33,470. (See photograph, p. 38.)

Cancer, or the **Crab**, the fourth sign of the zodiac (q.v.), which the sun enters about 22 June.

Cancer, in pathology, a malignant growth. A malignant growth may be defined as the appearance in a single area of cells which divide and grow in a manner unrelated to the needs of the body. After the needs of normal growth have been satisfied and with ageing there is a general lessening of the reproductive activity of the body cells. That they still retain their capacity to divide and multiply, however, is evidenced by the continual replacement of those lost in the course of wear and tear. The blood-forming organs, for example, remain active throughout life and the epithelial cells of the skin and mucous membrane are always balancing the loss from daily usage by reproducing their kind. When tissue continuity is

broken by wounding or other cause the surrounding cells multiply and push forward to bridge the gap so that, in the process of healing, lost tissue is to a large extent replaced. These activities are those of a normal growth for the purpose of maintaining the organism intact. Malignant growth, however, has no such purpose. It is a purposeless, abnormal cell growth, unresponsive to ordinary biological control, and therefore autonomous. When normal development of an individual takes place, the cells grow and divide, and become specialised for certain work, that is, they become

of the connective tissues. Carcinoma is the more common C. of the 2 and tends to be a disease of later life, while sarcoma may affect people of any age. The original source of malignant growth is known as the primary C., and the organ in which it grows as the primary site. Metastatic malignant growths are known as secondary C.s, and where they take root is known as the secondary site. Primary C. may start in any tissue, but certain sites are more liable than others. Thus the oesophagus, stomach, colon, and rectum are well-known sites of primary C. in the alimentary canal. For some reason

Australian Official Photograph

FEDERAL PARLIAMENT HOUSE, CANBERRA

The building to the right is west block, which accommodates several government departments. Among the trees in the background is the U.S. embassy.

differentiated. In C., these differentiated cells degenerate, returning almost, but not quite, to their primitive condition, and in so doing they regain some of their primitive capabilities. They resemble embryonic cells in their power of extensive multiplication, but differ from them in retaining some semblance of their differentiated form; e.g. a C. of the liver contains cells which have the form of normal liver cells, and even though such a C. may migrate to another part of the body, and continue its growth, the tissue in which it was originally formed can be detected by examination of the cancerous cells. It is this power of migrating and forming secondary growths (metastases) in other parts of the body which forms one of the chief distinctions between C. and other tumours.

There are 2 main types of C.—the carcinoma and the sarcoma. Carcinoma originates from the epithelial cells of the body, whereas sarcoma grows from those

unknown, the small intestine is rarely affected. Of glandular structures, the thyroid, the ovary, the cervix uteri, and the breast in the female, and the prostate in the male, suffer most. The true primary C. of the skin is the epithelioma, but another kind, the rodent ulcer, is partially malignant only, since it invades and destroys tissues locally but does not metastasise. The predilection of primary C. for certain sites is not fully understood, but it seems clear, in some cases at all events, that chronic irritation plays a part. Metastases, or secondary C.s, may appear anywhere, but again certain sites are more common than others. The mode of spread from the primary C. is by means of the lymphatic channels and the blood stream. Secondary C.s which are distant from the primary have usually been carried by the blood stream, while the secondary C.s originating from lymphatic spread are as a rule to be found in the chain of lymphatic glands into which the

lymphatic channels from the site of the primary C. drain. Thus a primary C. in the breast will cause secondary C.s of the axillary lymphatic glands, and an epithelioma on the cheek will cause secondaries in the cervical, or neck, glands. Because of its large blood supply, the liver is a frequent site of secondary C., particularly if the primary C. is in the alimentary canal. The recorded deaths from the disease have shown a steady increase during the last 50 years. In 1906 939 people per million of the pop. died of C. In 1930 the number was 1454, and in 1950 it was 1901. But these figures do not necessarily reflect a real increase in incidence of the complaint. For instance, the expectation of life is greater now than it was at the beginning of the cent., which means that more people to-day live to reach the C. age. Diagnosis is more accurate now than it was, so that the mortality statistics reflect the state of affairs more truly than in earlier years. Although it is probable, therefore, that the overall incidence of C. has increased little, if any, there is no doubt that C. of certain sites has increased, while it has decreased in others, and in others still it has neither increased nor decreased. Thus C. of the mouth and of the skin is less common than it was, whereas the figures for C. of the lung have shown a sharp increase, and are still increasing. Analysis of mortality statistics from various localities and various social classes show that, although there may be some common aetiological factor, C. is a disease of diverse aetiology. Its appearance in different parts of the body results from various specific irritants which may be ingested, inhaled, absorbed, or even produced by the body itself. Statistics have already supplied the clue to the nature of some of these irritants, and in the case of lung C. smoking is undoubtedly an aetiological factor. C. resulting from certain industrial hazards has been proved and the appropriate measures have been taken to guard against the risk.

So long as the essential biological mechanism of cell growth, both normal and malignant, remains unknown, it cannot be said that any real preventive treatment of C. is available. The main treatment, as always, must be that of extirpating the primary growth as quickly as possible. Yet the insidious and often symptomless onset of the disease, especially when in the deep-seated tissues, makes all-important early recognition, by patient and surgeon alike, often a matter of difficulty. By the time the growth is diagnosable beyond doubt metastases have usually occurred and it is less likely that treatment will avail. Research is going on continually and progress has been made not only in perfecting physical aids to diagnosis but also in pathological methods. There is some reason to hope that a diagnostic serum reaction specific for C. may evolve from research now proceeding, and which has already shown some promise. The treatment of C. is one of the greatest problems of medicine. Surgery and radio-

therapy remain the 2 chief methods, but lately certain treatments which involve a readjustment of the natural hormone secretions have been followed up and have shown considerable promise, particularly in those cases of widespread secondary C. which, from the nature of things, are not amenable to local extirpation of the growth. A great increase in the scope of surgical treatment of C. has come about as the result of modern anaesthesia and the application of present-day knowledge of physiology. The patient can now be subjected to prolonged and extensive surgical procedures of a kind which would formerly have been out of the question. Parts of the body at one time inaccessible to the surgeon are now amenable to operation. The complete excision of primary C. in its early stages in more or less any organ is now a practical proposition. The eradication of secondary C.s, however, is often beyond the province of surgery and here radiotherapy, either by X-rays or radium, is the treatment of choice. A combination of surgery and radiation is sometimes employed. Radical radiotherapy aims at cure by destroying the malignant cells without too much damage to adjoining normal tissues. To adjust the dose to achieve the object is one of the problems of this method of treatment. Clearly the nearer the C. is to the surface of the body the more accessible it is to radiation, but recent advances in physics have put more powerful agents at the disposal of radiologists. The cyclotron, an apparatus which disintegrates the atom, and the more lately developed betatron and synchrotron are instruments which, working at 30 million volts, are capable of providing gamma rays of such penetrating power that they are effective against deeply situated malignant tumours. Another development is the use of the waste products from the atomic piles now being used to provide atomic energy for peaceful purposes. These products are known as radioactive isotopes. Some of these radioactive isotopes, notably radio-phosphorus, radio-iodine, and, lately, radio-caesium, have a selective action on certain C.s, and when injected into the body they concentrate in the malignant cells and destroy them. Much research has yet to be done in this field, yet obviously to be able to inject a substance into the blood stream which will seek out and destroy C. on its own ground is a therapeutic ideal if it can be carried out without harm to the body as a whole. Another promising field of research is that of hormone treatment. It has long been known that the ductless glands act as a team and the activities of one are dependent on the activities of the others. The prostate gland, for example, depends for its normal function on the testicle, and it was observed that C. of the prostate is considerably accelerated by the administration of the male sex hormone. From this it was but a short step to discover whether administration of the opposite, or female, sex hormone in these cases would impede the growth. Such was found to be the case. This discovery has opened up many possibilities, and most

recently considerable success has been achieved in cases of multiple secondary C., incurable by any other means, by removing surgically the suprarenal glands (q.v.) and thus cutting off the body's natural supply of the cortico-steroid hormones. Generally speaking, it may be said that therapeutics, though they have not actually caught up with C., are close on its tail.

But the cause of C. is still unknown. It is probable that many different causes may operate, and good work has been done in investigating probable causes by researches conducted under the auspices of the Imperial C. Research Fund. The able administration of this fund and the unselfish co-operation of medical men and scientists throughout the empire has led to the accumulation of a body of statistical and experimental knowledge, which, though it has had no very definite results, has put the inquiry on a proper footing. Many investigations have been conducted with a view to finding a specific micro-organism for C., but without satisfactory results. None of the claims made to have isolated a C. bacillus have been estab. Cases are quoted too which appear to show that an embryo escapes the disease although the uterus may be diseased, and on the other hand, a child may be born from a healthy womb with C. developed at an early period in its foetal life. The effect of irritation in the formation of cancerous growths has been widely discussed. There is no doubt that irritation is often at least a predisposing cause, and chimney-sweeps' C., to which sweeps at one time were peculiarly liable, was caused by the irritating effect of soot, as was first noticed in 1775 by an Eng. doctor, Percival Pott. The active carcinogenic principle of coal-tar has now been isolated as benzpyrene; other similar substances are also being investigated. The chewing of betel-nut and the eating of hot rice in China have been shown to be associated with cancerous growths. Irritation may also be produced within the body by chemical means, e.g. alcohol is known to promote the degeneration of cells, and arsenic to stimulate their activity. The connection between smoking and lung C. has been estab. beyond doubt. Over-exposure to X-rays or to ultra-violet rays, or to radium, causes the rapid and premature degeneration of cells and the formation of C., but carcinogens produce a change only in the manner of the growth of the cell; they do not provide the continuing stimulus. The mechanism for unlimited growth lies in the cell itself, and what this mechanism is we do not know. In 1955, Otto Warburg, of Berlin, pub. his theory on the cause of C. It is known that a cell needs oxygen to live and to produce energy. But a cell can produce energy not only by respiration but also by fermentation. Warburg's theory on the difference between a C. cell and a normal cell is that a C. cell can obtain as much energy from fermentation as from respiration, while a normal cell obtains more energy from respiration than from fermentation. When a normal cell is injured

its respiration suffers, and one way of injuring a cell is to deprive it of the means of respiration—that is to deprive it of oxygen. It then resorts to fermentation instead of respiration. A carcinogen, therefore, is any agent which poisons a cell by impairing its respiration. But not all poisoned cells become C. cells. Some respiration may continue together with fermentation and, according to Warburg, it is not until fermentation has entirely supplanted respiration that a normal cell changes to a C. cell. This may never occur or it may take a long time. It is well known that the interval between the introduction of a carcinogen to normal cells and the appearance of the subsequent malignant growth which it causes may be several years. There is a 'pre-cancerous' stage of cell life, and this would fit in with Warburg's theory. He suggests that if those pre-cancerous cells in which fermentation is not fully estab. could be killed by some chemical which did not affect normal cells then a cure for C. would be found. There is no doubt that Warburg's theory is an important contribution to C. research.

With regard to the question of heredity, more satisfactory information has been obtained through long extended experiments with many generations of mice; and it has been estab. that mice with a cancerous ancestry are more liable to C. than those born from a healthy line. A strain of mice showing a hereditary tendency to develop, for instance, a mammary C. can only be maintained by constant in-breeding such as would never occur in humans. It is only when information is gathered upon the comprehensive scale adopted by the Imperial Research Fund committees that reliable statistics can be obtained. Those at present available show that C. in man is rarely directly inherited. See W. S. Handley, *The Prevention of Cancer*, 1936; E. L. Hoffman, *Cancer and Diet*, 1937; I. Hieger, *One in Six: An Outline of the Cancer Problem*, 1955; R. W. Raven, *Cancer and Allied Diseases* (Modern Health Series), 1955.

Cancer, name of a genus of decapod crustaceans to which belongs *C. pagurus*, the edible crab. The species live in pairs in holes of rocks. See CRAB.

Cancer, Tropic of, parallel of lat. -a small circle—23° 27' N. of the equator. At the summer solstice in the N. hemisphere the sun is in the zenith at local noon at every place on this circle.

Cancer-root, see BRECHMEIERS.

Cancionero, Sp. (and Portuguese Cancioneiro) word used to describe a collection of early lyrical poems, especially such a collection as was made by the poetic guilds which flourished in the Middle Ages. The oldest is that made c. 1445 by Juan Alfonso de Buena, a converted Jew, for King Juan II. Its poems belong to the 14th and 15th cents. A later C., attributed to Lopez de (Stunica) Zúñiga, contains songs by poets who accompanied Alfonso V of Aragon to Naples, and afterwards in his imprisonment at Milan. The first *Cancionero General* (pub. in 1511), was that of Juan de Fernández, embracing

lyrics by over a hundred writers, the earliest of whom is the Marquess of Santillano. The earliest of the Portuguese collections is that of King Diniz (1279-1325); the best known is Garcia de Resende's *Cancioneiro Geral*, 1516. These anthologies are important, because of the flood of light they throw on contemporary manners and ideals. See Vollmüller, *Les Cancioneros et Romanceros Espagnols*, 1909.

Cancroma, see BOATBILL.

Candaba, tn on is. of Luzon in the Philippines, on the Pampanga, 10 m. from San Fernando. It grows rice and sugar, and there are fisheries. Pop. 16,036.

Candace, title of sev. Ethiopian queens regnant. In 24 and 23 bc one of them, Amenirhas C., was involved in war with Rome. Imperial troops under Gaius Petronius, prefect of Egypt, invaded her ter. and occupied the capital, Napata. Augustus, however, ordered their withdrawal without even demanding tribute.

Candahar, see KANDAHAR.

Candela, lt. tn in Apulia (q.v.), 22 m. S. of Foggia (q.v.). Pop. 9090.

Candelabrum (Lat. *candela*, a candle), large candlestick, and also a lampstand. Candelabra were used by the Romans for domestic purposes and also in sacred rites. They were generally made according to one design, with a base formed of 3 or more feet of some animal, the shaft branching off into arms which ended in spikes for candles or in flat disks from which lamps could be suspended. Specimens have been found in Pompeii, Herculaneum, and Etruria. Some are beautifully wrought in various metals; others are more massive and are carved in marble.

Candia, officially *Heraklion*, largest city and chief port of Crete; it is situated to the N.E. of Mt Ida, almost in the centre of the N. coast. The city was founded by the Arabs in the 9th cent. It was held by the Venetians from 1207 till 1669 when the Turks captured it after a 21 years' siege. Hostilities between the Muslim and Christian inhab. have been frequent. In 1897 Greece became involved in a war with Turkey on behalf of the Christian residents of the is., when for nearly a year C. was under blockade. The tn is very picturesque with its bazaars and mosques and old Venetian fortifications. Fruit, vegetables, and olive oil are exported. There are some industries concerned with processing agric. products. C. is on the site of the port of the anc. Chossus, the city of Minos. Pop. 51,150. See CNOSSUS.

Candidate (Lat. *candidatus*, white-robed, because Rom. candidates wore white), one who takes steps towards fulfilling his aspirations for any office, post, or honour, especially one who stands in a parl. election. Technically there is no legal decision as to when the aspirant becomes a C. He is popularly recognised as such when he enters on an active campaign for the promotion of his object, whilst certain judges regard the appointment of the election agent as the sanction of his candidature.

Candle, source of artificial light. C.s

are usually cylindrical in shape and are made of waxes or other solid fatty material enveloping a wick of cotton, or (rarely) linen. Until the middle of the 18th cent., beeswax and tallow (q.v.) were the only materials employed in the manuf. of C.s. Subsequently spermaceti, coco-nut oil, stearine, and paraffin wax were introduced, in that order. Paraffin wax is by far the major component of household C.s throughout the world. There are 5 methods of manuf.: dipping, moulding, pouring or rolling, drawing, and extrusion. (1) *Dipping*. Dipped C.s are made as follows: a number of wicks of suitable length are suspended on a frame spaced about twice the intended diameter of the C.s. The frame with the wicks is then dipped into a vessel of molten wax, withdrawn and allowed to cool, immersed again and the operation repeated until the intended thickness or weight is obtained. In some cases final shaping is imparted to the C.s mechanically. Dipping is now mainly confined to paraffin wax and stearine C.s for dinner table and decorative purposes. (2) *Moulding*. For moulding a machine is used comprising a number (possibly 500) of burnished tin moulds set in a tank of cooling water. Through the centre of each mould a wick is stretched and the moulds are filled by pouring molten wax into a trough above the top of the tank. After the wax becomes cool it is ejected from the moulds by the aid of pistons which themselves form the tips of the C.s. Moulding is now the most common method of candle-making, particularly for ordinary household C.s. (3) *Pouring or rolling*. Altar C.s for the Rom. Catholic church must, according to the Rubric, consist 'in the greater part' of beeswax. Such C.s are usually made by pouring. Lengths of wick are hung up round a wooden hoop, the beeswax mixture poured over the wicks, time allowed for hardening, and pouring repeated until the size and shape required are attained. C.s are then rolled between a smooth board and a marble slab to impart a regular finish, cut to length, and tips shaped. (4) *Drawing* is a method of manuf. by which a long length of wick is drawn continuously through a bath of wax until the required thickness has been built up, when the C.s are cut to size and tipped on a separate tipping machine. (5) *Extrusion*. Since 1951 the production of C.s by extrusion from either solid or powdered wax through a die has been introduced commercially and is tending to replace moulding. Candlewick is usually made from cotton and following the invention of Cambucères in 1825 has usually been plaited or braided. Such construction, together with impregnation with suitable chemicals, controls burning so that the tip of the wick burns off cleanly in the hot edge of the C. flame and does not need snuffing to remove accumulations of carbon. Tapers consist of a thick loosely twisted wick thinly covered with waxes and are used for gas lighting, etc. Night lights may be described as short C.s fitted with a thin wick so that they burn

slowly with a small flame. The wick is furnished with a metal sustainer at the base to prevent it collapsing. The standard for illuminating power is a spermaceti C. burning at the rate of 120 grains per hour. The ordinary household C. is about 1½ candle-power.

Candle-fish, or **Oulachan** (*Thaleichthys*), name of a genus of fishes of the family Osmeridae; it is closely allied to the smelt. It inhabits the Pacific coast of N. America and contains so much oil—more perhaps than any other animal—that it will burn like a candle.

Candleberry, **Candlenut**, **Varnish-tree**, names given to *Aleurites moluccana*, evergreen tropical tree of the Euphorbiaceae; the seeds of which yield an oil used in varnish and soap making, and in treating woodwork, cloth, etc. C. Myrtle is the Bayberry (q.v.) or Wax Myrtle.

Candlemas, feast of the Purification of the Virgin Mary, celebrated by Rom. Catholics on 2 Feb. The festival gets its name from the fact that on that day there is a procession of candles, and those candles which will be required in divine service for the ensuing year are blessed. The festival of C. is also observed by the Church of England and by the Armenian Church. It has been compared with the Rom. festival held in honour of Februa, mother of Mars, when candles were burnt; possibly the old custom was utilised by the Church and turned into a Christian ceremony. In Scotland C. Day is the first of the quarterly terms, when interest, taxes, rent, etc. must be paid. The state of the weather at this time is said to determine that of the year.

If Candlemas is fair and clear,
There'll be two winters in the year.

See also J. Brand, *Observations on Popular Antiquities*, 1849, and L. Duchesne, *Christian Worship*, 1903. G. L. Apperson's *English Proverbs and Proverbial Phrases*, 1929, has 3 columns of proverbial sayings relating to C. Day. See PURIFICATION.

Candlenut (*Aleurites triloba*), tropical species of Euphorbiaceae which is grown on account of the oil and the dyeing properties contained in the nut. The flowers are large and white, and the fruit is the size of a walnut. See also CANDLEBERRY.

Candlish, Robert Smith (1806–73), Scottish preacher, graduated at Glasgow Univ. in 1823, and after 3 years' study in divinity, accepted a tutorship to a Scottish boys at Eton. His appointment to St George's, Edinburgh, at once brought him into prominence. After his first speech in the Assembly in 1839, he came to the forefront of those who later constituted the Free Church, and the part that he played in securing the Disruption was second only to that of his friend and leader, Dr Chalmers. Moderator of the Assembly in 1861, he accepted the principalship of New College, Edinburgh, in the following year. C. worked unceasingly to secure the union of the various dissenting Presbyterian sects, and the speedy advancement of public education.

Candolle, Augustus Pyramus de (1778–1841), Swiss botanist, b. Geneva, of an ancient noble Provençal family. He came to Paris in 1797 for the purposes of study, and pub. (1802) *Astragalologia*. Two years later he obtained his doctor's degree. His system of natural classification of plants, which was opposed to that of Linnaeus, introduced him to Cuvier and Lamarck. Both prompted him to undertake the pub. of the *Flore française* (1803–15). He began to lecture in the Collège de France in the same year, and in 1805 pub. 4 vols. of the *Flore française*, followed by 6 vols. in 1815. The Fr. Gov. employed him to carry on research work in botany and agriculture in France and Italy during the years 1806–12. He was appointed to the professorship of botany at Montpellier Univ. (1810–16), and held the same chair at Genova (1816–1841). C.'s most important work was *Regni Vegetabilis Systema Naturale* (2 vols., 1818–21), which was reissued under another name as *Prodromus Systematis Naturalis Regni Vegetabilis* (17 vols., 1824–73), to which he did not contribute more than the first 7 vols. His valuable herbarium was bequeathed to his son, Alphonse Louis. See his *Mémoires et souvenirs* (ed. by his son in 1862), and W. de la Rive's *De Candolle*, 1851.

Candon, city in the Ilocos Sur prov., near the W. coast of the is. of Luzon in the Philippines. It mills sugar. Pop. 22,362.

Candy, see KANDY.

Candytuft, popular name for annuals of the genus *Iberis* (q.v.).

Cane, name applied to sev. plants, but most properly to those belonging to the genus of palms known as *Calamus* from which rattan canes are made. The stems of these plants are thin and reedy, and they are used in bottoming chairs and making ropes and baskets. The rattan C. which is used as a walking-stick is the thick stem of *C. Scipionum*. All the plants which yield rattan come from tropical regions of Asia, Africa, and Australia. The sugar C. is really a grass which is cultivated in the tropics for the sweet juice it contains; its botanical name is *Saccharum officinarum*. The C.s which are employed in making fishing-rods are the plant stems of the large grass, *Arundo Donax*.

Canea, or **Khania**, cap. and chief commercial tn of Crete, situated on the NW. coast, 70 m. from Candia. The tn was built on the site of the ancient Cydonia by the Venetians, who settled here in 1252. The tn was captured by the Turks after a 2 years' siege in 1646. The harbour is poor but there is considerable coasting trade. C. is in the centre of one of the richest areas of Crete and exports olives, olive oil, and garden produce. Pop.: dept. 126,200; tn, 33,200.

Canella, family Canellaceae, genus of 2 species of evergreen trees, the W. Indian *C. winterana* being the wild or white Cinnamon of which the white bark is used as a tonic and stimulant.

Canelli, It. tn, in Piedmont (q.v.). It is in the famous wine-producing prov. of

Asti (q.v.) and its sparkling wine is very fine. It also manufs. nougat. Pop. 9000.

Canelones: 1. Dept. of S. Uruguay, a lowland area at the mouth of the Rio de la Plata. It is one of the most heavily populated depts. of the country. Area 1835 sq. m.; pop. 200,300.

2. Cap. of the above dept, 24 m. N. of Montevideo, a trading centre for an agric. dist. Formerly called Guadalupe, it was the seat of the Uruguay Gov. in 1828. Pop. 27,000.

Canes Venatici, 'Hunting Dogs,' a small constellation, added by Hevelius in 1690. They are close behind Ursa Major, and near Bootes and Coma Berenices. The chief objects of interest are Cor Caroli, so named by Halley after Charles II, which is a double star of magnitudes 3 and 6; a spiral nebula, discovered by Lord Rosse, 1845; and a cluster of more than 900 stars of the eleventh magnitude.

Cañete, Manuel (1822-91), Sp. writer and critic, b. Seville. He was for many years Spain's prin. dramatic critic, and strove to raise the standard of the drama of his country. He also did much to make known the hist. of dramatic art in Spain. Among his works are *Un Rebato en Granada*, 1845, *El Duque de Alba*, 1945, and lyrics, odes, and letters. He was a member of the Royal Academy.

Caneva, Carlo (1845-1922), It. general, b. Tarcento, Venezia. Entered army, 1866. Served in Abyssinian campaign of 1897; lieutenant-general, 1902. He commanded the troops embarked for Tripoli at the end of Sept. 1911. The conquest of the coast was all that he could accomplish, his forces being insufficient. Much cruelty was alleged against them. He was recalled in Sept. 1912, and was not prominent again until he presided over the commission that inquired into the great disaster to the It. forces at Caporetto (q.v.), Oct. 1917.

Canfield, Dorothy (1879-), Amer. author, b. Lawrence, Kansas. She was educ. in U.S.A. and Paris, finally graduating at Ohio Univ., where her father was president. In 1907 she married John Hedwood Fisher, and settled on a farm near Arlington, Vermont, where most of her life was spent, except for intervals of travel in Europe and 3 years of relief work in France during the First World War. From 1921 to 1923 she was the first woman member of the Board of Education in Vermont, and later (1938) became president of the Amer. Adult Education Association. Her writings on educational subjects have been both numerous and influential, but represent only one part of her literary work, which covers novels, short stories, plays, literary criticism, and miscellaneous writing. Her trans. of Giovanni Papini's *Life of Christ* became a best-seller in 1923. Among her novels, which are for the most part studies of the problems of middle-class married life, may be mentioned *The Bent Twig*, 1915, *The Brimming Cup*, 1921, *The Deepening Stream*, 1930, and *Seasoned Timber*, 1939.

Cang, Cangue, or Kea, instrument of

punishment used in China. It is a ring or heavy wooden yoke, the weight of which varies according to the nature of the culprit's offence. The man's head and shoulders are fastened into this cage so that he is unable to lie down or feed himself. On the C. is inscribed his name, the nature of his offence, and the duration of his punishment. He is paraded through the streets, and finally left in some open thoroughfare, or at the city gates, till his sentence has expired, which may last for some weeks or even months.

Cangas de Onis, Sp. tn in the prov. of Oviedo. Here Pelayo (q.v.) estab. his court, and near by in the Asturian Mts is Covadonga where he was proclaimed king and where the first Christian victory of the Re-Conquest (see SPAIN, History) was achieved. C. has many Rom. remains. Pop. 11,000.

Cange, Charles Dufresne, Sieur du, see DU CANGE.

Cango, dist. of S. Africa, about 17 m. N. of Oudtshoorn. It is famous for the magnificent caves, where some of the finest stalactites in the world are to be seen. They were discovered in 1780, and are said to have inspired Rider Haggard's *King Solomon's Mines*. The explored section extends for 2 m.

Canicatti, tn in Sicily (q.v.), 15 m. ENE. of Agrigento (q.v.). It is in a sulphur-mining region. Pop. 31,100.

Canicular Days, see DOG-DAYS.

Canidae, dog family, which includes wolves, foxes, jackals, etc., constitutes the group Cynoidea of the Carnivora, and is placed between the cats and the bears. All the members of the family are carnivorous, but some will eat vegetables and insects as well. They are cosmopolitan and nearly always hunt in packs; they are found abundantly in fossil state with many extinct species. The number of teeth varies in the genera, but the commonest form is that with 42-3 incisors, 1 canine, and 4 premolars on each side of the upper and lower jaw, with 2 or 3 molars on each side of the upper, 3 on the lower jaw. The origin of the domestic dog is unknown, but it may have come from the wolf. Wild dogs abound in S. America, among them *Cercopithecus hows*, the crab-eating dog. *Vulpes vulpes* is the common fox, *Alopex lagopus* the Arctic fox, *Canis dingo* the dingo, *C. lupus* the wolf, *C. aureus* the jackal, *C. latrans* the prairie wolf; *Speothos venaticus* is the bush-dog; *Otocyon megalotis* is a solitary African species; *Lycan pictus* is the Cape hunting-dog. (See photograph, page 44.)

Canigou, The, mt. of France, at the extremity of one of the lateral chains of the oriental Pyrénées. It is clothed with vegetation almost to its summit. Height 8555 ft.

Canis Major, or Orion's Dog, constellation of the S. hemisphere, S. of Orion. Its chief star is Sirius, by which the constellation may easily be found, this star being on the extension of the line through Orion's belt.

Canis Minor, constellation of the N. hemisphere, N. of Canis Major and E. of Orion. Its brightest star α (see PROCYON)

lies nearly on the line between Sirius and Pollux, and almost midway between the 2 stars.

Canister Shot, see CASE SHOT.

Canitz, Friedrich Rudolf Ludwig, Freiherr von (1654-99), Ger. poet, b. Berlin. He held the highest state offices under the great electors. He wrote many satirical poems in the style of Boileau, which were not pub., however, till a year after his death.

Canker, name of a plant disease which attacks fruit trees, such as the apple, and sometimes forest trees, as the larch. It may usually be found to be present when the bark begins to split, or when the ripe fungus protrudes from the wounded

posterior stamen of the inner whorl bears a bilocular anther on its edge; of the petaloid structures, the *staminodia*, one is larger, turns back on itself, and is known as the *labelium*. The gynaeceum is inferior and consists of 3 carpels which are trilocular, have a petaloid style, and contain numerous ovules. Nearly all the species of *Canna* have a great deal of starch in their rhizomes, and *Canna Starch* ('Tous les mois') is made from *C. edulis*. This plant has large, tuberous roots, smooth leaves, and stems coloured at the base.

Cannae, anct city of Apulia (q.v.). Italy, near the mouth of the Aufidus (now Ofanto). To-day it is called Canne, near

CRAB-EATING DOG

bark. Many varieties of low plants may cause the disease, but the ones to which most importance is attached are the fungi *Dasyscypha catyrcina*, causing larch C., and *Nectria galligena* (not *N. ditissima* as was formerly supposed), producing C. of apple and pear. The best methods of curing the tree of C. are to cut off the diseased branches or to cut out the affected parts, and to smear over the wound with an impermeable substance. Some varieties of apples, e.g. Bramley's Seedling and Newton Wonder, are much more resistant than others such as Cox's Orange Pippin; resistance also varies with the dist. and the type of soil.

Cannore, Malcolm, see MALCOLM III.

Cannabis Sativa, see HEMP.

Cannaceae, monocotyledonous family of a single genus of plants, all of which are tropical or subtropical. *Canna indica* (Indian shot) is a handsome ornamental plant often cultivated on account of its appearance. The inflorescence is terminal, the flowers are hermaphrodite, asymmetric, and epigynous, with 3 free sepals and 3 united petals; the fruit is a capsule. The androecium is represented by a number of petaloid bodies in which the

Barletta (q.v.). Here in 216 bc Hannibal (q.v.) inflicted a crushing defeat on the Romans.

Cannan, Gilbert (1884-), novelist and playwright, b. Manchester. He was called to the Bar in 1903 after graduating at Cambridge, and also worked as dramatic critic. His first novel, *Peter Homunculus*, 1909, was followed by a number of others, including *Young Earnest*, 1915, *Three Pretty Men*, 1916, and *The Stucco House*, 1917, which estab. his reputation as a writer of the realistic and psychoanalytic school. His plays include *Miles Dixon*, 1910, *James and John*, 1911, *Mary's Wedding*, 1912, *The Perfect Widow*, 1912, *Wedding Presents*, 1912, and *The Armour of Refuge*, 1913. He has also written books and essays on social and literary subjects, and was the translator of Romain Rolland's *Jean Christophe* in 4 vols., 1910-13.

Cannanore, tn on Malabar coast, in Madras state, India. It is a port of call for coastal trading vessels. It was once Portuguese ter, and the fort (AD 1595) still stands on the cliffs.

Cannel Coal, coal containing an unusual amount of ash and volatile ingredients,

and burning with a clear, candle-like flame. Valuable as a source of gas and oil. See COAL.

Cannes, resort on the Fr. Riviera (q.v.), in the dept of Alpes-Maritimes, 13 m. SW. of Nice (q.v.). It is beautifully situated on the Bay of La Napoule. In Rom. times it was on the Aurelian Way (q.v.), but it was nothing more than a fishing vil. until the middle of the 19th cent. Its reputation as a winter resort began when Lord Brougham (q.v.), who had been detained in C. in 1834 by an outbreak of cholera in Savoy, built a villa, and his example was soon followed by others who were attracted by the mildness of the winter climate and the temperate heat of the summer. On the N. the tn is sheltered from the mistral (q.v.) by low, wooded hills, on which there are numerous hotels and villas. The tn itself extends in a crescent along the Rade de Cannes, and has fine gardens and boulevards, as well as casinos, baths, and sporting facilities. On the Mont Chevalier, beside the harbour, is a 16th-17th-cent. church and a watch tower (1070-1305), built by the monks of the nearby Lérins is. (q.v.). Fruit and flowers are grown, and there is a trade in olive oil, soap, and fish. Pop. 50,200. See CANNES CONFERENCE.

Cannibalism, or **Anthropophagy** (Gk *anthrōpos*, man; *phagēin*, to eat) the practice of eating human flesh. The word is a variant form of Carib, a fierce man-eating tribe of the W. Indies. Callban is probably another variant. C. has, at some time or other, existed in almost every part of the globe. Strabo asserted that C. existed in Ireland, and the authority that the practice once prevailed in Scotland is St Jerome. As late as 1782, gipsies were executed in Hungary for practising C. It is still known among the tribes of W. and Central Africa, New Guinea, and Melanesia. C. may often be traced to an economic cause. Even among modern civilised races it has been resorted to in cases of dire necessity, such as siege, famine, shipwreck, etc. Savage tribes may be prompted by hunger to eat men when the flesh of animals is not available. Among certain African tribes, the Azande and Mangbetu, human flesh was formerly sold in the market-places, and corpses of relatives were eaten. A S. Amer. tribe used to breed from their captive women, in order to procure a constant supply of human flesh. Higher motives for C. are religious. It was thought that a man acquired the qualities of the thing he ate. Thus the heart of a lion consumed by a chief would make him valiant, and a man would eat his enemy in the hopes of acquiring his courage or perseverance. This motive for C. existed among the Issedones of Central Asia, mentioned by Herodotus (iv. 26). The Maoris, Australians, and Indians of N. America believed in the transmigration of souls. The eating of the enemy might, therefore, prevent his spirit finding another resting-place and would secure the murderer against being haunted by the ghost. In Australia certain tribes felt that the most fitting burial place for the

deceased was within their living relatives. Such funeral feasts were attended by many religious rites. Among the anc. Mexicans and the natives of Fiji human flesh was regarded as the only fit offering to the gods, and the victims thus offered were often devoured by the onlookers. Another ritual motive for C. existed among the 'Hametzen,' magicians of NW. America, whose rule it was to eat human flesh for admittance to their order.

Canning, Charles John, Earl (1812-62), statesman, Governor-General of India during the mutiny of 1857. He was the son of George C., was educ. at Eton and at Christ Church, Oxford, and entered the House of Commons in 1836. Under Peel's administration C. was under-secretary of state and postmaster-general, 1853-5. In 1856 he became Governor-General of India, and when the mutiny broke out his strong moral qualities, good administrative ability, and clear judgment enabled him to deal with the situation in a masterly way, little expected of him by many who felt that his powers were not equal to the occasion. His policy of conciliation towards the native princes and his devotion to the work of reform and development of the country stood him in good stead in a difficult position. He became first viceroy of India in 1858 and was made an earl in 1859. See life by H. S. Cunningham, 1891.

Canning, Elizabeth (1734-73), criminal around whose case raged excitement and controversy, into which Fielding entered with his *Clear State of the Case of Elizabeth Canning*, 1753. She told a mysterious tale of detention in the house of a 'Mother Wells.' Her story led to a condemnation, but on its being afterwards proved to be false she herself was transported.

Canning, George (1770-1827), statesman, b. London, educ. at Eton and Christ Church, Oxford, and entered Parliament as a Tory in 1794. A couple of years after he took his seat Pitt made him under-secretary for foreign affairs, and promoted him to the office of commissioner of the Board of Control (1799), and then to paymaster-general (1800). When Pitt resigned in 1801 C. did not join the Addington administration, towards which, although nominally a supporter, he acted the role of 'candid friend.' When Pitt returned to office in 1804, C. became treasurer of the navy; and, on the death of his leader 2 years later, he declined to serve in the Cabinet of 'all the talents.' He became foreign secretary under Portland in 1807, but his disagreement with Castlereagh's (q.v.) conduct of the war, as war-minister, led to a duel between the 2 men (1809). Both ministers subsequently resigned; but in 1816 C. went to the India Office under Lord Liverpool. As a supporter of Queen Caroline he declined to take any part in the proceedings against her in 1820, and tendered his resignation, which was eventually accepted (1821). The following year he accepted the appointment of Governor-General of India, but on the eve of his departure Castlereagh committed suicide, and he stayed at home, going again to

the foreign office. In 1827 C. became prime minister and chancellor of the exchequer, but d. 4 months after taking office. C. had literary as well as political interests, and in 1797-8 he printed many pieces in the *Anti-Jacobin* (q.v.), including the well-known *Needy Knife-grinder*. His poems were collected in 1823. His foreign policy was fundamentally a continuation of that of his rival, Castlereagh; but he was ready to intervene in Europe whenever intervention by other powers threatened Brit. interests, as in Portugal, 1825 and 1827. C. was more liberal in his views on domestic policy than most of his colleagues in Liverpool's gov.; but was

GEORGE CANNING
After Gainsborough.

opposed to parl. reform. He was, however, consistently in favour of Catholic Emancipation. As an orator, for excellence of phrasing, for admirable delivery, and for sound common sense, he has had few rivals. His speeches were pub. in 1823. See also J. A. R. Marriott, *George Canning and his Times*, 1903; H. W. V. Temperley, *Life of Canning*, 1905, and *The Foreign Policy of Canning*, 1925; and a life by Sir C. Petrie, 1930.

Canning, Sir Samuel (1823-1908), engineer and one of the pioneers of submarine telegraphy. His first cable was the one connecting Cape Breton Is. with Newfoundland; then he assisted in laying the first Atlantic cable. He laid the Atlantic cable of 1865-6, inventing the grappling machinery for recovering the

Canning, process of preserving meat, fish, fruit, etc., by sealing up in cans or tins. The principle upon which this process is based is that of excluding the air from the produce it is desired to preserve. Before C. was thought of, many

methods of covering the cooked food with an air-tight coating were experimented with. These all failed for the reason that, although the air was thereby excluded, the germs contained in the air were not; these were imprisoned in the food and caused putrefaction. In C. the air is expelled and the germs killed at one and the same time by subjection to intense heat. Removal of oxygen may also be secured by exposure under pressure to an inert gas, such as nitrogen. The meat or other food is packed in cans, which are then either placed in a steam oven, immersed in boiling water, or stood in a vat partially filled with a solution of calcium chloride and water, and then subjected to a heat of 270° F., for a length of time that varies according to the character of the food. Thus the germs and spores are destroyed; air and steam escape through a pin-hole which has been left in each can. The holes are then soldered up and the tins allowed to cool. Food thus preserved should, if the process has been perfectly carried out, remain in good condition. Experiments have proved that even after 20 years there is no sign of deterioration. This could occur only if the process were not thorough, and the presence of putrefaction could be detected by a bulging of the can due to gases developed in the course of decomposition. C. was probably invented by M. Appert of Paris about 1810, but many others made experiments in the same direction. The 20th cent. has seen an enormous increase, not only in the variety of foods to be canned, but also in the quantity produced. Now canned meats, fish, soups, fruits, and vegetables of all kinds can be obtained at all seasons of the year, all over the world, the diet of each individual country being thus greatly extended. The U.S.A. still leads, as it always has done, in the canned foods industry, but the Brit. dominions are a formidable rival. In Great Britain itself the trade has increased, as it has in Norway, Spain, Portugal, Italy, and other European countries, in Japan and in the Malay States, where pineapple canneries have been started. The past 20 years especially have seen a considerable development of the C. industry in the U.K., and there are now a large number of factories for canning fruit and vegetables. The Campden Fruit and Vegetable Preservation Research Station attached to Bristol Univ. gives useful scientific advice to the industry. See T. E. Bashford, *Hygiene and Canning Practice* (pamphlet, Metal Box Co.), 1951; R. Taggart and F. D. Farrow, *Heat Penetration into Canned Foods* (pamphlet, Metal Box Co.), 1951; J. L. Rogers, *A Course in Canning*, 1952.

lost cable of an unsuccessful first attempt.

Canning Town, industrial dist. of E. of London, in the bor. of West Ham, Essex, in which are situated the extensive Victoria and Albert docks.

Cannock, urb. dist. of Staffs, England. C. forms the centre of the C. Chase coal-field, and includes tracts of woodlands and common land suggested as

part of a conservation area. The principal industries are mining, edge tools, brick and tile making, and light engineering. Its pop. has increased from 2099 in 1851, to 41,030 (estimated) in 1952.

Cannon, see GUN.

Cannon-ball Tree (*Couroupita guianensis*), family Lecythidaceae, a tall, soft-wooded tropical Amer. tree. The fruit is a large, round, woody capsule, and this has earned for the plant its popular name.

Cannstadt, Bad., Ger. tn in the Land of Baden-Württemberg (q.v.), on the Neckar. It is a NE. suburb of Stuttgart (q.v.). It has noted mineral springs, thought to have been known to the Romans, and has machinery manufs., foundries, and brick works. Moreau defeated the Archduke Charles (qq.v.) near by in 1796.

Cano, Alonso (1601-67). Sp. painter, sculptor, and architect. b. Granada. He studied painting under Francisco Pacheco, the master of Velazquez, and sculpture under Juan Martinez Montañes. In 1637 in consequence of a duel, he was obliged to flee from Seville to Madrid, where he was befriended by Velazquez. Through the influence of his fellow artist, he was appointed court painter and royal architect but, again in trouble, fled in 1652 and d. at Granada. C. excelled in the 3 arts, and on account of the universality of his genius was called the Michelangelo of Spain. He executed 2 colossal statues of St Peter and St Paul. There are beautiful specimens of his work in the cathedral of Granada, and in the Prado, Madrid.

Cano, Juan Sebastian del (d. 1526), Sp. navigator. He sailed under Magellan, who was killed in the Philippines. C. continued the voyage, doubled the Cape of Good Hope, and landed near Seville in 1522, being the first to circumnavigate the world. Charles V gave him a pension and a globe inscribed with the motto *Primus me circumdedit*.

Canoe (from a Caribbean word through the Sp. *canoa*), a boat having both ends pointed and propelled by paddles with or without sail assistance. Primitive C.s used by anc. Britons and N. Amer. Indians were made of hollowed tree trunks: many of these 'dug-out' craft have been unearthed in the Brit. Is., and they are still used by natives of Africa and S. America. C.s used by Eskimos are known as kayaks and originally consisted of seal skins stretched over a framework of reindeer bones. C.s have been made of paper, tin, aluminium, inflatable rubber, and glass fibre. Modern C.s are either rigid or collapsible (folding), varying in length from 8 to 18 ft and being single- or double-seaters, generally with decks of wood or canvas. Rigid C.s are constructed of oak, cedar, or pine (but Amer. C.s may be of cedar, mahogany, or bass-wood), or on the lines of the Indian birch bark C. The 'Canadian', heavy and expensive but long-lasting, is an open type of rigid C. with upturned ends. Its hull can be made in sev. ways, for instance with narrow planks placed flush and strengthened by laterally fixed light ribs. Folding C.s have rubberised hulls, canvas

decks, and lightweight framework of ash rods and cross-pieces with brass fittings. They weigh between 40 and 60 lb. and can be assembled or dismantled in 20 minutes, being carried in 2 canvas bags. Such craft shoot rough rapids and seldom capsize owing to their low centre of gravity. They are ideal for sea canoeing, having been paddled numerous times across the Eng. Channel, and twice (1928 and 1957) sailed across the Atlantic Ocean. Enemy coasts were reconnoitred with them, sometimes operating from submarines, in the Second World War, and many took part in Commando raids. Their peace-time uses include survey work and bridge inspection. Sport canoeing began about 1866 when John MacGregor founded the Royal C. Club. To-day more than 50 clubs are active in Britain, the largest being the C.-Camping Club, 35 Old Kent Rd., London, S.E.1. MacGregor toured extensively in Europe and his *Rob Roy* books describe his adventures with a 14-ft cedar-decked craft built of oak and fitted with sails, dyed blue to counteract the sun's glare. Other pioneers of C. cruising were W. Baden-Powell who wrote *Canoe Travelling*, 1871; Wm Bliss, 1865-1949, author of *Canoeing, Rapid Rivers, and Heart of England by Waterway*; and R. Raven-Hart, whose 7 books cover his 15,000 m. canoeing since the First World War, including voyages down the Mississippi and Irawadi R.s, and an Australian cruise. C.s figure in the Olympic Games, while sev. countries, e.g. France, Spain, S. Africa, U.S.A., and Great Britain, hold C. races either on smooth water or along fast rivers. For safety C.s should be fitted with bladders and paddlers must wear life-jackets in difficult water. Since 1934 slalom competitions have taken place and Brit. clubs organise a dozen each summer. In these, C.s are paddled over a stretch of riv. having natural hazards (weirs, rapids, rocks) or artificial obstacles (poles or staves hanging from ropes to form 'gates') which must be negotiated. See Noel McNaught, *The Canoeing Manual*, 1956.

Canon (Gk *kanōn*, a straight rod, hence measuring rod or rule; metaphorically anything which regulates or keeps straight), term used in a number of special senses. (1) In the early Church, a rule of faith. By the 4th cent. it had come to mean the rules of faith and practice laid down by Church councils (q.v.). (2) The list of saints honoured by the Church. (3) The central and essential portion of the Rom. Mass and Oriental Liturgy. (4) Member of a religious order or congregation. The institution of bodies of clergy, known as C.s, living a common life under no very clearly defined rule dates from early times. In the early part of the 4th cent. the clergy at Verelli were so united, and St Augustine of Hippo also followed this system in the following cent. At the Lateran at Rome there was another early foundation of the same kind. The practice became more general in the 8th cent., when Chrodegang, Bishop of Metz (742-66), drew up a definite rule for C.s, founded largely on the Benedictine

rule, but owing something to the traditional rule of the Lateran. In 816-17 Louis le Débonnaire made this rule binding on all C.s throughout the empire. In course of time the institution deteriorated, and a distinction between C.s regular and C.s secular was made. The former observed the rule, while the latter, frequently laymen, were mainly administrative dignitaries. Various attempts were made at reform, notably by the papal synods of 1059 and 1063. These councils insisted on the original plan of the common life, and also urged the necessity of poverty, for canonries were often considered merely as lucrative sinecures. A new rule, founded chiefly on the writings of St Augustine, was now made, and those observing it were known as Augustinian C.s. There were over 200 houses of Augustinian C.s in England at the Reformation. Since that date few attempts have been made to improve the system of C.s regular. The chief orders of the kind in the Rom. Catholic Church are those of the Lateran and the Premonstratensians. Many foundations were entirely abolished at the Reformation. (5) In both the Rom. Catholic and Anglican Churches the title C. is also used for those clergy who are connected with cathedral churches, and form the cathedral chapter.

Scriptures. The C. of the O.T. and N.T. comprises those books which are held to be authoritative and of divine inspiration. See BIBLE.

Music. A C. is a form of composition, based on rule and written in strict imitation. The introductory theme or melody is taken up and repeated note for note in succession while the other part or parts continues. The entries may be on the same or different degrees of the scale. This kind of composition was introduced about the 12th cent., and like the fugue is one of the difficult problems in the art of musical composition.

Canon Law, body of laws enacted at various times by eccles. authority for the gov. of the Church. It was not until the 6th cent. that the Church possessed a code of eccles. law; but at that date she began to use a collection of canons compiled by Denys the Little, a Scythian monk who also fixed the beginning of the Christian era. Later, Charlemagne prescribed a more elaborate corpus, known as 'Hispana' because it originated in Spain. Next we have the celebrated forgery known as the 'False Decretals' (see ISIDORIAN DECRETALS), which attributed to former popes a number of decisions and decrees which, though spurious, reveal no small degree of wisdom. In the middle of the 11th cent. the Church determined to systematise her legal text-books, and a start was made by Fr. canonists, notably by Yves of Chartres. But their work was quickly superseded by that of Gratian, the great master of Bologna Univ., who in 1152 pub. his *Concordia discordantium canonum*, a regular treatise of canonical lore, which completed, corrected, and pruned the ant. corpus. Though not official in the strict sense of the word, Gratian's work

became a classic in the schools and was adopted in the courts. Roland Bandinelli (afterwards Pope Alexander III) enlarged the *Concordia*; but it was Innocent III who brought the C. L. under papal supervision by appointing a commission of notaries to revise Gratian. They added sev. more canons and decretals, and presented the result of their labours to Bologna Univ. The new pub., however, was both diffuse and defective. About 1230, therefore, Gregory IX instructed his chaplain, St Raymond of Pennafort, to draw up a systematic code of C. L. This epoch-making work, entitled *Quinque Libri Gregorii IX.*, was pub. in 1234; it was adopted by the whole church, and received no additions until the *Liber Sextus* of Boniface VIII. The *Clementines* of Clement V were pub. by John XXII in 1317. These 3 works, forming the *Corpus Juris Canonici* continued to represent the Church's laws down to the promulgation of the present *Codex Juris Canonici* by Benedict XV in 1917. The latter, a masterpiece of codification, was prepared under the direction of Cardinal Gasparri, and is binding upon the whole Rom. Catholic Church. It may not be trans. into vernacular without permission of the Holy See, and in no case has this yet been granted. See the Introduction (Lat.) to the *Codex Juris Canonici*; article in *The Catholic Encyclopedia*; C. Bachofer, *Commentary on the New Code of Canon Law*, 1938; S. Woywod, *Practical Commentary on the Code of Canon Law*, 1949.

Canon Law in the Church of England. By the Act of Submission of the Clergy (1534) provision was made for a commission to survey the canon law (q.v.), which was meanwhile to remain in force, except in so far as it conflicted with the royal pretensions or with the alleged customs and laws of the realm. Failure to implement this provision led to much uncertainty as to which parts of the *Corpus Juris Canonici* were to be recognised in England. The Act of 1534, however, had empowered the convocations to make new canons, subject to the king's assent; and in 1604 James I authorised 141 canons made by the convocation of Canterbury, which were held by Coke to bind the clergy alone. In the meantime, Thomas Cromwell had prejudiced the study of canon law by ordering the univs. in 1535 to substitute lectures in civil law for those in canon law; while in 1540 Henry VIII founded regius professorships in civil law at Oxford and Cambridge. Further, by an act of 1545, laymen who were doctors of civil law only were permitted to serve as judges in the eccles. courts. This marked the victory of civil over canon law; and although Doctors' Commons continued until 1857 as a centre for lawyers learned in canon law, both the eccles. law and the Church courts gradually fell into abeyance, especially after the toleration act of 1689. A commission under the Archbishop of York was appointed in 1939 to prepare a revised body of canons. Its report, pub. on 16 May 1947, did not

presuppose a return to the auct authority of canon law, but merely aimed at restoring among the clergy and laity of the estab. Church an agreed body of eccles. rules to form the basis of consensual obedience. These proposals were not carried into effect. See E. Kemp, *An Introduction to Canon Law in the Church of England*, 1957.

Canonbury, dist. of London, in the bor. of Islington. C. Tower (c. 1530), in C. Place, is a relic of the country residence of the priors of St Bartholomew, Smithfield.

Canonesses, associations of women first instituted in the Frankish empire during the 8th cent., in imitation of the early groups of canons (see CANON (4)). The members were generally ladies of high birth, living under a rule which imposed vows of chastity and obedience, but not the vow of poverty. They observed the common life and were bound to recite the divine office (see BREVARY), but were not enclosed. C. devoted themselves mainly to educational work, teaching the embroidery of vestments and the transcription of liturgical books. As with the canons, a distinction was later drawn between regular and secular C. The present C. of the Holy Sepulchre are an enclosed order of nuns; they have 1 house (with school) in England, at New Hall near Chelmsford, Essex.

Canonical Hours, certain hours appointed by the Rom. Catholic Church for the celebration of divine office the sev. parts of which (see BREVARY) came thence to be known as C. H.

Canonisation, recognition on earth of a departed Christian as a saint in heaven, originally by the inclusion of the person's name in the list of saints commemorated in the Eucharistic Canon. In the earliest ages there was no other formal act of C., as it was only in their own locality that martyrs were venerated. The fact that a person was a saint was largely estab. by the opinion of the Christian community where he had lived, and by the growth of a spontaneous local *cultus* (see below). During the early Middle Ages, it rested with each bishop to decide which saints should be honoured in his diocese, and on what day. However, much carelessness crept in, and sev. scandals arose from the 7th to the 10th cents., men of evil life being inscribed among the saints. The policy of centralisation also tended to bring the act of C. under the papal power. The earliest known case of C. by the Pope is that of Ulric of Augsburg by John XV in 993. At the end of the 12th cent., by decrees of Alexander III (1170) and Innocent III (1200), the right was exclusively reserved to the Rom. Court. This rule was made more stringent by Urban VIII in 2 constitutions (1625 and 1634), and the procedure of the process was then laid down. With slight modifications it is in force at the present day. It was strictly forbidden publicly to venerate in any fashion any person not papally canonised. Two exceptions were made, those who had received immemorial *cultus*, and those whose *cultus* had been

sanctioned by preceding popes. Those falling in either of these classes receive what is known as *equipollent* C. The procedure of *formal* C. is as follows: Fifty years must normally elapse after the death of the candidate. A court is then instituted by the ordinary of the dist. where the claim is made, and material is gathered on which the case may be judged. The materials are then sent on to the Congregation of Rites at Rome, and after a lapse of 10 years the case is *introduced*. The promoters of the cause are opposed by an '*advocatus diaboli*'. If they are successful, the claimant may now be called *Venerable*. After proof of 2 miracles performed at the candidate's intercession, and also of the candidate's possession of Christian virtues in a heroic degree, the *beatification* (q.v.) is performed. After the proof of 2 more miracles since beatification, the Pope then proceeds to canonise the *Beatus*. Finally there is a solemn mass of the new saint in St Peter's, preceded by a reading of the bull of C. The Orthodox Eastern Church makes no distinction between beatification and C. There are a number of persons long recognised and celebrated as saints by the general consciousness of the faithful (clergy and laity). Apart from these, claims to sanctity are examined and verified by a synod of all the metropolitans, archbishops, bishops, and clergy of the particular church. The life, orthodoxy, and miracles of the proposed saint are closely scrutinized. A deed of proclamation is then signed by the whole synod at a special service in the church. A liturgical proper of the saint is later drawn up, and the relics (if any) are trans. and anointed with Holy Chrism. In the Anglican Church no new saints have been canonised since the Reformation, though Rom. Catholic and Orthodox C.s since then have been widely recognised.

Canons, **Books of**, in Scottish eccles. law, a body of constitutions for the regulation of the Church in Scotland prepared by the bishops of that country and confirmed by letters patent under the Great Seal in 1635, after they had been revised by Laud. In the next year they were pub. at Aberdeen, and caused discontent throughout the country on account of the stringency of their regulations. The king's supremacy in matters eccles. was emphasised.

Canonsburg, bor. of Pennsylvania, U.S.A., near Pittsburgh. It is a bituminous coal-mining centre, and manufs. tin plate, steel, and metal products; other products are gas, oil, fruit, grain, and potatoes. Pop. 12,070.

Canopic Jars, so called because of the legend that Canopus, a pilot of Menelaus, buried at Canopus in Egypt, was worshipped in the form of a jar. C. J. were used to hold the viscera of mummified bodies. In sets of four and usually made of stone, they had lids shaped, at first, like human heads (Middle Kingdom) and later with heads of the animal forms of the 4 'Children of Horus' (man, baboon, dog, and hawk).

Canoppi, Antonio (1773-1832), It. artist. He was first engaged as a fresco-painter by various It. nobles; later he became a scene-painter at the Fenice Theatre, Venice, and afterwards at Mantua. In Moscow, where he sought refuge during the Napoleonic wars, he decorated the hall of the senate and other public buildings, but his work was destroyed in the great fire of 1812. In 1811 he went to St Petersburg, where he remained till his death. At the Imperial Theatre he executed a number of architectural scenes, including those for the operas of the *Zauberflöte* and *Semiramis*, which excited the highest admiration. Author of *Opinion d'Antoine Canoppi sur l'architecture en général et en spécialité sur la construction des théâtres modernes*, 1830.

Canopus, anct port of Egypt, near modern Aboukir, 14 m. E. of Alexandria, on W. mouth of the Nile, called after it the Canopic mouth. C. was a pleasure resort of the anct Alexandrians. Site of the famous temple of Serapis (q.v.). See also CANOPIC JARS.

Canopus, second brightest star (magnitude - 0.9) in the heavens, situated in the constellation Carina, which is one of the 4 constellations composing the former constellation Argo. It is extremely remote, probably 470 light-years away, and of enormous luminosity. Proper motion 2" per century.

'Canopus', name of a first-class Brit. battleship of 1897 class, launched in 1898 and of 12,950 tons burthen. Just after outbreak of First World War this ship joined Adm. Craddock's squadron. Owing to its being old and slow, Craddock did not bring it into action at the battle of Coronel (1 Nov. 1914). After the battle she escaped to the Falkland Is., and fired the first round when Adm. Sturdee sank Von Spee's fleet on 8 Dec. 1914. The name was first used in the R.N. in 1798, and was associated with the engagement off San Domingo, 1806, and the passage through the Dardanelles, 1807.

Canopy (Gk *kônôpeion*, from *kônôps*, a gnat; Lat. *canopium*). The word was used by Herodotus (book II) in speaking of the nets with which the Nile fishermen protected themselves from mosquitoes. Hence it is used for a covering, but in particular for one suspended over a bed or throne, or over a coach in state processions. In architecture the word denotes the projection over an altar, tomb, or niche, especially as a feature in Gothic architecture. A modern flat C. over the entrance to a theatre, hotel, etc., is called a 'marquise.' See BALDACHIN.

Canosa di Puglia, It. tn, in Apulia (q.v.), 43 m. W. of Bari (q.v.). It occupies the site of the anct *Canusium*, and has Rom. remains, including a ruined amphitheatre. Outside the cathedral (partly 11th cent.) is the tomb of Bohemund I (q.v.). There is a trade in agric. produce. Pop. 33,800.

Canossa, It. vil., in Emilia-Romagna (q.v.), 12 m. SW. of Reggio nell'Emilia (q.v.). The ruins remain of the castle where, in Jan. 1077, the Emperor Henry IV (q.v.) humiliated himself before Pope Gregory VII. This event is the origin of

the phrase 'to go to Canossa,' i.e. to humiliate oneself before a person whom one has previously resisted.

Canova, Antonio (1757-1822), It. sculptor and painter, b. Possagno, Treviso. He came of a family of stone-cutters, and at 14 entered the atelier of the sculptor Torretti, through the help of his patron, Giovanni Falleri, a Venetian senator. C. accompanied his master to Venice, and, after Torretti's death, studied under his nephew Ferrari and at the Venetian Academy. At 15 C. worked on a group, 'Orpheus and Eurydice,' and at 22 had finished his famous 'Daedalus and Icarus,' now in the Venetian Academy. In

CANOVA

An engraving from a painting by Sir T. Lawrence.

1779, through the influence of his friend Falleri, C. was awarded a pension by the Venetian Gov. In 1780 he went to Rome to study, and sought (like Flaxman and Thorwaldsen, q.v.) to create a new and purified classicism. He exhibited in 1782. Before long he was acknowledged as the first sculptor of his day. C. was 3 times summoned to Paris by Napoleon. He carved the well-known bust of Napoleon in the Pitti Palace, and also Pauline Borghese as a reclining Venus, and the Empress Maria Louisa as Concordia. C. also executed many commissions for the Pope, on whose account he suffered exile during the revolution of 1798-1800. He visited England, 1815, and expressed regard for Haydon (q.v.), especially for his championship of the Elgin Marbles. In 1816 he was created Marquess of Ischia, and his name was inscribed in the Golden Book of the Capitol. He died at Venice, and was buried in the church he himself built at his bp. His famous 'Cupid and Psyche' is in the Louvre. Among his other well-known pieces are 'Hercules throwing Lichas into the Sea,' 'Perseus,'

'Venus and Adonis,' 'Hebe pouring Nectar,' 'Theseus and the Centaur,' and 'Mars and Venus.' See lives by Quatremère de Quincy, 1834, and A. G. Meyer, 1898.

Cánovas del Castillo, Antonio (1828-1897), Sp. statesman and historian, b. at Málaga. He became a member of the Cortes in 1852 as leader of the Conservatives, was Premier 1875-81, and held this office 6 times at intervals up to 1897. C. was a member of the Sp. Academy from 1867 till his death. He ed. and directed the pub. of *Historia General de España*. He was assassinated by an anarchist at Santa Aguada.

Canrobert, François Certain (1809-95), marshal of France, b. St Céré. He first became noted through his valour, displayed in the Algerian wars of 1835 and 1841-51. He also rendered Louis Napoleon great service in his *coup d'état* of 1851. When the Crimean War broke out he was given command of the first div. of the Fr. Army, but on the death of Marshal Saint-Arnaud he was made commander-in-chief. Although twice wounded, he completed the lines of investment at Sevastopol. He resigned his command in May 1855 through a disagreement with Lord Raglan. He fought at Magenta and Solferino in the It. wars in 1859, and in the Franco-Ger. war, 1870. He was besieged at Metz, but had to surrender, and was thereupon imprisoned in Germany.

Canso: 1. Cape in Nova Scotia, on the N.E. extremity, and on the S. side of Chedabucto Bay.

2. Gut or strait, 17 m. long, 2½ m. wide, between Nova Scotia and Cape Breton Is. In 1955 a causeway 4500 ft long and 80 ft wide was opened linking Cape Breton Is. to the mainland by highway and railway.

Cant, Andrew (1590-1663), Scottish preacher and leader of the Covenanters. He became minister of Pitsligo in Aberdeenshire in 1633; of Newbattle, Midlothian, in 1638; and of Aberdeen in 1640. In July 1638 he was made a commissioner for the purpose of converting people to Presbyterianism, and in the same year he took an active part in the celebrated assembly which was held at Glasgow.

Cant, in architecture, an external angle cut off obliquely; apparently synonymous with 'bevel,' 'chamfer,' and 'splay'—terms generally applied only to small details in building. It is also applied to a ship's timber, forward or aft, lying obliquely to the keel.

Cantabri, ant. race of mountaineers living in the N. of Spain. The Bay of Biscay was named after them by the Romans, Sinus Cantabricus. The Basques (q.v.) of the Pyrenees sometimes claim the C. as their ancestors. The Cantabrian war, between the C. and the Romans, lasted for 6 years (25-19 BC), and was finally concluded by Agrippa (q.v.). Although Rom. garrisons were stationed in their country, the C. continued to assert their independence.

Cantabrian Mountains, range of mts in N. Spain, continuing the line of the Pyrenees W. for about 300 m., parallel to the coast of the Bay of Biscay.

Cantacouzenus, Byzantine family, some of whose members became very influential at court and aspired to the imperial throne. 1. John C. (c. 1292-c. 1380), Byzantine soldier and historian, b. Constantinople. He was chief adviser to Andronicus III (1328-41), who left him as guardian and regent to his son, John V, then a boy of 9. C. was suspected by the queen-mother, fled from Constantinople, and proclaimed himself emperor as John VI. He was the effective ruler from 1347 to 1355, and his daughter married John V. But in 1355 he was forced to abdicate. He was responsible for seeking help from the Ottoman Turks, thus giving them an entry into Europe.

2. Matthias (d. 1383), his son, waged war for 2 years, after his father's retirement, against John V, but was unable to make himself effective emperor.

Cantal, central dept of France, in the S. part of the old prov. of Auvergne. The region is occupied by an extinct volcanic mass, the highest peaks being Plomb de Cantal (6095 ft) and Puy Mary (5850 ft). Cattle are bred, and part of the country makes good arable land. Rye, potatoes, and chestnuts are the chief products. The only 2 riva. of any importance are the Truyère and the Dordogne. The prin. tns are Aurillac (the cap.), Mauriac, and St-Flour (qq.v.). Area 2229 sq. m.; pop. 177,100.

Cantaloupe, small, round, ribbed musk melon; so called from the castle of Cantalupo in the Marca d'Ancona, Italy. The word is much used in the U.S.A. and in Canada, where it is applied to a variety of edible melon much grown in those countries and marketed in great quantities.

Cantarini, Simone (1612-48), It. painter, called Pesarese, or Simone da Pesaro, b. Orpezza, near Pesaro. He was first a disciple of Pandolfi and Claudio Ridolfi, and afterwards of Guido Reni, whose style he approached very nearly. He painted the portrait of the Duke of Mantua, but was mortified at the result, and died, possibly of poisoning, at Verona. C. was a good colourist, but his work lacked character and originality. His best-known paintings are a portrait of Guido in Pesaro, the 'Assumption' in the Bologna Gallery, 'St Thomas placing his fingers in the side of Christ' at Naples, and 'Joseph and Potiphar's Wife' in the Dresden Gallery.

Cantata (Lat. *cantare*, to sing), in music, term applied to certain forms of composition for solo voices and chorus, with instrumental accompaniments, sacred or secular in character. In the former case it resembles an oratorio, but is shorter; in the latter it may be compared to an opera, but it has no stage accessories. Originally a C. was a composition sung by 1 person to a single instrument.

Canteen, refreshment room provided in a barracks, camp, on a ship, in a factory, office, shop, or other premises for the use of persons serving or employed therein. In the Brit. armed forces C.s provide service personnel with facilities for buying refreshments to supplement their ordinary rations. C.s were once kept by civilians,

but in 1857 they were put under the control of the War Office, and became a recognised army institution. They were managed by a small committee of officers, and the goods were sold at practically cost price, any profit being spent for the benefit of the corps. A C. consisted of a beer shop, a grocery shop, and a coffee bar. The last-named supplied all kinds of non-alcoholic drinks. In France the C. is a club room used by the whole regiment for social purposes. The word has also come to be applied to the place where meals are provided by an industrial or other organisation for the benefit of members of its staff.

The First World War revolutionised the Brit. C. system. The existing organisation proved inadequate to provide for millions of men and women in the fighting services in all parts of the world. In 1915 an organisation called the Expeditionary Force C. (E.F.C.) came into being to conduct the C. business overseas. After paying working expenses and repayment of loans, all profits were devoted to the general welfare of the troops at the discretion of the Army Council. In 1916 the Navy and Army C.s Board (N.A.C.B.) was formed, whose main business lay in the U.K., but it also maintained C.s in permanent stations overseas. The profits were dealt with in a manner similar to those of the E.F.C. The E.F.C., being a purely war-time concern, ceased to exist in 1919, and its stock, etc., was taken over by the N.A.C.B. In 1920 an inter-departmental committee recommended that the N.A.C.B. should be enlarged and made permanent, and this found effect in the Navy, Army and Air Force Institute (N.A.A.F.I.), which is under the control of a council of members of the 3 services. The surplus profits of the E.F.C. and N.A.C.B. were handed over to the United Services Fund, after the dominions, colonies, and U.S. forces had been given an agreed share. The operations of the N.A.A.F.I. extend to every station at home and abroad where there are Brit. sailors, soldiers, and airmen, and a percentage of the profits in each locality is paid into unit funds. The N.A.A.F.I. system and its overseas counterpart, E.F.I. (Expeditionary Forces Institute), operated satisfactorily throughout the Second World War. C.s provided for employees in factories and other places of employment are sometimes termed staff restaurants (see RESTAURANT). See Sir J. Portescue, *A Short Account of Canteens in the British Army*, 1928.

Cantelupe, Thomas de (c. 1218–82), Eng. saint and bishop, nephew of Walter de C. (q.v.). He studied at Oxford, Paris, and Orleans, and became chancellor of Oxford Univ. (1262–3), and lectured in theology at Paris and at Oxford. He was appointed lord chancellor (1265), and was consecrated Bishop of Hereford in 1275. He became involved in a dispute with Archbishop Peckham in the Council of Reading (1279), who excommunicated him in 1281. C. appealed to Rome, and on his way died at Orvieto. He was buried in his own cathedral, and was popularly regarded as a saint, owing to

the miracles that were worked at his tomb. He was canonised as St Thomas of Hereford in 1320.

Cantelupe, Walter de (d. 1266), Eng. bishop. He held sev. rich rectories in plurality, and strongly resisted the interference of the papacy in England. He was consecrated Bishop of Worcester at Viterbo in 1237. He defended pluralities against the papal legate Otho (1237), and opposed the papal demand of a tenth for Henry III (1252). He supported the barons in 1264–5 and was summoned to Rome, but died before leaving England.

Cantemir, or Kantemir, Demetrius (1673–1723), orientalist, historian, and Prince of Moldavia. He studied as a youth in Constantinople, where he returned, 1700, as his brother's ambas. He returned to Moldavia as voivode, 1710, but next year declared for Peter the Great against Turkey, and on Peter's defeat retired with him to Russia. He took part in the Russian expedition against Persia, 1722. His first work was one of ascetic theology, 1698. He introduced a musical notation into Turkey. He was the first critical historian of the Rumanian principalities and of the Ottoman empire. (*History of the Growth and Decay of the Ottoman Empire*, 1734–5, is his only work trans. into English.) However, he anticipated the more extreme modern nationalism by claiming that the Moldavians and Vlachs were of pure Rom. descent. He was a member of the Prussian academy and a moving spirit in the foundation of the Russian. In philosophy he was influenced by J. B. van Helmont.

Canterbury, city and co. bor. of Kent, England, on the R. Stour, 56 m. ESE. of London. It forms part of the C. constituency of the parl. co. of Kent. The city is a co. of itself and is not in the administrative co. of Kent, although it is in the geographical co. It is a cathedral city, the see of the primate, and the eccles. metropolis of all England. C. occupies the site of the Rom. *Durovernum*. It was an important fortress and military station, being situated on the highway to London from Dover. To the Saxons it was known as Cantwarabyrig, 'town of the men of Kent,' and was the cap. of the kingdom of Kent. The see was founded about 597, when St Augustine became Archbishop of Canterbury, and from this centre Christianity spread through England (see CANTERBURY CATHEDRAL). The King's School, founded by Henry VIII in 1541, is attached to the cathedral. There are many anc. churches in C., the most notable being St Martin's, part of which is built of Rom. brick and tile of the 6th cent.—in its font St Augustine is supposed to have baptised King Ethelbert; and St Dunstan's, containing the burial-vault of the Roper family, with the head of Sir Thomas More. C. has the ruins of a Norman keep, a guildhall (1439; rebuilt 1697), now demolished, and a hospital for poor brethren, founded by Archbishop Lanfranc. The Chequers Inn, immortalised in the *Canterbury Tales*, and an anc. artificial mound, Dane John, possibly a corruption of donjon, are of special

interest. The most famous archbishops have been St Augustine, St Dunstan, Lanfranc, Anselm, Becket, Cranmer, and Laud. The Archbishop of C. is the first peer of the realm, and crowns the sovereign in Westminster Abbey. The city's chief trade is in fruit; it is a market and shopping centre for E. Kent. The industry of weaving, introduced by the Walloon and Huguenot refugees, who settled in C. in large numbers, at one time employed 2000 persons and has of late years been to some extent revived in the old, gabled, half-timbered houses of the C. weavers. Chaucer is associated with C. through his lively picture of a party of pilgrims coming to the shrine of St Thomas Becket in the *Canterbury Tales*; it is the bp. of Marlowe, who was educ. at the King's School. Charles Dickens used to stay at the Fleur de Lis Hotel, which retains a 13th-cent. window. The author of *The Ingoldsby Legends* was born here. An engine built by George Stephenson in 1825, and used on the C. and Whitstable railway is preserved here. The Buffs' war memorial is in St Michael's Chapel in the cathedral, the Kent co. war memorial on the bowling green, and the city of C. war memorial opposite Christ Church gate. The cathedral escaped destruction in the Second World War, but of the rest of C. damage from air attack extended over one-quarter of the city area. Subsequent demolitions revealed considerable Rom. remains. One of the most important discoveries since excavation was begun in the bombed area of C., to ascertain the lay-out of the Rom. city, was made in 1948, with the finding of the massive remains of the Rom. public baths of the city, with walls more than 5 ft thick. Since then further excavations have given the lay-out of the Rom. streets in the bombed area; these confirm that the Rom. wall was on the line of present city wall and ran right round to the W. Gate. In all probability there was continuity from the Rom. to the Saxon period. Remains of the largest Rom. theatre in this country have been found. The city returns 1 member to Parliament. Pop. 30,000.

Canterbury, prov. dist. in the centre of S. Is., New Zealand. It covers an area of 14,040 sq. m., 3900 sq. m. of which form the C. plains sloping from the mts to the coast. The wheat-growing and sheep-rearing for which this part is noted are all carried on in this dist. It is from here that the celebrated C. lamb and mutton of the Eng. market comes. Dairy-farming and cheese-making, also cocksfoot grass seedling, are the prin. industries of Banks peninsula, a volcanic region with rich soil. The cap. is Christchurch, and the chief ports are Lyttelton in the N. and Timaru in the S. Pop. 307,024.

Canterbury, metropolitan municipality of Sydney, in Cumberland co., New S. Wales, Australia. C. ranks third in order of pop. in the metropolis. Pop. 111,400.

Canterbury Bells, see CAMPANULA.

Canterbury Cathedral. The splendid cathedral at Canterbury is in the form of

a double cross, with a central and two W. towers. The total length is 522 ft, the E. transept measuring 154 ft. Various styles of Gothic architecture are represented, Transitional-Norman and Perpendicular predominating, and the cathedral illustrates some four cents. of progress in eccles. building. It is difficult to say how many buildings have previously stood on the site of the present C. C., though Bede mentions that St Augustine 'recovered' a church at Canterbury which had been built during the Rom. occupation. Certainly a great fire (1067) caused Archbishop Lanfranc (1070-93) to rebuild the church then existing, but although further renovated by Prior Ernulf between 1096 and 1107, and by Prior Conrad between 1107 and 1126, this church was also devastated by a fire which destroyed the choir in Sept. 1174. Here was an opportunity to make the church worthy of the memory of the martyred St Thomas Becket, murdered in St Benedict's chapel in the NW. transept, 29th Dec. 1170, and a new choir was completed before the end of the 12th cent. The chief artificer during the 12th cent. was a Frenchman, Wm of Sens. On his death Wm the Englishman took over the reconstruction, and he was responsible for the E. crypt and the Trinity chapel above. The side screens were added in the opening years of the 14th cent., and between 1376 and 1410 the Norman nave of the previous church was replaced, largely under Prior Chillenden, and the transepts built. With the addition of Cardinal Morton's great central tower the church was completed in 1500. The numerous chapels originated from the great wealth of relics possessed by the church, and the necessity of finding shrines for them. These relics included those of the bodies of the saints Blasius, Dunstan, Wilfrid, Alphege, and Becket, the most important, whose shrine stood in the Trinity chapel immediately behind the high altar. The body was first interred in the crypt, but in 1220 it was translated to the then newly erected chapel on the site of that in which Becket had first solemnised mass after becoming archbishop. In the Middle Ages C. C. owed much of its European fame and great riches to this shrine. But in 1538 Henry VIII solemnly issued a writ of summons against Thomas Becket, sometime Archbishop of Canterbury, accusing him of treason and contumacy, and the shrine which from the early 13th cent. had been enriched by many costly gifts from royal and other pilgrims was dismantled. Further destruction was wrought by the iconoclasm of the Puritans at the time of the Civil war: windows were shattered, the choir stripped, and the monuments defaced. In 1872 fire destroyed the outer roof of the Trinity chapel. The precincts are entered by Christ Church gate (now refaced in the upper regions), built in 1517 and a striking example of Perpendicular work. The SW. porch, the prin. entrance to the cathedral, was built by Prior Chillenden, c. 1400, but the figures in the canopied niches are of 19th-cent. workmanship.

The nave. The present nave dates from the late 14th cent., when it was rebuilt (with the exception of the NW. tower, taken down in 1832). The aisles with the clustered pillars are narrow and lofty. In monastic times the nave was the people's church. Owing to the crypts the choir is raised well above the level of the nave, which is very high in proportion to its breadth. The monuments in the N. aisle include that to Archbishop Benson (1896). The unusual shaped font dates from 1639. Near the E. end is a marble monument to the men of H.M.S. *Kent* (battle of the Falkland Is., 8 Dec. 1914).

the vaults in the circuit around the choir were now arch-ribbed with key-stones; and replacing the old wooden ceiling was a beautifully constructed stone vault. The single triforium gave place to two in the choir and a third in the aisle of the church. The monuments in the choir are nearly all of eccles. dignitaries, the most conspicuous being that in memory of Henry Chichele, archbishop from 1414 to 1443, founder of All Souls, Oxford. The Decorated screen which surrounds the choir was constructed by Prior de Estrle (Henry of Eastry, prior from 1285 to 1331) early in the 14th cent. The SE.

Copyright Walter Scott, Bradford

CANTERBURY CATHEDRAL: THE SANCTUARY

In the S. aisle is a tablet to Dean Farrar (1903), author of *Eric, or Little by Little*. The piers supporting the central tower are the original piers of Lanfranc's building encased with Perpendicular works by Chillenden. From one pier hangs the flag flown by H.M.S. *Canterbury* at the battle of Jutland.

The choir is the most important specimen of Transitional-Norman work in the country, using both the pointed and the rounded arch. It was the work of Wm of Sens between 1174 and 1179, and of his successor, Wm the Englishman, after 1179, who rebuilt Prior Conrad's 'glorious choir' which had been burnt. Gervase of Canterbury (q.v.), in chronicling the difference between the new work and the older Romanesque choir of Conrad, describes the changed mode of workmanship and design. The pillars were elongated and the new capitals exquisitely sculptured;

transept is an adaptation of the work of Ernulf by Wm of Sens, conforming to the new design of the choir. A little further E. on the S. aisle is St Anselm's chapel, forming part of the tower of the same name. Behind the high altar is St Thomas's or Trinity chapel, built to receive Becket's shrine, and the whole of this part of the choir from the screen eastward is the work of Wm the Englishman. The site of the shrine is shown by the marks worn in the stones by many generations of pilgrims. The curious mosaic pavement resembles that round the shrine of Edward the Confessor in Westminster Abbey. Near this site is the tomb of Edward the Black Prince (1376) with reproductions of his accoutrements above, and facing it the tomb of Henry IV and his consort, Joan of Navarre. The circular chapel at the E. end of the cathedral is known as the Corona, or

Becket's Crown. Near by, against the N. wall, is the tomb of Cardinal Pole (*d.* 1558), the last archbishop who acknowledged the supremacy of the Pope. In the centre of the Corona is the marble chair known as the 'Chair of Augustine,' in which each Archbishop of Canterbury is seated at his enthronement. There is also a memorial to Archbishop Temple, whose grave is in the cloister garth. Opposite Becket's tomb is the chantry of Henry IV., completed in the first half of the 15th cent. N. of the presbytery is the chapel of St Andrew, corresponding to

latter is notable for its Pointed arcading. Here Becket's body was placed for 50 years before its translation to the shrine in Trinity chapel. Here also Henry II did penance and was scourged by the eccles. authorities.

The monastic buildings stood on the N. side of the cathedral, and were extensive, comprising quarters for the monks and for the prior, and a separate palace for the archbishop, the domestic offices necessary for maintaining a great monastic house, the infirmary with its own chapel and cloister, accommodation for guests, and

Will F. Taylor

CANTERBURY CATHEDRAL

that of St Anselm on the other side of the choir, and one of the oldest parts of the building. Both the E. transepts are notable for the skill with which Wm of Sens adapted the work of Ernulf, and that of Conrad which succeeded it, to make it harmonise with his own choir. The NW. transept was much altered by Chillenden when building the nave; he also built the SW. transept. Leading out of the latter is St Michael's or the Warrior's chapel, in the Perpendicular style, and containing the coffin of Archbishop Stephen Langton, leader of the barons at Runnymede. The very fine Norman crypt is entered from the S. transept; the sculptured capitals are very striking. The W. portion was built by Ernulf in Anselm's time, while the E. portion or crypt of Trinity chapel was the work of Wm the Englishman. It is loftier than the W. end, and like the

the great cloister, rebuilt by Prior Chillenden at the same time as the nave, and incorporating some parts of Lanfranc's earlier building. The cloister is complete; it is 144 ft square, and the N. wall retains some beautiful Early Eng. arcading, and the vaulting is enriched with a fine display of heraldry. From the NW. corner there is a splendid view of the great central tower. Lanfranc's chapter-house, in the E. alley of the cloister, was rebuilt c. 1304 and the roof renewed in 1405-6. It was restored and reopened on the thirteenth centenary of the landing of St Augustine (1897). The cathedral was shaken by air attack during the Second World War, and a number of buildings within the precincts were destroyed or severely damaged, including the medieval school room, canonical houses, the deanery, and the King's School dining-hall. Of the

cathedral itself, only the library was totally destroyed, but the concussion sustained by the fabric made plans for a major restoration necessary, and these were laid in 1946. The beautiful and valuable medieval glass, dating from the 12th, 13th, and 15th cents., had all been removed to safety, but has now been re-instated. See R. Willis, *The Architectural History of Canterbury Cathedral*, 1845-69, and M. A. Babington, *Canterbury Cathedral*, 1948.

Cantharidae, or **Meloidae**, family of coleopterous insects in the div. Heteromera, known popularly as blister beetles or oil-beetles. The species, of which about 1500 are classified, are subdivided into winged Cantharides and wingless Meloides, and many of them are remarkable for their power of raising blisters when in contact with the skin. The term 'Sp. flies' is a commercial term. *Cantharis vesicatoria* is the true Sp. fly, *C. vesicatoria* being known as blister beetle. *C. (or Lytta) vesicatoria* occurs in Spain, France, Italy, and S. Russia, and has this property. Species of *Mylabris* yield the so-called China cantharides, the Telni 'fly' of India (*Mylabris cichorii*) giving twice as much cantharidin as the ordinary *C.* They are about three-quarters of an inch long, bright green in general colour, with legs and antennae bluish-black. When touched they feign death and emit a penetrating odour. The larvae feed on the roots of plants, but those of the *Sitaris humeralis* feed on the eggs of a bee, while the young of *Epicauta vittata* live on the eggs of a locust. The drug called cantharides is prepared from the dried bodies of *C. vesicatoria*, and is used on account of its blistering properties.

Cantharus, typical genus of a section of *Sparidae*, or sea-breams, is to be found in the Mediterranean, the Atlantic, and off the coasts of Africa and India. The species lack molar and vomerine teeth, are carnivorous and edible. *C. lineatus* is known both as the black sea-bream and as old-wife.

Cantharus, wide-bellied drinking vessel with handles, varying in size and form. Often dedicated to Bacchus, and decorated with Bacchanalian scenes.

Can-tho, cap. tn of prov. of same name in S. Cochín-China on r. b. of the W. arm of the R. Mekong (q.v.). C. stands 43 m. from the sea and is a busy riv. port. The prov. of C. is mainly engaged in rice cultivation.

Cantioles, Vulgate Cantium Canticorum, trans. of the Heb. title, which is a superlative (cf. Holy of Holies), a love poem written at a much later date than Solomon, but attributed to him as a great lover, a quite reputable literary device. Some have made it a poetic drama, others reject its unity and make it a collection of love poems. The love of the 2 pastoral sweethearts is described in sensuous imagery of great beauty. But it stands in the Bible not as a mere description of earthly love, however chaste and true, but as an expression of the love of the soul and of the Church for God, often described in the prophets as a betrothal or bridal

union (as also in the N.T.). The Fathers of the Church are unanimous in this interpretation. By an extension it has been applied to the Blessed Virgin, as *par excellence* the loving soul and the Bride of the Spirit. Rabbi Aqiba said: 'All the Hagiographa are holy, but the Canticle is most holy' (cf. Mishnah, *Yadayim*, 3, 5): see commentaries by Origen, St Ambrose, Rupert of Deutz, St Bernard, Harper (1907), Haller (1940).

Cantigny, Battle of, battle of the First World War; the first independent operation of Amer. troops after the U.S.A. entered the war. The 1st Div., about 30,000 strong, took over the Montdidier sector from the 45th Fr. African Div. of shock troops. Facing them in a salient of which C. was the main feature was the Seventh Ger. Army, under Gen. von Boehn. On 28 May 1918 the Americans attacked after a 2-hour bombardment, and with splendid dash reached their objective, advancing 1 m.

Cantilan, tn, prov. of Mindanao, Philippine Is., 47 m. SE. of Surigao. Pop. 20,519.

Cantilever, in building, a beam projecting like a bracket from a wall, and held down at that end either by the weight of the wall or by some other means, and capable of carrying a weight on the remainder of its length. The principle of the C., though not new, has been widely developed in architecture of the 20th cent.; notably in the generous provision of cantilevered balconies for modern flats, and C.s for the roofs on is. platforms of railway stations. Another important use of the C. principle is its application to bridges. The idea has been applied to the bridging of spaces too wide to be crossed by a single plank from the earliest times, and in its simplest form is still employed by many E. nations. In these primitive C. bridges 2 planks, firmly fixed in the banks, project over the stream, and are connected by an independent truss overlapping the end of each. The principle has recently been greatly developed, and applied in cases where girders or suspension bridges are impracticable. The modern practice is to erect in the bed of the riv., at a convenient and equal distance from each bank, 2 piers each supporting 2 C. arms, one of which extends to the shore and the other over the stream. These outer ends are connected by another truss. The first modern bridge erected on these lines was one over the Niagara R., designed by Charles C. Schneider in 1882; and another famous example is the Forth bridge, Scotland, with its 2 great C. spans of 1760 ft. The C.s of the Lansdowne bridge over the Indus at Sukkur are supported by the bank itself. The bending stress of a C. causes it to bend with a convex curve upwards, in the opposite direction to the curve of a bridge supported at both ends. See also BRIDGE.

Cantire, see KINTIRE.

Canto Firmo (It.), see CANTUS FIRMUS.

Canton, John (1718-72), scientist, b. Stroud; spent most of his life in London, part of the time as a school-teacher. His

researches in physics were mainly in the field of electricity, for discoveries in which he was made a fellow of the Royal Society in 1749, gaining the Copley medal in 1751. Among his other work may be mentioned the invention of the pith-ball electrometer, the verification of Franklin's identification of lightning and electric fluid, and his demonstration of the compressibility of water, for which he received the gold medal of the Royal Society. He investigated phosphorescence in the sea, tracing it to the decomposition of animal matter. He wrote sev. treatises in the *Philosophical Transactions*. See also CANTON'S PHOSPHORUS.

E.N.A.

THE GREAT PAGODA, CANTON

Canton: 1. Cap. of the prov. of Kwangtung, and one of the first cities in China. It stands on a riv., almost on the seaboard, 90 m. NW. of Hong Kong. Until recent years it was surrounded by walls, and had narrow, crooked streets. A great part of the pop. live in boats on the riv. A municipal council was estab. in 1918, and demolished the old city wall, replacing it by a motor road 6 m. long. C. has now 4 parks. The entire circuit of the city is 10 m. Its mint formerly issued coins, all bearing a picture of Dr Sun Yat-sen. There are factories and sev. hundred workshops for producing hosiery, matches, silk, porcelain, metal goods, and fancy goods. Its exports included tea, silk, and cassia. Recently canned-food factories (especially fruit-canning plants), sugar factories, and paper-mills have been constructed; export of fruits is one of the main items of China's foreign trade. There are numerous

temples (chiefly Buddhist), pagodas, and many curio shops, a Rom. Catholic cathedral, a Church of England church, and a masonic hall. Sev. lines of railway start from C., reaching Hankow to the N. and Kwellin to the S. The pop. (1954) was just over a million. From 1917 there has been much turmoil and fighting at C. In 1924 24,000,000 worth of damage was done while Dr Sun Yat-sen was suppressing the Merchants' Volunteer Corps. In 1925 the foreign concession, Shameen, was besieged for 4 months. An attempt to estab. a Communist regime in Dec. 1927 was crushed after 3 days, but only after many lives were lost and much damage done to property. An administration was then set up known as the S. China Gov., which for the next 10 years acted in semi-independence of the central gov. at Nanking. C. was the centre of the nationalist spirit in China, and was the base of the republican revolutionary movement, Dr Sun Yat-sen being himself a Cantonese. For this reason the Japanese encountered stiff resistance in C. during their invasion of China, but after a period of severe bombing the city fell to the Japanese on 21 Oct. 1938, and remained in their hands until the end of the Second World War. The centre of the city was reduced to ashes, and large areas, including industrial works, were demolished by the Chinese Army before their retreat from the city. While in the possession of the Japanese, C. was subjected to further bombing by the U.S. Air Force at intervals during 1942-5. There were anti-British riots in C. in Jan. 1948 during which the Brit. Consulate was destroyed. The riots arose out of demonstrations resulting from the eviction by the Brit. authorities of some 2000 Chinese 'squatters' in Kowloon. The city was captured by the Communist Army in the spring of 1950.

2. City, co. seat of Stark co., Ohio, U.S.A., 52 m. SE. of Cleveland. Industries include steel mills, roller bearings, and an oil refinery. There are also fire-clay quarries and coal-mines. It was the home of President McKinley. Pop. 116,900.

Canton: 1. Geographical area in Switzerland, with its own laws and a local gov. which looks after domestic affairs such as taxation and control of public money. Foreign policy, control of the army, etc., are left to the central gov., which is at Bern.

2. In France a term meaning a subdivision of the arron.

Canton River (Chinese Chukiang, pearl riv.), arm of the delta Sikiang in the prov. of Kwangtung, China. It is the lower portion of the Pekiang R. About 45 m. below C. the riv. is called Bocca Tigris, or Tiger Gate. The estuary of the riv. S. of Bocca Tigris is called Outer Waters. The celebrated Bogue Forts, taken by the English in 1841 and 1856, guard the entrance to this part of the riv.

Cantonments, military term applied to a temporary resting-place for troops. On active service, troops in C. are quartered actually in a tn or vil., and the term is also used when they are detached and

quartered in sev. neighbouring tns. The most common use of the word was in relation to military settlements in Brit. India, where C. were equivalent to permanent barracks, situated at a short distance from a tn, or formed isolated military stations. *See also* BILLETING.

Canton's Phosphorus, form of calcium sulphide which, after exposure to sunlight, itself emits light for some time. Pure sulphide (CaS) does not show the same property. It was discovered by John Canton (q.v.) in 1768 by heating oyster shells with sulphur.

Cantor, **Eddie** (real name **Edward Isakowitz**) (1892-), Amer. comedian, b. New York City. He appeared on the stage at 14 with Gus Edwards's children's troupe (*Kid Kabaret*); from 1916 to 1919 he was in New York musical productions, including *Ziegfeld Follies*. His first star role was in 1917 in *The Midnight Rounders*. He made his film debut in *Kid Boots* in 1926, and made many famous pictures including *Palmy Days*, *The Kid from Spain*, *Roman Scandals*, and *Kid Millions*. He is at present engaged in television.

Cantor, Georg (1845-1918), Ger. mathematician, b. St Petersburg (Leningrad) and educ. Berlin and Göttingen. Prof. C. mathematics at the univ. of Halle, of created a new field of mathematical investigation and provided a powerful instrument for dealing with the foundations of mathematics and for stating the inevitable limitations to which mathematical results are liable. In 1870 he solved the question of the uniqueness of the representation of a function by Fourier's series. His chief work is *Contributions to the Founding of the Theory of Transfinite Numbers* (pub. in London and Chicago in 1915), in which he developed the theory of sets of points. For his research in pure mathematics he was awarded the Sylvester medal in 1904. He d. at Halle.

Cantoris, in architecture, the N. side of a choir on which the cantor or precentor sits facing the Dean. From the fact that the precentor sits opposite the dean, the 2 sides of the choir are named Decani (i.e. 'of the Dean') and C. (i.e. 'of the Precentor').

Cantù, Cesare (1804-95), It. historian and novelist, b. Brivio near Milan. He was a prof. of It. literature and language at Como, Milan, and Sondrio. He was thrown into prison between 1832 and 1833 for remarks made against the policy of the Austrian Gov. in his book *Ragionamenti sulla Storia Lombarda nel Secolo XVII*. While in prison he wrote his historical novel *Margherita Pusterla*, pub. in 1838. His great work is his *Storia Universale* (1836-42) in 35 vols., which brought him in £12,000 in royalties; but it is often polemical, and written with a strong clerical bias. His books for young people are *Lecture Giovanili* and *Il Galantuomo*. Among his other works are *Storia degli Italiani*, 1855-7, which is in 6 vols., and *Italiani Illustri, Ritratti*, 1870-2, in 3 vols.

Cantù, It. tn, in Lombardy (q.v.), 5 m. SSE. of Como (q.v.). It has furniture and silk manufs. Pop. 14,000. *See* BRIANZA.

Cantus Firmus (Lat. = It. *canto fermo*), in old polyphonic music, especially masses and motets, up to the end of the 18th cent., it was customary to use a folk or popular tune (often associated with highly unsuitable words) or a plainsong theme, sung in one part (usually the tenor) in long notes and to weave a contrapuntal web of parts round it. The C. F. was usually so slow and so deeply buried in the elaborate surrounding parts as to become completely unrecognisable in performance. *See also* PLAINSONG.

Canuck, popular term in the U.S.A. for all inhab. of Canada. In the dominion itself it is more often applied to the Fr. Canadians. The word is supposed to be of Indian origin.

Canusium, *see* CANOSA DI PUGLIA.

Canute (Cnut) the Great (d. 1035), second King of Denmark of his name, and King of England. He was the son of Sweyn, King of Denmark, who, after conquering England and driving Ethelred II (q.v.) into exile in Normandy, d. at Gainsborough in 1014. Ethelred at once returned to England. In 1015 C. invaded England, over-running most of the country and defeating Ethelred, who d. 1016. Ethelred's son, Edmund Ironside, continued the battle against C. but after being defeated at Assandun (Ashington) Edmund agreed to a div. of the country, by which he kept Wessex and C. took Mercia and the N. This agreement would probably have proved unworkable, but in Nov. 1016, Edmund died, leaving C. undisputed King of England. Edmund's young sons fled to Hungary and C. married Emma of Normandy, Ethelred's widow. C. soon consolidated his position in England, dividing the country into earldoms, on the Dan. pattern. He gained popular favour when he sent large numbers of his soldiers back to Denmark; he was prepared to place Saxons in positions of importance and Saxon nobles went with him on his expeditions against Sweden and Norway. Under his rule, Eng. trade revived, and cultural contacts with Europe increased; while a lengthy legal code is one of the salient features of his reign. C. is traditionally remembered for his piety, though he committed sev. acts of great barbarism when personal interest demanded it. Though he brought many benefits to England, Eng. taxes had to pay for his foreign house-carles and his foreign wars, and the many Scandinavian names recorded in Domesday Book, scattered as they are all over England, suggest that many of C.'s followers received Eng. land as a reward for their services to him. C. became King of Denmark in 1018, and of Norway in 1030. On his death C. was succeeded by his illegitimate son Harold I (q.v.). The story of his rebuke to his flattering courtiers is told by Henry of Huntingdon. It describes how C. sat by the seashore as the tide rose and commanded the waves to come no nearer. When the tide reached him, he rebuked his courtiers for their flattery, saying that he could not prevent the encroachment of the waters though they called him king. Holinshed also tells this story. *See* L. M.

Larson, Canute the Great and the Rise of Danish Imperialism, 1931.

Canvas, heavy, strong cloth, made of jute, hemp, or flax. The strands or fibres are woven in exactly the same way as in linen. Although the C. used for sailcloth is sometimes made from hemp and other fibres, the best and strongest kinds are made from flax, and generally in widths of 24 in. A piece, or bolt, is 40 yds long. There are different kinds of C., varying according to weight. Artists' C. used for oil paintings is one of the finest kinds of C., and the sails of racing yachts are often cotton-duck. The term C. is also used to denote a coarse type of plain cloth having hard twisted yarns.

Canvassing, soliciting votes at an election, or trade or business by commercial travellers.

Canvey, is. in the Thames estuary off the Essex coast, 30 m. E. of London, area 7 sq. m. It was reclaimed from the sea in the 17th cent. It is reached by rail, the station being at Benfleet, with which it is connected by a bridge. In Feb. 1953 the is. was flooded and much damage caused in the winter gales. Pop. 11,258.

Canyon (Sp. *cañón*, a gorge), deep and narrow valley or gorge which has been cut by the action of a riv. In Colorado the Grand C. (q.v.) is a perfect and beautiful example of this natural formation of the earth's surface. The riv. here has carved its way through solid rock, in parts to the depth of 6000 ft and not a mile in width. The walls are of sandstone and limestone with varying colours, quite bare of vegetation, and also cut into buttresses and terraces by the action of the atmosphere. There are other causes for these deep cuttings besides the work done by the stream itself; one is the continual uplifting process which maintains the rapid flow of the riv., and the other the dry climate which keeps the rocky walls from being crumbled away by frost and springs. At Niagara there is also a fine gorge below the falls, due to erosion by the water in a 'young' land.

Canzone, form of poetry used principally for love lyrics, though occasionally for religious and other subjects. The earliest specimens from Provence date from the 12th cent., and those of Italy from the 13th cent. The number of stanzas was generally five or six, but they varied sometimes, and the last stanza was often shorter than the others. In Provençal C.s the same set of rhymes went through all the stanzas, but in the Italian a fresh set was introduced for each stanza. Dante, Petrarch, Tasso, and Leopardi all wrote this form of poetry. Drummond of Hawthornden wrote the best examples of Eng. C.

Canzonet (from It. *canzonetta*, dimin. of *canzone*), in music, a short song in parts for sev. voices, set to light verses; from the 18th cent. onwards also for a single voice.

Cão, Diago, see CAM.

Cao-bang, cap. of the prov. of the same name in N. Tonking (q.v.), close to the Chinese frontier. The country is mountainous and picturesque. Tin, wolfram,

gold, and iron are mined and there are fine forests. The inhab. include Tho, Nung, Man, Meo, and Vietnamese.

Caodaism, religion, native to Viet Nam, which numbers appreciably more than a million adherents. Its Holy See is at Tay-ninh, Cochinchina, where there is a large and architecturally remarkable cathedral built by the first pope. C. was first founded in 1926 and claims to embrace all the prin. religions of the world. It is headed by a pope and boasts a college of cardinals (some female), bishops, and priests. See G. Gobron, *Histoire du Caodaïsme*, 1948.

Caoutchouc, see RUBBER.

Cap-de-la-Madeleine, city in Quebec, Canada, on the N. shore of the St Lawrence R., near Trois-Rivières. Prin. industries are pulp and paper, aluminum products, paper boxes, and bags. Pop. 22,800.

Cap Haitien, city and port in the rep. of Haiti, cap. of Nord dept, and an episcopal see, situated in a magnificent harbour 5 m. from Port au Prince. Under the Fr. gov. it was the cap. of Haiti. It is connected by cable with France, S. America, and the Dominican Rep. It is a trading and export centre founded in 1670 by the French. Near by was fought the last decisive battle for independence (1803).

Capablanca, José Raúl (1888-1942), Cuban chess player and diplomat, b. Havana. At the age of 12 he won a formal match against the chess champion of Cuba. Graduated at Columbia Univ., New York. In 1909 he beat Frank Marshall, the chess champion of the U.S.A. and, in 1911, took the first prize at the international tournament at San Sebastian. Financial disengagement postponed his meeting with Dr Emanuel Lasker for the world's championship for nine years, but in the intervening period the 2 met as competitors in the St Petersburg tournament, when Lasker won by half a point. At Cuba in 1920 he at length met and defeated Lasker easily, Lasker complaining of the climate. C. held the championship from 1921 to 1927, losing it at the first challenge to Dr Alekhine—he won 3, lost 6, and drew 25 games, but dictated the style of the play. He continued to gain remarkable victories, including his win over Dr Euwe in 1931 and tie with Botvinnik—5 points ahead of Lasker—in the Moscow tournament of 1935. The characteristics of his play were simplicity, mathematical exactitude, and a perfect sense of timing. Wrote 2 admirable text-books in English: *Chess Fundamentals*, 1922, and *A Chess Primer*, 1935.

Capacitance, the ratio of electric charge to potential of a conductor, or the charge needed to raise the potential by 1 unit. C. is measured in farads, F (see UNITS, ELECTRICAL); in practice the microfarad, $\mu F = 10^{-6}$ F, is used. A cable carrying direct current is normally at a constant potential and a charging current flows only at the initial charging-up when the cable is switched on to the supply. On alternating current the potential in alternating and at each reversal a considerable

charging current flows. See CAPACITOR; CIRCUIT, ELECTRIC; TRANSMISSION, ELECTRIC POWER.

Capacitor, or condenser, name given to 2 electrical conductors separated by insulating material (dielectric). The Leyden jar was the first form of C., the nature of the equal and opposite charges on the coatings being correctly interpreted by Franklin, who also constructed the first parallel-plate C., 2 equal lead plates separated by a glass pane. The capacitance of a plate C. is directly proportional to the area of the plates, inversely proportional to their distance apart and dependent on the dielectric. Variable C.s of small capacitance may be made by 2 sets of interleaved sector-shaped plates, one set being fixed, the other being rotated around the common axis so as to present a varying area to the fixed sectors; or as 2 cylinders, one sliding inside the other. Large C.s used for power-factor correction on transmission lines are made on the plate principle, the plates being rolled up in many layers. Batteries of such C.s are used on the Swedish 380 kV. lines. See CAPACITANCE; CIRCUIT, ELECTRIC; TRANSMISSION, ELECTRIC POWER; POWER FACTOR.

Capacity, in law, means competency or ability to do any legal act or hold any office, and the state of possessing the necessary discretion to be chargeable for one's crimes. In the law of contracts, e.g., lunatics and infants are, generally speaking, incapable of entering into binding contracts. In criminal law children under 8 are absolutely incapable of committing a crime. Between 8 and 14 the infant is still presumed to be *doli incapax*, but the presumption may be rebutted by evidence of discretion in the infant.

Capacity, power of containing a quantity. *Cubic C.*, the number of units of vol. in a solid or closed space. *C. for heat*, the amount of heat required to raise the temp. of a body one degree. *Electrical C.*, see CAPACITANCE.

Capacity, Measure of, see METROLOGY. **Capaneus**, Gk hero who took part in the first expedition of the Seven against Thebes. While he was trying to scale the walls he was struck by lightning by Zeus.

Cape Breton Island, rocky is. at the E. extremity of Nova Scotia, Canada; now joined to the mainland by Canso Causeway, 4500 ft long and 80 ft wide, with highway and railway. The greatest length of the is. is 110 m., the greatest width 85 m., and the area 3120 sq. m. It is bisected by the waterway formed by the inlet of the Bras d'Or, on the E. coast, the lake into which it widens, and the St Peter's Ship Canal, which joins this lake to the Gut of Canso. The Bras d'Or lake is 50 m. long, 20 m. broad, and from 12 to 60 fathoms deep. It is surrounded by beautiful scenery, and renders practically the entire is. accessible by water. The N. portion of the is. is much more mountainous and rugged than the S., and rises to an elevation of 1800 ft at N. Cape. The coast is deeply indented by numerous bays and harbours. The climate is milder than that of the mainland, but very moist. The harbours are

open all the year round. A certain amount of grain is grown, and there is considerable mineral wealth, coal and iron (in the Sydney dist.), copper, marble, granite, limestone, slate, gypsum, and salt being mined and exported. Lumbering and fishing are important industries. The is. is a great tourist resort. The pop. of N. C. B. is mainly of Scottish highland descent, and Rom. Catholic by religion. Gaelic is still spoken. In the mining dists. there are many Irish and Italians. There are also Fr. Acadians and some Micmac Indians. The is. is divided into four cos.: Richmond, Inverness, Victoria, and C. B. The chief tns are Sydney, Arichat, Port Hood, and Louisbourg. C. B. was ceded to France in 1654 at the peace of St Germain. The French settled and fortified Louisbourg, 1713-20. This fortification was captured by New Englanders in 1745, returned to France by the Treaty of Aix-la-Chapelle in 1748, captured by the British under Amherst and Wolfe in 1758, and finally became British in 1763 and was annexed to Nova Scotia. It was made a separate prov. in 1784 with Sydney as the cap., but in 1820 it was annexed to Nova Scotia again. Over 4,000,000 tons of coal are now shipped yearly. Pop. 157,696. See A. C. Walworth, *Cape Breton: Isle of Romance*, 1947.

Cape Coast, tn on the W. coast of Africa, in Ghana, and once the cap. of the Gold Coast; the site of a Portuguese castle built in the 16th cent., when C. C. was an important slave depot. Exports are cocoa and palm products. Pop. approximately 20,000.

Cape Cod, sickle-shaped sandy peninsula of Massachusetts, U.S.A., 65 m. long and 1 to 20 m. broad. It is a favourite summer resort, and there are numerous small vils. and settlements. It produces huge quantities of cranberries and some asparagus.

Cape Colony, see CAPE PROVINCE.

Cape Coloured People, name given to the mixed pop. of Cape Town and surrounding areas in S. Africa. They are descended from Europeans, Hottentots, and E. Indian slaves, with some admixture of Negro. To-day there are about a million, living mainly in Cape Town and Port Elizabeth. They speak Afrikaans, and, except for 60,000 Muslims (the 'Cape Malays'), are Christians. Formerly they had the vote and mixed to some extent with Europeans, but the present S. African Gov. has taken the vote from them and is trying to group them into inferior residential areas apart from Europeans. See W. M. MacMillan, *The Cape Colour Question*, 1927, and S. Patterson, *Colour and Culture in South Africa*, 1953.

Cape Fear River, N. Carolina, U.S.A., formed by the junction of the Deep and Haw R.s., enters the Atlantic at Cape Fear, 20 m. S. of Wilmington. About 200 m. long, the head of navigation is Fayetteville.

Cape Girardeau, city and riv. port in Missouri, U.S.A., on the Mississippi R. (bridged) 100 m. SSE. of St Louis. It

manuf. shoes, cement, and wood and tobacco products. SE. Missouri State College is here. Pop. 21,600.

Cape Golden Mole, see *CHRYSOCHLORIDAE*.

Cape Henry, Action off. The British in 1781 occupied Portsmouth on the James R. in Chesapeake Bay, N. America, and the Fr. squadron at Newport, Rhode Is., proceeded thither under the command of Commodore des Touches. He was met by Vice-Adm. Marriot Arbuthnot off C. H. on 16 Mar. A fight followed which was indecisive, the French losing heavily. The result of the battle was that the English once more gained command of Chesapeake Bay.

Cape Horn (Sp. Cabo de Hornos), headland on a small is. of the Fuegian Archipelago, forming the southernmost point of S. America. It was sighted by Drake in 1578, and named by the Dutch in 1616.

Cape Hunting-dog, see *HYAENA DOG*.

Cape Pondweed, see *APONOGETON*.

Cape (Cape of Good Hope) Province, or **Kaapland** (formerly Cape Colony), the most southerly portion of Africa, forming a prov. of the Union of S. Africa. It is named after the promontory on the SW. coast discovered by Bartholomeu Diaz in 1488 and named then Cape of Storms, but afterwards renamed Cape of Good Hope by the King of Portugal. The boundaries of the prov. are Bechuanaland Protectorate on the N., SV. Africa, formerly Ger. SW. Africa, on the NW. and on the NE. and E. the Transvaal, Orange Free State, Basutoland, and Natal. The breadth of the prov. may be measured by its diameters (NE. to SW. and NW. to SE.), which are respectively 750 and 800 m. long. It comprises Brit. Bechuanaland and the extremity of the African continent S. of the Orange R. and Natal, including the Transkei ter. It is nearly twice the size of the U.K. The total area is 277,170 sq. m. (the prov., 260,615 sq. m.; Transkei ter., 16,555 sq. m.).

Coastline. The coastline from the mouth of the Umtamouna on the E. to the mouth of the Orange on the W. measures some 1300 m. The estuary of the Kynsna, on the S. coast, provides the only good natural harbour of the prov. But excellent docks have been constructed at E. London and Port Elizabeth (qq.v.), and at Mossel Bay (q.v.) there is a smaller but efficient harbour. Skirting the coast westward, the traveller will pass the mouths of many mt. torrents, broad stretches of forest, and the green slopes of mt. ranges. Further to the W. he will see Cape Agulhas and the Cape of Good Hope, which rises 840 ft. above sea level. If the traveller doubles the Cape, he will find himself in Table Bay, above which towers the flat-topped, cloud-girt Table Mt (3582 ft.). Cape Town, the cap. of the prov., extends along the coast and the lower slopes of the mt. on the side of the peninsula opposite False Bay, which lies on the S. So far the shore has been fertile and well watered, and the scenery often picturesque, but along the W. the coast is covered with white sand and scrub, and presents a barren aspect. Saldanha Bay,

20 m. N. of Dassen Is., is a safe and sheltered roadstead. Robben Is., outside Table Bay, is the only other is. of importance, and is fortified by the Brit. Gov. as a naval base.

Ocean currents. The Agulhas current rushes south-westward from the S. and E. coasts so forcibly that a counter-current, running in a north-easterly direction, is set up. Ships going towards Natal from Cape Town avail themselves of this back drift. At the S. extremity the warm Agulhas current meets the cold W. drift from the Antarctic. The current flowing northward along the W. shores is really part of this W. drift, though its course is diverted.

Rivers. Beginning on the E. coast the Buffalo rises beyond King William's Town, which is on its bank. At its mouth lies E. London, the third port of the prov. Port Alfred is situated at the mouth of the Kowie, which rises in the Zuurberg Mts. and is noted for the beautiful country through which it flows. The source of the Kei is in the Stormberg. Further S., the Great Salt R. enters the sea. It is formed by the flowing of the Kat, which rises in the Winterberg, into the main stream, there called the Great Fish R. Rising in the Zuurberg, the latter, like the Sunday and the Groote, crosses the Great Karoo; it is remarkable alike for its swollen waters after rains, and for its tortuous course. At one time it makes a great circular sweep of 20 m., the 2 ends being less than 2 m. apart. The Sunday joins the Indian Ocean in Algoa Bay after watering a very fertile dist. The Groote is the more important of the 2 streams which are known after their junction as the Gamtoos. It takes its rise, like the Gamka, in the Nieuwveld Range. The Gamka unites with the Olifants to form the Gouritz, which is fed by the trib., Groote (125 m.), just before it pierces the coast range. The most westerly riv. of importance on the S. coast is the Breede, which rises in the Warm Bokkveld. Breaking through the mts at Mitchell's Pass, it afterwards receives the streams from the celebrated Hex R. Pass. On its banks are the picturesque tns of Ceres and Worcester. Unlike most of the rivs., whose mouths are silted by sand-bars, it is navigable for some 35 m. There are 3 rivs. flowing into the Atlantic Ocean N. of Cape Town, namely the Berg and the Buffalo, each 125 m. long, and between them the Olifants, 150 m., which, rising in the Winterhoek Mts and cleaving a passage between the Cederberg and Olifants chains, maintains a fair depth throughout its lower course. The great waterway of the Orange, which stretches almost from the Atlantic to the Indian Ocean, forms a N. boundary to the prov. The Zak, Ongers, and Brak unite with the middle courses of this riv., whilst the united Modder and Riet from the SE. and the Harts from the NE. both effect their junction with the Vaal, the greatest of the Orange offshoots, within the confines of the colony. The inner mt. range is the main watershed. Unfortunately hardly any of the rivs. are navigable for any distance. As they

tear down the mt sides, cutting deep ravines, they grow into splendid streams after heavy rainfall, but in the hot weather they shrink to the size of brooks or dry up altogether.

Though the prov. has no lakes, there are many 'salt pans,' the largest being Commissioner's Salt Pan, some 20 m. in circumference. Situated in the barren NW. flats, this natural basin, like the rest, rapidly loses its waters in the dry season, so that the salt layers at the bottom may be reached. Near Knysna and elsewhere are shallow basins, called *vleis*, which overflow into one another in time of flood. These pools vary in

portion being occupied by the Stormberg peaks and the N. by the flanks of the lofty Drakensberg. The central range E. to W. includes the Zuurberg, Winterhoek, Groote R., Groote Zwartberg (greatest elevation 6989 ft), and the Cedarberg Mts. Great gorges called kloofs have been pierced in this chain by the rushing streams. The third mt rampart, running 120 m. inland from the shores, is variously named the Nieuwveld, Sneeuwberg (in which is Compass Berg, attaining the greatest altitude in the prov., 8500 ft), Zuurberg, and Stormberg ranges. The E. coast is flanked by the Roggeveld and Komsberg Mts, which continue the

THE CAPE OF GOOD HOPE

bulk according to the humidity of the atmosphere.

Mountains and tablelands. For the most part the 3 mt chains are well defined and their configuration is simple to grasp, since they follow the coastlines. Beyond the coast plain, which rarely rises to 600 ft, the abrupt S. slopes of the coast range ascend to a plateau some 30 m. wide, known as the Little Karroo (Hottentot for arid). The terraced formation is continued by the second chain of mts, which give on to the Great Karroo, a tableland whose area is something like 28,000 sq. m. The main belt of heights, shutting in this plateau to the N., fringes the immense plain of S. Africa, only a strip of which lies in this prov. Thus in spite of a perplexing nomenclature, the structure of the high lands is plain. Passing E. to W. the coastal chain is known successively as the Uiteniquas, Langeberg, Zondereinde, Drakenstein, and Ollifants Mts. The prov. E. of the Kei R. is very hilly, the S.

Nieuwveld. It is true that the contours of the mts are often imposing, yet these hardly compensate for the monotony of the bare stretches of veld, and for the marked deficiency in water and trees. The flowering shrubs and grasses have no sooner sprung up on the Bushmanland plateau (in the NW.) than they are withered away by the hot suns, which undo the fertilising work of the heavy rains. Cattle, however, often find good pasture by the *vleis*, if the soil is not too brackish. The vast, treeless tableland to the N., whose average altitude is 3000 ft, is broken only by the great Orange R. which cuts across its whole length.

Geology. The geological structure of the mt ranges is fairly uniform, most of them consisting of huge masses of quartzose sandstones on granite bases. Whilst the granite when it occasionally crops out has rounded contours, the formation of the sandstone, as on Table

Mt. is flat. The latter often covers the primitive rock to a thickness of 1750 ft. The Stormberg chain alone presents traces of recent volcanic action. Ferruginous reddish sands and argillaceous clays, resting on blue slaty rock, form the surfaces of the karroos and N. plateau. The 3 systems are known as the Cretaceous, Karroo, and Cape systems, whilst there are also pre-Cape rocks that are little understood.

Climate. The climate of the prov. is healthy. As a rule the air is remarkably dry and clear. The mean ann. temp. may be taken as less than 55° F., although the daily range is considerable, the average variation on the Karroo being as much as 27° F. The drawback is the prevalence everywhere of dust, which is blown by every wind. The climate mainly depends on 2 factors: the elevation of the land and the expanse of ocean in the lower hemisphere. It is the cold currents of the latter which give to Cape Town as low a mean temp. as 63° F., the same as that of the It. Riviera, which is 8' farther from the equator. The mt. chains exhaust the rains of the moisture-laden winds from the E. and SE. Thus these winds fertilise in plenty the coastlands, but, as the more they advance into the interior the drier they get, most of the prov. is subject to frequent drought. Along the W. coast, N. of the Olifants, rain does not fall for years together. A line from Walvis Bay to Port Elizabeth, on the SE., roughly divides the prov. W. and E. into the areas of winter and summer rainy seasons respectively. W. of 23° E. the mean ann. rainfall is under 10 in. By the W. coast and on the Little Karroo it varies from 10 to 20 in., but on the S. and SE. coasts it is over 25 in., and in the Cape peninsula sometimes rises above 40 in. The thunder-showers which usually follow the dry hot N. wind from the desert are the one source of rainfall to the arid N. dists. Dec. and Jan. are the hottest months, and June and July the coldest. On the N. plateau and on the Karroo the mean minimum temp. is 49° F., and the mean maximum 77°. Though the hot westerly winds make the daytime often oppressive, the nights are cool and refreshing. Frosts are frequent in the winter, and whilst snow rarely falls on the coasts, it often caps the high mts. for months together.

Flora. Along the coast the flora is rich. Of the 10,000 varieties of species, some 450 are found only in the prov. Prickles and thorns are common characteristics of the plants. There are over 400 genera of the bushes and heaths; the abundant pink rheenoster bush is not unlike heather. Aloes, 'everlasting flowers,' and the castor-oil plants are also indigenous. Among flowers the iris and arum lily are conspicuous, whilst the spurge plants, the elephant's foot, and the stapella, or carrion flower, may be noted among plants structurally eocentric. Forests of trees rarely more than 30 ft high cover some 550 sq. m. of the S. seaward slopes. The yellow-wood (of the yew species), the silver-tree, black ironwood, the

melkhout, and the heavy, hard stinkwood are indigenous, whilst oaks, which grow luxuriantly, pines, and poplars have been introduced with success by settlers. Though the native fruits, including gourds, water-melons, and hard pears, are rare, most of the varieties introduced from other countries grow well. In the spring the blossoms of the dwarf mimosas on the Karroo are splendid. A coarse yellow grass covers the tablelands of the interior.

Fauna. The fauna is varied, though lions and rhinoceroses have been expelled and the blaauwbok and quagga exterminated. Zebras, elands, antelopes, gnus, buffaloes, and elephants now require special protection. Not so the silver jackal, wild cats and dogs, aard-wolf, and hyaena, which are still fairly common. Springboks herd on the open veld, whilst other species of Ungulata are the steinbok, the kilspringer, and the dassie rabbit. There are also baboons, otters, pangolins, and other ant-eaters, mongooses, jerboas, and hares. Among reptiles may be mentioned puff adders and other snakes, lizards, and tortoises. There is a great variety of game birds, including the ostrich, the huge kori bustard, the quail, teal, snipe, widgeon, and many others. Eagles, falcons, owls, and aasvogels, besides flamingoes, pelicans, and cranes, are also found. Most of the birds belong to the Passeroides order. Larks, weavers, and starlings—the Eng. starling is the only naturalised European bird—are the commonest varieties. Of native insectivora, the 'golden mole' is notable for the splendid lustre of its yellow fur. Jumping shrews, tarantula spiders, scorpions, toads, and frogs are also native to the prov. The large baba and yellow-fish occur in fresh water, whilst in the sea are found seals, sharks, whales, steenbrass, snoek, and many edible species.

Agriculture and allied industries. Artificial irrigation is much needed to promote the cultivation of large tracts of land, whose one deficiency is water. Mealies (Indian corn), oats, wheat, barley, and rye yield good crops. The vegetable produce consists chiefly of potatoes, mangolds, peas, and beans. Most of the farmers live by sheep-rearing, the number of sheep in the prov. amounting to nearly 31,000,000; of cattle there are over 3,600,000, and of goats 5,000,000. The number of domesticated ostriches on the farms had declined in 1955 to about 40,000, showing a very considerable decrease since 1912, and the total to-day is even below that figure. Oudtshoorn was, and still is, the great ostrich farming centre of S. Africa, but the industry was at its peak from 1906–12, when there were 400,000 birds in that dist. alone. By 1939 the number had dropped to fewer than 20,000, and feathers, which had previously sold at any price from £20 to £100 per lb., sold at no more than 22s. per lb. Mules are bred on the veld. In the W. dists. of the Cape the vine is grown and produces an abundance unknown in other countries. There is only a limited demand for the Cape wines in Europe in spite of the fine flavour of the

grapes. The export trade has, however, improved. The tobacco crop is becoming increasingly important, and cotton, also, is grown. Great improvements in transport have made it worth while for fruit-growers to cultivate grapes, apricots, oranges, and peaches for foreign markets. The ann. harvest of each fruit runs into millions, and S. Africa supplies the Brit. market with fruit of all kinds during the winter months. Great quantities of wheat and maize are annually ground in the flour-mills, which are second only in importance to the diamond mines as a source of industrial wealth.

Mining. The diamond mining is carried on in Kimberley, which yields more diamonds than all the other mines combined, Hopetown, Griqualand W., and other places near the Orange R. Up to the end of 1952, the total value of diamonds mined in S. Africa was £394,691,116. The industry was severely hit by the First World War, when many of the mines closed down, and there was another serious slump in 1931. Diamond output is, however, now controlled by an agreement fixing quotas of members of the Diamond Producers Association. There are a number of collieries in the Stormberg dist., and copper, gold, tin, and salt are also found.

Trade. Since the Union of S. Africa came into effect, no complete record of the trade of the separate provs. has been kept, but it is estimated that the value of goods sent from the Cape to the U.K. has averaged annually some £14,000,000 in the past decade. Goods imported from the U.K. were valued at an equivalent amount. Transit of goods to and from the Transvaal and other parts of the Union considerably augments the commerce of the prov.

Posts and telegraphs. Besides a well-organised postal service, the prov. is connected with Europe by 4 distinct cable routes, is in complete telegraphic communication with all the S. African provs., and has estab. within her own boundaries an excellent telegraphic system under state control. A telephone service has been instituted in the tns. The prov. is also in wireless communication with the U.K.

Railways. The railways are owned by the state. The first was built in 1859 from Cape Town to Wellington as the result of private enterprise, but in 1871 Parliament began to construct railways at public expense. The Western, Midland, and Eastern are the 3 chief systems. Of the first system the main line runs from Cape Town through Kimberley, Vryburg, Mafeking, Bulawayo, and the Victoria Falls (1623 m.) on to the Belgian Congo frontier. Branch lines connect Cape Town with Johannesburg, Pretoria, Salisbury, and Beira (2037 m.). The terminus of the Midland system is Port Elizabeth. The main line passes through Cradock and Naauwpoort to Norval's Pont, and thence is continued to Bloemfontein, Johannesburg, and Pretoria. The Midland and Western systems are connected by branch lines at De Aar. The Eastern system runs from E. London

to Springfontein (314 m.), which is a junction for the Bloemfontein railway. A series of railways crosses the prov., running E. and W. parallel to the coast. There is a total mileage in the prov. of over 5000 m. The S. African Railways Administration operates an extensive network of road motor services in rural areas and as feeders to the railway. Route mileage (1954) totalled 27,163 m.

Other communications. The W. route to the Cape is via London or Southampton to Cape Town, the E. is via the Suez Canal and Natal. There are steamer connections too with Australia and India, and Cape Town may also be reached by air, Wingfield airport being situated 6 m. from the city.

Races and population. Of the 2 indigenous tribes, the Bushmen (q.v.) and the Hottentots (q.v.), the former have retreated before the settlers and have been much reduced in number, and the latter have been absorbed into the Cape Coloured Community. The Kaffirs come from the Bantu negroid stock, their chief tribes being the Bechuana, who live N. of the Orange, and the Fingos, Tembus, and Amaxosa. The Griquas are half-castes of Dutch-Hottentot blood. A number of Malays, whose bond of union is their Muslim religion, have settled round Cape Town. In 1951 the white pop. was 935,674; Bantu, 2,483,652; coloureds, 980,456; Asiatics, 16,548. Notwithstanding the great numerical superiority of the coloured races, in the SW. corner of the prov. the white pop. is actually numerically the stronger. Only a very small proportion of the people live any distance inland. The majority of the coloured pop. is engaged in agric. or domestic employment. Since early years there has been a steady stream of immigration. In 1903, after the Boer war, the number of immigrants was phenomenal, namely 61,870, that is, 30,000 more than the emigrants. But in 1905 the outgoing figures (34,533) were actually more than those of immigration (33,775), and the number of immigrants continues to below.

Chief towns. The cap. of the prov. is Cape Town (q.v.). Kimberley, Port Elizabeth, and E. London (q.v.) come next in importance as seaports. In the W. half of the prov. the chief tns are Paarl, Mossel Bay, Oudtshoorn, Worcester, George, Graaf Reinet, Cradock, Middelburg, Caledon, Malmesbury, Wellington, Stellenbosch, and Beaufort W. (q.v.). In the E. half the most important tns are Uitenhage, Grahamstown, Queenstown, King William's Town, Alwal N., (q.v.), and Somerset E. Simons-town (q.v.) is a naval station which has large docks.

Religion. Of the European pop. (1946 census) the Dutch Churches claim 1,201,936 adherents and the Anglican 374,625. Other denominations: Methodists, 181,008; Rom. Catholics, 117,890; Presbyterians, 84,820; Baptists, 23,532; Lutherans, 22,669; Congregationalists, 12,677; Christian unspecified, 22,000. There were 104,156 Jews and 6500 unspecified.

Education. There is a state system of free primary education, which is compulsory for white children. School boards and school committees conduct the local school administration, the prov. being divided into 111 school dists. There are special day and industrial schools for the natives. The elementary schools are undenominational. There are 3 univs. in the C. P. for Europeans: Cape Town, Stellenbosch, and Grahamstown. There is a univ. college at Fort Hare for Bantus.

Law. The administration of justice is well systematised. What was the supreme court of the Cape became, like those which sit at Kimberley and Grahamstown, a local div. of the Supreme Court of S. Africa after the Act of 1909.

History. The hist. of the prov. of the Cape of Good Hope falls easily into 2 sections, with 1814—the year when it was finally recognised as an Eng. colony—as the dividing line. Two Portuguese, Bartholomeu Diaz (in 1486) and Vasco da Gama (1498), were the first explorers to round the stormy Cape. Though from that time onward Portuguese, Dutch, and Eng. traders rarely went to the E. by the Cape route, a first definite step towards acquisition was taken by the Dutch E. India Co. in 1652, when it estab. a fort at the foot of Table Mt. and made a small settlement, with the object of ensuring a fresh-water supply for its merchant vessels in their passage to the E. Indies. But the company was early induced to cultivate the fertile earth and to found a colony as well as a water station. Unfortunately it did not encourage individual colonists to co-operate, with the result that the latter sent home many protests against its jealous monopolies—protests, however, which proved quite unavailing. When France seized Holland, the latter appealed to England for help. The effect of this at the Cape was that an Eng. force held the colony in trust for the mother country till the peace of Amiens (1802), when it was given back. After about 4 years' rule, under state administration this time, instead of the company's, an Eng. force (about 4000 strong) was again landed in the colony to forestall any efforts the common enemy, France, might make to capture so prosperous a land. Gen. Janssens, the Dutch general, was obliged to capitulate. Thus, after a military occupation which extended over some years, the colony was recognised by the European powers as a Brit. possession. Once the company with its narrow, selfish ambitions was removed, agriculture and industries, especially sheep-rearing for wool, advanced by leaps and bounds. But in the course of its rapid development the colony encountered other disturbing forces. It happened that the native Kaffir tribes were expanding southward at the same time that the colony was pushing N. The contact of Kaffir and colonist led to a series of wars, the obvious cause of which was the cattle-lifting propensities and the predatory habits of the former. But the wars were really an expression of the inevitable conflict between tribal laws and European administration, a conflict which

allowed of no settlement by compromise. The disastrous battles at last brought home to the Eng. Gov. the need for controlling native ters. by imperial administration. This was actually carried into effect by the Scanlen ministry. Paternal gov. of the natives outside the colony was substituted by the Uppington-Sprigg ministry. Jameson, who was a doctor at Kimberley, in 1896 made an unsuccessful raid into the Boer ter. of the Transvaal. The colony, especially Kimberley, played an important part in the S. African war (q.v.) (1899–1902), but the Cape rebellion ended early in 1900. Cecil Rhodes, who was Prime Minister of the colony from 1890 to 1896, pursued an imperial policy in sharp contrast to that of the Bond party. The latter, stimulated by the active encouragement of the famous Afrikaner Bond, hoped in vain to establish a Dutch rep. See SOUTH AFRICA, UNION OF.

Constitution. The constitutional development of the colony was much more rapid than in the older countries. As in the first instance the governors of the colony were autocrats, it was a fortunate thing that many of them proved men of ability and public spirit. The first Executive Council was called in 1825, and 10 years later the first Legislative Council, one half of which was nominated by the governor, the other by the Crown from its officials. In 1853, at the instance of the council and with Crown support, a House of Assembly and a Legislative Council were conceded to popular wish. Finally, responsible gov. was put altogether in the hands of the colony in 1872. As early as 1829 it was decreed that men of all nationalities were to enjoy alike the advantages of the common law, and every slave was emancipated in 1838. By the South Africa Act of 1909, the colony entered the Union of S. Africa, sending 51 representatives to the House of Assembly and 8 to the Senate. Its former constitution was naturally revoked. A prov. council, elected for 5 years, consisting of 61 members, and presided over by an administrator appointed for 5 years by the governor-general, and an executive committee of 4 members control local taxation and all matters that concern the prov. only.

The Cape native franchise. When in 1902 the Brit. Gov. annexed the Boer reps. the terms offered included not only the promise of self-gov., but an assurance that no native franchise would be given until this had been attained. It was conceded, however, that political union implied a unified native policy, and a Native Affairs Commission, appointed in 1903, investigated (*inter alia*) the question of the franchise. The commission found that in the Cape there were 8117 registered native voters out of a total electorate of 135,168 and that in 7 constituencies out of 46 the native vote could determine the issue of an election. The commission concluded that this was a dangerous position and therefore proposed the creation in each colony of S. Africa of native constituencies in which Africans

should vote separately from Europeans. In 1908-9, when the National Convention met to decide the Constitution of the Union, the Cape delegation proposed a uniform franchise dependent upon a civilisation qualification, which would have admitted some natives, but the delegations from outside the Cape preferred the abolition of any native franchise. It was eventually decided to retain the then existing position, the Cape franchise being 'entrenched' by the provision in the South Africa Act that it could be modified only by a two-thirds majority of both Houses of Parliament sitting together. The right of natives to sit in Parliament, which had been implicitly theirs in the Cape, was now withdrawn. The question of the franchise was raised anew as an element in the policy of racial segregation when the National Party came into power in 1924, but a Bill for the abolition of the Cape franchise failed to secure a two-thirds majority. The attack on the native franchise (then 2-7 of the Cape electorate and 1-2 of the Union electorate) was renewed in 1934-5. The fact that the policy of segregation was already effective throughout the Union was a strong argument for the separation of the natives from the European electorate. The Representation of Natives Act passed in 1936 provided (*inter alia*) that the Cape and Transkei should be separately represented. The Act as originally introduced would have abolished the Cape native franchise but in its final form it made a compromise: it maintains the Cape native franchise but provides for separate election by the Cape native voters of 3 members of the House of Assembly and 2 members of the Prov. Council, who are additional to the existing members and hold office for 5 years irrespective of a dissolution. In 1936 the Separate Representation of Voters Act created separate electoral rolls for the White and Cape Coloured (mixed-blood) voters. See also SOUTH AFRICA, UNION OF.

Cape River, otherwise known as Coco, Segovia, Wanks, Yare, or Oro, rises in Nicaragua. It forms the boundary between Nicaragua and Honduras. It is 300 m. long and flows into the Caribbean Sea at Cape Gracias á Dios. Navigable for 140 m. and adequate for timber floating, though its mouth is impeded by a sand-bank.

Cape Sable Island, situated at SW. extremity of Nova Scotia. C. S. is the most southerly point.

'**Cape Times**,' independent Eng.-language morning newspaper, pub. in Cape Town, its circulation covering the whole of the W. Cape. Estab. in 1876, it is the

oldest daily newspaper in S. Africa, with national and prov. coverage and an extensive overseas cable service. Its weekend ed. is very popular.

Cape to Cairo Railway. Cecil Rhodes evolved the scheme of running a railway right from end to end of the continent of Africa, traversing Brit. ter. as much as possible and acting thereby as a connecting link between all Brit. possessions in Africa. The distance between Cape Town and Cairo is about 5000 m. The first passenger train arrived at the Victoria Falls on 22 June 1904. At this spot the Zambesi R. is spanned by a steel cantilever bridge, which is 380 ft above flood water, and the highest bridge in the world, the next being the Viaduct du Viaur in France, that being 375 ft. In the year 1910 the railroad from Cairo had reached Sennar, except for the riv. gap between Aswan and Wadi Halfa. This was a length of line of about 1000 m. The line from the Cape had by 1906 reached Broken Hill, a length of 2017 m. Changed political and economic considerations make it unlikely that the railway gap will now be closed, but the existing sections in the Union of S. Africa, the Rhodesias, and the Belgian Congo carry an ever-growing volume of both internal and through traffic resulting from the rapid development of those countries. The northernmost point which may be reached directly by rail from Cape Town is Port Francqui in the Belgian Congo, a distance of 3287 m.

Cape Town, or Kaapstad, seaport, the legislative cap. of the Union of S. Africa, seat of the Cape Prov. Council, and the metropolis of S. Africa; it is 6008 m. distant from Southampton (transit by mail steamship 13-16 days, and by aeroplane 2 days). It is situated on the N. side of the Cape peninsula in the SW. of the prov., on Table Bay, and at the foot of Table Mt. 30 m. N. of the Cape of Good Hope. The central portion lies in an amphitheatre, which extends down to Table Bay towards the NE. and is backed on other sides by the precipitous face of Table Mt. (3582 ft) and its outlying masses, Devil's Peak on the E. and Lion's Head and Signal Hill on the W. This part of the city is built on the slopes at the foot of these mts and extending down to the shores of Table Bay. Table Bay is not a good natural harbour, being exposed to N. and NW. gales. But the modern Duncan dock, together with other enclosed and protected areas, covers 365 ac. Entrance depths to the harbour are 38-40 ft; harbour facilities rank with the world's finest. The tn is the terminus of sev. railway lines. It was laid out after the Dutch fashion with geometrical precision, is well drained and paved, and has a good water supply coming from Table Mt. and a most up-to-date transport system. The chief buildings are the 2 cathedrals, Anglican and Rom. Catholic; sev. Muslim mosques; the S. African College; the museum and public library (the gift of Sir George Grey); the observatory (1820); the castle (a fort 400 years

old); the Houses of Parliament; Government House; the buildings of the univ. of the Cape of Good Hope (1873), which is an examining body only; these are on a splendid site on the Groote Schuur estate, Rondebosch; and the botanic gardens. The city hall can accommodate 6000 people, and the Dutch Reformed church, the earliest edifice for public worship in S. Africa, 3000. Since 1910 the Union Parliament has met in a new wing added to the original Houses of Parliament. The Gov. Gardens, containing a fine oak avenue, serve as a public park. Some fine old buildings of the Dutch

city in the world. It has become a recognised health and holiday resort. The public library contains 150,000 vols. In the S. African Museum are a number of 'post office stones' beneath which captains of ships outward bound placed their letters for conveyance home. In the Jewish synagogue, which cost £40,000, is a memorial to local Jewish victims of the First World War. A striking war memorial and a memorial to Capt. Scott, who perished in the Antarctic, are near the entrance to the pier, which was completed in 1914 at a cost of £85,000 and is 1800 ft in length. Pop. (1951): Whites,

CAPE TOWN: PARLIAMENT BUILDINGS

period still survive, the chief being the castle, begun in 1666, and to-day the oldest building in S. Africa; and the Koopman de Wet Museum, a Dutch house of the early 18th cent., containing specimens of old Dutch furniture and antiques. C. T. has a modern and well-equipped aerodrome, Wingfield Airport, 6 m. from the centre of the city. There are numerous fine and populous suburbs, including Green Point, Sea Point, Woodstock, Maitland, Mowbray, Rosebank, Rondebosch, Newlands, Claremont, and Wynberg. A chain of well-armed forts extends along the shores of Table Bay. The climate is somewhat similar to that of the Riviera, the mean ann. temp. being 63° F. (Jan. 69-9° F., July 55-1° F., with a maximum of 102° F. and a minimum of 34° F.). The mean ann. rainfall is 24.8 in. The city, which is an important port of call, was founded by the Dutch in 1652. It is perhaps the most beautifully situated

267,212; Coloured, 297,645; Bantu, 59,893; Asiatic, 8237.

Cape Verde, most westerly cape in Africa, situated in Senegal. It was discovered in 1443 by Nuno Tristão.

Cape Verde Islands, archipelago, in the possession of Portugal, in the Atlantic Ocean, off the W. coast of Africa, about 300 m. W. of Cape Verde. The is. may be divided into 3 groups: 1. The W. Windwards (Barlavento), comprising Santo Antão (246 sq. m.), São Vicente, Santa Luzia, São Nicolau and the small is. named Branco, and Razo. 2. The E. Windwards, comprising Sal and Boa Vista. 3. The Leewards (Sotavento), comprising Maio, Santiago (São Thiago) (396 sq. m.), Fogo, Brava, Grande, and Bombo. The total area is about 1516 sq. m., and 10 of the is., the chief being Santiago, Santo Antão, Fogo, Brava, and São Nicolau, are inhabited. The is. are all mountainous and largely of volcanic

formation, but some auct. granites and gneisses point to a continental origin, and on some is., as Maio, there are sedimentary deposits. The main peaks are the volcano of Fogo (8800 ft), which was active in 1847; the Pico da Antonia, on Santiago (7380 ft); and the Pão de Assucar, on Santo Antão (8000 ft). The climate is tropical, though tempered by sea breezes. There is only a short rainy season in Aug. and Sept., and much distress and famine are caused by drought. The soil is not very fertile, and trees are especially rare, but coffee, sugar, maize, corn, beans, oranges, grapes, peanuts, cacao, cotton, tobacco, cinchona, and indigo are grown and exported. Cattle-rearing is carried on, and the coasts abound in turtles. The inhab., mainly Negroes and mulattoes, speak a debased Portuguese. Porto Grande, on São Vicente (20,000), is a coaling station. The cap. is Praia (6000). The Portuguese discovered the is. in 1441-56. Total pop. 147,331 (1950): 103,251 mulattoes; 42,092 Negroes; 2913 Europeans. See A. Lyall, *Black and White make Brown*, 1938. An ann. pub., *Anuário Estatístico de Cabo Verde* (Praia), is obtainable in Lisbon.

Capé Violet, see IONIDIUM.

Capé Wrath, see WRATH, CAPE.

Čapek, Karel (1890-1939), Czech author and playwright, b. Malé Svatoňovice, Bohemia. Became famous in 1920 by his play *Rossum's Universal Robots* (or *R.U.R.*), which added a new word to the world's vocabulary, a robot being an automatic servant or workman. Another successful play of his was *The Macropulos Secret*, and in 2 others he collaborated with his brother Josef—*Adam the Creator* and *The Life of the Insects*. His last play, *Power and Glory* (*The White Scourge*), is anti-war propaganda and was performed in London in 1938. His reputation as a dramatist gave wide circulation to his novels, which show traces of the influence of H. G. Wells, especially *The Factory of the Absolute*, *Krakatit*, and the clever satire *War with the Neuts*, 1937. In fiction he wrote a trilogy forming a convincing picture of Slav peasant life: *Horadubal*, 1934, *Meteor*, 1935, and *An Ordinary Life*, 1936. His other pubs. include travel books: *Letters from Italy*, 1923, and *Letters from England*, 1926, a witty description of Eng. life; *Travels in the North* (self-illustrated), 1939; short stories, essays, and fairy tales: *Money*, 1929, *Tales from Two Pockels*, 1932, *Fairy Tales*, 1933, *The Stolen Cactus*, 1937, and *The Gardener's Year* (illustrated by his brother), 1929. His stories are often very poignant and many have been trans. into English. In *President Masaryk tells his Story*, 1929-1931 (Eng. ed., 1934), he records his appreciation of the statesman whose liberalism he fully shared. C. is the best-known Czech author abroad. See O. Elton, in *Essays and Addresses*, 1939.

Capell, Arthur, 1st Baron Capell of Hadham (c. 1610-49), Royalist soldier, created a baron in 1641. He acted as the king's lieutenant-general in Cheshire and N. Wales. He became one of Charles I's

most trusted adherents, and accompanied the queen to Paris in 1646, and helped Charles to escape from Hampton Court in the following year. He surrendered after Colchester, 1648, and was imprisoned in the Tower, but escaped, was rearrested, tried, and beheaded.

Capell, Edward (1713-81), Shakespearean critic, b. Troston Hall, near Bury St Edmunds. Educ. at Cambridge, he lived mainly at Hastings and in London, where he was deputy-inspector of plays from 1737. His ed. of Shakespeare in 10 vols., with introduction, appeared in 1767-8. The complete ed. in 3 vols. of his *Notes and Various Readings to Shakespeare* was first pub. in 1783 after his death.

Capella, or Capra, star of the first magnitude (0.2) in the constellation of Auriga, of which it is the brightest. It has a companion, magnitude 9, at a distance of 158". In 1899 the astronomers Campbell and Newall discovered it to be a spectroscopic binary, the components revolving round each other once in 104 days. The luminosity of C. is at least 100 times as great as that of the sun. Proper motion 44" a cent.

Capercailzie (Capercally or Capercaillicie are variants in spelling, the *z* being pronounced *y*), or *Tetrao unopallus*, species of grouse of the family Tetraonidae, and is the largest gallinaceous bird of Europe. Also called wood-grouse, or cock of the woods, the latter a trans. of Gaelic *capull coille*. The C. is about the size of a turkey and resembles the blackcock in appearance and polygamous habit; the general colour of the male is blackish-grey above, black below, with dark green chest, while the female is smaller, mottled, and has a reddish breast barred with black. The feathers on the legs and feet are longest in winter time, and the toes are quite naked. At breeding-time the male indulges in curious love-songs and antics to attract a mate, and fights between rival cocks are of common occurrence. The food of the birds consists of insects, worms, berries, and young pine-shoots. The C. is widely distributed in countries where pine forests abound; at the end of the 18th cent. it was exterminated in Scotland, but in 1838 it was successfully reintroduced. See J. G. Millais, *Game Birds*, 1892.

Capernaum, anct. city usually identified with the modern Tell Hum, on the NW. coast of the sea of Galilee, but occasionally with Khan Minieh, a little further S. Am Tabligha, or Kherase, all of which are within a few m. of each other. Christ made C. the centre of his Galilean ministry and preached there his great discourse on the Manna and the Bread of Life. See H. V. Morton, *In the Steps of the Master*, 1949.

Capers, see CAPPARIDACEAE.

Capsterre, or Le Marigot, tn in Basse-Terre is., Guadeloupe, Fr. W. Indies. 12 m. ENE. of Basse-Terre. Pop. 12,350.

Capet, family name of the third Fr. dynasty, founded by Hugh C. (q.v.). This family ruled France in a direct line from 987 to 1328.

Capet, Hugh (c. 940-96), King of

France, son of Hugh the Great, Count of Paris. In 987, on the death of Louis V, the last of the Carolingian line, he seized the Fr. crown and founded the third, or Capetian, dynasty. He was accepted by most of the nobles, but his claim was contested by Charles of Lorraine, the rightful heir of Louis V, whom, however, he defeated. He rallied the great nobles round him as grand vassals, and feudalism became a recognised part of the constitution. He also estab. hereditary succession to the monarchy, and made the king's eldest son 'master of the palace.' He was succeeded by his son Robert.

Capgrave, John (1393-1464), Eng. theologian and historian. He was b. at Lynn and became an Augustinian friar. He wrote Bible commentaries in Latin and, in English, *The Chronicle of England*, from the Creation to AD 1417, and a metrical *Life of St Catherine*.

Capias (Lat. 'you may seize'), term once used in legal practice to denote writ directed to the sheriff, commanding him to arrest some person named in the writ to come up for judgment, discharge a fine, or perform some other legal obligation. The writ of attachment for contempt has replaced the old C. for all practical purposes.

Capillarity, phenomenon which occurs when a fine tube, open at both ends, is placed vertically in a liquid; the surface of the liquid within the tube is either above or below the surface outside. The condition is only observed when the diameter is small, hence tubes which exhibit this property are called capillary or 'hair-like' tubes. A similar effect is produced when 2 glass plates are held vertical and parallel a short distance apart in a liquid; the liquid forms a film between the 2 plates. If the plates are pulled gently apart at 1 side so as to form a very acute angle, the surface of the contained film presents a curve (an equilateral hyperbola), having its greatest distance from the free surface of the liquid at the point of the angle. Thus C. diminishes as the distance between the walls increases, the ascent between smooth glass plates being, however, only one-half of the ascent in a tube of the same diameter. Every liquid has at its bounding surface between it and another medium (say air or glass) a surface tension, or tendency for the surface to withdraw itself into the smallest possible area. In small amounts of liquid, this tendency is sufficient to overcome the effects of gravity; thus a minute quantity of mercury becomes on a flat surface a globule that is practically spherical, whilst a large amount simply shows a convexity at the edges, gravity having produced the horizontal surface that we look upon as characteristic of liquids. In the instances mentioned it should be noticed that there are 3 substances in contact, such as glass, air, and water, and the form taken by the visible fluid surface, i.e. that of the water, depends on the relative attracting power of the 3 substances on each other. Thus whilst water rises in a capillary

tube and presents a concave surface upwards, mercury is depressed and has a convex surface. C. is a widespread phenomenon; oil rises in the wicks of lamps, moisture in the roots and stems of plants, by virtue of C. All substances with pores of sufficient size are capable of sucking up water, e.g. blotting-paper, sponges. See ABSORPTION and SURFACE TENSION.

Capillary Vessels, smallest blood-vessels in the body. The arteries which convey blood from the heart are split up into myriads of branches which vary from a five-hundredth to a three-thousandth part of an inch in diameter. By their means the blood is supplied to every part of the body. The capillaries reunite in the veins, by means of which the impure blood is returned to the heart. See p. 70.

Capistrano, St John of (1386-1456), It. preacher and theologian. b. Capistrano in the Abruzzi. He began his career as a lawyer, and was for some time Governor of Perugia until the death of his wife in 1416. He then joined the Franciscans and collaborated with St Bernardine in advocating the reform of his order. Most of his religious life, however, was spent as papal legate to various states. In that capacity he proved himself a tireless worker in the cause of orthodoxy, opposing the Fraticelli and Jesuiti in N. Italy, the Jews of Sicily and Moldavia, and especially the Hussites of Germany and Bohemia. His attitude towards the Hussites has been adversely criticised; he aimed to prevent them negotiating with the Holy See on the ground that such talks were equivalent to condonation of heresy. In 1455 C. enrolled troops for a crusade against the Turks, and his efforts in this direction contributed to the relief of Belgrade. He was canonised in 1724, and his feast is celebrated by the Rom. Catholic Church on 28 Mar.

Capital, in architecture, see COLUMN.

Capital (of a company), see COMPANY.

Capital may be shortly defined as that part of wealth which is accumulated in order to assist future production. In commerce the term is used to express the stock of the manufacturer or trader, used in carrying on his business, in the purchase or manuf. of commodities, and in the payment of wages of labour; in this sense it includes not only money but also buildings, machinery, and all other material objects which facilitate commercial operations. The C. of a country comprises the products of industry possessed by the community, and available for consumption or for further production. C. may be applied either directly in the employment of labour, or indirectly in aid of labour; it may be spent in the food and clothes of labourers, or in tools and other auxiliary machinery, to assist their labour and increase its productiveness. The former is usually termed circulating C. in economics, and the latter fixed C.

C. in social polemics is regarded by some schools of thought as that which is radically opposed to labour. Karl Marx (q.v.), starting from the position that the

economic structure of society, i.e. the method of production and distribution of the products of labour, is the basis upon which everything else—the juridical, the religious, the political, the social life of the people—rests, argued that while political economy was right in holding that the consumption of surplus products by productive labour was a feature of accumulation, it was wrong in holding that all surplus value that was changed into C. became such C. as was represented

and C. combine to create, and that no progress can be made in any sphere of industrial activity without the help of funds controlled by persons who risk them for the sake of progress. From the moment at which a man produces more than he consumes, he is creating C.; and the accumulated surplus of production over the consumption of the whole community is the C. of a country. Those parts of the products of labour which are reserved for the

A diagram illustrating the change from arterial to venous systems in the network of capillaries.

by labour power. With the same critical analysis of prevalent principles of economists, Marx considered that private property, based upon the labour of its owner, had become by the evils of our civilisation replaced by what he termed 'capitalistic' private property, based on the labour of other persons than the owner of the property. Henry George, in *Progress and Poverty*, contended that the wages of labour were paid from the value of that which labour produces, and that therefore labour produced its own remuneration. Opposing theories assert that the accumulated savings of labour and accruing profits constitute a collective abstinence on the part of both capitalist and labourer for the ultimate good of all; and that, because the capitalist postpones or denies himself the present enjoyment of a portion of his means of consumption in the expectation of prospective reward, C. is justified in claiming such reward, whether by way of rent or interest or profit. It is further argued that wages are paid not out of labour but out of C. It may be said that the ultimate source of both wages and profits is the value of that which labour

reproduction of other commodities, and those intended solely for use or consumption, have constituted a distinction amongst economists. Adam Smith classed the one as C. and the other as revenue. Both, however, are generally regarded as forms of C., although it is true that the accumulation of C. proceeds slowly or rapidly in proportion as one or other of these modes of expenditure is most prevalent. As to the relation of profits to accumulated C., John Stuart Mill laid it down that in proportion as C. increases, the rate of profit falls, because the competition of C. with C. is more active than that of labour with labour (*Principles of Political Economy*). It is generally agreed that a high rate of profit is favourable to accumulation; also that rich and populous countries are denied this advantage; that, if they enjoyed it, their C. would continue to increase more rapidly than it does in fact increase; but that, under ordinarily favourable circumstances, the masses of inherited C. and the aggregate savings of vast numbers of capitalists still facilitate accumulation in a greater ratio than the increase of pop., which a high state of civilisation has a

tendency to check. In ordinary parlance C. and money are synonymous; but they are not the same thing. If they were, it would be untrue to say that C. was one of the requisites of the production of wealth, for money in itself does not assist in the production of wealth. It is usual, indeed, to distinguish between the money market and the C. market, the former being concerned with short-term borrowing and the latter with long-term borrowing; in both uses what is borrowed is command over C. in the form of money. See CAPITALISM.

THE CAPITAL 'I' AT THE OPENING OF THE EARLIEST COMPLETE ENGLISH BIBLE, TRANSLATED BY MILES COVERDALE, AND PROBABLY PRINTED IN ZÜRICH IN 1535

Capital (Lat. *capitalis*, pertaining to the head), in typography, larger and differently formed letter placed at the head of a paragraph, at the beginning of lines of poetry, of sentences, of proper names, etc., to help the eye and so facilitate reading. The ancients never used C.s (*maiuscula*) and small letters (*minuscula*) concurrently; either all C.s were used or all small letters. All the old MSS. are in C.s alone up to the 7th cent. After this time C.s began to be used only at the beginning of books and chapters; they were often elaborately illuminated and decorated: 'We writeth capital letters with reed colour...' (Trevisa's explanatory notes in Higden's *Polychronicon* i. 129). These illuminated C.s were very much bigger than the small letters, and not, as in ordinary typography, about twice the size. There were 2 chief types of C.—the square and the rustic; the latter were characterised by curves and by finer strokes. C.s are in general use at the present day in nearly all languages, and their use is chiefly to help the reader. In the Ger.

language every substantive has an initial C.; in English C.s were formerly used much more freely than they are now. Adjectives derived from proper nouns, as *English*, *French*, etc., have initial C.s in English, though not in French or German; so also have all nouns and pronouns referring to God. The pronoun I is always written with a C.; the Latins did not think it necessary to write in this way, an *i* standing alone: the Lat. verb *ire*, to go, had in the imperative *i*, and so it was written. See also MANUSCRIPT.

Capital Account, see BOOK-KEEPING.

Capital Levy. The national debt of the U.K., which had stood at £650 millions at the beginning of the First World War, was more than 10 times as great in 1920, when it reached £7830 millions. The question arose how it was to be paid. The facile idea that the losers of the war should pay all its costs was not treated seriously by economists or statesmen of repute. The debt had therefore to be paid in the main by the Brit. people. A levy upon capital was suggested: a tax levied on (and paid out of) privately owned wealth. The first recorded demand for a C. L. was made by a private member in the House of Commons in 1914. It was put forward in the early days of the war as a 'business proposition,' i.e. as an alternative to a high income tax. But as the war continued so-called ethical factors came into the problem. Firstly, it was said that as 'life' was being conscripted, 'wealth' should be conscripted too; secondly, despite the heavy income, super-, and excess-profits taxes, enormous fortunes were being made by some, while others were being impoverished. The suggestion of a C. L. at first found some supporters in each political party, and among the Conservatives Bonar Law was said to have had some sympathy with the idea. It remained part of the Labour party's programme until 1927, and was revived at various times thereafter, particularly after the Second World War. It was variously proposed that those whose total net wealth exceeded £5000 should become liable to the levy. This was the figure proposed by the Board of Inland Revenue in 1919 in its scheme for the taxation of war fortunes. This minimum would have exempted small property owners and those then exempt from income-tax, and have brought within the scope of the measure between 300,000 and 400,000 persons. An illustration of the scale of levy proposed in that scheme was that a man worth £6000 would pay £50, or 1.2 per cent of his total fortune; one worth £10,000 would pay £550, or 5.5 per cent; one worth £100,000 would pay £32,800, or 32.8 per cent; and a millionaire would pay £502,800, or 50.3 per cent of his fortune. The Colwyn Committee on Taxation and the National Debt, appointed by the Labour Administration in 1924, rejected the scheme in its report of 1926, and even the minority report of that committee was favourable only to the levy 'provided it were generally approved.' The nearest to a C. L. in Britain came in 1948—the 'Special

Contribution,' a 'once-for-all' levy on capital holdings. See INCOME TAX.

Capital Punishment, punishment by death for crime in conformity with the sentence of a properly constituted tribunal, civil or military. Whatever may have been its origin, whether in feelings of revenge, regularised by the *lex talionis* (the law of 'an eye for an eye and a tooth for a tooth'), or in theories of retribution or deterrence, C. P. is a term opposed to all irregular modes of punishment such as the Amer. 'lynch law,' or any modern survival of 'blood-avengers.' C. P. is so named from the Lat. *caput*, because hanging or decapitation was the most usual mode of C. P. In more primitive societies, when civil tribunals were far from being of certain authority or possessed of adequate machinery for enforcing their decrees, the punishment of murderers or other homicides was, as in the case of most other kinds of criminals, a matter for self-redress. Subsequently, in England during Saxon times, manslaughter became the subject of compounding by the payment of what was known as wergild, or blood-money, the amount of which varied with the degree of importance in the social scale of the murdered person.

There have, in the early hist. of this country, been various forms of C. P. in use, but gradually hanging became the sole accepted form. The offences for which C. P. could be ordered have also varied. During the 18th and early part of the 19th cent., C. P. came to be used with increasing frequency; 156 new offences were made capital between 1714 and 1830. By the latter date there were 220 capital offences. Criticism of this state of affairs was not lacking. Bentham, arguing that the evil of punishment should not exceed the advantage gained by the criminal through his offence, wished to limit C. P. to murder and treason. His views were greatly influenced by Beccaria, whose *Treatise on Crimes and Punishment*, pub. in 1764, had denied that man had the right to punish in this way.

The practical movement for abolition in this country owed its inception to Sir Samuel Romilly, who in 1810 introduced an unsuccessful bill for the abolition of C. P. for stealing 5s. or over from a shop. Opposition was based on the assumption that C. P. must be the most effective deterrent. The Chief Justice of England, Lord Ellenborough, speaking against the Bill in the House of Lords, maintained that 'the expediency of justice and the public security require that there should not be a remission of C. P. in this part of the criminal law.'

On the other hand, at a slightly later date, a group of London bankers petitioned for the abolition of C. P. for forgery, as they held that the law was the reverse of deterrent. Juries were frequently so unwilling to make the accused liable to a death sentence that they brought in a verdict of not guilty contrary to the evidence. This was a state of affairs not limited to the one offence.

The C. P. laws did in practice enable many guilty persons to escape punishment altogether.

In 1832 C. P. was abolished for stealing cattle, etc., and the following year for housebreaking. In 1837 the number of capital offences was reduced to 15, and in 1861 to the 4 offences that still remain capital: murder, treason, piracy with violence, and setting fire to Her Majesty's vessels, arsenals, etc.

Other changes in the law that have occurred since are: 1868, public executions abolished; 1908, C. P. for persons under 16 abolished; 1932, minimum age raised to 18 and in 1948 to 18 at the time the offence was committed; 1922, C. P. abolished in cases of infanticide when the mother has not recovered from the effects of her confinement; 1931, C. P. abolished for expectant mothers.

Although the death sentence has to be pronounced in every case in which a verdict of murder has been brought in by the jury, actually only a small proportion of all murderers are hanged, as the table on p. 73 shows.

The figures in brackets relate to victims under 1 year and are included in the total. The crimes of persons accused of murder but convicted of some lesser offence such as manslaughter are not included.

The question of C. P. has been the subject of various gov. inquiries and parl. debates.

The following are the most important of these:

1. 1930: *Report of the Select Committee of the House of Commons*. This recommended the abolition of C. P. for an experimental period of 5 years in cases tried by the civil courts in time of peace, and that the substituted penalty should be that now attached to reprieved murderers. The recommendations had the support of 8 of the 15 members of the committee. Six of the members withdrew owing to their disagreement with the draft report, but did not produce a report of their own. None of the recommendations was implemented.

2. 1938: *Motion in House of Commons* suspending C. P. for an experimental period of 5 years was carried by 114 to 89. No further action was taken by the gov.

3. 1939: *Amendment to the Criminal Justice Bill* for a 5-year suspension was defeated.

4. *Amendment to the Criminal Justice Bill, 1948*, for a 5-year suspension of C. P. passed in the House of Commons by 245 to 222. The clause was thrown out by the House of Lords and the Bill passed without it.

5. 1949: A Royal Commission was set up to consider whether the liability 'to suffer C. P. for murder should be limited or modified.' A consideration of abolition did not fall within these terms of reference. The report was pub. in 1953. Amongst its recommendations were the following:

(i) The doctrine of constructive malice should be abolished. (At its broadest

Year	Murders known to the Police	No. of Crimes in which Supposed Murderer committed Suicide	Persons arrested for Murder	Persons found insane before Trial, on Arraignment, or 'Guilty but Insane'	Persons convicted of Murder (excluding those found 'Guilty but Insane')	No. of those shown in Preceding Column who were Executed
<i>Annual Av.</i>						
1920-9	148.6 (43.0)	35	79.5 (14.4)	24.1	23.9 (12.3)	13.9
<i>Annual Av.</i>						
1930-9	132.9 (24.5)	44.7	61.1 (8.1)	26.5	19.1	8.5
<i>Annual Av.</i>						
1940-9	166.6 (26.9)	42.8	81.5 (4.7)	32.5	26.9	12.7
1950	138 (16)	38	76 (6)	32	29	14
1951	124 (8)	40	65 (2)	31	24	19
1952	141 (9)	36	76 (4)	35	34	17
1953	141 (12)	41 (2)	67 (3)	20 (1)	26	16
1954	145 (9)	41 (4)	73 (1)	36 (1)	28	12
1955	133 (10)	32	70 (2)	40	24 (2)	9

this doctrine means that if one person kills another, even quite accidentally, while committing a felony or resisting arrest, he is guilty of murder. As applied in recent years by the courts, the doctrine may be said to be limited to cases in which death results from an act of violence. Nevertheless cases may arise where a person is convicted of murder who would only have been convicted of manslaughter were no felony involved.)

(ii) The minimum age below which a person cannot be sentenced to death should be raised from 18 to 21. (This recommendation was made by a majority of 6 to 5.)

(iii) The majority of members of the Royal Commission considered that it was advisable to abrogate the McNaughten rules, and to leave it to the jury to decide whether the accused was suffering from disease of the mind or mental deficiency to such a degree that he ought not to be held responsible for his act.

Failing this, they recommended that in addition to the 2 existing provisos under the McNaughten rules, namely, that the accused as a result of disease of the mind (a) did not know the nature and quality of his act; (b) did not know that it was wrong, a third proviso should be added: that he was incapable of preventing himself from committing it. They also recommended that the law should make no distinction between mental deficiency and insanity in tests to determine fitness to plead.

(iv) Without accepting the Scottish doctrine of 'diminished responsibility' as suitable for England, it was recommended that (a) the death sentence should not be carried out on any person certified as mentally defective; (b) in cases of epilepsy there should be a presumption that this may have been one of the causes that led to the crime; (c) the existence of a psycho-

pathic personality ought to be given due weight in determining whether the death sentence should be carried out.

(v) The Commission was concerned to find some way of 'enabling the courts, instead of the executive, to take account of extenuating circumstances so as to correct the rigidity of the existing law.' They recommended that the jury should be empowered to decide in each case whether a life sentence could properly be substituted for the death penalty. The trial would then be divided into 2 stages. In the first the jury would consider guilt or innocence. The second would arise only if guilt had been found. The jury would then consider any extenuating circumstances brought forward by the defence, and if they found that there were such circumstances, this finding would be binding on the judges, who would have to pronounce sentence of life imprisonment.

The pub. of the report gave a fresh impetus to the movement for abolition, and in 1956 a private member's bill was introduced by Mr S. Silverman, M.P., for total abolition, the gov. promising facilities if it was passed by the House. It did go through all stages in the House of Commons, but was thrown out by the House of Lords. The arguments against the bill that carried most weight were those concerned with the possible effect of abolition on the professional criminal. The fear was widely felt that in the event of abolition burglars and others would be more likely to carry arms and that the police would be faced with greater dangers, though the experience of abolitionist countries does not appear to give any support to this theory.

Following the House of Lords' rejection of the bill the gov. introduced its own Homicide Bill which received the royal assent on 21 Mar. 1957. Murder is now

punishable by death only if the offender has previously been convicted of a murder committed in Great Britain, or is found guilty of any of the following offences described in the Act as capital murder: (a) any murder done in the course or furtherance of theft; (b) any murder done by shooting or by causing an explosion; (c) any murder done in the course of or for the purpose of resisting or avoiding or preventing a lawful arrest, or of effecting or resisting an escape or rescue from legal custody; (d) any murder of a police officer acting in the execution of his duty or a person assisting a police officer so acting; (e) any murder by a prisoner of a prison officer in the execution of his duty or of anyone assisting a prison officer. Any murder not committed in any of the aforementioned circumstances is punishable by life imprisonment.

Experience of foreign countries. An important part of the reports both of the Select Committee of 1930 and the Royal Commission dealt with the experience of foreign countries which had already abolished C. P. On both occasions there was complete agreement amongst the foreign witnesses that the number of murders had not increased after abolition. The Royal Commission included a worldwide survey of available statistical evidence by the Amer. criminologist, Prof. Thorsten Sellin. His conclusion was that 'whether the death penalty is used or not, both death penalty states and abolition states show rates [of murder] which suggest that these rates are conditioned by other factors than the death penalty.'

This conclusion was accepted unanimously by the members of the Commission, who stated that 'there is no clear evidence in any of the figures we have examined that the abolition of C. P. has led to an increase in the homicide rate, or that its reintroduction has led to a fall.'

The following states have either abolished C. P. by law for the civil crime of murder or allowed it to fall into abeyance by a policy of reprieve:

Europe and Asia. Austria: Finally abolished, June 1950. Belgium: Abrogated by disuse; last execution, 1863, except for one case during 1914-18 war. Denmark: Abolished, 1930; no execution since 1892. Finland: Abolished, 1949; no execution since 1826, except during the revolution of 1918. W. Germany: Abolished, 1949. Netherlands: Abolished, 1870; no execution since 1860. Iceland: Abolished on estab. of rep., 1944. Israel: Abolished, 1954. Italy: Finally abolished, 1948. Luxembourg: Abrogated by disuse; no execution since 1822. Nepal, India: Suspended for 5 years in 1931; not reintroduced. Norway: Abolished, 1905; no execution since 1876. Portugal: Abolished, 1867. Rumania: Abolished, 1864; no execution since 1838; restored for political crimes, 1938. Sweden: Abolished, 1921; no execution since 1910. Switzerland: Abolished, 1942; no execution since 1924.

United States of America. C. P. is

abolished in 6 states of the Amer. Union, namely: Michigan, 1847; Wisconsin, 1853; Maine, 1887; Minnesota, 1911; Rhode Is., 1952; N. Dakota, 1895. In the 2 last states there is abolition except for murder in the first degree.

In 35 of the remaining 42 states there is power to pronounce an alternative sentence of life imprisonment. Nine states, having abolished C. P., restored it, 7 of them after a very short period.

Tennessee: Abolished, 1915; restored, 1919. Arizona: Abolished, 1917; restored, 1919. Missouri: Abolished, 1917; restored, 1919. Colorado: Abolished, 1897; restored, 1901. Iowa: Abolished, 1892; restored, 1898. Washington: Abolished, 1913; restored, 1919. Oregon: Abolished, 1914; restored, 1920. S. Dakota: Abolished, 1915; restored, 1939. Kansas: Abolished, 1907; restored, 1935.

South America. Argentina, 1922; Brazil, 1891; Colombia, 1910; Costa Rica, 1880; Dominica, 1924; Ecuador, 1897; Honduras (not included in constitution of 1894); Mexico, 1928; Panama, 1903; Peru (discontinued for about 50 years; reintroduced for political crimes, 1949); Uruguay, 1907; Venezuela, 1863.

Australia. Queensland, 1922; no execution since 1913.

See also MURDER.

Bibliography. C. R. Calvert, *Capital Punishment in the 20th Century*, 1927; Lord Templewood, *Shadow of the Gallows*, 1951; Royal Commission on Capital Punishment, *Report* (Cmd 8932), 1953; G. Gardiner, *Capital Punishment as a Deterrent*, 1956; Sir E. Gowers, *A Life for a Life*, 1956.

Capitalism, system underlying a society in which capital is privately owned and industry privately organised. But economic analysis shows that all forms of advanced industrial society depend on the employment of capital, whether privately owned, as in W. Europe, America, and the Brit. Commonwealth, or State-owned, as in the U.S.S.R. Where little capital is employed, as in the undeveloped Far E., society remains primitive and the standard of living low.

The accumulation of capital was fostered by means of commercial transactions, more especially when these were carried through on a large scale and involved the use of credit. On the termination of the crusades and the estab. of peace between E. and W. after sev. cents. of intermittent warfare, the E. began to pour her treasures into Europe. From their geographical situation the large cities in Italy were the first to profit from this new commerce, and a capitalist state of society began to show itself in the city states of Italy. This economic stimulus had its repercussions. At convenient points on the trade routes leading from Italy to the NW. of Europe, fairs were estab. These existed at first for the exchange of goods—barter pure and simple. But later the use of money became necessary, and with a wider variety of coins in use a new type of merchant came into being. This was the trader, who carried on the business of

money exchange; the foreign exchange of to-day had its beginnings in him. The *lettre de foire* (fair letter) was the forerunner of our modern bill of exchange. Another development was the system of transferring and cancelling these letters as they fell due at the fairs, which thus came to perform, in addition to their normal functions, the actions of the clearing-houses of to-day.

From commercial capital to financial capital was a short step. The troubled times of the Middle Ages often rendered it necessary for the heads of states to borrow money. These borrowings enriched all who took part in the money trade—tax-collectors, lenders, bankers, all helped in the accumulation of large stocks of capital. A development of the fair was seen in the estab. of exchanges, which assumed a growing importance in the 16th cent. In the fairs the business of buying, selling, and settlement could only be carried on intermittently (i.e. when the fairs were held at their different seasons), but the estab. of the exchanges rendered such operations a matter of daily routine. Although the Church had long forbidden the lending of money at interest, govts. were soon forced to recognise the desirability and necessity of this transaction. Lending money at interest is one of the props of modern C. The business of fairs and exchanges brought into use negotiable securities which contributed to the increase in speculation.

As the estab. of trade between E. and W. after the crusades regenerated the economic life of Europe, so the discovery of America gave additional impetus to this economic life, and in particular to the larger nations of W. Europe. Maritime and colonial commerce expanded, and Europe was enriched by the tropical products of the Far E. and the gold and silver from the mines of the New World. Another development which must be noticed at this time was the estab. of large colonial trading corporations such as the Eng. and Dutch E. India Companies. The rise of Holland as a great economic power in the 17th cent. was due to her success as a commercial and financial nation. Her maritime trade was considerable, and she conducted a lucrative business in negotiable securities. But by the beginning of the 18th cent. Holland's rapid expansion had ceased. She was primarily a commercial country, and industrialism had now set in, bringing England and France to the forefront by their ability to export not only natural products but also the products of their manufacturers. The rise of England and France marks another stage in C. which, in addition to its commercial and financial functions, now began to exert its influence on manufacturing industry. This at first had been in the hands of small men with little capital who were gradually ousted by larger merchants who sought to control the rural and domestic industries. They collected the products and found the customers. Industrial capital has been extended by the growth of large corporations, which

were at first formed to control industries where the initial outlay of capital was very high, but which now control many branches of modern manufacturing industry. The 3 forms of capital—commercial, financial, industrial—now operate concurrently. In modern times the influence of capital has made itself felt in practically every field of economic effort. At its commencement the colonial system assisted greatly in the development of capital, but this development was in turn responsible for the overthrow of the trade monopolies which had been estab. for the benefit of the mother country. The monopolies came to be regarded as obstacles to the natural expansion of commerce, and the rise of industrial capital contributed to the fall of the colonial system.

Karl Marx drew attention to the social effects of C. He demonstrated that it had created social classes characterised by economic rather than other distinctions, the effect of which had been to make society much more mobile and less hemmed in by the barriers of former times. But class-consciousness in the labouring classes, which resulted from economic changes, was not new. It was particularly noticeable in the Low Countries, where workmen became dependent on the merchants engaged in the export trade. Then, as now, commerce had its good and bad times, and it was the workmen who suffered most during the bad times. Risings, often accompanied by bloodshed, were frequent, and, by degrees, the craftsmen took their place in the gov. of the Flem. tns, which seemed to be moved by a guild rather than a class spirit. At the beginning of the Industrial Revolution (q.v.) in England it was the workmen who opposed the innovation. They were the conservatives who demanded the maintenance of the old order of things. But in the end the policy of *laissez-faire* as opposed to intervention prevailed, and the new industrialists developed their manufacturing businesses with little or no interference from the State.

The relationship between capital accumulation and the distribution of income was clearly described by J. M. Keynes in his *The Economic Consequences of the Peace*, 1920. He states that Europe was so organised socially and economically as to secure the maximum accumulation of capital. While there was some continuous improvement in the daily conditions of life of the mass of the pop., society was so framed as to throw a great part of the increased income into the control of the class least likely to consume it. The new rich of the 19th cent. were not brought up to large expenditures, and preferred the power which investment gave them to the pleasures of immediate consumption. In fact it was precisely the inequality of the distribution of wealth which made possible those vast accumulations of fixed wealth and capital improvements which distinguished that age from all others. Herein lay, in fact, the main

justification of the capitalist system. If the rich had spent their new wealth on their own enjoyments, the world would long ago have found such a regime intolerable. But like bees they saved and accumulated, not less to the advantage of the whole community because they themselves held narrower ends in prospect. The immense accumulations of fixed capital which to the great benefit of mankind were built up during the half-century before 1914 could never have come about in a society where wealth was divided equitably. The railways of the world, which that age built as a monument to posterity, were, not less than the pyramids of Egypt, the work of labour which was not free to consume in immediate enjoyment the full equivalent of its efforts."

The capital system has been more widely, more bitterly criticised than any other human institution. Its detractors point to its blemishes, but rarely indicate the blessings which it has conferred. These are too often taken for granted. It is 40 years since the beginning of the greatest experiment ever undertaken by man in an endeavour to ameliorate the lot of his fellows by the overthrow of the private capital system and the imposition of a state C. called Socialism. And there are 2 opinions about its achievements. Nowhere in the present state of society is there any sign of evolution on lines of Marxian prophecy: that the smaller capitalist would be engulfed by the few largest, and that this process of centralising the means of production must at length reach the point of incompatibility with the capitalist system. If the Marxian theory of concentration has now been very generally abandoned, it is because theoretical investigation has invalidated every step in its hypothetical development. Facts continue to multiply the evidence in favour of the capitalist system: contrary to Marx, the system does not necessarily involve economic crises; or depress the condition of the working class; nor does it, through the introduction of ever-improving technical machinery, reduce the chances of employment—all of which consequences are repeatedly asserted in Marxian theories and by the followers of Marx. Moreover the experiment in Soviet Russia has supplied the most powerful arguments to those writers who defend the capitalist system. Russia, hit by the First World War far less than most of the other belligerents, only very slowly showed a power of recuperation in any way comparable to the rest of Europe, in spite of her unlimited potentialities. So impracticable did Lenin find his anti-capitalist organisation that he had perforce to introduce his 'new economic policy,' which allowed a restricted degree of free exchange in the capitalistic sense. Lenin's attempt to save the situation by the introduction of free price fixing for marketed products was foredoomed, for the reason that it could have been effective only in regard to capital. It had no relation to a system which,

temporarily at all events, abandoned private property in capital. There came to be a private money market in Russia on a limited scale, and, as may be supposed from Russia's difficulty in obtaining credit from other nations, this market showed phenomenal private discount rates. A significant development of capital in the 20th cent. was the growth of cartels (q.v.). It has been argued that the formation of cartels is the necessary consequence of ruinous competition, and that one important factor in this competition as it affects cartels is the growth of fixed costs, i.e. the costs which form a permanent part of every concern irrespective of demand. But so long as there is no external authority to inhibit competition, the cartel is liable to be weakened by changes in the demand for its products and by the supply of new substitutes. Moreover much monopoly is itself the creation of the State, and can be avoided or minimised by anti-monopoly legislation. See MONOPOLY. See also H. Withers, *The Case for Capitalism*, 1920; Sir E. J. Bann, *Confessions of a Capitalist*, 1925; H. See, *Modern Capitalism* (trans. by H. B. Vanderblue and G. F. Doriot), 1928; A. Weber, *In Defence of Capitalism*, 1929 (trans. by H. J. Stenning, 1930); R. G. Hawtrey, *Capital and Labour*, 1937; M. Capitanate, see FOGGIA.

Capitation Tax, see POLL TAX.

Capito, Gaius Ateius, Rom. jurist of the time of Augustus. He became *consul suffectus* in AD 5, *curator aquarum publicarum* in 13, and *d.* in 22. He studied law under Oflivius, and was a rival of Laeoe (q.v.). C. founded the Sabinian school of jurisprudence in opposition to the Proculian of Laeoe. Only fragments of his works remain.

Capitol (Lat. *Capitolium*), name given to the temple of Jupiter Capitolinus and other buildings on the Capitoline Hill (*mons capitolinus*) in auct Rome. The temple is said to have been founded by Tarquinius Priscus (see TARQUINIUS), and dedicated in 509 BC. It was damaged by fire in 83 BC, rebuilt, but destroyed again by fire in AD 69 and AD 80. It was again restored by Domitian. It formed the central point of the religious life of Rome. To it generals went to make thank-offerings to the gods for triumphant campaigns, and consuls to record their vows, while the senate often met on the hill. The temple was surrounded by minor buildings, and by an esplanade on which were statues of gods and heroes. The steepness of the hill rendered it an admirable natural fortress. Near the temple was the Tarpelan rock from which traitors were thrown. On the NE. peak—the Arx—stood the temple of Juno Moneta. In the Middle Ages all the buildings had fallen into ruins, and in 1534 Michelangelo

was commissioned by Pope Paul III to draw up plans for new buildings on the site. The C. now consists of a square, containing a statue of the Emperor Marcus Aurelius, the Campidoglio, built by Michelangelo, the Senatorial Palace (1579), the Capitoline Museum (1644), and the church of S. Maria in Ara Coeli. See T. Ashby and S. Platner, *Topographical Dictionary of Ancient Rome*, 1929.

Capitularium (Capitularies) (Lat. *capitulum*, chapter, from *caput*, head), name applied to the constitution or laws promulgated by the Frankish kings. These laws were classed under different chapters, called capitularies. The first collection of these was pub. in the reign of Louis the Pious.

Capitulation, in time of war, an agreement for the surrender to a hostile armed force of a fortress, tn, piece of ter., or body of troops, naval or military, with the detailed conditions under which the surrender is to be made. The term used to be restricted rather to the surrender of a beleaguered garrison. The agreement by which an army or a large div. of troops surrendered to a superior force, or engaged to evacuate the ter. which it occupied, when its strength and condition were yet such as to make itself respected by the enemy constituted a set of circumstances known as a convention. Such was the convention of Cintra, made at Lisbon between Gen. Dalrymple and the Fr. general, on the departure of the Fr. army from Portugal in 1808. When the provisions and ammunition of a garrison or force are nearly expended, and no chance remains of the siege being raised or the force succoured, the governor of the besieged town, or commander of the defeated force, is justified in entering into an agreement with the enemy respecting the terms on which he consents to surrender; and by the rules of war he is entitled to obtain an honourable C. It is to be observed, however, that if he should postpone surrender proposals till his provisions are entirely exhausted, the enemy may refuse to grant terms, and he can then only surrender at discretion. The conditions of C. vary greatly, and are necessarily determined by the circumstances of the case and the degree of generosity or patience of the victors. From the nature of the circumstances of most C.s, no previous instructions are or can be required from the capitulating party's gov. before the final determination of the conditions of C. The conditions generally include the surrender of the arms and military stores of the garrison or other capitulating body to the victors; the officers and troops retain only their private property, but are, or were, allowed to march out of the fortress or tn, or to their place of destination, with the honours of war, that is, with drums beating and colours flying. Other very usual conditions are, or were, freedom of religion and security of private property. It must be admitted, however, that the rules of warfare on which an ordered C. depends do not always find a place in modern warfare as exemplified

in the Second World War. Where a C. is made by an officer who is not invested with the proper authority, or who has exceeded the limits of his authority, the C. is called a sponson. Article 35 of The Hague Convention of 1899 requires a sponson to be confirmed by the express or implied ratification of the state or commander-in-chief on the side of the officer accepting the surrender, coupled with the agreement of the other side to accept the ratification, in order to be binding. It is an implied term in the C. of a place that the capitulating force shall not destroy its fortifications, stores, or ammunition after the agreement has been concluded. *Authorities*: T. E. Holland, *The Law of War on Land*, 1908; W. E. Hall, *Treatise of International Law* (ed. Higgins), 1924; W. Wheaton, *Elements of International Law* (ed. Wilson), 1936.

Capitulations denote the arrangements and confirmatory treaty by which foreigners are granted immunity from the civil or criminal jurisdiction of the state making such C. Such arrangements and treaties necessarily constitute a derogation from the inherent sovereign rights of an independent state, and are only resorted to as against states which can hardly be said to be sufficiently advanced in their civilisation to observe the general rules of international law. An instance of such C. is furnished by the arrangements made at various times since 1535 between the various powers and the former Turkish Porte. Even before the First World War signs were not wanting that the era of C. was ending. Certain countries, such as Morocco and Tripolitania, had passed under the control and jurisdiction of great powers like France and Italy, whose laws were deemed adequate to the needs of all European nationals. Then other countries, of which Japan is an outstanding example, reached the full status of a great power, which would allow no derogation of their sovereignty. The First World War intensified national feeling, and few nations to-day would, without strong protest, grant capitulatory rights to foreigners. In large part, too, the willingness of a nation of 'backward people' to grant capitulatory privileges depended on the prestige attaching to a united Europe. When this unity was shattered by the First World War the 'backward' countries were encouraged to resist these encroachments on their sovereignty. Also the series of peace treaties at the end of the war deprived the nationals of the Central Powers of these rights, and the Soviet Union in some cases voluntarily gave up these privileges. By the terms of the treaty of Lausanne, 1923, Great Britain gave up her C. in Turkey, and she abandoned them in Albania in 1926, and in Persia in 1928. C. in some form or other for certain European powers continued, however, to exist in China, Egypt, and Morocco until the Montreux Convention of 1937. By the terms of this convention, which came into effect the following year, C. were virtually abolished, except for a few small nations such as

Muscat and Oman; the former consular courts were replaced in the countries concerned by mixed tribunals set up for a period of transition of not more than 12 years.

Capitulum (Lat. diminutive of *caput*, head), botanical name for a form of inflorescence which is usually disk-shaped, and is closely covered with sessile flowers, as in the inflorescence of the Compositae and Scabiosa. This C., or head, is vulgarly confused with a single flower.

Capiz, prov. and city in the Is. of Panay, belonging to the Philippines. The city is situated on the N. coast, on a riv. large enough for small steam craft. The climate, though hot, is considered healthy. Sugar and rice are cultivated, and to a lesser extent tobacco, cacao, and Indian corn. There is some copper mining, and canned fish and copra are exported. The fisheries are also important. Pop. of city 32,353; of prov. 441,871.

Capodistria (Slovenian *Koper*; Serbo-Croat *Kopar*; anct. *Capris*, *Justinopolis*), fortified seaport of the Free Ter. of Trieste (q.v.). In the Yugoslav zone, 9½ m. SSW. of Trieste. It stands on an Is. in C. Bay, an Adriatic inlet of the Gulf of Trieste, and is connected with the mainland by a causeway ½ m. long. It was the cap. of Istria (q.v.), 1278-1797, under Venetian and Genoan dominance. Later it was in the hands of Austria and (1915-47) Italy. There is a cathedral, and the Gothic In hall stands on the site of a Rom. temple. The tn has saltworks, and a trade in fish, oil, and wine. Pop. 7000.

Caporetto, **Battle of**, battle of the First World War, which took place on the It. front from 24 Oct. to 18 Nov. 1917, resulting in a defeat of the It. armies. The battle, which was fought over a great area from the Carnic Alps to near Venice, was so named from the fact that the defeat began with the loss of C., a key position, on the Isonzo R., near Monte Nero, a loss so serious that it exposed first one and then another It. army to the risk of being outflanked and enveloped. In Oct. 1917 the main It. armies were still struggling with the Austrians in the broken country along the Isonzo. One It. army was on the Carso plateau fighting for the road to Trieste, another, based on Cividale and Gorizia, was attacking further N., and a third, still further N. on the Upper Isonzo, E. of C., on the Bainsizza plateau. It was then that Ludendorff (q.v.) planned a combined Ger. and Austrian offensive, with the assistance of large forces of guns and men released from the E. front by reason of the Russian Revolution. Ludendorff's strategy was to strike at the less tried It. troops on the Upper Isonzo so as to cut the communications of the It. armies both there and on the Carso, and then to outflank them, so as to bring about a major disaster. 'o the entire It. military machine and, by wiping out the It. front as an effective theatre of allied resistance, pave the way for a final offensive on the Fr. and Flemish front. On 24 Oct. Austro-Ger. artillery bombarded the Tolmino positions, outraging the It. guns. The Ger. troops then broke through

and crossed the riv., whereupon 2 It. corps surrendered, thereby exposing C. and rendering It. forces southward liable to be outflanked. The It. retreat from the Bainsizza and Carso plateaus became almost a rout, and by 28 Oct. the Austro-Ger. forces had captured over 50,000 men and 500 guns. Then Cividale and Gorizia fell, and shortly afterwards Udine, the It. H.Q., and the Austro-Ger. armies were strongly entrenched in It. ter. on the Tagliamento R., the number of prisoners rising to nearly 200,000 and the guns captured to 1500. This resulted in the main It. armies withdrawing from the Isonzo and those defending the frontier through the Carnic Alps being driven from the mt passes into a retreat by the valleys leading to the Piave and Tagliamento Rs. The retreat continued for days during Nov. The Austro-Ger. armies crossed the Tagliamento at various points, and, when Livorno was abandoned by the Italians, became masters of the line of the Piave (18 Nov.). Thus ended the battle, for Gen. Cadorna (q.v.) was superseded by Gen. Diaz, and strong forces of Fr. and Brit. guns and infantry arrived to strengthen the It. defence; while any further advance by the opposed forces, during the reorganisation of the allied resistance, was prevented by the flooding of country between the Piave mouth and Venice, thereby averting the threat to that city. C. is in Yugoslavia. See It. Cadorna, *La guerra alla Fronte Italiana*, 1921.

Cappadocia, dist. in Asia Minor differing very much as regards its boundaries at different times during its hist. It was originally a prov. under Persian rule, and included all the NE. portion of Asia Minor, bounded on the W. by the R. Halys and on the S. by the Taurus. Later on, while still under the rule of Persia, it was divided into two parts or satrapies, the N. one being called C. ad Pontum, afterwards shortened to Pontus—also called C. Minor—and the S. part C. (C. Major). In AD 17 C. became a Rom. prov. under Tiberius, and after this time the dists. of Melitene and Catalonia were added to it. Its 2 chief rivs. were the Halys and Melas.

Cappadocian Fathers, The, see BASIL, ST.; GREGORY OF NAZIANUS, ST.; GREGORY OF NYSSA, ST.

Capparidaceae, dicotyledonous family of herbs or shrubs found in the tropics and warmer countries. The flowers are hermaphrodite, isobilateral, usually growing in racemes; the sepals are in 2 whorls of 2; the petals are cruciform and 4 in number, the stamens are either 4 or more, the carpels are usually 2 in number, superior, syncarpous, and are borne on a gynophore. The fruit is a silique or a berry. The family resembles the Cruciferae in many respects, but few species are economically useful. The flower-buds of *Capparis spinosa*, which grows in S. Europe, are marketed under the name of capers.

Cappel, see KAI'PEL.

Cappelletti, see CAPULETS AND MONTAGUES.

Capponi, Gino, Marchese (1792-1876). It. historian and statesman, b. Florence. He went into exile with Ferdinand III, grand Duke of Tuscany, but returned to Florence when the duke was reinstated, being head of the Tuscan Gov. from 1848. On the unification of Italy he became a senator. His prin. work is *Storia della Repubblica di Firenze*, 1875.

Capoquin, mkt. tn. of Co. Waterford, Rep. of Ireland, on R. Blackwater, 4 m. E. of Lismore, and centre for Mt. Melleray (q.v.) which is 4 m. N. Pop. 850.

Capra, genus of Bovidae, including goats and ibex, distinguished by having both sexes with flattened horns and the males with a beard and a strong odour. The species inhabit the mts. of Europe and Asia. *C. ibex* is the Swiss stoinbok, *C. pyrenaica* the Sp. ibex, and *C. hircus* the wild goat of Persia. The last species produces 'bezoar stone' in its stomach.

Capraria, see **CABRERA**.

Caprae, see **CAPRI**.

Capra, is. of Italy, in the Ligurian Sea (q.v.), off the N.E. coast of Sardinia (q.v.). It is generally rocky, but there is some cultivated land. Garibaldi (q.v.) had a residence here, 1854-82. Length 6 m., width 2 m.

Capri (anc. **Caprae**), It. is. at the SW. extremity of the Bay of Naples (q.v.). It is composed almost entirely of calcareous rocks, and the scenery is beautiful. Solaro, commanding an extensive view, is the highest point in the is. *C.*, the cap., is situated on one of the accessible spots on the is., and possesses a cathedral. The other tn. in the is., Anacapri, is reached by a narrow road cut in the rocks. N. of this tn. is the 'blue grotto', for which the is. is famous. It is a cavern entered from the sea, and obtains its name from the reflections of blue seen everywhere. The Rom. Emperor Augustus (q.v.) resided in *C.*, and his palaces were afterwards enlarged by Tiberius (q.v.). The remains of the Villa Jovis, one of the largest built by him, are still in existence. It is said that Tiberius lived a life of crime and debauchery here, and that from a high rock on which one of his palaces was built he used to hurl people into the sea. During the Second World War the Germans in their occupation of Italy left the is. in the hands of an It. garrison, with whose co-operation *C.* fell to the Allies on 18 Sept. 1943. The chief products of the is. are wine, oil, oranges, and figs. Area 3½ sq.m.; pop. 9400.

Capric Acid, or **Decolo Acid** ($C_{10}H_{20}O_2$), is found, together with caprylic and caproic acids, in butter, and also in coco-nut and fusel oils. It forms slender needle-like crystals, and has a faint odour somewhat like goatskin.

Capriccio (It. = caprice, whim), in music, a name given to different types of composition: in the 18th cent. to animated pieces in a free fugal style; in the 19th to studies for the violin and occasionally to fantasies on familiar themes; since then to short, lively and humorous instrumental pieces.

Capricorn, Tropic of, the parallel of lat. —a small circle—23° 27' S. of the equator.

At the winter solstice in the N. hemisphere the sun is in the zenith at local noon at every place on this circle.

Capricornus, or the **Goat**, *S. constellatio* which forms the tenth sign of the zodiac (q.v.), usually represented by a sign consisting of the forepart of a goat and the hinder part of a fish. It marks the winter solstice, being entered by the sun about 22 Dec., and was regarded by the ancients as a precursor of good fortune. It contains no bright stars, the most important being only of the third magnitude.

Caprifigation, anct. but erroneous custom in the Levant for the maturation of figs. It consists in planting wild fig-trees among trees bearing edible figs, grafting them on the cultivated plants or merely hauging the branches upon them. The *Caprificus*, goat, or wild fig, bears male flowers, and the cultivated fig chiefly female, so that by introducing the former to the latter pollination may be effected by means of wasps and parasitic insects.

CAPRIFOLIACEAE: ELDER

Caprifoliaceae, dicotyledonous family of mostly shrubs, 350 species of N. hemisphere and the Andes; with opposite leaves, 5-parted perfect flowers, regular or zygomorphic, inferior ovary, and berry, drupe or capsular fruits. Chief genera are *Abelia*, *Alseuosmia*, *Diervilla*, *Dipelta*, *Kolkwitzia*, *Lycasteria*, *Lonicera*, *Sambucus*, *Symphoricarpos*, and *Viburnum*.

Caprifolium, an old genus, now included in *Lonicera* (q.v.).

Caprimulgidae, family of nightjars or goatsuckers, consists of birds with soft, owl-like plumage. They feed on insects caught on the wing at dusk or during the night. See **GOATSUCKER** and **WHIP-POOR-WILL**.

Caprino, It. tn. in Veneto (q.v.), near the E. shore of Lake Garda (q.v.). It has silk manufs. Pop. 7500.

Capris, see **CAPODISTRIA**.

Caprivi de Caprera de Montecuccoli, Georg Leo, Count von (1831-99), Ger. soldier and statesman, b. Charlottenburg and educ. in Berlin. He fought in the campaigns of 1864 and 1866, and in the Franco-Prussian war. In 1883 he was made head of the Admiralty. He succeeded Bismarck in 1890 as chancellor and foreign minister. He started a

number of negotiations with the British in S. Africa; these were on the whole advantageous to his country, though the colonial party attacked him for relinquishing claims to Zanzibar in exchange for Heligoland. C. passed the Army Bill in 1893 and was dismissed in 1894, militarists, land-owners, and colonialists all being violently critical of various aspects of his policy.

Caproic Acid, or **Hexoic Acid** ($C_6H_{12}O_2$), acid found in butter and coco-nut oil. It is obtained from the latter by saponification with caustic potash and distillation with dilute sulphuric acid. It is a fermentation product of butyric acid, and an oily liquid of unpleasant odour.

Carpus, genus of hoar-fishes, occurs in the Atlantic and Mediterranean in rather deep water. *C. aper* is not unlike the John Dory, but the dorsal spines lack long filaments. This species is about 6 in. long, a pale carmine colour above and silvery-white beneath.

Capsella, genus of Cruciferae, known in Britain chiefly from *C. bursa-pastoris*, the shepherd's purse (q.v.).

Capsicum, genus of Solanaceae, which is of economic importance on account of the pepper obtained from some of the species. The shell of the fruit is fleshy, coloured, and contains a pungent principle which also exists in its seed. Both the fruit and the seed of different species are therefore valuable as a condiment, and are used in seasoning food and in the preparation of pickles. *C. annum*, a weedy plant found wild in S. America and the W. Indies, is greatly cultivated, and its fruit and that of *C. longum* are known to us as chilli or red peppers; dried and ground they form cayenne pepper. *C. frutescens* is an E. Indian shrub with a small fruit, which is called goat-pepper.

Capstan (Fr. *cabestan*; Lat. *capistrum*, a halter; Sp. *cabestrante*), machine used on a ship for manipulating weights, such as anchors. C.s were originally made of wood, but are now generally made of iron. The axis of this appliance is vertical, differing in this respect from a windlass, which has a horizontal one. The barrel, round which the rope is coiled, is larger at the top and bottom than in the centre, thus allowing the cable to be drawn towards the centre. It is also ridged so that a larger amount of rope may be wound at one time. The drumhead, which is fixed above the barrel, has a number of square holes in it, and the C. bars project from these holes like the spokes of a wheel. At the base of the C. are placed the pawls, or short bars of iron, bolted to the deck by means of the pawl rim. These are to prevent any recoil of the rope. The usual method of working C.s at the present time is by machinery rather than by hand. C.s are also used in railway goods yards for shunting trucks.

Capsule, name applied in botany both to dry dehiscent (splitting) fruits formed from more than one carpel and to part of the sporogonium of the Bryophyta, or liverworts and mosses. In the latter case the C., or theca, gives rise to spores, and

thus is of importance in the asexual generation of the plants. The capsular fruits are developed from ovaries of which the carpels are fused, and there may be 1 loculus (chamber) or more than one; the dehiscence, or splitting open, is performed in various ways, and ought to be noted. If the splits run down the midrib of the carpels, e.g. Iris, it is called *loculicidal*; if the fruit splits into its various carpels, e.g. rhododendron, *septicidal*; if the outer wall breaks and the seeds remain in the middle, e.g. thorn-apple, *septicidal*. In the poppy the dehiscence is *porous*, the seeds falling from holes at the top of the fruit and in the pink the fruit dehisces by means of teeth. The C.s of the scarlet pimpernel and the plantain split open by means of a lid; they are examples of *pycidia*.

Captain, title found in almost all languages to denote a chief of a small band of men (from Lat. *caput*, head, chief). This name is especially applied to a grade of officer in the army or navy.

Navy. Strictly the commanding officer of a man-of-war or of a frigate carrying at least 20 cannon. In the Brit. Navy and most others the C. is next in rank to the rear-admiral or commodore (almost corresponding to an army colonel). This rank was first clearly defined in the Brit. Navy in 1747, originating probably from the time when navigating and fighting forces on war vessels were combined. In earlier times the 'master' had charge of the navigation and the fighting was done by soldiers under their military officer. A C. in the R.N. is responsible for military gov., navigation, and equipment of his ship, for the crew's discipline and health, and for neglect of duty in inferior officers. *Post-C.* merely means full C. (from the time when C.s of large vessels were 'posted' on the permanent list of C.s, from among whom admirals were chosen). A *flag-C.* commands the admiral's ship. The *C. of the fleet* is a temporary official appointed by the Admiralty to keep up the discipline of the fleet. He acts under a commander-in-chief as adjutant-general of the force, and wears the uniform of rear-admiral. The title is applied by courtesy to all who command ships at sea, whether they hold that rank or not. It is also given to the chief sailor of particular gangs of men in charge of a certain portion of the ship's company, as C. of the 'top,' 'forecastle,' 'hold,' 'gun,' etc.

Military. In the Brit. Army the commanding officer of a company, troop, or battery, ranking between a major and a lieutenant. This grade is the third in the order of promotion. Formerly the title of an officer of high rank (like the modern colonel), it is nowadays restricted to the head of a company or squadron. He is responsible for the arms, clothes, discipline, welfare, and efficiency of his unit. The C. also keeps all accounts and reports of the company. He selects the first sergeant, and recommends non-commissioned officers. The title *C.-general* meant chief commander of the army or militia, and is still so used in

Spain; also for the governor of Sp. provs. or colonies.

'Captain,' ship name in the Brit. Navy closely bound up with Nelson's battles. But the best-known C. is that of the disaster of 7 Sept. 1870. This vessel was a turret ironclad of 6950 tons built in 1869; it capsized in a violent storm off Finisterre and was lost. The first ship of this name was built in 1678, and the following are important battles in which a C. figured: Beachy Head, 1690; Barfleur, 1692; the battle off Cape Passaro, 1718; Minorca, 1756; Louisbourg, 1758; the Quebec expedition, 1759; Toulon, 1793; Hotham's battle off Genoa, 1795; Hyères, 1795; at Corsica, 1795; Cape St Vincent, 1797; Copenhagen, 1807; and Martinique, 1809.

Capua, It. fort. tn, in Campania (q.v.), on the Volturno (q.v.), 7 m. WNW. of Caserta. The site of the ant. city of this name is 3½ m. SE., and is to-day called Santa Maria di Capua Vetere. The ant. city was founded by the Etruscans (see ETRURIA), but in the 5th cent. BC was captured by the Samnites (see SAMNIUM), and eventually became subject to Rome. It was then a city of great wealth and influence. After the battle of Cannae (q.v.) it went over to Hannibal (q.v.), whose army wintered here in 216 BC; 4 years later it was recovered by the Romans. In the 5th cent. AD it was razed by Genseric (q.v.), but evidently soon rebuilt, and in 840 it was again destroyed by the Saracens (q.v.). The modern C. was begun c. 856 on the site of the old tn of Casilinum. It was besieged by Cesare Borgia (q.v.) in 1501, an event commemorated by a tower. Later it was fortified by Vauban (q.v.), and the fortifications were extended in 1855. The tn was very severely damaged during the Second World War; the archiepiscopal cathedral was almost completely destroyed. Since the end of the war there has been much reconstruction. Agric. machinery is manuf., and there is a large trade in agric. produce. Pop. 15,400.

Capuana, Luigi (1839-1915), It. novelist, playwright, and critic, b. Mineo, Catania. As dramatic critic to the *Nazione* of Florence and other periodicals he wrote the articles which form the vols. called *Studi di letteratura contemporanea, Libri e Teatro*, etc. But C. was at his best as a story-teller and novelist, and particularly when dealing with the world of his infancy and youth. He advocated a realistic and impersonal art, and his works are of an almost scientific objectivity. Many of his novels and tales are known in trans. In England, France, Germany, and Russia. Among his best works are *Profil di donne*, 1877, *Giacinta*, 1879, *Il Profumo*, 1890, *Paesane*, 1894, *Il Marchese di Roccaverdina*, 1901.

Capuchin Monkey, name given to either the whole genus *Cebus*, or sapsajous, or else specifically to the individual *C. capucinus*, the weeper. A native of Guinea, it is distinguished by having the hair on the crown and back part of the head black, resembling a monk's hood or cowl, the remainder of the body being greyish.

The genus consists of monkeys which have a completely hairy tail and a well-developed thumb, and the species are not woolly. They are found wild in S. America and are frequently kept in captivity, especially by organ-grinders. Their diet is chiefly vegetable, but they do not refuse insects and caterpillars.

Capuchins, order of friars in the Rom. Catholic Church, originally a branch of the Franciscans. It was founded by Matteo di Bassi in 1528, who, returning to what he believed to be the true habit of St Francis, grew a beard, went barefoot, and wore a pointed hood (*capuche*) from which the order takes its name. In 1619 the C. became an independent order. They are numerous, wear a brown habit, and are occupied mainly in missionary labours. See FRANCISCANS.

Capulets and Montagues, Eng. names of 2 legendary noble Veronese families, the Cappelletti and the Montecchi, famous for their rivalry, their hereditary hatred, and bitter feuds. Their story is bound up with the It. traditions of the Middle Ages; both families belonged to the Ghibelline party, and they are referred to by Dante (*Purgatorio*, canto vi). Shakespeare immortalised them in *Romeo and Juliet*.

Capus, Vincent Marie Alfred (1858-1922), Fr. dramatist and novel-writer, b. Aix-en-Provence. He received the education of an engineer, but never followed the profession. His first novel, *Qui perd gagne*, appeared in 1890; it was followed by *Faux Départ*, 1891, and *Années d'aventures*, 1895. His best-known plays are *Brignol et sa fille*, 1895, *Rosine*, 1897, *La Veine*, 1901, *Les Deux Écoles*, 1902, *Le Beau Jeune Homme*, 1903, *Un Ange*, 1909, and *L'Aventurier*, 1910. C.'s works are pervaded by an optimistic fatalism; they are highly amusing and, in general, reflect the life of Paris of his time.

Capybara, or Carpincho (*Hydrochoerus hydrochoerus*), species of rodent of the Caviidae, or cavy family; also known as water-hog. It is the largest rodent in existence, being sometimes 4 to 5 ft in length; the ears are small, there is no tail, the hair is rough. The anterior limbs are 4-toed, while the posterior are 3-toed, and all the digits are webbed, with hoof-like nails. It is an aquatic animal and does not move swiftly on land, but is a good swimmer and diver. See CAVY.

Caraballos Occidentales, range of mts in the Is. of Luzon in the Philippines. They extend in a northerly direction from the Gulf of Lingayen to Mayra Point. The highest point is 5517 ft. The range is complex in character, with a central ridge of spurs.

Carabidae, or ground-beetles, form a family of coleopterous insects, many of which are large and adorned with brilliant metallic colours. They are terrestrial, and few of the Brit. species are capable of flight. About 13,000 distinct members of the family are known to exist. The larvae destroy many smaller insects and worms.

Carabine, see CARBINE.

Carabineers, or Carbineers (from Fr. *carabinier*), literally means soldiers armed

with carbineers, but was actually applied to cavalry who used the carbine, a shorter and less cumbersome form of the musket. Their function was to act as skirmishers and harass the enemy. The name was abolished in the Fr. Army in 1870. The 6th Dragoon Guards, now represented by the 3rd Carabineers (the Prince of Wales Dragoon Guards), in the Brit. Army obtained the appellation of the C. See DRAGOON GUARDS.

Carabobo, state of Venezuela, bounded on the N. by the Caribbean Sea. Valencia (cap.) and its port, Puerto Cabello, are the prin. tns. It is a notable agric. area; the chief products are cotton and sugar cane, and others include tobacco, rice, cacao, and corn. At the small tn of C., some 15 m. SW. of Valencia, is the fine memorial of the battle which ended Sp. rule in NW. S. America (1821). Area 1795 sq. m.; pop. 243,160.

Carabus, typical genus of the family Carabidae (q.v.), represented in Britain, for example, by *C. violaceus*, a metallic-coloured beetle. Some species are vegetable feeders, but others eat carrion, and some will attack living snails.

Caracal, tn of Rumania, in the prov. of Czulova, 95 m. WSW. of Bucharest. Its name is derived from the Emperor Caracalla, who in 217 built a tower there, the ruins of which still remain. Pop. (1930) 15,000.

Caracal, species of lynx found in Africa and SW. Asia. It is a reddish-brown, with white under-parts and 2 white spots near each eye. The ears terminate in a long tuft of black hair. It is savage and powerful. The skin is made into coats by the Kafirs.

Caracalla, Marcus Aurelius Antoninus Bassianus (186-217), Rom. emperor, eldest son of Septimius Severus; the nickname C. was due to his wearing the long Gallic tunic. He accompanied his father to Britain (208-11), and in 211 became joint emperor with his brother Geta, whom he murdered, thus becoming sole emperor (212). Among the 20,000 supporters of Geta who also perished was Papinian, the jurist. C.'s reign was a series of cruelties and extortions. His 'Constitutio Antoniana' extended full citizenship to all free inhab. of the empire, merely so that he might get money from the provs. C. was murdered on a plundering expedition against the Parthians, at the instigation of Macrinus, who succeeded him. He built at Rome the Thermae Caracallae or Antoninianae, and the triumphal arch of Septimius Severus. See Gibbon's *Decline and Fall* (Chap. VI) and Meister's *Dissertatio de Caracalla*, 1792.

Caracara, or Carancho (*Polyborus tharus*), carrion-hawk of the family Falconidae, and common to America. The bird is a powerful flyer and a good walker. Its nest is sometimes built in trees and sometimes on the ground, and the eggs are 3 or 4 in number. It feeds on carrion and also on young animals which it captures alive.

Caracas, city and cap. of Venezuela. It lies in a vale of the Andes 7 m. N. of its port, La Guaira. The soil is fertile,

the water supply good, and the climate healthy, owing to its being about 3000 ft above sea level. Since the recent oil boom it has been almost entirely rebuilt on the best modern lines. Among its notable buildings are the cathedral, univ., gov. buildings, museum, and library. C. has been sev. times shaken by earthquakes, and in that of 1812 was almost destroyed. It is a large manufacturing city and an important commercial and cultural centre. Bolivar is buried in the Partheon. Pop. 500,000; with suburbs, 700,000.

Caracci, or Carracci, name of 3 It. painters who founded the 'eclectic' school of painting in Bologna in the 16th cent. A sonnet written by Agostino makes clear their ambition; they were to combine Michelangelo's power, Titian's 'truth and nature,' Correggio's 'purity of style,' and Raphael's symmetry. The criticism of this learned approach is that it did not make for originality and was even somewhat neutral in result.

Lodovico Caracci (1555-1619) was the founder of the school, but finding that he could not carry out his plan without help, he persuaded his 2 cousins, Agostino (1557-1602) and Annibale (1560-1609), to join him. The three opened an academy in Bologna, which they maintained together for 3 years. Agostino, who had prepared himself by study under Fontana and then in Parma and Rome, was esteemed as an engraver as well as a painter. Annibale left Bologna at the invitation of Cardinal Odoardo Farnese, who commissioned him to decorate his palace in Rome. Here Agostino joined him and assisted in the work till the 2 brothers quarrelled and finally separated. 'Susannah and the Two Elders,' in the National Gallery, is a fine example of Lodovico's work, Agostino's masterpiece is his 'Communion of St Jerome' (Bologna), while Annibale's work is well represented by 'Silenus gathering Grapes' (National Gallery).

Caraccioli, name of an anct noble Neapolitan family, the most distinguished members of which were Marino, Gianni, Domenico, and Francesco:

Marino Caraccioli (1469-1538), cardinal and statesman, created Duke of Milan by Charles V.

Gianni Caraccioli (c. 1480-1550), Prince of Melfi and grand seneschal of the kingdom of Naples. He was on the Fr. side (except for a short interval) after the conquest of Naples by Charles VIII. For his defence of Luxembourg in 1543, Francis I made him a marshal.

Domenico Caraccioli (1715-89), statesman and economist; ambas. successively at Turin, Paris, and London. He d. as viceroy of Sicily.

Francesco Caraccioli (1748-99), admiral. He served in the Brit. Navy, then had command of a Neapolitan squadron. In 1798, when Naples fell into the hands of the French, he entered the service of its new gov. After the battle of the Nile the court of Naples was drawn into the war against France and the king and queen of Naples took refuge in Palermo under the

protection of Nelson. When Suvarov drove the French out of Italy again, the king and queen re-entered Naples on the faith of a treaty which amnestied their 'revolted' subjects, among whom was C. Nelson declared the capitulation of Naples null and allowed the vindictive creatures of the court to wreak vengeance on disarmed enemies and gave his sanction to the execution of C., who had served in the rebel cause only under compulsion, and C. was hanged on Nelson's ship (1799).

Caractacus, or **Caratacus**, Brit. king, son of Cunobelin (q.v.). King of the Trinovantes of SE. Britain. He led the resistance to the Romans, AD 48-51. He was decisively defeated by Ostorius, 51, and sought refuge with Cartimandua, Queen of the Brigantes. She, however, handed him over to the Romans. C. was sent to Rome, where he probably d., the Emperor Claudius rewarding his courage by granting him an honourable captivity.

Caradocian Series, a term describing a group of Ordovician rocks in the upper part of that system. The name is derived from Caer Caradoc in Shropshire. The Caradoc Group and the succeeding Ashgill Group can be taken as equivalent to the Bala Series which includes the uppermost Ordovician rocks in Wales.

Caradori-Allan, Maria (1800-65), Alsatian singer, b. Milan. After singing in France and Germany, she came to London in 1822. She was popular as a concert singer; she went to Venice and sang there for a season, returning to England, where she settled in 1830. She sang the soprano part in the first performance of Mendelssohn's *Elijah* at Birmingham in 1846.

Caraffa, name of a famous Neapolitan family of whom the following members are the best known:

Giovanni Pietro (1476-1559), became Pope Paul IV (q.v.).

Carlo (1519-61), nephew of Giovanni Pietro. After serving under the Spaniards in the Netherlands, he was made a cardinal by his uncle, who was then Pope.

Antonio (1539-91), cousin of Carlo, was made a cardinal by Sixtus V. He arranged for a revision of the Bible, an exposition of the canons of the Council of Trent, an ed. of the *Septuagint*, etc.

Antonio (d. 1693), later member of the family, distinguished himself in the service of Austria, and became a field marshal. He was made Governor of Hungary in 1685, but his cruelty in the affair of the Tekeli conspiracy led to his recall in 1687. In 1688 he conquered Transylvania from the Turks.

Caragiale, Iohn Luca (1852-1912), Rumanian author and playwright. His works are popular in Rumania, and include comedies and novels. His comedies are satirical; the best known of them are *Noctea furtunoasă* (A Stormy Night) and *Scrisoarea pierdută* (The Lost Letter). In his greatest piece, *Năpasta* (Contempt), he attained genuine tragic horror. Later in his life he wrote a number of short stories admirable for their psychological observation. An Eng. trans. of 4 plays was pub. in 1956.

Caraglio, Giovanni Jacopo (c. 1500-51), It. engraver, b. either Verona or Parma. His engravings—a large number of which are after Raphael—place him high in his profession. He also devoted a great deal of his time to the cutting of precious stones.

Carales, see CAGLIARI.

Carambola, or **Caramba**, see AVER-RHOA.

Caramel, substance produced by the application of heat to loaf sugar. When sugar is gradually heated it loses water and other substances. At the temp. of 220° C., the liquid which has been formed becomes frothy; it is maintained for some little time at this temp., and then poured out to cool. The solid thus produced is a dark-coloured brittle mass, with a characteristic smell and a persistent bitter taste. It is used for artificially colouring many things, such as beer, vinegar, gravy. The name is also given to a popular kind of sweetmeat.

Caran, see COURLAN.

Caran d'Ache, see POIRÉ, EMMANUEL.

Caranco, see CARACARA.

Carapa, genus of trees, family Meliaceae. The species are tropical and *C. moluccensis* inhabits muddy swamps. *C. procera* and *C. guianensis* both yield oil from the seeds.

Carapace, protective covering of many animals, particularly the arched bony plate which is characteristic of the Chelonia (e.g. tortoise), and to the shield which protects the fore parts of the Crustacea (e.g. crab).

Carapegua, tn. of Paraguari dept., Paraguay, 45 m. SE. of Asunción. The surrounding country is fertile, oranges, cotton, tobacco, sugar-cane, etc., being grown. Pop. 21,300.

Carat, see GOLD and METROLOGY.

Caratacus, see CARACTACUS.

Carausius, Marcus Aurelius, Rom. soldier, b. Gaul during the 3rd cent. AD. He was given a command in the Rom. army, but was suspected of trying to enrich himself by encouraging piracy. Being sentenced to death, he retired to Britain, usurping the title of emperor (286) and the Emperor Maximian was eventually compelled to recognise his rule there. He was assassinated in 293.

Caravaca, Sp. tn in the prov. of Murcia, on the C. It has 2 fine Baroque churches, is known for its wine, and manufactures *espadrilles* and paper. Marble is quarried near by. Pop. 21,000.

Caravaggio, Michelangelo Amerighi, or **Merisi**, da (1573-1610), It. painter, b. Caravaggio; originally a mason, turned to painting and became famous and controversial in Rome for his 'Naturalism' or revolt against the insipid conventions then prevailing. He introduced plebeian types into religious subjects; and painted from nature and by artificial light, with dramatically violent effects of light and shade. His wild life, in the course of which he visited Naples, Malta, and Sicily, brought him to an unfortunate end; but his art had a European influence, from Holland to Spain. The Entombment (Vatican) and his portrait of Olaf de Wignacourt, grand-master of the

Knights of Malta (Louvre), are among many impressive works. See R. Hinks, *Caravaggio*, 1953; B. Berenson, *Caravaggio*, 1953.

Caravaggio, Polidoro Caldara da (c. 1495-1543). It. painter, b. Caravaggio. He was first employed to carry mortar for the artists, but Raphael noticed his ability, and he was taught to paint. After the sack of Rome he fled to Naples and then to Messina, where he amassed a large fortune. He was robbed and murdered at Messina. One of his best-known pictures is 'Christ bearing the Cross' (Naples).

Caravaggio, It. tn. in Lombardy (q.v.), 14 m. S. of Bergamo (q.v.). It has a famous pilgrimage shrine, and was the bp.

industry in the world, exporting considerably to the Continent. America produces the greatest number of C.s (roughly 100,000 a year compared with Britain's 24,000). In America C.s are called trailers and over 90 per cent are residential. They are very much larger than those in Britain, averaging 40 ft in length, and are entirely self-contained. On the Continent C.s are becoming increasingly popular: in France over half the C.s are British. They are not, however, used very much for residential purposes yet, being used mostly for touring.

The Caravan Club of Great Britain was first formed in 1907, and was reorganised in 1935 exclusively for motor trailers.

E.N.A.

A CARAVAN IN THE GOBI DESERT

of Michelangelo C. and Polidoro C. (qq.v.). Pop. 10,000.

Caravan: 1. Literally a house on wheels. C.s are usually of the trailer type in Great Britain, except for those of travelling showmen which have motorised chassis, and also those used for motorised banks, laundries, libraries, dark rooms, etc. The C. is often made from aluminium in England and America, but there is an increasing tendency to use moulded plastics (polyester resins reinforced with glass fibre); these plastics are much more elastic, and allow for rougher treatment than aluminium. They are also easier to work, and have a better finish. The maximum size for a C. in Britain is 22 ft long by 7 ft 6 in. wide, and the average length for a touring C. is 15 ft. The C. is amazingly compact and well designed to conform to the road regulations and also to ensure that it is properly balanced as a trailer. For those who cannot afford a house it is ideal. Nowadays some sites have all the amenities of a village, with shops, laundries, educational facilities, and children's playgrounds.

Britain has the second largest C.

It is a national organisation giving advice on all aspects of caravanning, being run on parallel lines to the Automobile Association and the Royal Automobile Club. It is also a social club, and has affiliated clubs in New Zealand and S. Africa.

2. (Persian *karwan*, from *kāra*, people, army) Name in N. Africa and the E. for large companies of merchants, pilgrims, or others travelling together for security, especially across the deserts. From the very earliest times C.s have been the chief means for transfer of merchandise in Asia. There are frequent references to them in the Bible (Gen., Job, Isaiah, Psalms). Camels are largely used for transport of heavy goods, especially in arid, sandy regions, as their powers of endurance are so great. Heavy C.s are those in which the camels have a load of 500 or 600 lb., going about 13 to 20 m. a day; in light C.s they only have half that weight, and go about 22 to 25 m. a day. The ordinary seasons for trade C.s are spring, early summer, and later autumn, Friday being the favourite day for the start. The leader of the trade C. is called *Karwan-Bushi*, or *Rals* (chief), and is chosen by

the merchants before starting. He acts as general manager, spokesman, and arbitrator; but in the matter of trafficking each member of the C. acts independently. The word does not occur in English before the early years of the 17th cent.; another form is *carouan*. The trade between Tripoli and the interior of Africa, between Darfur and Egypt, between Russia and China, used to be mainly carried on by C.s. The old Arab trade routes led to Egypt, Syria, and Mesopotamia; and between the 8th and 11th cents. AD Arab traders appear to have gone regularly as far as the Baltic. Many old Arabic coins have been discovered in NW. Europe.

Caravansary, or **Caravanseral**, kind of unfurnished inn where the caravans (q.v.) are put up in E. countries.

Caravel, sailing boat of Portuguese origin, having 3 or 4 masts; much used by navigators of the 15th and 16th cents. The oldest forms were entirely lateen rigged, the foresail being the largest; subsequent types had square sails fitted to the foremast. Another characteristic feature was the square stern. See **CARVEL**.

Caravelas, seaport of Bala, Brazil. It is a centre of the whale fishery of the Abrolhos is. Pop. 2150.

CARAWAY

Caraway (*Carum carvi*), biennial herb of the Umbelliferae, grown for its furrowed, halved fruits, known as C. seeds, which are used for flavouring in confectionery, in perfumery, as a carminative in medicine, and in distilling a liqueur; while the roots are sometimes eaten in N. Europe.

Carayon, Auguste (1813-74), Fr. author, b. Saumur. He joined the Society of Jesus, and from that time almost all his work was in connection with the society. He edited the *History of the Jesuits of Paris*, by Père Garnier. Among his works may be mentioned *Expatriation of Jesuits from Louisiana*, 1855, *Unedited Documents concerning the Company of Jesus*, 1863-75, and *Historical Notes on Jesuits and the Parliament of the Eighteenth Century*, 1867.

Carballo, Sp. tn in the prov. of La Coruña, with mineral springs. Pop. 14,000.

Carbamide, see **UREA**.

Carbamines, see **ISOCYANIDES**.

Carbazotic Acid, see **PICRIC ACID**.

Carberry Hill, situated in Midlothian, Scotland, 7 m. SE. of Edinburgh. It is noted in hist. as the place where Mary Queen of Scots surrendered to the confederate nobles in 1567.

Carbides, compounds of carbon with other elements. Many were unknown until they were prepared by H. Moissan in the electric furnace. The prin. C. are those of calcium, manganese, iron, aluminium, chromium, barium, strontium, lithium, etc. Of these the most important commercially is calcium carbide, much in demand for the production of acetylene, which is generated by bringing water and calcium carbide into contact (see **ACETYLENE**). Acetylene may be obtained in a similar way from lithium carbide. Other C., as aluminium and beryllium carbide, give methane, while manganese carbide gives methane mixed with hydrogen. Silicon carbide is a stable compound prepared by heating sand and coke in the electric arc; on account of its hardness it is used as a substitute for emery. Silver carbide and cuprous carbide are highly explosive.

Carbine, or **Carabine** (from Fr. *carabine*; corruption from O.F. *calabre*, from Med. Lat. *calabra*, an engine of war), firearm carried by horse-soldiers, usually attached to the saddle. It is no longer used in this capacity; but a self-loading form has replaced the revolver or automatic pistol in the U.S. Army. See also **FIREARMS**.

Carbinol, see **METHYL ALCOHOL**.

Carbinol, Ethyl, see **PROPYL ALCOHOL**.

Carbo, Gaius Papirius, Rom. politician, tribune of the people in 131 BC. He was suspected of responsibility for the death of Scipio in 129. Later he sided with the aristocracy against the popular party, and as consul in 120 successfully defended Lucius Opimius, the murderer of Gaius Gracchus. But in 119 he was himself impeached for having put Rom. citizens to death without trial, and committed suicide.

Carbo, Gnaeus Papirius, Rom. general, b. about 130 BC. He was one of the chiefs of the Marian party, and he was 3 times elected consul. When beaten by Sulla's general, Metellus Pius, he fled to Sicily, where he was taken prisoner and put to death by Pompey's order (82 BC).

Carbohydrates, see **FOOD AND DIET**.

Carbolic Acid, **Phenol**, or **Hydroxybenzene** (C_6H_5OH), coal-tar product, formerly much used as an antiseptic. It was discovered in coal-tar by Runge in 1834, and has since been observed in the urine of certain animals. For commercial purposes C. A. is prepared from the fraction of coal-tar distillate which comes over between 150° and 200° C. This distillate is treated with caustic soda, which dissolves it out together with other substances. Water is then added, which precipitates some of the hydrocarbons; the solution is afterwards treated with

sulphuric acid, when the phenols form an oily layer on top of the liquid. The layer is carefully removed and subjected to fractional distillation to separate the phenols. C. A. is manuf. for military and other purposes by fusing sodium benzene sulphate with caustic soda. C. A. has a peculiar and characteristic odour, a burning taste, is poisonous, and has antiseptic properties. It crystallises in colourless rhombic prisms which melt at 43°C ., and have a boiling point of 182° ; its sp. gr. at the melting point is about 1.066. At ordinary temps. it is moderately soluble in water, but it dissolves readily in alcohol, ether, glacial acetic acid, and glycerol. Upon exposure to light and air it deliquesces and assumes a red colour, but its other properties are apparently unaffected. Tests for C. A. are provided by the fact that it gives a violet colour with ferric chloride, and produces a white precipitate with bromine water. C. A. decomposes at a very high temp., benzene, toluene, naphthalene, and other substances being formed. Though called an acid, it is neutral to the usual tests, but forms salts called phenoxides or phenates. The phenates of the alkali metals may be prepared by dissolving the acid in a solution of alkali caustic with the exclusion of air. Phenol forms many substitution products, chlorine and bromine readily forming chlorophenols and bromophenols. It is used commercially for the manuf. of artificial colouring matters, explosives, plastics, dyes, aspirin, etc.

Therapeutics, etc. C. A. is a general germicide, and is used to exterminate such fungoid growths as ringworm. When used in concentrated form it acts at first as a caustic, and afterwards produces local anaesthesia, which is maintained for some hours. It is readily absorbed by the unbroken skin, and may be used to treat a collection of septic matter near the skin surface, but its absorption in this way may produce symptoms of poisoning. A little cotton wool soaked in C. A. often relieves toothache caused by decayed teeth. Internally C. A. is taken in doses of $\frac{1}{4}$ to 2 grains, and is useful in fermentation in the stomach and as an intestinal antiseptic; it is occasionally used to stop vomiting.

Poisoning. Phenol is a nerve poison, and, in concentrated form, a strong caustic. A quantity of 15 grains provides a very dangerous dose. Diagnosis of poisoning by absorption is made by observing the condition of the urine, which assumes a characteristic dark green colour. The usual antidote is sodium sulphate introduced either by the mouth or by intravenous injection.

Carbon, symbol C, atomic number 6, atomic weight, 12.01, non-metallic element of widespread distribution. It occurs in nature in practically a pure state as diamond, and a somewhat less pure state as graphite or plumbago. In combination with oxygen, it occurs in the atmosphere to a small extent, and in combination with metals, notably calcium, forms many important rocks. More important still, however, is its occurrence in every

form of animal and vegetable life, and so many different compounds of C. are met with in living tissues that the study of them is set apart as a special section of the science of chem. under the title of organic chem., which might therefore be rendered chem. of the C. compounds. C. as the chief constituent of vegetable tissues has another special significance, as the proportion of C. determines the characteristic properties of those substances considered as fuel. Thus dry wood contains about 50 per cent of C.; peat, or vegetable matter partly decayed, contains about 58 per cent, if moisture be disregarded; brown coal contains about 66 per cent, excluding moisture; bituminous coal contains about 84 per cent, and anthracite contains sometimes 95 per cent of C. The extent to which the plant matter has been allowed to part with its gaseous constituents therefore determines the percentage of C., and the heating power of a coal-like fuel and the extent of freedom from smoke increases with the proportion of C. Where the decomposition of the plant tissues proceeds with the elimination of all the oxygen, the resulting product is bitumen, and large deposits of this substance occur in many parts of the world.

Diamond is a crystalline form of C. It is usually found as octahedra or cubes, but many modifications exist. It was first discovered to be a form of C. by Smithson Tennant in 1797, who succeeded in burning the substance in fused nitre and demonstrated the products of combustion to be C. dioxide only. The diamond owes its economic value to its excessive hardness and great brilliance. It is found chiefly in S. Africa and S. America. *Graphite*, blacklead, or plumbago is a mineral occurring in beds or plates amongst the older crystalline rocks, as in Cumberland, the Laurentian Mts, Spain, Bohemia, and elsewhere. It is also artificially produced in electric furnaces, and the greater portion of the raw material for the manuf. of writing pencils is now obtained in this way. It is a dark grey or black mineral with a metallic lustre, and possesses a peculiarly greasy softness, so that it leaves a mark on anything with which it comes fairly forcibly in contact. Besides its use for the manuf. of writing pencils, it is commercially important as a dry lubricant. *Amorphous* C. is obtained by burning many kinds of animal and vegetable tissue in a limited supply of air. C. does not readily enter into chemical composition except at high temps., and it is only when oxidation is rapid that C. burns to form C. dioxide. *Lampblack* is a form of C. prepared by burning tar, resin, or turpentine, and condensing the products of combustion. The C. thus collected is a densely black substance with impurities of hydrocarbons. It may be purified by heating in closed vessels, when a fairly pure form is obtained. Its most important property is that it does not reflect light from any angle and it is therefore in demand as a black pigment and as a constituent of printer's ink. C. black, another form of finely divided C., is used as a reinforcing

filler in rubber compounding, especially tyres. Gas C. is a particularly hard and dense form obtained in the distillation of coal in gas-works, apart from the porous form known as coke. Gas C. is a bad conductor of electricity, and is used for the manuf. of rods for electric arc-lights. There are various forms of charcoal obtained by the slow combustion of animal or vegetable matter. Wood charcoal is obtained by burning wood in a limited supply of air. The old method practised by the charcoal-burners of the forests of Europe from time immemorial consists in collecting branches of suitable length and thickness into heaps, which are closely packed in and then covered over with turf. The wood is ignited at the top and sides and allowed slowly to burn towards the centre, the charcoal-burner inspecting the heap from time to time to see that the combustion is regulated by a proper adjustment of the scanty air-holes at the base. Charcoal thus prepared is used as a fuel and as a reducing agent in smelting ores. *Animal charcoal*, or bone black, is obtained by distilling bones in iron retorts. It is usually very impure, but possesses considerable decolorising and absorbent powers, and is used for the purpose of decolorising raw sugar. Charcoal varies in its properties according to the structure of the substance from which it was prepared and the mode of preparation. It has the power of absorbing gases, being capable of absorbing such quantities that they must be in a state of compression analogous to the liquid state. It is to this property that charcoal owes its value as a deodoriser, its affinity for ammonia in particular being very marked. The practice of eating charcoal in the form of charcoal biscuits is based on the expectation that gases causing pain and inconvenience in the stomach and intestines will be thus absorbed. *Active charcoal*, an even better absorbent, is made from ordinary charcoal, peat, or coal by various methods, e.g. by heating first with phosphoric acid, charring, and washing. It is used in respirators, for removing fusel oil from crude spirit, for recovering volatile solvents in dry-cleaning works, for decolorising sugar syrup, etc. Charcoal is used as a reducing agent in the laboratory to separate a metal from its ore. Charcoal, as has been said, is not chemically active at low temps., but at high temps. it combines readily with oxygen in an oxide, giving off C. dioxide, while the metal is extracted pure. Before the widespread use of coal in iron furnaces, wood charcoal was commonly used to reduce the ore, and the process is still used where coal is scarce, as in Sweden. The compounds of C. are numerous and important. With oxygen 2 prin. compounds are formed. C. dioxide (CO_2) is produced whenever C. is burned in excess of air or oxygen. It is a colourless gas, heavier than air, does not support combustion, and is soluble in water, the solution having an acid reaction (see CARBONIC ACID). When wood or coal is burnt without sufficient excess of air, C. monoxide (CO) is produced, as in blast-furnace operations,

etc. It is a colourless, tasteless gas of a poisonous nature (see CARBON MONOXIDE). C. dioxide in association with water acts as a dibasic acid, which forms 2 series of salts with metals, the carbonates and bicarbonates (see CARBONATES). C. is also capable of combining with metals directly in the electric furnace, giving rise to compounds called *carbides* (q.v.). It also combines directly with hydrogen when an electric arc is estab. between C. poles in an atmosphere of hydrogen. The resulting product is *acetylene* (q.v.). C. unites with fluorine to produce C. *tetrafluoride* (CF_4). When heated in sulphur vapour, C. unites with sulphur to form C. *bi- or di-sulphide* (CS_2), a very volatile, colourless liquid, boiling at 46°C . and giving off an inflammable vapour. It has remarkable solvent powers, dissolving fats, india rubber, sulphur, iodine, and phosphorus, which are otherwise difficult to obtain in solution. C. *oxysulphide* (COS) is a colourless, odourless, inflammable gas, produced when C. monoxide and sulphur vapour are passed through a tube at a moderate heat. *Carbonyl chloride*, or *phosgene* (COCl_2), is a colourless, heavy gas with a pungent smell, prepared by the action of sunlight on C. monoxide and chlorine. It is very poisonous. C. and hydrogen unite in many different proportions, giving rise to bodies which are collectively known as *hydrocarbons*. The many other compounds of C. with oxygen, hydrogen, and nitrogen which are associated with forms of living matter are usually classed as organic compounds; their number seems to be without limit, for not only have new compounds been isolated through the efforts of chemical research workers, but hitherto unknown substances have been synthesised in the laboratory. See also ALCOHOL; ALDEHYDES; FAT; SOAP; STARCH.

Carbon Dioxide, see CARBONIC ACID.

Carbon Monoxide, CO, gas formed during combustion when the supply of oxygen is not sufficiently large. It is found in chimney gases, in the gases of blast furnaces, and in the vapours arising from volcanoes. It is prepared in the laboratory by the action of concentrated sulphuric acid on formic acid, sodium formate, or oxalic acid, an equal volume of carbon dioxide also being produced in the latter case. C. M. is a colourless, odourless gas slightly lighter than air. It is sparingly soluble in water and burns with a pale blue flame to form carbon dioxide; this flame may sometimes be observed near the top of a coal fire when there is incomplete combustion in the lower part of the grate, or when the carbon dioxide first formed is turned into C. M. by passing over a heated mass of coal. CO is a very poisonous gas, and is particularly dangerous in coal-mines where it is sometimes formed in small quantities. It is, however, non-poisonous to green plants. Mixed with hydrogen, as 'water-gas' prepared by passing steam over red-hot coke, C. M. is largely used as an industrial fuel. 'Producer gas,' a mixture of C. M. and nitrogen made by burning coke in a limited current of air, is

also an important industrial fuel. C. M. is the starting point for the commercial synthesis of many carbon compounds.

Carbonado (Sp. 'coal'), form of carbon. It is black in colour, is found in pieces as large as the ball of the thumb, and is sometimes used for the boring of rocks.

Carbonari (It. 'charcoal-burners'), members of an It. political secret society, probably formed in the first instance by Neapolitan republicans during the reign of Joachim (Murat). (A C. rising against the French in 1813 was suppressed and Federici, the C. leader, executed.) It had for its objects the expulsion of strangers from the throne of the country and the estab. of democracy. Its ritual was taken from the trade which gave it its name; thus a lodge of the society was a *baracca*, or hut, an ordinary meeting was called a *vendita*, or sale; an important meeting an *alla vendita*. Mystic religious language was used to explain the aims of the society, 'clearing the wood of wolves' was said to be their aim, alluding to Christ as a lamb torn by wolves. The objects of the society were at first only the expulsion of foreigners, but later became democratic and then anti-monarchical. The C. rapidly increased in numbers, and by 1820 included many of the leading patriots in Italy. After the suppression of the Neapolitan and Lombard revolutions of 1821, Carbonarism was made high treason. After 1821 the C. never quite revived in Italy, and, though active again in 1830-1, they were superseded by the wider 'young Italy' movement of Mazzini (q.v.).

Carbonates, salts of carbonic acid. Carbon dioxide dissolves in water to form a feebly acid solution, and therefore carbon dioxide is regarded as the anhydrous (i.e. without water) form of carbonic acid, H_2CO_3 , which, however, has never been isolated. The acid is dibasic, that is, it contains 2 atoms of replaceable hydrogen per molecule; when both atoms are replaced by a metal, the product is a carbonate, and when one atom only is replaced, the product is an acid carbonate, or bi-carbonate (q.v.). The univalent alkali metals, such as sodium and potassium, yield both C. and acid C. with the general formulae M_2CO_3 and $MHCO_3$. The C.s of sodium, potassium, rubidium, caesium, and thallium are soluble in water, all the others are insoluble. Aluminium and chromium do not appear to yield C., and magnesium, bismuth, and copper yield basic C. If an acid be added to a carbonate, effervescence takes place with evolution of carbon dioxide, and most C. are decomposed by heat into carbon dioxide and the oxide of the metal.

Carbondale, city of Pennsylvania, U.S.A., in Lackawanna co., situated on the Lackawanna R. It is in the midst of the anthracite coal-field of the U.S.A. There are foundries and the manuf. of textiles and metal products. Pop. 16,296.

Carbonear, port of Newfoundland, situated on Conception Bay, 4 m. N. of Harbour Grace. Pop. 3928.

Carbonic Acid, term applied to the substance H_2CO_3 , but formerly to the anhydride carbon dioxide CO_2 , or C. A. gas. Carbon dioxide occurs in the atmosphere to the extent of 3 to 4 volumes in 10,000, though in tns the amount may be larger. It occurs also in solution in riv. and sea water, being carried down by rain or liberated from decomposing carbonates in the soil. Lime gas, is produced in large quantities in limekilns, being formed by the decomposition of the chalk or limestone from which the chalk is made. Fermentation and putrefaction give rise to carbon dioxide, which may exert considerable pressure if the processes are carried out in closed vessels. In the laboratory, carbon dioxide is prepared by treating marble or chalk with dilute hydrochloric acid, but it may generally be stated that all carbonates when treated with most acids yield the gas. Carbon dioxide is a colourless gas about 1.5 times as heavy as air, moderately soluble in water; it liquefies at $0^\circ C.$ under a pressure of 36 atmospheres. The 'snow' form can be compressed into blocks and such solid has in air, i.e. at 1 atmosphere pressure, at temp. of $-78^\circ C.$ It is used in the preparation of aerated waters, quantities being dissolved in water under pressure to produce the sparkling effect when the pressure is at length removed by releasing the stopper of the bottle. Carbon dioxide plays an important part in the making of bread, being generated in the dough by the use of yeast in order to obtain the porous condition which makes bread light and palatable. In the vital processes of animals and plants, carbon dioxide is a necessary factor, for it is a product of the oxidation of waste organic substances occurring in the continuous change of material in the animal economy, and it forms the raw material from which plants obtain the carbon necessary to build up their tissues. Thus plants absorb carbon dioxide and give out oxygen, while animals breathe in air and expel air containing a larger proportion of carbon dioxide. Unless there is adequate ventilation in a room the increasing proportion of carbon dioxide interferes with the proper supply of oxygen to the lungs, and symptoms of suffocation may ultimately appear. Solid carbon dioxide is used as a refrigerant ('dry ice' or 'drikold'), e.g. in the ice-cream and engineering industries.

Carboniferous System, series of stratified rocks which contains the great coal-bearing strata of economic value. The system includes much more than the Coal Measures, and, on the other hand, coal is found in strata unconnected with the system. The C. S. lies above the Devonian or Old Red Sandstone, and below the Permian and Triassic systems. It comprises in the U.K. the lower C. S. or C. Limestone, above which lies the Millstone Grit, and above that the Coal Measures. The C. Limestone may usually be divided into lower, middle, and upper rocks. The lower consists of limestone and shales in the S. and centre of England, and Calciferous Sandstone in Scotland;

the middle consists mainly of limestone; and the upper of black shales with thin limestones. The *Millstone Grit* separates the 2 great systems, and consists of grits, thin coal seams, and limestones. The *Coal Measures* may also be divided into lower, middle, and upper. The lower consists of shales, thin limestones, and coal seams; the middle of the prin. coal seams; and the upper of thin limestones and coal seams, sandstones, and clays. In England the greatest thickness is attained in the N. and W.; this is because the land was at the C. period covered by shallow water and received a considerable amount of sediment from the land to the N., while the S. and E. of England lay under some depth of clear water. The thickness of all parts of the system therefore varies considerably with the locality. With reference to the Coal Measures, these are found to a thickness of 8000 ft in S. Wales, 6000 in Lancs, 3000 in the Midlands, Durham, and Northumberland, and about 2000 in Scotland. In Ireland the system is represented chiefly by limestone. In Europe the C. rocks appear in Belgium, in France, in Westphalia, Saxony, and Bohemia. From Russia the system extends northward as far as Spitzbergen, and is continued through S. Siberia into China. C. rocks are also known in Australasia, N. Africa, and S. America, while in the U.S.A. the system is widespread, attaining its greatest thickness in the E., the beds of greatest economic importance being in Pennsylvania and the surrounding dists. In the C. period as represented by rocks in the U.K., the sedimentation is of 2 kinds: marine and continental or lagoonal. In the marine strata the fossils include crinoids, corals, foraminifera, and brachiopods. Remains of many fish are found, including sharks with piercing teeth and others with teeth adapted for crushing crustaceans, etc. In the continental strata are found 6 great groups of plants, including the club mosses, horse-tails, gigantic ferns, etc. Some of the tree ferns have been so well preserved that the minutest details of their structure can be studied. The vegetation appears to have been luxuriant and abundant, and there is evidence that the climate was, if not hot, at least mild and moist. It has been suggested that, owing to continual volcanic disturbances, of which there is abundant evidence, the air was charged with a greater proportion of carbon dioxide than it has now, so that vegetation was proportionately encouraged. The animals of the continental strata include fresh-water molluscs, ganoids, occasional salt-water fish, spiders, cockroaches, locusts, bees, etc., and in the later C. rocks are found large numbers of early amphibians. The economic importance of the C. S. lies mainly in the coal found in Britain, Belgium, Germany, Russia, Japan, and America, but many other products are in continual demand. The C. Limestone yields limestone for the manuf. of lime, bleaching powder, etc. The ironstone found in association with the coal, and ores of zinc, lead, and

antimony found in the limestone, are worked. The sandstones are used for building purposes, and for grindstones, millstones, etc. Fire-clay and terracotta clay often occur, and the various shales are treated for the extraction of oil, sulphur, and sulphuric acid.

Carbonisation (Low Temp.). The manuf. of coke from coal has been carried on since the 17th cent., and the gas industry was founded by Wm Murdoch in 1792. In the ordinary or high-temp. process for producing gas and coke a temp. of about 1000° C. is maintained, but to produce a fuel, or semi-coke, suitable for use in open grates, and also to obtain a higher yield of liquid products, a temp. of about 600° C.—the so-called low-temp. C.—is resorted to.

In 1850 James Young, the founder of the Scottish shale industry, obtained a patent for the purpose, and in 1906 T. Parker took out a patent for the manuf. of 'coalite.' Numerous investigators have worked on the problem, prominent among them being Sir George Bellby (1850-1924). He studied fuel problems all his life, in particular those connected with low-temp. distillation either of shale or coal, and in 1917 was made chairman (honorary) of the newly formed Fuel Research Board. He hoped that the successful low-temp. C. of coal would provide home supplies of fuel oil for the navy and mercantile marine, and he designed the National Fuel Research Station at E. Greenwich with this as one of the aims in view. He was responsible also for the introduction of the therm system of charging for company's gas. Sev. difficulties have appeared in connection with low-temp. C., chief among them being swelling of the coal during treatment and low rate of heat penetration. Many types of plant have been evolved to overcome these and other difficulties, though even now coals which can be treated successfully in one type of plant may be comparative failures in another. This may be modified in the future by pre-treatment of the coal before C. The prin. low-temp. processes are readily divided into 3 classes: (a) externally heated systems; (b) combined external and internal heating systems; and (c) internally heated systems. All these classes include continuous and intermittent retorts or carbonising chambers.

Carborundum, trade name of a proprietary brand of silicon carbide (SiC). It is manuf. by heating together in an electric furnace sand and coke. It is a black crystalline solid, with hardness greater than that of ruby. Its great hardness makes it invaluable as an abrasive, and leads to its use in place of emery.

Carbuncle, abscess of hair follicle or sweat-gland (see SKIN). The infecting organism is nearly always the staphylococcus. A C. differs from a boil (q.v.) only in that more than one follicle or gland are involved, consequently the abscess is larger and the pain and constitutional upset, due to toxæmia, are correspondingly greater. Apart from

size, C.s may be distinguished from boils from the fact that a boil discharges through one opening or 'head,' while a C. discharges through sev. Like all bacterial skin infections, C. is contagious. Abscesses in other skin areas may occur as a result of transference of bacteria by the fingers or other means. Infection of other people may occur from direct contact or from contamination of baths, wash-basins, utensils, etc.

Carbuncle, almandine garnet, so called by the ancients because of its appearance of a glowing coal in certain lights. Cut with concave surfaces it has a dark red colour, but owing to its relative softness it is not very valuable. The best specimens are found in E. Asia, notably Burma and Ceylon; also found in Brazil and U.S.A.

Carburettor, originally an apparatus for charging gas or air with carbon by passing it through a liquid hydrocarbon, usually with the object of increasing its illuminating power. The word is now used to describe a device attached to an internal-combustion engine, which uses volatile, spirituous liquid fuels, e.g. petrol, benzole. Before the fuel can be burned effectively within the cylinder of the engine, it must be finely broken up into very small particles and mixed with air in definite proportions, depending upon the chemical composition of the fuel: usually for petrol about 15 parts of air to 1 part of fuel by weight. The chief function of the C. is to pulverise the fuel and supply it to the engine thoroughly mixed with the correct proportion of air, under all conditions of load variation. In addition, the C. must provide a small reserve of fuel to enrich momentarily the combustible mixture for sudden acceleration or to ensure easy starting. When fixed to aero engines, provision must be made in the C. to alter the mixture strength to suit the conditions met with in the rarer atmosphere at high altitudes.

The earlier C.s were of the 'surface' type, in which a current of heated air was drawn across cotton wicks saturated with petrol. This method usually resulted in an over-rich mixture, which had to be diluted by extra air before reaching the engine cylinder. The C.s generally used to-day are the spray type, in which the liquid fuel is metered through one or more calibrated jets and discharged into a stream of air moving at high speed through a restricted passage called the choke. The effect of the petrol thus impinging is that it is broken up and intimately mixed with the air. Liquid fuel reaches the jets from a small reservoir, called a float-chamber, where it is maintained at a constant level by a float which operates a small valve controlling the supply from the main fuel tank. See also AERO-ENGINES; GAS ENGINES; INTERNAL-COMBUSTION ENGINE; MOTOR CAR; MOTOR CYCLES.

Carbylamines, see ISOCYANIDES.

Caragante, Sp. tn in the prov. of Valencia. It has a fine Baroque church, and is one of the largest orange-producing centres in Spain. Pop. 15,100.

Carcano, Giulio (1812-84), It. poet and novelist, b. Milan, disciple of Manzoni. His first work was *Angiola Maria*, pub. in 1839. He then, with most other It. authors, took part in the fight for the freedom and unification of Italy, and was obliged to go into exile. On his return he became in 1859 prof. at the academy of Milan and was afterwards appointed senator. He wrote numerous works, best known among which are his novels and collections of short stories, often dealing with domestic life: *Racconti Semplici*, 1843, *Damiano*, 1851, and *Dodici Novelle*, 1853; his collections of *Poesie edite ed inedite* (2 vols.), 1861-70, and *Poesie varie*, 1875; and his tragedies *Spartaco*, 1857, *Ardoine*, 1860, and *Valentina*, 1870. He also trans. Shakespeare into Italian, 1874-82.

Carcar, tn on the E. coast of the is. of Cebu, belonging to the Philippines. Coco-nuts and corn are grown, and there is fishing. Pop. 32,818.

Carcase, see CARCASSONNE.

Carcassonne (Rom. Carcaso), Fr. tn, cap. of the dept of Aude, on the Aude and the Canal du Midi. On the l.b. of the riv. is the 'lower' tn, founded by Louis IX in 1247, and crowning a hill on the r.b. is the 'City,' which, surrounded by 2 ramparts and 53 towers, is one of the most curious of medieval fort. tns surviving. The City was fortified by the Visigoths (see under GOTHES), was occupied by the Saracens (q.v.) from 725 to c. 750, and was later a stronghold of the Albigenses (q.v.). In 1346 it successfully resisted the Black Prince, and at the end of the religious wars the lower tn supported Henry IV (q.v.), while the City supported the League (q.v.). C. is the seat of a bishopric, and has sev. very fine churches. It produces excellent wines. Pop. 38,200.

Carcharodon, genus of shark of the family Lamnidae consisting of the single species *C. carcharias*, the great white shark or man-eater. It grows to a length of about 40 ft and is found in all the warm seas of the world. There are a number of authenticated records of it attacking human beings. The young are born alive from the female.

Carchemish, ancient city on the W. bank of the Euphrates, N.E. of the modern Aleppo, was N. cap. of the Hittites (2 Chron. xxxv. 20). It is identified with the ruined Jerablus (Hierapolis).

Carco, Francis (1886-), Fr. poet and novelist, b. Nouméa, New Caledonia. He went to Paris when quite a young man, and made his début in authorship with his poems *La Bohème et mon cœur*, pub. in 1912. His greatest successes, however, have been with his novels and short stories dealing with the Parisian underworld and plentifully sprinkled with Apache argot. One of his best-known books is *Jésus-la-Caille*, 1914. Another, *L'Homme traqué*, received in 1923 the grand prize for romances offered annually by the Fr. Academy. His essays and critical works include *Le Roman de François Villon*, 1926, *Le Montmartre au Quartier Latin*, 1927,

Envoitement de Paris, 1938, and *Verlaine*, 1939.

Cardale, John Bate (1802-77), an expert in the knowledge of church hist. and anct liturgies, one of the foremost ministers of the Catholic Apostolic Church (q.v.).

Cardamine, genus of the Cruciferae which is widely distributed. The species are usually smooth herbs, with stalked, entire, lobed, or pinnately cut leaves, and racemes of white or red flowers, commonly known as Bitter-cress. *C. pratensis*, a perennial with lilac flowers in spring, is the Cuckoo Flower or Lady's Smock; *C.*

Educ. at Pavia Univ. and at Padua Univ., where (1526) he took his medical degree. Excluded from the College of Physicians by reason of his birth, his earlier efforts in medical practice were unsuccessful and he was reduced to penury. But through the influence of a Milanese senator, whose child he had cured, he was admitted to the medical fraternity and, in 1534, appointed to the chair of mathematics at Milan. In 1536 he gave the first clear account of typhus fever. A few years later the pub. of his *Practice of Arithmetic* brought him into notice. This was followed in 1545

D. McLeish

THE 'CITÉ,' WITH ITS DOUBLE ENCEINTE, AT CARCASSONNE

amar, also perennial, the Large Bitter-cress; *C. impatiens*, Narrow-leaved Bitter-cress, is an ann. or biennial; *C. flexuosa*, often perennial, the Wood Bitter-cress; *C. hirsuta*, the ann. Hairy Bitter-cress; and *C. trifolia* is a perennial of central Europe which has become naturalised.

Cardamoms, fruit of sev. species of Zingiberaceae from the genera *Amomum* and *Elettaria*. *E. cardamomum* is an Indian plant in which the rhizome produces leafless shoots, and these bear the fruit which, when ripe, yield the spice C. In the species of *Amomum* the same thing occurs: *A. cardamomum* is a native of Sumatra. *A. angustifolium* of Madagascar, the one producing small, the other large C. Grains of Paradise are the fruits of *A. granum paradisi*, and are an inferior quality of C.

Cardan (Cardano), Girolamo (1501-76), It. physician and mathematician, b. Pavia, illegitimate son of a jurist of Milan.

by *Ars Magna*, a treatise on algebra, noteworthy for its exposition of the principle of cubic equations and its solution of geometrical problems by algebra—for the first of which he was indebted to his instructor Tartaglia. In 1551 his fame was estab. by his chief work, the treatise *De Subtilitate Iterum*—speculation in physical phenomena; and this was followed a few years later by its sequel, *De Varietate Rerum*, in which work too he seeks to explain ordinary physical phenomena. But the chief interest of this later work lies in its groping but advanced thought on the inorganic realm of nature, which he suggested was animated no less than organic nature. He afterwards continued the practice of medicine at Pavia and Bologna till 1570. After leaving Bologna he went to Rome, where he d. See H. Morley, *The Life of Girolamo Cardano*, 1854; life by J. Eckman, 1946; O. Ore, *Cardano the Gambling*

Scholar, 1953; autobiography trans. by J. Stoner, 1950.

Cardboard, thick board made by compressing together sev. leaves of paper pulp in the process of manuf. Pasteboard is a form of C., produced by pasting together sev. sheets of paper. Bristol board is a finer kind of C. used for pen-and-ink drawings. Strawboard is a coarse yellow board made from straw pulp.

Carden, Sir Sackville Hamilton (1857-1920), admiral, son of Capt. Andrew C. of Templemore, Ireland. Entered the navy as a midshipman and first saw active service in the Egyptian war of 1882. Served in the Suakin operations and in the E. Sudan in 1894. In 1897 served under Sir Harry Rawson in the Benin expedition, and attained flag rank in 1908. In 1914 he was admiral superintendent of Malta dockyard, and when Sir Berkeley Milne left the Mediterranean Adm. C. became commander-in-chief of that station. He was in command of the naval operations at the opening of the Dardanelles campaign and the destruction of the forts at the entrance, but resigned his command through illness, and was succeeded by Adm. Sir John de Robeck. Created K.C.M.G. in 1916 and promoted full admiral in 1917.

Cardenal, Pierre (d. 1306), Provençal troubadour. He was canon of the cathedral of Puy-en-Velay, his native tn, and his songs consist principally of *servientes*, a name given to the satirical songs of the troubadours, dealing with the vices of the nobility and the clergy. The *servientes* of C. are extremely forceful. He also supported the Albigenses against the crusade of the Catholics. His songs are to be found in Mahn's *Gedichte der Troubadours*, 1856-73.

Cardenas, Lázaro (1895-), progressive constitutional president of Mexico from 1934-40, b. Jiquilpan, Michoacán. He was responsible for many educational and industrial reforms; and was the first president for many years to be normally elected and retire voluntarily after serving the full term. From 1942-5 he was minister of war.

Cardenas, seaport on the N. coast of Cuba, 75 m. E. of Havana, in the prov. of Matanzas. It is one of the chief sugar exporting tns of the is., and is a leading fishing centre. It has a good harbour and is well served by railways. Pop. 37,000.

Cardia, opening in the upper part of the stomach by which the oesophagus enters. As its name indicates it is close to the heart.

Cardiff (Welsh *Caerdydd*), city and co. bor., parl. bor., seaport, and the co. tn of Glamorganshire, S. Wales, on the l. b. of the R. Taff. C. was made cap. of Wales, Dec. 1955. C. has made greater and more rapid progress than perhaps any other tn in the U.K., and this was begun by the opening of its first dock in 1839. The docks known collectively as Bute Docks, in commemoration of the parts played by the marquesses of Bute in the early days of the port, have a total deep-water area of 165 ac., with a quaysage of 33,750 ft., equipped in every detail and providing

facilities for the handling of all classes of traffic, comparable with those at any other Brit. port. Transit sheds, etc., have a floor space of 1,012,252 sq. ft., which includes a modern cold-storage plant capable of accommodating 10,000 tons of frozen meat. C. is an important commercial centre, and it was formerly one of the largest coal-exporting ports in the world, but since the shortage of coal

Cracly's Studios Ltd, Cardiff
THE PARISH CHURCH, CARDIFF

supplies available for export this trade has been considerably affected. It exports considerable quantities of iron, manuf. iron and steel goods, and general cargo of all descriptions. The import trade is considerable, and includes large quantities of bulk commodities such as timber, pitwood, grain, iron ore, pig-iron, etc., also all sorts of manuf. goods, fresh and dried fruit, fish, frozen and chilled meat, live cattle, and many other commodities comprising the needs of the large pop. served by the port.

Ship repairing is an important industry in C., and in addition to the great iron and steel concerns there are milling, brewing,

paper making, wire ropes, biscuit making, enamel ware, and hollow-ware industries, together with a large number of light industries, giving a general industrial pattern of great diversity.

C. was raised to city status by royal charter in 1905. Its hist. is very fascinating, and C. Castle in particular is a unique object lesson. From the 1st cent. AD, when the Romans estab. their fort, the site has been in almost continuous occupation. Rom., Norman, medieval, and later builders have all left their traces upon it. The castle was presented to the citizens of C. in 1947 by the Marquess of Bute. The interior, which is famous for its decorations, is seen by about 100,000 visitors annually. C. is noted for its parks and open spaces, and the Civic Centre in Cathays Park is one of the world's finest. Here are the City Hall, Glamorgan Co. Hall, Welsh College of Advanced Technology, the Univ. College of S. Wales and Monmouthshire, Temple of Peace, and the National Museum of Wales. The cathedral of Llandaff is situated 2 m. to the NW. In a suburb of the city. The city sends 3 members to Parliament. Pop. (1954) 246,600.

Cardigan, James Thomas Brudenell, 7th Earl of (1797-1868), cavalry officer, b. Hambledon, Hants. He commanded the 15th and 11th Hussars and was constantly in dispute with his officers. He served in the Crimea, during which campaign he led the famous charge of the Light Brigade at Balaclava, 1854. Afterwards he was inspector-general of cavalry, 1855-60, and lieutenant-general, 1861. See Cecil Woodham-Smith, *The Reason Why*, 1953.

Cardigan, seaport tn, a municipal bor., and the co. tn of Cardiganshire in S. Wales. It stands on the r. b. of the R. Teifi, about 5 m. inland from St George's Channel. It contains the ruins of a castle supposed to have been built in the 12th cent. Pop. 3500.

Cardigan Bay, wide inlet of St George's Channel stretching from Braich-y-Pwll in the N. to Strumble Head in the S. It washes the shores of 5 Welsh cos., among them being Cardiganshire.

Cardiganshire, co. of S. Wales, washed on the W. by Cardigan Bay, and extending from the mouth of the Dovey to the mouth of the Teifi, bounded on the S. by Pembroke and Carmarthen, and on the E. by Brecon, Radnor, and Montgomeryshire. Traces of early Brit. camps are scattered over the co., and there are remains of Rom. roads and military stations, and inscribed stones. The ruins of Strata Florida Abbey (12th cent.), SE. of Aberystwyth, are also of interest. The surface of the co. is comprised of Cambrian and Silurian rocks, and the interior is very mountainous. Its culminating point, Plynlymon (2469 ft), lies in the NE. The most important rvs. are the Teifi, the Rhedol (with the Rhedol Falls spanned by the Devil's Bridge), the Ystwyth, the Aeron, and the Towy, though the Teifi is the chief. The prin. occupation is agriculture. In the N. and NE. there are large sheep farms, while in

the lower parts of the co. milk production plays the main part in farming activity. The H.Q. of the Welsh prov. of the National Agric. Advisory Service is at Trawscoed, and there is a large milk collecting and processing factory at Felinfach. There are a number of small, interesting woollen mills, with a considerable amount of tourist traffic at the coastal resorts of Borth, Aberystwyth, Aberayron, New Quay, and Aberporth. The rvs. and lakes are noted for fresh-water fishing, while coracle fishing still survives on the R. Teifi. Formerly the mineral deposits of lead, copper, and zinc were mined. The chief tns are Cardigan (the co. tn), Aberystwyth, and Aberayron, all on the coast, and Tregaron, Lampeter, and Llandysul in the valley of the Teifi. C. sends 1 member to Parliament. Area about 690 sq. m.; pop. 53,750.

Cardinal (principal, from Lat. *cardo*, hinge), title of the highest dignity, next to the Pope, of the Church of Rome. The word is still used adjectivally, meaning pre-eminent. Originally of more general application, the title was later reserved especially for members of the Sacred College at Rome (1568, by Pius V). The Pope is not obliged to consult them, but usually does, and they form his council or senate. They are all appointed by the Pope alone. As early as the 5th cent. priests permanently ruling par. churches in Rome were called C. priests. There were also C. deacons, who administered the charities of a particular region of the city, and C. bishops in charge of the suburban sees of Rome (Porto and Santa Rufina, Sabina, Albano, Frascati (Tusculum), Palestrina, Ostia, and Velletri). Hence the title was always given to one on whom eccles. affairs 'hinged', but the 3 bodies did not form the one Sacred College till the 12th cent. The C.s are the chief members of the 21 sacred congregations (standing eccles. committees) of the papal gov., such as holy office, rites, index, studies, propagation of the Faith. They meet in consistory, usually with the Pope as president. They are most prominent on the Pope's death, as they elect his successor, usually one of their own number, this being a special duty of the Sacred College. Pope Sixtus V in 1586 fixed the number of C.s at 70 (6 bishops, 50 priests, 14 deacons). The numbers always varied greatly before, and may still do so, but the number of C. bishops remains 6. About half are of It. birth and live in Rome, except the priests. Those of foreign birth are known as protectors. The first C. bishop (of Ostia) is dean of the Sacred College, and has the right of consecrating the Pope, if he be not already a bishop at the time. The first C. deacon may proclaim and crown the new Pope. The 'Camerlengo', who rules the church during a papal vacancy, is a C. C.s have the title 'Most Eminent Lord' (Eminentissimo Signore). Among Eng.-speaking C.s are the archbishops of Sydney (New S. Wales), New York (U.S.A.), Westminster (London), and Armagh (Ireland). C.s enjoy an income out of the papal treasury. They

are often sent as papal representatives on delicate missions, as *legati a latere*. They wear a distinctive scarlet dress and red cap (biretta), given them by the Pope. A red hat is also given them in a public consistory, but they do not wear it, and they receive the C.'s ring from the Pope.

Cardinal-bird, or Redbird, species of *Cardinalis* of the passeriform Fringillidae, or finch family. The birds are very sweet singers which inhabit N. and S. America, and are often kept in captivity. The general colour of the male is red with a bright red crest and black forehead and throat.

Cardinal Points, see COMPASS, MAGNETIC.

Cardinal Virtues, recognised by the ancients to be Justice, Prudence, Temperance, and Fortitude, and so named because all other forms of virtue were regarded as hingeing or turning upon them (Lat. *cardo*, a hinge). Such classification can be traced back to the time of Socrates. In Catholic theology these virtues are classified as moral virtues in contradistinction to the theological virtues, Faith, Hope, and Charity.

Carding, process for combing the fibres of wool, cotton, etc. This is done to remove all impurities, and to separate the imperfect from the perfect fibres, and so prepare the latter for spinning.

Cardington, vil. of Beds, England, 3 m. from Bedford. Formerly airships were built here; C. now forms an R.A.F. camp. Here was the home of John Howard (q.v.), the prison reformer. Pop. 350.

Carditis, inflammation of the endocardium, myocardium, and pericardium (see HEART). The commonest causes of acute carditis are rheumatism and the toxæmias and infectious diseases. Chronic C., more frequently met in the myocardium, is usually associated with arteriosclerosis due to old age.

Cardona, Sp. tn in the prov. of Barcelona, on the Cardener. It has a Gothic church and a fortified castle. SW. of the tn is the 'Salt Mt.' containing valuable salt mines. Pop. 5300.

Cardoon (*Cynara cardunculus*), family Compositae. The C. is grown for its thick fleshy stalks and the ribs of the leaves which are eaten; it is cultivated after the manner of celery, coming into season by the middle of Nov. Originally a native of Spain, it now flourishes in the Pampas, having been introduced into S. America for cultivation.

Cardozo, Benjamin Nathan (1870-1938), Amer. jurist, b. New York, 24 May, of Jewish parentage; educ. at Columbia Univ. He was admitted to the New York Bar, 1891, and elected justice of the Supreme Court of New York for term 1914-28. In 1927 he was made chief justice of the Court of Appeals of New York state. On the resignation of O. W. Holmes in 1931, C. was recommended by all the leading Bar associations as his successor, and on 15 Feb. 1932 he was appointed associate justice of the Supreme Court of the U.S.A. In many of his judgments he strongly supported President Roosevelt's policy of the New

Deal. He was noted for his learning in the philosophy of the law as well as in its application. His publs. include *The Nature of the Judicial Process*, 1921, *The Growth of the Law*, 1924, and *Law and Literature and other Essays*, 1931.

Cardross, par. and vil. of Dumbartonshire, Scotland, on the Firth of Clyde, 3½ m. NW. of Dumbarton. Robert Bruce d. in C. Castle (now quite disappeared) in 1329. Tobias Smollett, the novelist, was b. at Dalquhurn House near Renton, in this par. Pop. 6500.

Cards, Playing. The origin of playing C. is uncertain, though it was probably in the E. Leaving undecided the question of how C. reached Europe, it is equally hard to decide the date when they first appeared in Europe. Italy is generally considered the country of origin. Tiraboschi, in his *Storia della Letteratura Italiana*, quotes a MS. of 1299, in which C. are expressly referred to, and other references are to be found between 1300 and 1350. In France C. are mentioned in the *Annals* of Provence about the year 1361, and also in the *Chronicle* of Petit Jean de Sainte in the reign of Charles V, in a decree by that king against gaming in 1369, and in a MS. entitled *Renard le Contrefait*, dated between 1328 and 1341. In Germany C. are mentioned as being permitted in 1380, so must have been introduced before that date—probably about 1350. In England a regulation forbidding the importation of C. is found in the Parliament Rolls of 1464, and it is reasonable to place their appearance about 1450. From the game of *trappola*, consisting of 36 C., the *tarlots* of Italy were derived. A pack consists of 78 C. made up of 4 suits, viz.: cups or chalices, swords, money, batons or clubs. Each suit is comprised of 14 C., i.e. numerals 1-10, and 4 court C.: king, queen, chevalier or knight, and valet. In addition there are 21 *alous*, numbered 1-21, and *Il Pazzo* (the Fool or Joker). The first 5 *alous* are known as *grands alous*, the last 5 as *petits alous*. They are allegorically representative of material forces—natural elements, virtues, and vices. The 4 suits are ascribed to represent the 4 estates of man, viz.: the church, the nobility, the merchants, and the peasants. From the 56 C. were evolved the 52-card Eng. and Fr. packs, and also the 48-card Sp. and the 32-card Ger. packs. The *tarot* emblems are still used in It. and Sp. C.; on Ger. C. hearts, bells, acorns, and leaves take their place. Eng. and Fr. C. have spades, hearts, diamonds, and clubs. In the reign of James I the excise tax on C. was 5s. per gross of packs. This tax was varied from time to time until 1862, when it became 3d. per pack, and it has remained at that. There is, in addition, an excise licence to sell of £1. Imported C. bear a duty of 3s. 9d. per dozen packs. It is estimated that some 4 million packs are sold per annum in Great Britain. Until 1832 C. were laboriously and expensively produced from stencils or printed entirely by hand. In that year Thomas de la Rue,

founder of the firm of Thomas de la Rue & Co. Ltd. was granted royal letters patent by William IV for the printing of cards by the typographical process, made possible by his experiments resulting in the production of oil inks which dried quickly and did not 'set off,' and his method of imparting a high gloss finish. This method revolutionised the production of C. and he is regarded as the originator of the modern playing C.

Carducci, Bartolommeo (1560-1610), It. painter, better known by the Sp. form of his name, *Carducho*. He studied architecture and sculpture with Ammannati and painting with Zuccaro. He helped Zuccaro to paint the great cupola at Florence, and went with him to Spain, 1585. There he became painter to Philip II and Philip III. With Tibaldi he painted much in the Escurial. He also began a series of frescoes, finished by his brother, Vincenzo (q.v.). His best work was 'The Descent from the Cross,' in San Felipe el Real at Madrid.

Carducci, Giosuè (1836-1907), It. poet, b. Val di Castello in Tuscany. He was the son of a physician, and began life as a teacher. He spent a youth of severe study, and was appointed in 1860 to a professorship of It. literature at the univ. of Bologna. This post he held until his death, with the exception of a short interval in 1867, when he was suspended for participation in the movement for the unification of Italy. In 1876, having become a supporter of the Savoy dynasty, he was made member of the It. parliament. His poetry bears the impress of his erudition, and is frequently pedantic and recondite. His earliest verses, afterwards pub. as *Juvenilia*, have little merit, and are modelled upon Alfieri and Manzoni. His best poems were written during the period 1860-70 following upon his appointment at Bologna, and were pub. under the title of *Decennalia*. They deal mostly with the political events of the time and include his famous poem, *Inno a Salana*, 1863, which eulogises the spirit of revolt and resurgence against effete custom and worn-out institutions. The *Decennalia* show a liberation from the earlier influences, which become more complete after 1870, when C. adopted Hugo as his model and gave freer expression to his political views. His most esteemed poems are the unrhymed *Odi Barbare*, 1877, 1882, and 1889, which, written in metres taken from Horace, place him, by their eloquence, dignity, and impressiveness, high in the ranks of classical writers. Other characteristic poems exalting the classical pagan spirit are *Canto di Marzo*, *In una chiesa gotica*, *Classicismo e Romanticismo*. In 1906 C. received the Nobel prize for literature. His complete works were pub. in 21 vols., 1889-1928. See life by B. Croce, 1927; A. Galletti, *L'Opera di Giosuè Carducci*, 1929; S. E. Sciala, *Carducci: his Critics and Translators in England and America*, 1881-1932, 1937.

Carducci, Vincenzo (1568-1638), painter, brother of Bartolommeo (q.v.), under whom and Zuccaro he studied. He went

with his brother to Spain, 1585, and after his death finished a series of frescoes begun by his brother for Philip III, adopting the hist. of Achilles instead of Charles V.'s life. He painted some 50 large pictures for the Carthusians of El Pualar, representing scenes from the life of St Bruno, and martyrdoms and miracles of the monks of that order. He wrote, in Castilian, *Dialogos de las excelencias de la Pintura*, 1633.

Carduchi, race of people who formerly inhabited the mountainous dists. of modern Kurdistan and are probable ancestors of the Kurds (q.v.).

Carducho, Bartolommeo, see **CARDUCCI**.

Carduus, see **THISTLE**.

Cardwell, Edward (1787-1861), historian, b. Blackburn, Lancs. He was Camden prof. of anct. hist. (1826-61), rector of Stoke Bruern in Northants (1828), and principal of St Alban's Hall, Oxford (1831). His pubs. include an ed. of Aristotle's *Ethics*, a students' ed. of the Gk Testament, 1837, *Documentary Annals of the Reformed Church of England from 1546 to 1716*, 1839, *History of Conferences, etc., connected with the Revision of the Book of Common Prayer*, 1840, and *Reformatio Legum Ecclesiasticarum*, 1850.

Cardwell, Edward Cardwell, 1st Viscount (1813-86), statesman, b. Liverpool; educ. at Winchester and Balliol College, Oxford. He became a barrister in 1838 and M.P. for Clitheroe in 1842. Sir Robert Peel made him secretary of the Treasury (1845-6). In Lord Aberdeen's ministry he was president of the Board of Trade (1852-5), and under Lord Palmerston became secretary for Ireland (1859-1861), Chancellor of the Duchy of Lancaster (1861), and while secretary for the colonies (1864-6) put an end to transportation. In Gladstone's ministry he was secretary for war (1868-74), and he carried out in 1871-2 his great plan of army reorganisation, abolishing the purchase of commissions, introducing the retirement of officers, the short-service system, and, above all, infantry organisation of linked battalions (see also **ARMY** and **HALDANE**). Raised to the peerage in 1874 as Viscount C. of Ellerbeck. See Sir R. Biddulph, *Lord Cardwell at the War Office*, 1904.

Cardwell, tn. and shire of Queensland, Australia; it is 800 m. N. of Brisbane. Sugar and fruit are grown locally, and timber is produced. Pop.: tn, 520; shire, 4600.

Caré, or **Carle**, Sunday, Sunday preceding Palm Sunday, so called from the practice of eating earings, i.e. peas roasted or fried in butter, on this day.

Carême, Marie Antoine (1784-1833), Fr. chef, b. Paris, who became cook to Talleyrand, the Fr. plenipotentiary. He accompanied his employer to the congress of Vienna. Subsequently he became chef to the Eng. prince regent (afterwards George IV) and to the empresses of Russia and Austria. He was famed for the artistic nature of his dishes. He wrote *Les Dîneurs de l'Empereur Napoléon*, *La Cuisine française*, *Le Maître d'hôtel français* and other culinary works.

Carentan, Fr. tn in the dept of La Manche, 25 m. W. of Bayeux. It is a busy market, and has the ruins of an anct castle. Pop. 4300.

Carew, George, Earl of Totnes and Baron Carew of Clopton (1555-1629), soldier and nobleman. He studied at Oxford, and afterwards fought in the Irish wars against the Earl of Desmond. In 1596 he led a successful expedition to Cadiz, and was afterwards appointed lord president of Munster, where he ruthlessly suppressed the Irish rebellion. C. preserved and annotated all letters and papers relating to the Ireland of his own day, and many vols. of his MSS. on Irish affairs were placed by Land in the Lambeth Library, while others are among the Harleian MSS. They throw considerable light on the Elizabethan and Jacobean administration in Ireland. He was a great friend of Sir Walter Raleigh, and pleaded with James I on Raleigh's behalf in 1618.

Carew, John Edward (1785-1868), Irish sculptor, b. Waterford, but came to London in 1809, where he d. He exhibited at the Royal Academy from 1830 to 1848. His best statues are 'Whittington listening to the London Bells,' 'The Death of Nelson at Trafalgar,' and the 'Model of a Gladiator.'

Carew, Sir Nicholas (d. 1539), Eng. courtier and favourite of Henry VIII, related to Anne Boleyn (q.v.). He attended Henry in France, 1513, and was knighted before 1517, when he became keeper of Greenwich Park. He was executed for his share in the Marquess of Exeter's conspiracy.

Carew, Richard (1555-1620), poet and antiquary, b. Cornwall. He studied at Christ Church, Oxford, and was appointed high sheriff of Cornwall in 1588. His *Survey of Cornwall*, 1602, is valuable as an account of the life of a country gentleman of the time. He also trans. the first 5 cantos of Tasso's *Gerusalemme Liberata*, 1594.

Carew, Thomas (1595-1639), poet and courtier, b. West Wickham. He was educ. at Oxford, afterwards leading a somewhat wandering life. For a time he travelled as secretary with his kinsman, Sir Dudley Carleton. He went on embassies to Venice, Turin, and to France (1619), and was later attached to the court of Charles I. C. wrote *Coelum Britannicum*, a masque, 1634, short poems, and sonnets addressed to a 'Celia.' His poems show Donne's influence. He was one of the poetic circle that surrounded Ben Jonson, and was a friend of Sir John Suckling. His collected works were ed. by Arthur Vincent, 1899. See G. Williamson, *The Donne Tradition*, 1930.

Carex, or Sedge, family Cyperaceae, a genus of about 1000 species of grass-like, perennial rhizomatous herbs, found chiefly in damp, swampy places and wet moors throughout the world. The stems are 3-cornered and solid, with 3-ranked leaves, and monococious flowers in spike-like panicles, as a rule; the male flowers, with 3 stamens in the axils of the glumes,

being of the terminal spike; the female with 2-3 united superior carpels below; the fruit is a nut in the perigynium. The leaves are minutely toothed, and sharp. Among those common in Britain are *C. arenaria*, Sand Sedge, used as a binder of sands, *C. flava*, Yellow Sedge, *C. sylvatica*, Wood Sedge, *C. vesicaria*, Bladder Sedge, *C. panicea*, Carnation Sedge, *C. nigra*, Common Sedge, and *C. pulicaris*, Flea Sedge.

Carey, Henry (c. 1687-1743), humorous poet and musician, reputed son of George Savile, Marquess of Halifax. He studied music under Roseingrave and Geminiani. C. was author of the libretto to *The Dragon of Wantley* (music by Lampe, 1737); he pub. 6 cantatas, 1732, and *The Musical Century*, 1737. His famous *Chrononhotontologos*, 1734, is a burlesque on the mouthing plays of his period. His *Poems on Several Occasions*, 1729, were praised by Addison. His name is best remembered for the ballad *Sally in our Alley*, but the present tune is not C.'s. C. was said to be author and composer of *God save the King*, but the claim was unfounded. His poem *Namby Pamby*, in ridicule of Ambrose Philips (q.v.), added an expression to the language. His granddaughter was mother of Kean, the tragedian.

Carey, James (1845-83), Irish revolutionary, b. Dublin. He became a Fenian (see FENIANS) and one of the originators of the Invincibles (q.v.). He took part in the murder of Lord Frederick Cavendish (q.v.) and Mr Thomas Burke, permanent under-secretary for Ireland, on 6 May 1882, but tried to save himself by turning queen's evidence. He was, however, murdered in revenge soon afterwards on board ship, near the Cape, by Patrick O'Donnell.

Carey, Sir Robert (c. 1560-1639), diplomat and soldier, youngest son of Lord Hunsdon, served Queen Elizabeth I as an envoy in Scotland and the Netherlands, and fought in the Netherlands, 1587. He carried the news of the queen's death to Edinburgh in only 60 hours. He was created Earl of Monmouth by Charles I in 1626, but the title d. with him. His *Memoirs* (ed. 1808) contain an interesting record of Border hist.

Carey, William (1761-1834), Orientalist and missionary, b. Paulerspury. Northants; 1786, shoemaker, schoolmaster, and Baptist pastor at Moulton; 1789, minister in Leicester. Active in forming the Particular Baptist Society for Propagating the Gospel amongst the Heathen (1792), in 1793 he went as a missionary to Bengal. He issued Bibles in 26 Indian languages; he also pub. grammars (of Mahratti, 1805; Sanskrit, 1806; Panjabi, 1812; Telinga, 1814; Bhotanta, 1826) and dictionaries (of Mahratti, 1810; Bengali (3 vols.), 1818; Bhotanta, 1826), and ed. the *Rāmāyana*, 1806-10, and Roxburgh's *Flora Medica*. He was prof. of Sanskrit at Fort William College, Calcutta, 1801-1830. In 1807 he was made D.D. by Brown Univ., U.S.A. See biographies by George Smith (Everyman's Library) and S. Pearce Carey, 1923.

Carfin, vii. in par. of Bothwell, Lanarkshire, Scotland, notable for a grotto laid out on similar lines to that of Lourdes. Many Catholic pilgrims visit it annually. Pop. 2000.

Cargados, Carajos, or St Brandon, group of is. on the Nazareth Bank, lying 250 m. NNE. of Mauritius, of which they are a dependency. There are fishing and meteorological stations.

Cargill, Donald (1619-81), Covenanter, b. Rattray, Perthshire. He was made minister of Glasgow in 1655, but deprived of his living for opposing the Restoration (1660). He fought at Bothwell Bridge (1679), became a field preacher, and took part in the Sanguhar declaration (1680). Soon afterwards he excommunicated the king and his officials at Torwood, near Stirling, for which act a reward was offered for his capture. Executed at Edinburgh.

Cargo, see **BILL OF LADING** and **FREIGHT**.

Cargo Cults, cults that appeared in the years after the Second World War among many peoples of Melanesia. The chief element was a belief that ancestors would arrive in aeroplanes and landing-craft (as did the Jap. and Amer. troops who fought in the area), bringing vast stocks of goods of all descriptions (the 'cargo'), which would herald a millennium of freedom and luxury. See M. Mead, *New Lives for Old*, 1956.

Carham, par. and vil. in the co. of Northumberland, England, in the rural dist. of Glendale. C. is situated on the R. Tweed, and was formerly the scene of fierce struggles between Scots and English.

Caria, anct maritime prov. of Asia Minor, bounded by Ionia and Lydia on the N., the Aegean Sea on the S., and Lydia on the E. The country is mountainous, its chief heights being over 3000 ft, while Mt Latmus reaches the elevation of 4500 ft. The coast is irregular and deeply indented, being fringed with numerous is., chief among which are the Gk is. of Rhodes and Cos. The Carians were originally a distinct nationality and maintained themselves in the interior against the Greeks, but were afterwards subdued by the Persians. The country was conquered by Alexander the Great, and became finally part of the Rom. Empire. It now forms part of Turkey.

Carisma, Dicholophus, or Serlema, genus of S. Amer. birds, resembles the secretary bird, and is often placed near it among the Falconiformes. Internally, however, it is nearer to the Gruiformes, and the family Cariamidae is now usually classed under that tribe. *C. cristata*, the serlema or crested screamer, is a common species with long legs, short wings, short and slightly hooked beak, a well-developed crest, and long tail. Easily domesticated and will guard its owner's fowls when tamed.

Cariban, see **CARIBS**.

Caribbean Federation, estab. by the British Federation Act, 1956, and the W. Indies Order in Council, 1957. The C. F. comprises Anguilla, Antigua, Barbados,

Dominica, Grenada, Jamaica, Montserrat, St Kitt's, St Lucia, St Vincent, Trinidad, and Tobago (qq.v.). It was recommended that the cap. of the federation should be at Chaguaramas (q.v.) on Trinidad. Lord Hailes was appointed first governor-general and took up his appointment in Jan. 1958. See also **WEST INDIES**, *West Indian Federation*.

Caribbean Regiment, see **WEST INDIA REGIMENT**.

Caribbean Sea, part of the Atlantic Ocean that lies between the coasts of S. and Central America and the is. of Cuba, Haiti, and Puerto Rico and the Leeward and Windward Is. It communicates with the Gulf of Mexico by the Yucatan Strait, and is divided into 2 basins, both in parts over 20,000 ft deep, by a broad submarine bank less than 6000 ft deep lying between Jamaica and Honduras. The E. and larger basin has an area of 231,000 sq. m. The W. basin is considerably smaller. The 2 basins are united by a strait between Jamaica and Cuba and Haiti. The sea forms the turning point of the Gulf Stream. See G. H. Blakeslee (ed.), *Mexico and the Caribbean*, 1920, and A. Waugh, *The Sunlit Caribbean*, 1948.

Caribbee Islands, see **ANTILLES**.

Cariboo, dist. of Brit. Columbia extending on both banks of the Fraser R., near its source. It is important on account of its gold-mines.

Caribou, see **REINDEER**.

Caribs, or Caribbees, name (first used by Columbus) of a predatory, warlike people of S. America. They were expert seamen and, according to the latest views, spread from S. America northwards, occupying the Lesser Antilles, near what is still called the Caribbean Sea, by conquest of the original Arawakan tribes. They were distinguished for ferocity and cruelty, and made a bold resistance to the Spaniards. Carib is said to mean valiant man. They were cannibals, the word cannibal itself being a variant of Columbus's 'caribal' (derived from their tribal name). See **CANNIBALISM**. To put an end to the constant disturbances caused by the C., the Brit. Gov. in 1796 deported nearly all of them from Dominica and St Vincent to Ruatan Is. off Honduras. They numbered about 5000, and have since spread over the nearby mainland, the majority being now settled in Honduras, Nicaragua, and on the Guiana coasts. They are usually slight in figure, but strong and well-formed. They were described at the discovery of the new world as 'the strongest, handsomest, and most intelligent' natives of that part. They are reddish-brown in colour, with long, thick, black hair, and Mongoloid features. They drink quantities of *paiwari* (liquor made from the cassava plant). Through admixture with Negroes some are known as Black C. The C. were partly an agric. people, and made good pottery. The modern tribes are far more peaceful than the anct. They no longer have communal dwellings, but separate families, each in its own house. Their religion is ceremonial, and they practise

the couvade (q.v.). The favourite weapon is a battle-axe of polished stone. See I. Rouse, 'The Carib,' in J. H. Steward, *Handbook of South American Indians* (vol. iv.), 1948.

Caricae, family Caricaceae, genus of tropical Amer. evergreen trees; the best known being *C. papaya*, the papaya or papaw tree. The edible fruit (and leaves) contain a protein ferment, papain—a meat tenderiser—and are eaten ripe or boiled; the milky juice is a vermifuge. The juice of the plant forms a cosmetic; the leaves may be used in washing instead of soap; and animals fed on the plant yield tender meat. *C. cundinamarcaensis* yields edible fruits and seeds.

Caricature (It. *caricatura*), representation of some person or group in such a manner as to excite ridicule or contempt. The word is from the Low Lat. *Caricare*, to load a car, and its connotation is 'to charge or load with exaggeration,' and the It. word *caricatura* was first given its present meaning by Annibale Carracci as applied to drawings in this vein by himself and others of his school in Bologna in the 16th cent. In English the word is comparatively modern having been first used by Sir Thomas Browne in his *Christian Morals* (part iii), but the hist. of C. goes back certainly to Gk, possibly early Egyptian times. In Greece and Rome, however, pictorial as compared with literary satire held but a small place. With the exception of a few vase paintings which have survived, Gk C.s are only known to us through references in Aristophanes and elsewhere, but many grotesque drawings have been uncovered in Pompeii and Herculaneum, and Pliny mentions painters skilled in burlesque portraiture. Both literary and artistic C. have always based themselves more or less on actual facts and features. Even physical deformity, which ought to excite pity, has often been made a subject for derision. Leonardo da Vinci made some pitiless exaggerations of physical deformity. As religious wars have been among the most cruel, so religious C.s, as in the pagan mockeries of the early Christians, and the broadsheets issued during the Reformation, have been among the most venomous and insulting. Artists in the Middle Ages loved the grotesque; witness the monsters of the illuminated MSS. and the gargoyles of the cathedrals. In the 10th and 11th cents. the story of Reynard the Fox among others, was used by monkish writers for satirical and didactic purposes; after passing through many variations, the story as now generally known was printed at Lübeck in 1498, with illustrations to match the text. Caxton had already pub. an earlier version in England. A generation later Holbein produced his 'Moralities,' including the famous 'Dance of Death.' These prepared the way for the great development of the art of C. in the 16th and following cents. Germany and Holland were at first most prolific, but Jacques Callot of Lorraine (1592-1635) struck out a new line, which was freely copied. As pictorial satire had played so great a part

in religious disputes, it was now employed also in politics. Political C., unknown in the conditions of society in the Middle Ages, was only introduced with the art of printing. One of the earliest engravings which can be called a political C. was a Fr. drawing of 1499 entitled 'Le Revers du jeu des Suisses' ('the defeat of the game of the Swiss'). The picture shows a card table round which are Louis XII of France, Henry VII of England, the King of Spain, and a Swiss noble, the lesson being that Louis has won the game, viz. his aspirations to It. ter., despite the open hostility of the Swiss nobles. The majority of such C.s as were produced in this early period were French. C.s in France became comparatively frequent in the 17th cent., but ceased with the curtailment of the freedom of the press under Louis XIV, though many were pub. in Holland or other countries and imported, Louis XIV being the especial object of satire. In England political C. was unknown up to the 16th cent., and only came into some vogue with the political struggles of the Stuart period. The earliest victims of such satire were the Episcopalian party in the Church and the cavaliers, whose insolence supplied the caricaturist with his cue. A famous Eng. C. of this period was one entitled 'An Embleme of the Times,' produced in 1647; it represents war as an armed giant trampling on mutilated bodies, while Hypocrisy, a 2-faced woman, is seen fleeing towards some distant city. Playing-cards were not seldom the medium for C. directed against the Commonwealth, Gen. Lambert being a favourite subject, the inspiring force behind these C.s being the Court party, who were the equals of the reformer in appreciating the power of C. on popular imagination. In 1710 there was a veritable storm of C.s in England, provoked by hatred of Dr Sacheverell; while in the same period the Whigs began to make full use of the weapon. Many if not most of these C.s were actually produced in Holland, to which country modern political C. though originating in France, owes its development. With the accession of George I (1714) the public appetite for political and social C. increased greatly and became almost a necessity of social life; but it was rather in the time of Walpole that Eng. political C. received its great impetus, when both Whig and Tory made use of it. Women of the period took so great an interest in politics that C.s of that time were often introduced on fans and on other articles of a personal nature. Yet even then the popular idea of a C. was indeterminate. C.s were called 'hieroglyphics,' because they were so full of mysterious allusion and not comprehensible to the ordinary mind. During the 18th cent. C. in England reached its height in the works of Hogarth, whose 'Marriage à la Mode' and similar C.s have never been excelled. In politics, the S. Sea Bubble and the abuses of Walpole's administration invited and received satire, and with the outbreak of the Fr. Revolution came also a furious cartoonists' war, Gillray and

Rowlandson being matched against Fr. rivals of equal virulence if less power. Gillray, whose first C.s were directed against the Shelburne Ministry and developed with malicious pungency against George III (as, for example, in the famous C. of 'The King and the Apple Dumpling') was the greatest caricaturist of his age, and his works form a hist. of the more important part of the reign of George III. Champfleury's *Histoire de la Caricature*,

was founded in England in 1842, and similar periodicals were produced in Germany, Italy, and in most, if not all, European countries, each country developing its own style of C. with strongly marked national characteristics. Among Ger. caricaturists T. H. Heine with his bitter satire deserves particular mention, and in France 'Carand'Ache' (Emmanuel Poiré) and 'Cham' (Vicomte de Noé), with many others carried on the brilliance

Sir John Soane's Museum

DETAIL FROM 'CHAIRING THE MEMBER' BY HOGARTH

gives an idea of the savage, often disgusting, work of that era in France. During the 19th cent. these grossnesses were quite abolished in England and largely so abroad. A great impetus to Fr., and indeed to European, C. was given by the Fr. periodical, *La Caricature*, founded by Charles Phillipon (1806-62) in 1830, followed 2 years later by *Le Charivari*. In these and in *Le Journal de Rire*, which was started in 1847, Phillipon encouraged a distinguished body of Fr. caricaturists, which included such celebrated names as Honoré Daumier, Paul Gavarni, H. T. Monnier, 'Grandville' (Jean Gérard), and Gustave Doré. Following the Fr. example, *Punch*, or the *London Charivari*

of their predecessors. To return to Great Britain, George Cruikshank comes between the school of Gillray and the later one of *Punch* with a style all his own. With his brother Robert, he began as a bitter political caricaturist, but is chiefly remembered for his later drawings depicting the social life of his time. Since his time Great Britain has been exceedingly rich both in caricaturists proper and in draughtsmen whose work is sometimes difficult to classify (e.g. the famous cartoon 'Dropping the Pilot' by John Tenniel). John Leech (1817-64) with his political cartoons (this word being first applied by him to a C. drawing), Richard Doyle (1824-83), Sir John

Tenniel (1850-1900), C. S. Keene (1851-1891), Du Maurier (1860-96), Linley Sambourne (1871-1910), Harry Furniss (1880-1925), E. T. Reed (1890-1920), Sir Bernard Partridge (1901-25), and others gave much of their best work in *Punch*, either in political C. or in illustration of jokes. C.s of prominent people gained an especial vogue in the pages of *Vanity Fair* with the work of 'Ape' (Carlo Pellegrini) and 'Spy' (Leslie Ward). Among other political cartoonists of the time mention must be made of W. Bowcher in the periodical *Judy* and Gordon Thomson in *Fun*. The introduction of photo process-engraving in the early seventies freed artists from their hitherto dependence on wood-cut technique, and was thus an important encouragement to C. of a wider range and versatility. The charming sketches of Randolph Caldecott (1846-86), the fun and pathos of Phil May, and the brilliant work of artists such as 'F. C. G.' (Sir Francis Carruthers Gould), Sir Max Beerbohm, and others, have helped to place Eng. humorous art in the very first rank. Gould was the first cartoonist to draw daily for a newspaper, the *Westminster Gazette*, and Max Beerbohm's wit found expression in his drawings of humorous situations in which he placed the leading figures of his day, mostly from the world of letters. His drawings were of the simplest in outline. Phil May, although Eng. born, began his career with his work for the *Sydney Bulletin*, a periodical in which an Amer. artist, Livingston Hopkins, also made a name for political and social satire. Will Dyson also graduated from the *Sydney Bulletin* to become well known in England during the First World War and for many years after it for his hard-hitting political cartoons, reminiscent of Gillray. Australia has continued to provide a flourishing field for the caricaturist. Norman Lindsay is only one among many names. Another Australian paper, the popular *Smith's Weekly*, provides an outlet for well-executed cartoons, although somewhat gross in taste, on political topics. As mentioned above, the word C. has to-day given place to cartoon, and this latter word, which in its primary significance meant a picture of a larger size than usual in a paper or periodical, is now applied to any political or social C. of any size whatsoever. In connection with humorous illustration, which is a C. of life and often combined with the creation of characters, mention must be made of Wm Heath Robinson with his whimsical inventions, George Belcher, and Bruce Bairnsfather, the creator of 'Ole Bill,' a prominent character of the First World War. In the thirties, however, the illustrated joke began to show a decline in popularity, and the comic situation picture with little or no explanation in words came into vogue. In the connection H. M. Bateman, 'Fougasse' (Kenneth Bird), and 'Pont' became acknowledged masters. Meanwhile, the London daily newspapers, taking their lead from the *Westminster Gazette*, made a regular feature of the cartoon. Some prominent

cartoonists, e.g. 'Poy' (Percy Fearnor) of the London *Evening News*, delighted in very small cartoons of no pretensions to artistic merit, with serial characters like 'John Citizen' and 'Dilly Dally,' symbolic of the gov. 'mandarin,' which became familiar through repetition. David Low, on the other hand, the Australian-born cartoonist and probably the best-known cartoonist in England of his day, indulges in bold outlines with considerable artistic merit. He possesses a keen political sense, and his satires in the London *Star* and, later, in the London *Evening Standard* on political and social life, were full of sting but sometimes coarse. In particular, his cartoons on Hitler, Goering, and other Nazi leaders before and during the Second World War were unrivalled. In a lighter vein the cartoons of Sidney Strube, the creator of the 'Little Man,' though intentionally devoid, like those of 'Poy,' of artistry, were always popular and apposite. W. K. Haselden of the London *Daily Mirror* became known for light social satire, and the work of the cartoonist as a sports cartoonist found its pioneer in Tom Webster. Social caricature to-day is well represented by the grotesque families in an elaborately drawn setting of Gilles of the *Daily Express*, and the schoolgirls of Ronald Searle's 'tough' school, 'St Trinian's.' In the U.S.A. political C. for a hundred years kept pace with that of Europe, deriving from Gillray, whose influence was brought to America by Wm Charles, a Scottish immigrant. From the time of the Civil war, political satire received a tremendous impetus in the U.S.A., achieving its greatest prominence in the work of Thomas Nast; and both in caption and draughtsmanship the cartoons of such papers as *Judge* and *Life* were ahead of those of almost any other country. During the last 40 years the work of Amer. cartoonists has given rise to the outstanding popularity of the 'comic strip,' without which a newspaper is hardly complete in the U.S.A. Comic strips portray a series of episodes in the lives of imaginary but typical cartoon characters. Harry Herschfeld, Reuben Goldberg, George McManus (of 'Bringing Up Father' fame), Rudolph Dirks (creator of the Katzenjammer Kids), Harold Gray, Bud Fisher (creator of Mutt and Jeff) are a few names among many artists who have achieved fame in the art of the comic strip, which also gained greatly in popularity in Great Britain during the Second World War. A modern form of the art is represented by the animal grotesques of the film by Walt Disney. See catalogues of *Political and Personal Satires* (Brit. Museum) by D. M. George; also Champfleury, *Histoire de la Caricature*; C. R. Ashbee, *Caricature*, 1928; R. Davis, *Caricature of To-day*, 1928; E. H. Gombrich and E. Kris, *Caricature*, 1940; Werner Hofmann, *Caricature*, 1957.

Caries, destruction of bone by inflammation. In its acute form it may be due to injury or infection from almost any pyogenic organism. In its chronic form it is usually tubercular in origin, and more

rarely syphilitic. It may occur in any bone, but most commonly in the spine. The affected vertebrae collapse as the bone gradually ulcerates away and a twisted and bent spine results. The 'hunchback' deformed person is not the common sight now that he was 30 years ago owing to earlier treatment of these conditions (see TUBERCULOSIS). Dental C. (see DENTISTRY), chronic decay of the teeth.

Carigara, tn on C. Bay on the coast of Leyte, Philippine Is. It is a port of call for steamers coming from Manila. Pop. 26,803.

Carignan (formerly Yvois), Fr. tn in the dept of Ardennes, on the R. Chiers. There are woollen manufs. Pop. 1700.

Carignano, It. tn, in Piedmont (q.v.), 10 m. SW. of Turin (q.v.). It gives its name to a branch of the House of Savoy (q.v.). Pop. 6800.

Caribós, one of the original tribes of Brazil. When the Portuguese colonised Brazil they received them and were not hostile in any way. Later on, however, they rose when attacked, and this led to their almost total extermination.

Carillon, set of bells, tuned to the intervals of the chromatic scale, and providing a compass of not less than 2 octaves (25 bells). They are hung rigidly in a frame and struck by clappers suspended within them, and pulled against the surface of the bells by wires and levers connected to a machine, or to a keyboard (clavier) which is played by a carillonneur. The keyboard also has foot-pedals for the larger bells, similar to an organ. In some parts of Europe C. playing has for cents. been important. There are famous C.s in the Netherlands. As a war memorial the idea of installing keyboard C.s was adopted after 1918 at Loughborough and at Wellington (New Zealand). C. music exists mostly in MS. Schott, in 1862, pub. an important selection of preludes, fugues, and minuets from the works of Matthias van den Gheyn (1721-85), which was ed. by van Elweyck in collaboration with the organist Lemmens. In more recent years, J. Denijl and J. A. F. Wagenaar wrote specially for the C. Elgar composed a special *Memorial Chime* for the opening ceremony of Loughborough C. in 1923. C. music must exhibit an intimate knowledge of a special technique. Two-part writing, with clearly defined harmonic suggestion, is regarded as the most effective. A school of C. playing was inaugurated at Malines (or Mechlin) in 1922 with Denijl as director. See also BELL and CHIME.

Carilocus, see CHARLIEU.

Carina, or Keel, term applied to the lower petals of a papilionaceous flower, e.g. pea or laburnum, which are fused together and form a boat-shaped structure.

Carinaria, genus of pelagic gastropod mollusc, is to be found in tropical seas and the Mediterranean. The shell is shining in appearance, small and conical in shape, the foot is long and the visceral sac is small. *C. mediterranea* is a common species.

Carinatae, larger of the 2 groups of

living birds, the other being the *Ratitae*, e.g. emus and ostriches. It receives its name from the fact that the sternum is always keeled except in flightless forms, e.g. dodos, but nearly all the species have well-formed wings capable of flight. See BIRD.

Carini, tn in Sicily (q.v.), overlooking the NW. coastal plain, 10 m. W. of Palermo (q.v.). It has a Gothic castle. Pop. 16,000.

Carinthia (Ger. *Kärnten*), prov. of S. Austria, bordered on the S. by Italy and Yugoslavia. In Rom. times part of the prov. of Noricum (q.v.), its inhab., the Carni, were overwhelmed by the Slavs (c. 6th cent.). Charlemagne (q.v.) annexed it to the Frankish Empire, and it finally came to the archdukes of Austria in 1335. After the First World War small portions of C. were ceded to Italy and Yugoslavia (see ST GERMAIN-EN-LAYE and TRIANON, Treaties of). The prov. is very mountainous; in the N. are the Noric Alps, and the S. is formed of the Drau Mt Chain. Grossglockner (12,460 ft) in the NW., belonging to the Hohe Tauern, is the highest peak in Austria. The R. Drau crosses the prov. E.-W., and there are nearly 200 lakes, of which the largest are Wörther, Millstätter, Ossiacher, and Weissen. The chief occupations are stock-raising, forestry, and mining (iron, lead, zinc, and coal). There are metallurgical, textile, and chemical industries, and hydro-electric installations, and there are numerous tourist resorts. The prin. tns are Klagenfurt (the cap.) and Villach (qq.v.). Area 3680 sq. m; pop. 474,750.

Carinus, Marcus Aurelius, Rom. emperor AD 283-4, son of Carus, and Governor of W. Empire under him. He fought against Ger. tribes, then returned to Rome and luxury. On the death of C.'s brother, Numerian, Diocletian was proclaimed emperor in Moesia. C. won a battle against Diocletian on the Margus, but was afterwards killed by his own soldiers.

Carisbrooke, part of the bor. of Newport (q.v.), Isle of Wight, in Hants, England. It lies SW. of the tn centre, and was once the cap. of the is. C. Castle, partly in ruins, is the distinguishing feature of the vil. It dates back to very early times, and was the scene of the imprisonment of Charles I for a time.

Carissa, genus of thorny shrubs of the order Apocynaceae, found in Asia, Australia, and Africa. *C. carandas*, Christ's thorn, or the carandas-tree, is used for fencing in India, and the edible fruit is pickled, preserved, or eaten raw. *C. xylocaron*, the bitter-wood, is a native of Madagascar.

Carissimi, **Giacom** (1605-74), It. musician. He was chapel master at the church of Sant' Apollinare in Rome, and is famous for his reform of the recitative, and for being practically the inventor of the cantata. His music is distinguished by its pure style and its exquisite melodies, while among his followers may be numbered such men as Bassani and Alessandro Scarlatti. He wrote a number

of oratorios and cantatas, the most famous among the former being *The Sacrifice of Jephthah*.

Caritat, Marie Jean Antoine Nicolas, see CONDORET, MARQUIS DE.

Carl Rosa Opera Company, formed by Carl August Nicolas Rosa (q.v.) in 1873. It became the foremost private travelling repertory opera company in the Brit. Isles.

Carl Sunday, see CARE.

Carlén, Emilie Flygare- (1807-92), Swedish novelist, b. Strömstad. In 1827 she married Dr Flygare. She was left a widow after about 6 years, and she then began her literary career, writing *Waldemar Klein* in 1835. Shortly after this she married Johan Gabriel C., a poet, and settled in Stockholm. Among her works, many of which have been trans. into English, are *Fosterbroderne*, 1840, *Rosen på Träskön*, 1842, and *Pål Värning*, 1844. Most of her novels are set in the W. coast of Sweden. See A. Kjellén, *E. Flygare-Carlén*, 1932.

Carlentini, tn in Sicily (q.v.), 21 m. NW. of Syracuse (q.v.). It is named after its founder, the Emperor Charles V (q.v.). Pop. 9000.

Carleton, Will (1845-1912), Amer. poet, b. Hudson, Michigan, son of a farmer. He became a journalist, and in 1871 wrote 'Betsy and I are Out,' which was pub. along with other poems in *Farm Ballads*, 1873. Three other vols. of country verses followed, and after moving to Boston he wrote *City Ballads*, 1885, and other collections inspired by town life.

Carleton, William (1794-1869), novelist, b. Prillak, co. Tyrone. Settling in Dublin, he wrote short stories which were collected in *Traits and Stories of the Irish Peasantry*, of which there were 2 series, in 1830 and 1832. Of his longer novels the best is *Pardorougha the Miser*, 1837. See D. J. O'Donoghue, *The Autobiography and Life of Carleton*, 1896.

Carli, or Carli-Rubbi, Giovanni Rinaldo, Count (1720-95), It. political economist and antiquary. The Senate of Venice made him prof. of astronomy and navigation, 1744-50. He persuaded Joseph II to abolish the Inquisition. His most famous work is *Delle monete e dell' istituzione delle zerche d'Italia*, on the coins of Italy (1754-60).

Carlile, Richard (1790-1843), free-thinker and radical, a reformer, b. Ashburton, Devon, the son of a shoemaker. He was educ. at the vil. school, and became a journeyman tinman in London. There he became an extreme radical, and underwent sev. terms of imprisonment for publishing various suppressed books, including those of Thomas Paine, and also for his work in numerous pamphlets and newspapers which were regarded as seditious. C.'s activities did a great deal towards securing the freedom of the press, and though he himself was imprisoned, his pubs. were never suppressed. Cobbett and others, however, deprecated the idea of establishing the theological or even the medical freedom of the press as mischievous. See G. A. Aldred, *Richard Carlile, Agitator*, 1923.

Carlile Wilson (1847-1942), founder of the Church Army (q.v.), b. Brixton of Scottish descent on his father's side; educ. at the London College of Divinity. In early life he entered business, travelled much on the Continent, and studied music. He was influenced by the Moody and Sankey mission of 1875, and in 1880 was ordained in the Church of England. Two years later, while working in the slums of Westminster, he founded the Westminster Mission, from which the Church Army developed. A breakdown in health caused him to accept a living at Netteswell, Essex, in 1891, but a year later he became rector of St Mary-at-Hill, London, where he remained until his retirement in 1926. His evangelistic and social work grew in value, and in 1896 the Church Army mission was carried to prisons and reformatories. In 1906 C. became prebendary of St Paul's Cathedral, and shortly after travelled on the Continent to study labour conditions, publishing on his return *The Continental Outcast*. After the First World War, during which the Church Army did notable work, the movement spread overseas, taking root particularly in the U.S.A., which C. visited in 1926. Awarded C.H., 1926; Hon. D.D., Oxford Univ., 1915, and Toronto Univ., 1926. C. had outstanding gifts of leadership and organisation, and as founder and hon. chief secretary of the Church Army his active missionary work did not cease until his death. Pub. *The Church and Conversion*, 1882, *Spiritual Difficulties*, 1885, *Baptism of Fire*, 1907. See Sidney Dark, *Wilson Carlile*, 1944.

Carlina, genus of Compositae, spreads over Europe to the middle of Asia. *C. vulgaris*, the carline thistle, is a native of Britain; it has the curious habit of opening widely in dry weather, and in wet seasons the white inner leaves of the surrounding bracts cover over the flower-heads, leaving the prickly outer bracts exposed to the rain. *C. acaulis*, the weather thistle, is abundant in the Alps and has the same characteristic action. The purgative obtained from the roots is used in veterinary practice.

Carlign, Sir John (1828-1911), Canadian statesman and capitalist, b. London, Ontario. His father, Thomas C., was a native of Yorks, and left England for Canada in 1818. In 1862 he held the post of receiver-general of Canada, and later became commissioner of agriculture and public works. He was afterwards minister of agriculture, and in 1882 post-master-general. He also founded the Agric. College in Ontario. K.C.M.G. in 1893.

Carlingford, seaport and mkt tn of the co. of Louth, in the prov. of Leinster, Rep. of Ireland. It stands amid fine mt scenery on the bay, or lough, of the same name, and has many historic associations. King John's Castle and Taafe's Castle are both of interest, and there are the ruins of a 14th-cent. Dominican priory Pop. 600.

Carlingford Lough, part of the Irish Sea at the mouth of the R. Newry,

between eos. Louth and Down. It is 10 m. long and 2 m. wide, and can accommodate the largest ships.

Carlisle, Sir Anthony (1788-1840), surgeon, b. Stillington, Co. Durham, first apprenticed to practitioners in York and Durham, then studied under John and Wm Hunter in London. Member of College of Surgeons, and surgeon-extraordinary to the prince regent (George IV); 1793-1840, surgeon to Westminster Hospital; F.R.S., 1800, contributing various treatises on physiology; 1808-26, lectured on anatomy at Royal Academy; knighted, 1821; became president of the College of Surgeons, 1829. C. introduced the thin-bladed, straight-edged amputating knife. His writings were largely on anatomy; also on artistic and scientific subjects. One pamphlet, written in collaboration with W. Nicholson in 1801, was on galvanic electricity. See T. J. Pettigrew, *Medical Portrait Gallery*, ii, 1840; J. F. Clarke, *Autobiographical Recollections of the Medical Profession*, 1874.

Carlisle, George William Frederick Howard, 7th Earl of (1802-64), Eng. statesman, educ. at Eton and Christ Church, Oxford. In 1826 he went to Russia, and in the same year was elected to Parliament. From 1835 to 1841 he was chief secretary for Ireland, and in 1850 was made chancellor of the Duchy of Lancaster. In 1855 Lord Palmerston appointed him lord-lieutenant of Ireland, an office he held till 1858 and from 1859 to 1864. He had succeeded to the earldom in 1848.

Carlisle (Rom. Luguvaillum, Brit. Caer Luel), parli., city, and (1914) co. bor., cap. of Cumberland, England, stands on a fertile tract of land about 10 m. from the Scottish border on gently rising ground surrounded on 3 sides by the Rrs. Eden, Caldew, and Petteril. It is on the NW. line of communication from England to Scotland by road and also an important railway junction with many lines converging into it. It is also the centre of an efficient local and long-distance bus service. The city is just S. of Hadrian's Wall from the Tyne to the Solway Firth; it was once a Rom. civil settlement—the great cavalry fort of Petriana being half a m. distant on the N. side of the riv. During the Dan. invasions it was attacked and burnt and lay in ashes until the coming of the Normans. Wm Rufus realised the importance of a place lying so near to the N. frontier of his kingdom and gave orders for its rebuilding. He also caused a keep and walled enclosure to be erected (1092). By 1170 the castle, further enlarged and strengthened, was playing its part both in the continuous border warfare, that only ceased with the Union, and also in greater national struggles—particularly in the Civil war when it was besieged and captured by the parli. forces under Gen. Lesley. Edward I held his last Parliament in the castle and Mary Queen of Scots was kept here for some time, virtually a prisoner, by Elizabeth. In 1745 it surrendered to Prince Charles Edward, but was quickly

retaken by the Duke of Cumberland. At the beginning of the 19th cent. great portions of the castle were pulled down (amongst them the banquetting hall where Edward I had held his Parliaments). As it now stands it is in the care of H.M. Office of Works and is used as barracks and depot for troops of the Border Regiment. It also serves as the museum for the Border Regiment—the old 34th (Cumberland) and 55th (Westmorland) Regiments. The bishop's see was founded by Henry I in 1133 and included the eos. of Cumberland, Westmorland, and regions of Lancs, lying N. of Morecambe Bay. The cathedral, originally the church of an Augustinian priory, built between the years 1092 and 1419, was once a noble edifice, cruciform in shape, but since the time of the Civil war, when the greater part of its Norman nave was pulled down and the stones used for military purposes, it has had the truncated appearance it now presents. It has a beautiful Early Eng. choir whose clustered columns have their capitals decorated with carved figures and flowers representing the occupations of the months of the year. The choir stalls with their carved miserere seats are surmounted by graceful tabernacle work. The E. window, measuring 80 ft by 30 ft and having 9 lights filled in with beautiful tracery, is considered to be the finest Decorated window in the kingdom.

The chief streets lead from the marketplace in front of the tn hall. There are sev. interesting public buildings and institutions, including the old Guildhall, a well-equipped modern public library, and also a splendid museum and art gallery—the museum being rich in Rom. remains and having one of the best natural hist. collections to be found in the provs. C. grammar school was founded in 1170. The city is engaged in a great variety of industries, of which the chief are the manufacturing of textiles—calico, cretonnes, muslins, voiles, artificial silks, and Cumberland tweeds—also of carpets, hats, biscuits, sweets, tin boxes, and cranes. The centre of a large agric. area, it has also important live-stock markets. By the Licensing Act of 1921 the wholesale and retail licensed trade of Carlisle was transferred to the home secretary. With the object of supplying all reasonable demands, whilst at the same time taking all possible care to avoid excess, the number of licensed houses was reduced and the others greatly improved—food being provided and served in rooms set apart for the purpose. The inns are in the care of managers with a district manager as head. The results of the scheme as far as C. is concerned are good. The pop. of the city and co. bor. in 1961 was 67,894. It sends 1 member to Parliament.

Carlisle, bor. in Cumberland co., Pennsylvania, U.S.A., about 19 m. from Harrisburg. Dickinson College was founded here in 1783, and there is also a school for Amer. Indians. Pop. 16,812.

Carlists, name given to the followers

of Don Carlos de Bourbon (1788-1855) and his successors, who in turn laid claim to the Sp. throne. Don Carlos was the brother of Ferdinand VII (1784-1833). In 1830 Ferdinand was persuaded by his queen to alter the existing Salic law and appoint his infant daughter as his successor, to the exclusion of Don Carlos, Carlos refusing to acknowledge the legality of this action. On Ferdinand's death intermittent civil war broke out, the constitutional party supporting the infant queen, the absolutists (and the Basques) Don Carlos. In 1840 Don Carlos's defeat was obvious. He *d.* in 1855; his son Carlos succeeded to his claim, but was expelled from France, and took no part in the abortive Carlist risings of 1846 and 1848. In 1860 he and his brother Ferdinand landed at Catalonia, but were captured and only saved their lives by a humiliating surrender of their pretensions. Their brother John now put forward his candidature, afterwards resigning it to his son, Don Carlos VII, who raised a Carlist war in 1872, and for a time had some success, but was finally driven out of the country in 1876. His son Don Jaime was subsequently recognised as the legitimate pretender, but the recognition had no practical results. There was a slight resurgence of Carlism during the Sp. Civil War, owing to the somewhat unexpected adherence of the Basque Nationalist and Catholic party to the Rep. Gov., but it is unlikely that any Carlist claimant would now find acceptance in Spain.

Carloforte, see SAN PIETRO.

Carloman: 1. Son of Charles Martel and brother of Pepin. He succeeded his father in 741, and, with Pepin, repelled the Ger. invaders in 743. C. advanced into Saxony and captured the Duke of Saxony. Later he entered a Benedictine monastery.

2. Younger brother of Charlemagne, with whom he unsuccessfully contested the Frankish kingdom. He *d.* in 771.

3. Second son of Louis II, whom he succeeded in 879. Proclaimed sole King of France on the death of his brother, Louis III. Killed while boar-hunting, 884.

Carlos I (1863-1908), King of Portugal, succeeded his father Luiz I in 1889. He was a lover of peace, and encouraged literature (he was the author of the best trans. of Shakespeare in the Portuguese language), science, and art, but the latter part of his reign was disastrous, owing to the policy of his chief minister, Senhor Franco. The king and his eldest son were assassinated in Lisbon, 1 Feb. 1908.

Carlos, Don (1545-68), Sp. prince, son of Philip II of Spain, showed signs of mental instability in his childhood. After an accident in 1562 the prince's derangement became more violent, and his vicious life caused much scandal. In 1567 he was put under restraint and *d.* in somewhat suspicious circumstances 6 months later. Sev. writers, including Schiller (q.v.) and Alfieri, have founded dramas upon the prince's mysterious death.

Carlota, La, Sp. tn in the prov. of

Córdoba, with manufs. of linen. Pop. 8900.

Carlovingians, or **Carolingians**, Fr. dynasty, named after its greatest monarch Carolus Magnus (Charlemagne, q.v.). About the year 623 Clotaire II, one of the Merovingian kings, gave his son Dagobert the kingdom of Austrasia (roughly speaking Lorraine and Franconia), with Pepin as mayor of the palace, whose grandson Pepin d'Héristal made himself master of both Austrasia and Neustria in 687, though he did not assume the royal title. His son, Charles Martel (q.v.), seized the reins of gov. on his father's death, and became renowned as a warrior and administrator, but still contented himself with being mayor of the palace to the nominal king. His son, Pepin le Bref, deposed King Childeric III and became king, reigning from 751 to 768. He was succeeded by his son, Charlemagne, one of the greatest monarchs in European hist., both as conqueror and ruler. Extending his kingdom across the Pyrenees to the Ebro, eastward to the Elbe, the Bohemian Mts, and even to Croatia and Dalmatia, and southward to Naples, he was crowned (800) by Pope Leo III as head of the Holy Rom. Empire. Charlemagne's son, Louis le Debonnaire, shared his domains between his sons, Charles II taking France (840). Forty years later Charles III reunited the empire but was deposed by Odo of Paris, and though there were other Carlovingian monarchs their authority was little more than nominal. The dynasty in France ended with Louis V, who was succeeded by Hugh Capet (987), though in Germany Carlovingians ruled as kings until 911.

Carlow: 1. Co. of the Rep. of Ireland in the prov. of Leinster, with an area of some 349 sq. m., mostly arable. It is bordered by the Blackstairs Mts in the SE. (Mt Leinster, 2610 ft.), the rest of the co. being level or undulating. Chief tns are C. Tullow, and Muine Bheag. C., with Kilkenny, returns 5 members to the Dail. Pop. 34,000.

2. Municipal bor., chief tn of above co., on R. Barrow, about 50 m. from Dublin. It is the seat of the Catholic Bishop of Kildare and Leighlin. Ruins of an Anglo-Norman castle dating from 1180 can be traced. There are flour mills, and C. forms the centre of a large sugar-beet industry; granite rock is found near by. St Patrick's College was founded in 1795; in 1798 Irish rebels attacked the tn, but were repulsed. Pop. 7500. See J. Ryan, *History and Antiquities of Co. Carlow*, 1833.

Carloway, Doon of, remains of a circular tower at C., a tn of Ross-shire, on the is. of Lewis in Scotland.

Carlowitz, see SREMSKI KARLOVCI.

Carlsbad, see KARLOVY VARY.

Carlshamn, see KARLSHAMN.

Karlskrona, or **Karlskrona**, fortified seaport and naval station of Sweden, on 5 rocky is. in the Baltic, which are connected together and with the mainland by 14 bridges. It was founded in 1680 by Charles XI. It has a magnificent harbour with a naval arsenal and dockyard. Pop. 33,552.

Carlsruhe, see KARLSRUHE.

Carlstad, see KARLSTAD.

Carlstadt, Andreas Rudolf Bodenstein at (1480-1541), Ger. theologian, b. Karlstad; prof. of Wittenberg Univ. While studying theology in Rome he became imbued with the same doctrines as Luther. His views, however, were more advanced than the latter's, and the two found themselves in opposition, as C. denounced the practices of the Church without limit. Accused of taking part in the peasants' revolt, he fled to Switzerland about 1525.

Carlton, tn 3 m. from Nottingham, England, with a pop. of 34,360 principally engaged in mining and railway industries.

Carlton Club, founded by the Duke of Wellington in 1832, and famous as the stronghold of Conservatism. The original building, 94 Pall Mall, was designed by Sir Robert Smirke, but was destroyed by enemy action in 1940, and the club is now housed at 69 St James's Street. In 1922 the club was the scene of an historic meeting of the leading Conservative members of Parliament and others, when one section, under the lead of Austen Chamberlain, decided to continue to support Lloyd George and the Liberal wing of the Coalition party, and another section, comprising the larger body, broke away and decided to throw in their fortunes with Bonar Law, who became Prime Minister. See CLUBS.

Carlruke, tn of Lanarkshire, Scotland, about 5 m. NW. of Lanark. The basic industries are agriculture and horticulture (particularly soft fruits and flowers), though formerly the area was a centre for coal and ironstone mining. Pop. (tn) 8000; (par.) 11,400.

Carlyle, Alexander (1722-1805), Scottish minister. He took his degree at Edinburgh Univ. and afterwards went to the univs. of Glasgow and Leyden. In 1748 he became minister of Inveresk, a position which he held for the rest of his life. He adopted the views of the writer John Home, one of his friends (and was censured for attending Home's *Douglas*, 1757), and favoured the moderate party in the Church. He numbered among his friends Smith and Hume (qq.v.). He was nicknamed 'Jupiter' C., on account of his fine presence and bearing. Moderator of the General Assembly. His *Autobiography* was pub. in 1860.

Carlyle, Alexander James (1861-1943), Scottish historian, educ. at Glasgow and Oxford Univs. He was curate of St Stephen's, Westminster, 1888. Secretary to S.P.C.K., 1890-1; rector of St Martin's and All Saints', 1895; became chaplain and lecturer in political science and economics at Univ. College, Oxford. In Aug. 1930 he was made canon of Worcester. His prin. work (written in collaboration with his brother, Sir R. W. C.) is *History of Medieval Political Theory in the West* (6 vols.) 1922-30.

Carlyle, Jane Baillie Welsh (1801-66), wife of Thomas C. (q.v.), b. near Haddington, the daughter of Dr John Welsh; among her ancestors were John Knox and Sir Wm Wallace. As a girl she was a pupil of Edward Irving (q.v.), who in 1821 introduced her to C.; they became

great friends, and their friendship ripened into a stronger feeling. He was, however, in poor circumstances; Mrs Welsh also discouraged his wooing, and a formal engagement was long postponed, but the wedding finally took place in Oct. 1826. For years C.'s income was small, and his wife, who was not used to hardships of which he made light, suffered in health and spirits. After sev. changes of residence, between Edinburgh and Craigenputtock, they removed in 1834 to London, and settled down in Cheyne Row, Chelsea. All household anxieties fell on her, and she suffered much from loneliness while he was entirely engrossed in his books. He failed to notice this, and though kind in great things, often vexed her in little ones. They were warmly attached to each other, but both too nervous and highly strung for a peaceful union. In 1863 Mrs C. was hurt in a cab accident, and the shock brought on serious results. Her husband, greatly troubled, did all he could to give her every comfort she required, but in 1866 she d. suddenly in her own carriage, and the shock completely overpowered him. See *Letters and Memorials of Jane Welsh Carlyle*, prepared for pub. by Thomas C., and ed. by J. A. Froude (3 vols.), 1883; *New Letters and Memorials*, ed. by Alexander C. (2 vols.), 1903; *Letters to her Family*, ed. by L. Huxley, 1924; *Letters to Joseph Neuberg, 1848-62*, ed. by T. Scudder, 1931; also life by T. Scudder, 1939.

Carlyle, John Aitken (1801-79), doctor and translator, younger brother of Thomas C. b. Ecclefechan. After studying medicine at Edinburgh and in Germany, he tried to establish a practice in London, but failed; he then obtained a post as private physician first to the Countess of Clare and afterwards to the Duke of Buccleuch. In 1843, having saved a moderate competency, he settled near his brother, and devoted himself to literature. He began a prose trans. of Dante's *Divina Commedia*, but only completed the *Inferno*, his rendering of which (pub. 1849) was highly praised; he also ed. Dr Irving's *History of Scottish Poetry*, 1861.

Carlyle, Thomas (1795-1881), historian and man of letters, second son of James C. by his second wife, b. Ecclefechan, Dumfriesshire. After acquiring the rudiments of education from his parents, he went for a time to the par. school, and then, in 1805, to the Annan Academy, where for the first 2 years at east he was profoundly unhappy, finding his only comfort in omnivorous reading. He matriculated at Edinburgh Univ. in 1809, and there he remained until 1813, when he came down without taking a degree. It was at this time that he began to prepare himself to take orders in the Church of Scotland, supporting himself the while by teaching. In 1814 he obtained the post of mathematical master at Annan Academy at a salary of about £80 and during the 2 years he was there he decided that he had not a call to the ministry. From Annan he went to Kirkcaldy to take up a somewhat better paid position as assistant master at

the par. school. There he became intimate with Edward Irving (q.v.), who was at this time head of a school in the same town, and fell in love with one of Irving's pupils, Mary Gordon, the 'Blumine' of *Sartor Resartus*. The friendship endured, but the love affair was nipped in the bud. By Nov. 1818, C. had come to the conclusion that schoolmastering was the most detestable occupation in the world, and, having saved £70, he threw up his post, and went with Irving to Edinburgh. It was his intention to become a lawyer, but he soon tired of the study of the law, and abandoned all desire to enter that

E.N.A.

THOMAS CARLYLE

profession. He contrived to pay his way by giving private lessons. Here he made his first plunge into authorship, writing articles for the *Edinburgh Encyclopaedia*. Irving in 1821 introduced C. to Jane Baillie Welsh (see CARLYLE, J. B. W.), with whom Irving was in love, and whom he desired to marry if he could obtain his release from his engagement contracted earlier with a Miss Martin. C. was kept in ignorance of the state of affairs, and he too fell in love with the girl. C. in 1822 became tutor to Charles and Arthur Rallier, both of whom acquired some distinction in the world, at what seemed to him the splendid salary of £200 a year. C. had soaked himself in Ger. literature for some years past, and these studies dictated his earlier works, *The Life of Schiller*, which, after appearing serially in the *London Magazine* in 1823 and 1824, was pub. in 1825; and *Wilhelm Meister's Apprenticeship*, a trans. of Goethe's novel, 1824. With Irving he had visited London in 1824, and made some acquaintances in literary circles; and after his return he persuaded Miss Welsh to become his wife.

They were married on 17 Oct. 1826, and settled in Edinburgh, furnishing on the proceeds of *German Romance*, comprising trans. from Musaeus, La Motte Fouquet, Tieck, Hoffman, Richter, and Goethe. He now depended entirely for his livelihood on his pen, and he was so fortunate as to secure admittance in 1827 to the *Edinburgh Review*, his first contribution being an essay on Jean Paul Richter. Soon he was in full work, writing for the prin. periodicals, the *Foreign Quarterly*, the *Westminster Review*, and *Fraser's Magazine*. It was in the last-named that in 1833-4 *Sartor Resartus* appeared, but it was so little popular that it was not until 4 years later he could find anyone to bring it out in book form. In the summer of 1834 he took up his residence at No. 24 Cheyne Row, Chelsea, London, and there he wrote *The French Revolution*, which appeared in 1837. He eked out a meagre income by delivering courses of lectures on Ger. literature, Heroes, Hero-worship, and the Heroic in History, and other subjects, but he hated the work, and was relieved when Mrs C. came into her mother's small fortune in 1842, and he could devote himself exclusively to his books. He pub. *Past and Present* in 1843, and 2 years later gave to the world the epoch-making *Cromwell's Letters and Speeches*. *Latter-day Pamphlets* was issued in 1850, and the *Life of John Stirling* in the following year. He now devoted the greater part of his time to the composition of *Frederick the Great*, the first vol. of which appeared in 1853, and the last in 1865. Long before this he had been recognised as one of the leading men of letters in the kingdom, and a proof of the high esteem in which he was held was forthcoming in 1865, when he was nominated against Disraeli as a candidate for the office of lord rector of Edinburgh Univ., and was elected by 657 to 310 votes.

The death of his wife from heart disease, while driving in Hyde Park, in April 1866, caused him much grief, and the rest of his life was embittered by the knowledge, which came to him too late, that he had, by his perverse ways and cross-grained temper, caused her great distress. He ed. her *Letters and Memorials*, but those were not pub. until 2 years after his death. He was much pleased when in 1874 the Prussian Order of Merit was bestowed on him, a compliment singularly appropriate, since Frederick the Great founded the order. In the same year Disraeli offered him the choice of a baronetcy or the Grand Cross of the Bath; this touched him greatly, for, as he said, Disraeli was the only man of whom he had always spoken with contempt. The letters exchanged on this occasion were worthy of the writers. C. refused both honours, but he thought more kindly of the statesman ever after. He d. on 4 Feb., and a burial service at Westminster Abbey was offered, but, in accordance with his wish, his remains were interred at Ecclefechan. C. won his place in the world of letters with difficulty. *Sartor Resartus*, his first important work, the fantastic gospel of

clothes, set more people against him at the time of its pub. than it is easy now to conceive. *The French Revolution*, too, had its detractors, the true Carlylean style, in spite of its brilliance, annoying the critics. Yet the style was the man. No man could acquire such a style, it was born with him, and his imitators, who at one time were numerous, have paid the penalty of oblivion for their attempts to ape the master. 'His faults of style,' said that discerning critic, Leslie Stephen, 'are the result of the perpetual straining for emphasis of which he was conscious, and which must be attributed to an excessive nervous irritability seeking relief in strong language, as well as to a superabundant intellectual vitality.' C. saw things so vividly that he was compelled to try to portray them vividly, and the conventional styles giving him no outlet, he made a style for himself. *The French Revolution* marked him out as a writer of importance, and this impression was confirmed by his *Cromwell*, in which he gave a new, and probably truer, conception of the Protector's character. The 14 years' labour that it took to produce *Frederick the Great* produced a work second only, if indeed second, to the *French Revolution*. As a picturesque historian C. has no equal. He had knowledge, as a matter of course; he had virility, and he had the power to convey his thoughts in a fashion so vivid that to read him once is never to forget him.

It has been said that all C.'s powers of persuasion as a religious teacher were devoted to that paganism of Christianity which was the cultural aim of Nazism, coupled with inculcation of Carlylean hero-worship, 'burning and boundless,' for a leader. Certainly violence was irresistibly attractive to him. He praised it whether it showed itself in the excesses of a mob, in Cromwell's Irish massacres, in Frederick's ruthless meanness, or in events in his own lifetime. As the critic Desmond MacCarthy observes, 'Though a tender-hearted man himself, there was a disagreeable amount of aesthetic cruelty in his make-up, and the gleams of beauty and of fantastic humour, cosmic and human, which give his writings their value, are combined with much insincere rhetoric.' His guiding principle in the interpretation of of hist. was: 'Right must triumph; therefore might must be right. He tried to read that into hist. and his own faith depended on success. He was greatest as an historian, and *The French Revolution* was, by universal consent, his greatest hist. To quote Prof. G. M. Trevelyan, 'its humour, its pathos, its trenchancy, its dramatic power and insight into human nature, make it one of the greatest, though certainly the strangest of histories. It lacks very much that later histories of the revolution have got. But it has got those qualities they all lack.' The prin. authority for C.'s life is his *Reminiscences*, ed. by J. A. Froude (1881) and in a better ed. by C. E. Norton (1887), who also ed. the *Correspondence* with Emerson (1883), with Goethe (1887), and *Letters*

of Thomas Carlyle, 1826-36 (1888). Froude's *Life* (4 vols.), 1882-4 is not wholly reliable. See also R. Garnett, *Life of Thomas Carlyle* (with bibliography), 1887; A. Carlyle (ed.), *Love Letters of Thomas Carlyle and Jane Welsh*, 1909; the monumental *Life of Carlyle* by D. A. Wilson (6 vols.), 1923-34; C. F. Harrold, *Carlyle and German Thought, 1819-34*, 1934; J. Symonds, *Thomas Carlyle*, 1952.

Carlyle, Thomas (1803-55), jurist, b. Kirkcudbrightshire, was called to the Scottish Bar in 1824, and acted as defendant's counsel in the Campbell heresy trial, 1831. Joining the Irvingite church in 1832, he was in 1838 appointed 'Apostle' to N. Germany, and during his residence there wrote his *Moral Phenomena of Germany*.

Carmagnola, Francesco Bussone, Count of (1390-1432), It. *condottiere*, b. at Carmagnola in Piedmont. He entered the service of Filippo, Duke of Milan, who raised him to the rank of count and made him governor of Genoa. His success in the field roused the duke's jealousy, and before long there was a coolness between them, ending in a definite rupture. C., in revenge, offered his services to the Venetians (1425). He defeated the duke's army at Maclodio, and took Brescia from him. After this peace was made, lasting for 1 year. On the renewal of hostilities C. again took command, but he was also in communication with the duke, who tried to seduce him by bribes. His indifference resulted in reverse and failure, and the senate, tired of his duplicity, enticed him to Venice, where he was brought before the Committee of Ten, tried, tortured to extort a confession of guilt, and beheaded.

Carmagnola, It. tn. in Piedmont (q.v.), on the Po (q.v.). It has an anct printing industry, and is in a dist. producing mint and hemp. Pop. 12,000.

Carmagnole (from Carmagnola, N. Italy): 1. Peasant costume of Piedmont and the Midi, carried by S. revolutionaries to Paris in 1793.

2. Wild song and dance which went with the costume, and were very popular with the revolutionaries during the Terror in Paris. The refrain of each verse was:

Vive le son, vive le son,
Dansons la Carmagnole, vive le son du canon!

Carman, William Bliss (1861-1929), Canadian poet, b. Fredericton, New Brunswick. He was related on his mother's side to R. W. Emerson. Educ. at the collegiate school of Fredericton, and the univs. of New Brunswick, Edinburgh, and Harvard, he became a journalist, and from 1890 to 1892 was office editor of the *New York Independent*. His chief poetical publs. were *Low Tide on Grand Pré*, the earliest and perhaps the best, 1893; *Ballads of Lost Haven*, 1897; *Songs from Vagabondia* (with Richard Hovey), 3 collections, 1894, 1896, 1900; *Behind the Arras*, 1895; *A Winter's Holiday*, 1899; *Christmas Eve at St*

Kavin's, 1901; *Ballads and Lyrics*, 1902; *The Word at St Kavin's*, 1903; *Songs from a Northern Garden*, 1905; *The Rough Rider*, 1909; *April Airs*, 1916; *Later Poems*, 1921; *Far Horizons*, 1926; *Wild Garden*, 1929. In a prose work, *The Kinship of Nature*, 1904, he developed his philosophy of nature-worship. In April 1929 the Royal Society of Canada awarded him the Lorne Pierce medal for contributions to Canadian literature. See J. Cappon, *Bliss Carman and the Literary Currents and Influences of his Time*, 1930; and studies by O. Shephard, 1923, and M. Miller, 1935.

'*Carmania*,' steel turbine steamer, triple screw, owned by the Cunard line. It was built by J. Brown & Co. Ltd. of Glasgow, in 1905, and launched at Clydebank. Length 650 ft, breadth 72 ft, speed 20 knots. As an armed merchant ship, it was severely damaged in action with the Ger. armed merchant ship *Cap Trafalgar* in the S. Atlantic in Sept. 1914, when the Ger. ship was sunk. After the war it was refitted and operated in the Liverpool-New York and London-Boston-New York service until 1931. It was sold to ship-breakers in 1932.

Carmarthen, co. tn of Carmarthenshire, Wales, on the R. Towy, 9 m. N. of Kidwelly. Formerly the Rom. *Maridunum*, the tn is largely modern, with remains of the Norman castle. It is the only Welsh tn which possesses a state sword, carried before the mayor on all civic occasions. Once it was the prin. centre of the Welsh wool trade. Made a parl. bor. in the 16th cent., C. now gives its name to one of the 2 parl. areas into which Carmarthenshire is divided. Pop. 12,120.

Carmarthen Bay, large opening on the S. coast of Wales; chief tns Tenby (Pembrokeshire) and Llanelly. See also PENDINE.

Carmarthenshire, co. of S. Wales, bounded E. by Brecon and Glamorgan, W. by Pembroke, N. by Cardigan, and S. by the Bristol Channel. The co. has Brit. and Rom. remains, and Carmarthen, the co. tn, was formerly the Rom. *Maridunum*. There are numerous grassy hills, mostly under 1000 ft; within the Brecon Beacons National Park on the E. border of the co. Carmarthen Van, in the Black Mts, rises to 2632 ft; in the N. is Mynydd Mallaen (1430 ft). The chief rvs. are the Towy, Taf, and Telft; along the coast are extensive sands and marshes. The valleys are fertile, and the hillsides afford good pasturage. Dairy-farming, stock-raising, and some woollen milling are carried on, while coal-mining, iron-founding, and smelting are the industries of the SE., Llanelly being a centre for tinplate and steel manufs. C. is divided into 2 parl. divs., Carmarthen and Llanelly, each returning 1 member. Area 918 sq. m.; pop. 171,100.

Carmathians, see KARMATHIANS.

Carmaux, Fr. tn in the dept of Tarn, on the Cérou. It is in a coal-mining dist., and has glass and brick works. Pop. 11,200.

Carmel, Mount, range of mts in Israel 18 m. long extending from the plain of

Esdraelon in a NW. direction through the plains of Sharon to the bay of Acre, where it terminates in the only promontory on the Palestine coast. The highest point is 1810 ft. It is very fertile and beautiful, and hares, partridge, quail, woodcock, and jackals are found. El-Mahragah ('the place of burning'), a cliff 1700 ft above sea level, is the reputed scene of Elijah's sacrifice, and close by is the cave in which he is said to have lived. The Carmelite Order was founded here, 1156. Towards the N. end are sev. hotels and pensions, and, within recent years, it has become a popular residential area for the inhab. of Haifa and for summer visitors.

Carmelites, Order of, or Friars of our Lady of Mount Carmel, commonly called in England White Friars, on account of their grey scapulary, was founded in 1156 by an It. crusader, Berthold, who estab. a hermitage on Mt Carmel with some few companions. It was believed by many, however, that a succession of anchorites had occupied this spot from the time of Elias till that of Christ, and that, its members being then converted, the community had continued without a break. The controversy on this question reached its height in the 17th cent., and was only stopped by a papal edict in 1698. In 1238 the C. were driven out of Palestine by the Saracens, and settled in Cyprus, then spreading throughout Europe. Their rule was modified to suit the W. climate, and the C. were in 1247 changed by Pope Innocent IV from hermits into mendicant friars. In England they flourished greatly, and possessed over 30 houses at the dissolution of the monasteries. Nuns in the Low Countries began to be affiliated to the order in 1452, whence they spread to France, Italy, and Spain. In 1562 St Teresa (q.v.) of Avila undertook to restore the Sp. nunneries to their primitive austerity. This rule was taken up by the men and resulted in the formation of a new order of Discalced or Barefooted C., which prospered far more than the old order. See A. de St Marie, *L'Ordre de Notre-Dame du Carmel*, 1910.

Carmen, port of Campeche state, Mexico, situated on the ls. of C., and possessing a good harbour. There are exports of chicla and timber. Pop. 7700.

Carmen Sylva, pen-name of Elizabeth (q.v.), Queen of Rumania.

Carmichael, James Wilson (1800-68), painter, b. Newcastle upon Tyne. He was chiefly known for his pictures of marine subjects: wrote 2 works of some value, *The Art of Marine Painting in Water Colours*, 1859, and *The Art of Marine Painting in Oil Colours*, 1864. His pictures were exhibited at the Royal Academy and elsewhere, his first appearance being in 1838. He painted in London from 1845 to 1862, when he went to Scarborough, where he d.

Carmignano, It. tn, in Tuscany (q.v.). 13 m. NW. of Florence (q.v.). Hats are manuf., and there is a trade in agric. produce and wine. Pop. 13,000.

Carmina Burana, collection of songs,

mostly in Latin, but some in German written by Gollards or wandering scholars of the 12th and 13th cents. These men were clerks, and the songs have generally the form of hymns. They vary greatly in character, some being lofty in tone, others worldly, satirical, and even distinctly immoral. The MS. is now at Munich, but was once kept at the abbey of Benediktbeuren in Bavaria, whence the songs derive their name. See ed. by A. Hilka and O. Schumann, 1930, and Eng. trans. of some of the poems in Helen Waddell's *The Wandering Scholars*, 1927.

Carmunnook, see CAMBUSLANG.

Carn, see BARROWS and CAIRN.

Càrn Mòr Dearg (4012 ft), mt of Inverness-shire, Scotland, to the NE. of Ben Nevis, with which it is connected by a narrow *arête*.

Carnac, vil. in the dept of Morbihan, France. It is famous on account of the great megalithic monuments in the neighbourhood. Long avenues, consisting of thousands of blocks of rugged grey granite, extend over 1½ m. of heath. The blocks are in the form of obelisks with the apex reversed; none are more than 18 ft high. These menhirs, or

THE MENHIRS OF CARNAC

D. McLeish

Carminatives, remedial agents which relieve flatulence, colic, etc. The ordinary condiments, as pepper, mustard, ginger, cinnamon, cloves, nutmeg, peppermint, may be used as C. They are also used in conjunction with purgatives to prevent painful griping and as gentle tonics to stimulate digestion.

Carmines, red colouring matter obtained from the cochineal insect. It was discovered in 1756 by a Franciscan friar at Pisa, while conducting experiments in medicine. In manufacturing C. the cochineal is exhausted with boiling water, and the colouring matter precipitated by the addition of acid or acid salt. See DYE.

Carmo, see CARMONA.

Carmona (Rom. Carmo), Sp. tn in the prov. of Sevilla, with Rom. and Moorish remains. There is a large Rom. necropolis near by. Woollens, leather, and earthenware are manuf., and there is a trade in wine, oil, and grain. Pop. 30,000.

standing stones, are in 11 parallel rows. Here and there the rows are irregular, the gaps being accounted for by the houses in the neighbourhood, for which the peasant builders have utilised this conveniently accessible stone. There are various groups of menhirs round C., situated at Kermario (place of the dead), Kerlescan (place of burning), Erdeven, and Saint-Barbe. The object and origin of these stones are uncertain. Rom. remains were found about 1½ m. away from C. when the Bossenno, another group of mounds, was explored by the Scottish antiquary, James Miln, in 1874. Pop. 3800. See J. Miln, *Excavations at Carnac*, 1881; Z. Le Rouzic, *The Megalithic Monuments of Carnac and Locmariaquer*, 1908.

Carnahuba, Carnauba, Carnuba, *Copernicia cerifera*, Brazilian Wax Palm, from the leaves of which the wax of commerce used in candles, polishes, etc., is gathered. The wood is extremely hard.

Carnarvon, George Edward Stanhope Molyneux Herbert, 5th Earl of (1866-1923), Egyptologist, b. Highclere, Berks, eldest son of Henry Howard Molyneux, 4th earl. Educ. at Eton and at Trinity College, Cambridge. With Howard Carter (q.v.) he undertook the excavation of tombs of the 12th and 18th dynasties in Egypt in 1906. He pub. *Five Years' Exploration at Thebes*, 1912. In Nov. 1922 Carter discovered the tomb of Tutankhamen. Shortly afterwards the earl d. at Cairo.

Carnarvon, Henry Howard Molyneux Herbert, 4th Earl of (1831-90), politician, educ. at Eton and Christ Church, Oxford, and succeeded to the title in 1849. He soon became a prominent member of the House of Lords, and in 1858 was made under-secretary for the colonies, succeeding to the secretaryship in 1866. He introduced the Bill (1867) for federating the Canadian provs., the N. America Act. In 1878 he resigned over the E. question and Disraeli's policy. In 1885 he was made lord-lieutenant of Ireland and had an interview with Parnell in which he was alleged to have made overtures on behalf of the Conservative party in regard to Irish Home Rule. He again resigned. In 1887 he advised the investigation of *The Times* charges against Parnell.

Carnarvon, see CAERNARVONSHIRE.

Carnarvon, dist. and tn. NW. of Cape of Good Hope prov., S. Africa, 102 m. NNW. of Beaufort W. For the most part the dist. is very dry. Van Wykesvlei, 52 m., provides unlimited water. Traces of mineral oil have been found in the neighbourhood, but a 4400-ft bore hole showed no results. Pop.: Whites, 1204; Coloured, 1893; Others, 50.

Carnarvonshire, see CAERNARVONSHIRE.

Carnatic, or Karnatic, European name of a region of S. India, lying between the Coromandel coast and the E. Ghats. In the 18th cent. it was ruled by the Nawab Sa'adat-Allah of Arcot and his successors, and was the centre of the struggle for supremacy in India between France and Great Britain. In 1801 it came under Brit. rule.

Carnation, name given to many double-flowering varieties of plants which have sprung from *Dianthus caryophyllus*, the clove-pink. They include hardy Border C.s and Picotees; Malmalson and Perpetual Flowering C.s usually grown under glass; and ann. Chabaud and Marguerite C.s, in self and variegated colours of white, yellows, pinks, reds, and mauves. Propagation may be effected by means of layering, cuttings, and seeds, but the most successful of these methods is by layering.

Carnades (214-129 BC), Gk sceptic philosopher, b. Cyrene. He was the successor of Arcesilaus (315-241 BC), founder of the Middle Academy, which embraced the new sceptical reaction against the dogmatism of the dominant schools and as a weapon against the stoics. More is known of his teaching than his life. His masters were Diogenes, the Stoic, and Hegesinaus. His chief study was the works of Chrysippus by exposing whose fallacies he estab. his own philosophy.

By C. scepticism was carried over into the realm of ethics as well; and it is narrated that while on a political embassy to Rome in 155, he created a sensation by arguing most eloquently in a public discourse on behalf of justice; and then the next day speaking with equal effect against it. But the fact that his eloquence and brilliant argumentation incited the young Romans to study philosophy was displeasing to Cato, who expelled him.

Carnegie, Andrew (1835-1919), Amer. manufacturer and philanthropist, b. Dunfermline, Fifeshire, Scotland; elder son of Wm C., damask-linen weaver. In 1848 his parents emigrated to America, settling at Allegheny, Pennsylvania. The boy entered a cotton factory as a weaver's assistant, and for some time his wages were a little over \$1 per week. At the age of 14 he became a telegraph boy in Pittsburgh, and learned to telegraph. Then, joining the Pennsylvania Railroad, he became telegraph operator, and ultimately rose to be superintendent of the Pittsburgh div. It was at this time that he laid the foundation of his fortune by the introduction of sleeping-cars on the railway, and by his successful investments in oil lands near Oil City. It was after the Civil war, during which he had rendered valuable service to the gov. as superintendent of military railroads, that his great work began, in the development of the Pittsburgh iron and steel industries. He estab. the Keystone Bridge Works and the Union Iron Works, for the manuf. of steel rails. He then built the Edgar Thomson Steel Works, and in 1883 acquired the Homestead Steel Works. His sphere of business extended with great rapidity, until in 1901 J. Pierpont Morgan made this vast C. enterprise the basis for the U.S. Steel Corporation, and C. himself retired from business. From that time he lived somewhat in the manner of a Scottish laird, at Skibo 'Castle' in Sutherland. Public attention was fixed by the manner in which C. utilised his vast wealth for philanthropic purposes. Chief among his works was the provision and equipment of libraries in the U.S.A. and Eng.-speaking countries. He distributed over \$10,000,000 for this purpose alone. For the benefit of Scottish education, he gave in 1901 a sum of \$2,000,000 to provide class fees for students, and he also made presentations to Eng. and Amer. univs. In 1903 C. founded the Dunfermline Trust with an income of \$25,000, for the improvement of his native tn. He also erected homes and provided funds for his old employees. The C. Hero Fund was started in 1904 for the U.S.A. and Canada; in 1908 for the U.K. Its purpose is 'to place those following peaceful vocations who have been injured in an heroic effort to save human life in somewhat better positions pecuniarily than before, until again able to work.' He d. at Lenox, Massachusetts. See also CARNEGIE TRUST. C.'s publs. include *An American Four-in-Hand in Britain*, 1883, *Round the World*, 1884, *Triumphant Democracy*, 1886, *The Gospel*

of Wealth, 1900. *Empire of Business*, 1902. *Problems of To-day*, 1908, and *Autobiography*, 1920. See B. J. Hendrick, *The Life of Andrew Carnegie*, 1933.

Carnegie, bor. of Allegheny co., Pennsylvania, U.S.A., 6 m. SW. of Pittsburgh. It was formed into a bor. in 1894, and takes its name from Andrew C. (q.v.). It possesses large steel and iron works, and manufactures bedding, Diesel engines, lubricants, food, beverages, and toys. Pop. 12,100.

Carnegie Trusts. The *Carnegie Trust for Universities of Scotland* (1901) was for the purpose of improving and extending opportunities for scientific research in Scottish univs. The purpose of the *Carnegie Foundation for the Advancement of Teaching*, instituted in 1906, was to secure adequate retiring allowances for univ. profs. and teachers in the U.S.A., Canada, and Newfoundland. The *Carnegie Endowment for International Peace* (1910) was to promote international peace and a greater understanding of national policies and attitudes. The *Carnegie United Kingdom Trust* (1914) was used by the trustees to develop public libraries by making grants to municipal libraries and to important special libraries.

Carnelian, or Cornelian (Low Lat. *carneolus*, from *carneus*, flesh-coloured, though some say the original spelling was Cornelian, derived from Lat. *cornu*, horn, from the appearance of the stone when fractured; others dubiously refer 'cornelian' to the fruit of the cornel), reddish variety of chalcedony (q.v.), but sometimes brown, yellow, or white. Usually bright and clear. Found chiefly at Cambay, India. Composition: silica (98 per cent), peroxide of iron, magnesia, alumina, potash, and soda. Used for engraved seals.

Carnforth, tn in Lancs, near Morecambe Bay, 6 m. N. of Lancaster. Pop. 3400.

Carniola (Serbo-Croatian *Kranjka*; Ger. *Krain*), former Austrian crown-land in the E. Alps. It was Austrian from the 14th cent. until the First World War (except for the period of the Napoleonic conquest, 1809-13). In 1919 it was divided between Yugoslavia and Italy (see *VENEZIA GIULIA*). Since the It. peace treaty of 1947 it has been almost entirely in Slovenia (q.v.). The prin. tn is Ljubljana (q.v.).

Carnival (Lat. *carneum levare*, to take away meat). C. formerly commenced on the feast of Epiphany, or Twelfth Day, and ended on Shrove Tuesday, but was afterwards restricted to 8 days before Ash Wednesday, the feast preceding the long fast. Its origin was doubtless the Saturnalia of the pagan Romans, who on becoming Christian incorporated many of their rites and customs in their new religion. In Rom. Catholic Germany, *Fasching*, as the C. was called, was the precursor of the drama, and at Nuremberg the first Fast Eve's play was produced. This developed later into masques and mysteries. In Germany only the Catholic cities of the Rhine formerly kept the festival, but it has been revived in Hamburg, Leipzig, and Berlin. As a rule

Protestant countries do not observe it. Italy is the country in which it is most celebrated. On Shrove Tuesday, after sunset, everyone sallies forth with a lighted taper. The object is to put out as many tapers as possible of other people while preserving one's own alight. Special names were given to the chief days, viz. Greasy Sunday, Blue Monday, or Fools' Consecration. On the Sunday before Lent the procession of the *Beauf Gras* takes place, the animals being led through the streets by butchers in costume. At the Nice C., *mi-carême*, an effigy of King C. is paraded through the streets.

Carnivora (Lat. *carneum*, flesh; *vorare*, to devour) form in zoology an important mammalian order. As the name implies, the members are all flesh-eaters, but they are not the only creatures which feed on their fellows—the diet of blood-sucking bats and some marsupials, such as the opossum, bear evidence to this fact—and many of these so-called carnivorous animals are either omnivorous or largely herbivorous. The order is usually divided into the sub-orders *Fissipedia*, or terrestrial members of the group, and *Pinnipedia*, or the aquatic forms, with flippers for limbs; the latter div. is, however, by some zoologists considered to be a separate, though nearly allied, order. The characteristics of the C. are the sharp teeth, small incisors, well-developed brain, simple stomach, reduced or absent caecum, incomplete or absent clavicles; there are never less than 4 toes on each foot; the scaphoid and lunar bones are fused in the manus (hand); and the claws are generally sharp and powerful. In the *Fissipedia* the most typical feature is the dentition, which is obviously adapted to the mode of life of the animals. There are nearly always 6 pointed incisors in each jaw, and 2 long powerful canines. The cheek teeth vary in number, but the last premolar in the upper jaw and the first true molar in the lower differ from the others in their larger size, and are called *caninial* or *seclorial*; in front of the caninial tooth are grinders with cutting edges, and behind are others which are broad and tuberculated. In the *Pinnipedia* there is no caninial tooth, the incisors are never less than 2 in each jaw, and the cheek teeth do not vary in formation. The mode of progression in the former suborder is digitigrade, semi-digitigrade, or plantigrade; in the last the pes and manus are both fully webbed for swimming purposes, but the hind limbs may be used when the animals travel on land. Considerable difficulty is experienced in classifying the C., but the usual plan among the terrestrial forms is to divide them into 3 groups, the *Ailuroidae*, represented by the cats (including the tiger, leopard, lion, etc.), the *Cynoidea* by dogs, and the *Arctoidea* by bears. The *Pinnipedia* consists of the walrus and various seals. Fossil species of both suborders have been abundantly discovered, and have proved of great scientific interest. The geographical distribution of the animals is world wide but for Australia and New Zealand, and our

domestic pets include 2 typical representatives in the dog and the cat.

Carnivorous Plants, see INSECTIVOROUS.

Carnot, Lazare Hippolyte (1801-88), Fr. politician, second son of Lazare Nicolas Marguerite C. b. St Omer. He shared his father's exile till 1823, and on his return to France devoted himself to literature and philosophy. Entering politics, he was elected deputy for Paris, 1839, becoming one of the opponents of Louis Philippe; he was minister of education in 1848, and afterwards became a prominent opponent of Napoleon III.

Carnot, Lazare Nicolas Marguerite (1753-1823), Fr. soldier and statesman, b. Nolay, Burgundy. He entered the Fr. Army, 1784, as an engineer, having obtained a captaincy on the completion of his studies at the military school of Mazières. In 1786 he pub. his famous *Essai sur les machines en général*. In 1791 he became a member of the National Assembly and an influential power on the Committee of Public Safety. His work was the reorganisation of the revolutionary armies. He became known as 'the organiser of victory' because of his numerous military successes in 1794. C. was a member of the Directory, 1795, but was exiled, 1797. He was recalled to Paris in 1800, and became minister of war, conducting the It. and Rhenish campaigns with great credit. These ended, he retired from public life, and wrote his *Traité de la défense des places*. In 1814 C. came out of retirement to help Napoleon magnificently defending Antwerp against the Allies. He was minister of the interior during the Hundred Days, and subsequently went into exile again, dying at Magdeburg.

Carnot, Marie François Sadi (1837-94), Fr. politician, the eldest son of Lazare Hippolyte C., b. Limoges. A staunch Republican, he was elected to the National Assembly in 1871 and joined the ministry in 1873; in 1880 he was minister of public works, and in 1885 minister of finance. In 1887, after the 'decoration scandals,' he was elected to the presidency and had to meet the danger from the anti-Republican movement under Boulanger; his personal success in bringing his country safely through an acute period of crisis was repeated during the Panama scandals of 1892. He was assassinated by an It. anarchist, Caserio, at Lyons.

Carnot, Sadi (1796-1832), Fr. physicist, b. Paris. He studied at the Ecole Polytechnique, enlisted, and became minister of war to Napoleon, devoting himself to science after Waterloo. His researches on heat led to the foundation of thermodynamics (q.v.) and the improvement of heat engines. His attitude to the 'caloric theory' of heat is not clear, but he probably rejected it. Most of his writings did not become known until some time after his death, but from them it is evident that he had formulated the law of the conservation of energy and knew the value of the mechanical equivalent of heat.

Carnot Cycle, see THERMODYNAMICS.

Carnotite, vanadate of uranium and

potassium, containing a high percentage of uranium oxide; occurs in Utah and Colorado as a yellow sediment. It is a source of both uranium and radium.

Carnoustie, tn and police burgh in SE. Angus, Scotland, 10 m. ENE. of Dundee. It is a favourite watering-place on the N. Sea, with excellent sea bathing and golf. The large artillery and camping grounds, known as Barry Links, are in the neighbourhood. Pop. 5200.

Carnuntum, Rom. fort. station, of which the remains exist near Hainburg (q.v.), in Lower Austria. It was the centre of Rom. military operations on the Danube, and of the trade in amber from the N. belonging first to Noricum and later to Pannonia (qq.v.). The name connected with *karn*, cairn, points to its Celtic origin.

Carnutes, Celtic tribe of central Gaul, between the Seine and the Loire. The chief tns were Cenabum (Orléans) and Autricum (Chartres). The C. were subdued by Julius Caesar, and in return for military services retained their institutions under Augustus, becoming *federati* of the Rom. Empire.

Carnwath, par. and vil. of Lanarkshire, Scotland, 27 m. SE. of Glasgow. C. vil. is chiefly agric., and forms a residential area for railway workers. Coal is obtained in the neighbourhood of Forth, a vil. in the par. 7 m. from the vil. of C. Pop. 6160.

Caro, Annibale (1507-66), It. poet. b. Civitanuova in Ancona. He lived chiefly in Rome. In 1543 he became the confidential secretary of Pietro Lodovico, Duke of Parma. He is famed especially for his fine trans. of the *Aeneid* and Longus' *Daphnis and Chloë*. Other works include a comedy *Gli Straccioni*, c. 1544, *Rime*, 1569, sonnets, and an amusing eulogy of the big nose of the president of the Accademia della Virtù, Leoni Ancona. His poetry is marked by high qualities, and his letters by remarkable finish of style.

Carob-tree, see CERATONIA SILIQUA.

Carol (Charles) I (1839-1914), King of Rumania. Prince Karl Eitel, second son of Prince Karl Anton of Hohenzollern-Sigmaringen, the Rom. Catholic branch of the Hohenzollerns, was b. Sigmaringen. Served in the Prussian Army; and, on the dethronement of Alexander John, was elected Prince of Rumania (then under Turkish suzerainty), April 1866. He was energetic in developing the country; but in 1870-1, faced by the Fr. sympathies of many of his subjects, an unsuccessful revolution, together with the failure of the speculator to whom he had entrusted an important railway contract, he offered to abdicate. The ability of a Conservative statesman, Lascar Catargi, aided over this unfortunate period. Prince C. took the field as an ally of Russia in 1877, and on 21 May the independence of Rumania was proclaimed. On 22 May 1881 C. was crowned King of Bucharest, with a steel crown made from a Turkish gun. He married Princess Elizabeth of Wied—'Carmen Sylva,' the poetess and musician—in 1869. On the death of their only

child the succession was settled on a nephew, Prince Ferdinand. The opening of the First World War, wherein Rumania's interests were against the Central Powers with which the king was linked, caused much friction between him and his ministry—terminating only with his death at Pelesch, 10 Oct.

Carol (Charles) II (1893-1953), King of Rumania, *b.* at the castle of Pelesch (Sinaja); son of King Ferdinand (q.v.) and Marie, daughter of the Duke of Edinburgh. After a fine military record in the First World War he married at Odessa a Moldavian named Zigi Lambrino, and they had a son. In 1919 he renounced his claim to the succession, since his wife was not recognised as princess; but his parents persuaded him to give her up, the marriage was annulled as illegal for want of banns, and C. was sent on a mission to Japan. On his return he married at Athens, 10 Mar. 1921, Helen, daughter of King Constantine of Greece, by whom he had issue the Prince Mihail (Michael). *b.* 1921. After attending the funeral of the queen-dowager of England, Nov. 1925, instead of going home he went to Paris and thence to Milan, where he formally renounced the succession, 28 Dec. 1925. The National Assembly accepted his renunciation, 4 Jan. 1926. C. went back to Paris, 24 Feb. 1926, accompanied by Mme Lupescu. In Paris, in Mar., Mme Lambrino claimed damages for the annulment of her marriage. C. took the surname of Carolaiman; the infant Prince Michael succeeded his grandfather, 20 July 1927, and Princess Helen obtained a divorce from C., 21 June 1928. By that time he had withdrawn his renunciation, and been expelled from England, 16 May 1928, for intriguing against the Rumanian Gov. He resided in Brussels for a while. On 6 June 1930 he flew to Bucharest, a new ministry was formed, and the regency resigned. On Sunday, 8 June, Carol II was proclaimed, while his deposed son was given the titles of crown prince and Prince of Alba Julia. After the outbreak of the Second World War the Iron Guard began an agitation for C.'s abdication, and after riots C., on 6 Sept. 1940, signed a proclamation announcing his decision to resign in favour of his son Michael. His efforts to stem the pro-Axis current in Rumania were unavailing and he left the country. He settled in S. America, where he married Mme Lupescu in 1947. They later settled in Portugal.

Carol (O.F. *carole*, a dance with song), in accepted Eng. usage, a song for Christmas, but also, in its early (15th-cent.) stages, a simple kind of part-song, unconnected with that festivity. Diez suggests that the origin of the word is 'chorus'; others derive it from *corolla*, a little crown or garland. The earliest meaning applied to the word seems to have been a 'ring-dance' or 'to dance in a circle.' Stonehenge, once called the giants' dance, was also the giants' carol. Dancing and singing were part of religious worship from the earliest times. Caroling,

dancing with singing, was handed on from pagan ritual to the Christian Church. In 1209 the Council of Avignon forbade dancing and secular singing in churches. In the cathedral of Seville the choristers perform a castanet dance round the lectern thrice a year. Caxton, in the *Golden Legend*, refers to the 'carolles of virgyns' and Chaucer uses the word in 'I saw her dance so comely, carol and sweetly sing.' In Spain many early C.s refer to gipsy girls dancing and singing. The Manx people have a collection of C.s, locally called 'carvels,' which were sung in the churches on Christmas Eve, each singer bringing with him a candle. Most of these Manx C.s consist of tales of judgment day and hell, and not of the Nativity or the joyful themes of Christmastide. The Bretons also have a large collection of ant C.s. The earliest printed collection was issued in 1521 by Wynkyn de Worde; this contains the famous *Boar's Head Carol*, still sung at Queen's College, Oxford, to usher in the boar's head; and this is an example of the 15th-cent. part-song type mentioned above. There are numerous collections of Fr. C.s, called *Noëls*, and sev. Ger. *Wiegenlieder*, cradle-songs associated with the Babe of Bethlehem, the lullaby *Dormi, Fili* being one of the best known. That the singing of C.s as an excuse for the asking of alms was a very early custom seems likely from an Anglo-Norman C. now in the Brit. Museum. The word C. is freely used by poets in reference to people or birds singing joyously, such as in Tennyson's *Elaine*, 'carolling as he went a true-love ballad,' or in Spenser's *Epithalamion*, 'the cheerful birds do chaunt their lays and caroll of love's praise.'

Carolan, Turlough (or Terence) (1670-1738), Irish harper, *b.* near Nobber, co. Meath. He was not a bard, as tradition has it, and Carolan is not an authentic form of his name. At about 18 he had smallpox and became totally blind; a patroness provided him with money, a horse, and a guide, and he travelled all over Ireland playing and singing his own compositions, teaching the harp and staying as an honoured guest at country houses.

Carolina, North and South, *see* NORTH CAROLINA and SOUTH CAROLINA.

Caroline Amelia Elizabeth, of Brunswick (1768-1821), Queen of Great Britain, wife of George IV, was the daughter of Charles Wm Ferdinand, Duke of Brunswick, and of Princess Augusta of England, a sister of George III. She was a bright, headstrong, foolish woman when she came to England in 1795 to marry the Prince of Wales. The marriage was unhappy from the beginning. After the birth of a daughter, Charlotte (1796), a formal separation took place, and the princess went to live at Blackheath. Weary of continual persecution at the hands of her husband, she went abroad in 1814. When she became queen 6 years later she returned to England. She was now tried before the House of Lords for alleged misconduct, but the bill was not proceeded with, Brougham (q.v.) defending the

charges against C. with great eloquence. Popular feeling in the country was strongly on the princess's side in the quarrels with her husband; but there seems little doubt that she was an extremely difficult woman to deal with, and that the couple were fundamentally incompatible, with faults on both sides. She d. a few days after George IV's coronation, at which she was not permitted to be present. See lives by L. Melville, 1912, and E. A. Parry, 1930.

Caroline Matilda (1751-75), Queen of Denmark and Norway, was the daughter of Frederick, Prince of Wales, and sister of George III; in 1766 she married Christian VII, King of Denmark and Norway. The marriage was unhappy, Christian being mentally feeble, and C. M. fell under the influence of the royal physician, Struensee (q.v.); he was popularly believed to have been her lover. When Struensee was arrested she shared his fate and made an attempt to shield him. On his execution she was divorced, and after a short imprisonment was, on George III's request, sent back to England.

Caroline Wilhelmina (1683-1737), Queen of Great Britain, wife of George II, the daughter of John Frederick, margrave of Brandenburg-Anspach. Left an orphan in 1696, the girl lived at Berlin with her guardians, the Elector Frederick III of Brandenburg and his wife, Sophia Charlotte, daughter of the Electress Sophia, and it was proposed that she should marry the Archduke Charles; but C.'s refusal to become a Catholic caused the proposal to be abandoned, and in 1705 she married George Augustus, then electoral Prince of Hanover, by whom she had sev. children, the eldest being Frederick, afterwards Prince of Wales. From 1727 to 1737 her political influence was enormous, and Walpole (q.v.) owed much of his power to C.'s consistent support. See P. Quennell, *Caroline of England*, 1939.

Caroline Islands, scattered archipelago in the Pacific Ocean, included in Micronesia, between 5° and 10° N. and 135° and 165° E. The total land area is 460 sq. m. Pop. about 40,000. They are divided into 3 groups: E., W., and Central. The chief is. are Ponape and Kusaie in the E. group, Yap in the W., and Truk in the Central. The Palau Is. are administered from Yap. The climate is healthy, but the is. are subject to severe storms and the rainfall is heavy. Among the chief products are copra, pearl, and turtle shell, and *bêche-de-mer*. The natives, very mixed ethnologically, are excellent boat-builders and navigators and successful agriculturists. Yap is remarkable for its peculiar currency; in addition to the ordinary shell-money, huge limestone disks are used, from 6 in. to 12 ft in diameter; those are brought from the Palau Is., and are piled round the chief's treasure-house and apparently regarded as public property. In Ponape and Kusaie colossal stone structures exist, pointing to a prehistoric race well advanced in general culture. In the is. of Lélé the ruins appear like a citadel with basaltic ramparts; there are also

numerous canals and apparently artificial harbours with high sea walls built in the water. The whole is. of Ponape is strewn with basalt blocks of huge size put together without mortar, once having formed massive walls. The C. I. were discovered in 1537 by the Portuguese Diego da Rocha, who named them Sequira Is.; in 1686 they were renamed by Adm. Francisco Lazeano in honour of Charles II of Spain. The C. I. were successively ruled by Portuguese and Spanish from 1537 to 1899, when they were bought by Germany. In 1919 they were assigned to Japan under the mandate of the League of Nations. Naval and seaplane bases were built among the is., which remained in Jap. hands until Sept. 1945 when they were surrendered to the U.N. The naval base at the Ulithi atoll has since been dismantled. The is. were taken over by the U.S.A., July 1947.

Carolingians, see CARLOVINGIANS.

Carolus, Eng. gold coin, struck in the reign of Charles I. It was rated at £1, but appreciated in value to £1 3s. 9d. Its official title was unit, and it was also called a broad. A C. was also a base silver coin of Charles VIII of France. 'C. dollars,' Sp. coins of Charles III and IV, were long current in the E., especially in China, containing 8 reals; they were known as pieces of eight. They are still current in some of the tea-growing dists. of China, and as the people hoard them they have greatly exceeded their intrinsic value.

Carolus-Duran, name adopted by Charles Auguste Émile Durand (1837-1917), Fr. painter, b. Lille. He first studied at the Lille Academy, and then went to Paris; in 1861 he travelled in Italy and Spain, where in particular he studied the style and technique of Velázquez. His first success was with a subject picture, 'Murdered, or the Assassination,' now in the Lille Museum. Later he became a portrait painter. In 1869 a portrait of his wife, called 'The Lady with the Glove,' was bought for the Luxembourg. He was the head of one of the prin. studios in Paris; and some of the most celebrated artists of his day, including J. S. Sargent, were his pupils. In 1904 he was made a member of the Académie des Beaux-Arts, and in 1905 director of the Fr. Academy at Rome.

Carolus Magnus, see CHARLEMAGNE.

Caronia, tn in Sicily (q.v.), overlooking the N. coastal plain. 63 m. ESE. of Messina (q.v.). Pop. 6000.

Carossa, Hans (1878-1956), Ger. prose writer and poet, b. Tölz, Bavaria. He studied medicine, and practised at Passau, Nuremberg, and Munich. His profession greatly influenced his writings, both as regards the subject-matter of some of his prose works (*Doktor Bürgers Ende*, 1913; *Der Arzt Gion*, 1931), but also in his objective outlook and keen observation. Many of his works are purely autobiographical: *Eine Kindheit*, 1922, *Kindnisches Tagebuch*, 1924, *Verwandlungen einer Jugend*, 1928, *Führung und Geleit*, 1933, *Das Jahr der schönen Täuschungen*,

1941, *Aufzeichnungen aus Italien*, 1947, and *Ungeliche Wellen*, 1951. Although his life was outwardly uneventful, his writings are admirable examples of broad-mindedness, tolerance, and wisdom. C. also pub. a volume of lyrical poems in 1938. See F. Klatt, *Hans Carossa*, 1937; G. Schaefer, *Hans Carossa*, 1947.

Carotenoids, generally highly unsaturated, fat-soluble, yellow or orange plant pigments which are widely distributed in nature and exemplified by carotenes, the isomeric hydrocarbon pigments in carrots and lycopene in tomatoes. Chemical knowledge of C. has been largely due to the application of chromatography and development of micro analytical technique and about a hundred distinct natural C. are now recognised, some of which exist in stereoisomeric forms. Carotene itself has the molecular formula $C_{40}H_{56}$ and all the known C. contain 40 or less carbon atoms, their constitution being of a regular pattern of isoprene units and polyene systems. Although the animal organism is unable to synthesise C., more is known of the significance of some C. in the animal kingdom than of their importance to plant life. Thus the occurrence of C. in green leaves suggests that these pigments have an important role in photosynthesis but this is without experimental foundation. The structural relationship between carotene and Vitamin A confirms the long held suspicion of the connection between carotene and the growth factor in the animal kingdom, since β -carotene can act as a substitute for Vitamin A₁. The conversion of β -carotene into Vitamin A₁ has been achieved, but although the change is apparently simple, viz. $C_{40}H_{56} + 2H_2O \rightarrow 2C_{20}H_{32}OH$, the large scale production of Vitamin A₁ has not been achieved. However, the synthesis of Vitamin A₁ has led to the synthesis of a variety of C. Whilst the role of C. in the process of vision has not been completely elucidated, it is known that visual purple is a protein-retinene complex which liberates the retinene component on exposure to light and in the visual process this component is converted into Vitamin A₁. In the dark the reverse process occurs. Although the study of C. has been going on since the time of Berzelius, it is only recently that many problems regarding the synthesis of C. have been overcome by the use of acetylenic intermediates, but the biochemical aspects of C. will doubtless reveal further knowledge.

Carotid Arteries, 2 arteries which convey the blood supply to the head. They pass through the neck on either side of the windpipe, and each opposite the angle of the jaw divides into two, one branch, the external, serving the face and scalp, and the other, the internal, branch the brain. The pulsation in these arteries is easily felt from the surface.

Caroto, or **Carotto**, Giovanni Francesco (or **Gianfrancesco**) (c. 1480-1546), It. painter, b. Verona; worked in Mantua under Mantegna, whose style he imitated. After returning to Verona he painted

frescoes in the church of San Tommaso Cantuariense (Thomas à Becket). Among his best works are the frescoes in Sant' Eufemia, Verona, depicting scenes from the book of Tobit. One of his earlier works was a 'Virgin and child, with an infant John the Baptist' in the Gallery of Modena. There are pictures by C. in many churches and galleries of Mantua and Verona, including his 'Glory of the Virgin' (signed and dated 1545) in Verona, where he d.

Carp, **Petre** (1837-1919), Rumanian statesman, b. Jassy. He was the leader of the Young Conservative or Junimist party, the Junimea being a literary society which he founded with Rosetti and Maiorescu and changed into a political association. The object of the party was to improve the condition of the peasantry, introduce a gold standard, and develop industries by means of foreign capital. He came into power in 1888, passed a Bill for the distribution of state lands, and succeeded in introducing a gold standard. He was, however, unable to retain office, and was succeeded, 1891, by L. Catargiu. He trans. some of Shakespeare's plays into Rumanian. In the Privy Council, from 3 Aug 1914, he alone supported King Charles's desire to side with the Central Powers in the First World War.

CARP

Carp (*Cyprinus carpio*) belongs to the order Ostariophysi of the Teleostei. Originally it belonged to Asia, but it has been introduced into Europe and for sev. cents. has flourished in Britain. The fish, which is closely related to such well-known species as goldfish and minnows, often grows to a very large size, and may weigh as much as 100 lb.; examples have been known to attain a great age. In colour they are brown above, light beneath, have a compressed body covered with large scales, a long dorsal fin and shorter anal fin, and round the mouth depend 4 barbels. The C.

usually inhabits quiet lakes, ponds, or sluggish streams, and during winter hibernates in mud; it is capable of living for a considerable time out of water. Its food is either vegetable or animal. The female is very prolific and spawns on weeds in May or June. The Crucian or Prussian C., a native of Europe, has the technical name *Carassius carassius*, while *C. auratus*, or golden carp, is the goldfish (q.v.).

Carpaccio, Vittore (c. 1450–1523/6), It. painter, b. Venice, of an old Venetian family, the correct name being Scarpozza. He may be regarded as a forerunner of the finest Venetian masters. His chief works were painted between 1490 and 1519. He was certainly a pupil of Lazzaro Bastiani, rather than his master, as formerly held. His greatest works are at Venice: the series of pictures in San Giorgio degli Schiavoni, brought so prominently to notice by Ruskin, was painted by order of the hospice of San Giorgio from 1502 to 1508. The St Ursula series (Accademia, Venice) is well-known. 'St Ursula leaving her father' (National Gallery) adequately exemplifies his style. See P. C. Molmenti and C. Ludwig, *Life and Works of Vittore Carpaccio* (trans. by R. H. Cust, 1907); G. Flocco, *Carpaccio*, 1931.

Carpathians, great mt system in central Europe, extending from Bratislava to Orsovo, in crescent form, for 800 m. The Danube valley divides them from the Alps, and the March from Silesia and the Moravian Mts. After forming the boundary between Hungary and Rumania they turn S., cut by the Danube, which flows in a picturesque gorge between Bazias and Turnu-Severin. They then slope down to the Rumanian plain in beautiful wooded declivities, intersected by valleys of numerous rivs., fed by the high rainfall of the dist. For the purpose of classification the whole system may be divided into 2 great groups, the E. and W. C. The E. C. stretch from the mouth of the Nera to the source of the Theiss. The W. C. start at the Theiss and terminate at Bratislava. The chief groups of mts are Little C., Beskids, Central C., White Mts, Lomnitzer Spitz, Elsthaler Spitz, and the High Tatra group, including the highest peak in the C., Gerlsdorfer, 8737 ft. Few mts reach or pass into the snow line. There are no glaciers, but glacial lakes, *Meerangen*, are hidden away in the snow-bound recesses at an elevation of 6000 ft. The best-known passes are Teregovia, from Orsova to Temeswar; Vulkar, in the valley of the Schyl; Rottenthurm, in the S. Transylvanian Alps, in a gorge formed by the Alata; Tursburg, between Bucharest and Brasov; and Jablunka, between Bratislava and Cracow. The C. form a watershed for the Baltic and the Black Seas, the most important rivs. rising there being the Dniester, Vistula, Theiss, Maros, and Szanos. Besides having more mineral wealth than any other mt system of Europe, the region of the C. is rich and fertile, and well wooded with oaks, beeches, evergreens, and firs. In the less

civilised parts wild animals are found, including the wolf, bear, and lynx, and occasionally chamois and ibex. The lammergeier, or bearded vulture, is found here. Geologically there are 4 zones of the C.: (1) the outer zone lying towards Russia, of soft Tertiary rock, containing salt and petroleum; (2) the sandstone zone, extending SE. from the March; (3) the crystalline zone of Palaeozoic rocks; (4) the volcanic zone, containing no active volcanoes, but subordinate mts of volcanic origin. Gold, silver, quicksilver, copper, and iron are the chief minerals obtained. See I. Phillimore, *In the Carpathians*, 1912.

Carpeaux, Jean Baptiste (1827–75), Fr. sculptor, b. Valenciennes. His father was a mason, and during his early years the family was extremely poor. For 2 years he worked in a drawing school in Paris, and in 1854 entered the École des Beaux Arts. He was awarded the Grand Prix de Rome for his statue of 'Hector with his Child, Astyanax.' At Rome he felt the influence of Michelangelo, and became more vigorous in style and passionate in expression. C. must be regarded as one of the influences which have helped to free modern sculpture from the weight of academic classicism. Among his chief works are 'La Palombella,' 1856, 'Neapolitan Fisherman,' 1858, 'Girl with a Shell,' 1869, 'Ugolino and his Children,' 1863, and 'Statue of the Prince Imperial,' 1866, after which he was made a chevalier of the Legion of Honour. In 1869 he executed one of the groups, 'Dancing,' for the opera house, which aroused much prejudice by its strong realism, vigour, and vitality. His last work, a fountain, is in the Avenue de l'Observatoire, Paris. Many of his drawings and studies are at Valenciennes.

Carpel, one of the divs. or units of the pistil of a flower, enclosing ovules. There may exist only one C. in the flower, and the gynoeceum is then said to be monocarpellary, e.g. sweet pea and other legumes, but if more than one should be present it is polycarpellary; in any case the C. or C.s are important parts of the female essential organ of the flower, the gynoeceum. When the C.s of a polycarpellary pistil are united to one another the condition is syncarpous, e.g. primrose; when they are free from each other it is apocarpous, e.g. buttercup. The fusion of C.s affects the way in which the ovules are placed within the ovary, e.g. those which are folded on themselves first, and then fused by their adjacent margins, bear ovules in the centre, when the placentation is said to be axile, e.g. bluebell. The placenta is a swollen cushion formed from the fused margins which are themselves called septa. The style is a prolongation of the upper part of the C., and the stigma is the terminal knob born at the apex of the style.

Carpentaria, Gulf of, situated on the N. coast of Australia, between Capes Arnhem and York. The most important ls. contained in it are Groote Eylandt and the Wellesley ls., the largest of which is Mornington ls. It receives a number of

riva, including the Roper, the Mitchell, the Flinders, the Leichhardt, and the Albert. The coast is low and swampy. It was named in 1823 by Carstensen, after Pieter Carpentier, Governor-General of the Dutch Indies.

Carpenter, Edward (1844-1929), author, b. Brighton, son of Charles C., barrister and retired naval officer. On leaving school at Brighton he went to Trinity Hall, Cambridge, and was tenth wrangler in 1868. He took orders, and was curate to F. D. Maurice at St Edward's. Becoming dissatisfied with his creed, he renounced orders and became univ. extension lecturer on astronomy in Yorks tns. In 1883 he took a cottage at Millthorpe, Derbyshire, worked in the fields, and grew his own fruit and vegetables. He wrote poetry: *Narcissus*, 1873, and *Towards Democracy* (under the influence of Whitman), 1883—and prose: *Civilization, its Cause and Cure*, 1889, *Love's Coming of Age*, 1896, *Angels' Wings*, 1898, *Art of Creation*, 1904, *The Intermediate Sex*, 1908, *My Days and Dreams* (autobiography), 1916. He visited Ceylon, and his *From Adam's Peak to Elephantia*, 1892, extols the oriental peace of mind. His whole life was in fact a reaction against Victorian conventions and respectability. He d. at Guildford.

Carpenter, Lord George (1657-1732), general, entered the army, 1672. He served in Ireland and Flanders, and in Spain as quartermaster-general to Peterborough, 1705. He commanded the cavalry at Alinanza, 1707, at which battle he was second in command. He joined the Hanoverian party, defeating the pretender at Preston, 1715. In return for his services he was made Governor of Minorca and commander-in-chief of the forces in Scotland. He was created baron, 1719; M.P. for Westminster, 1722-1729. His grandson was created Viscount Carlisle and Tyreconnel in the Irish peerage, but the earldom became extinct in 1853. See *Life of Lord George Carpenter*, 1736.

Carpenter, John (c. 1370-1441), merchant, London's tn clerk, 1417-38, and M.P. for the City in 1436 and 1439. C. compiled the City's privileges in the *Liber Albus*. He left a bequest which formed part of the foundation of the City of London School.

Carpenter, John Alden (1876-1951), Amer. composer, b. Park Ridge, Illinois. He studied under Amy Fay and Seeböck, and at Harvard under J. K. Paloe. His first notable works were *Improving Songs for Children*, 1907, and *Gitanjali*, a song-cycle of poems by Tagore. His first symphony, *Sermons in Stones*, was written in 1917. A ballet pantomime, *The Birthday of the Infanta* (after Oscar Wilde), was produced by the Chicago Opera Co. in 1919, and *Skyscraper*, also a ballet, by the Metropolitan Opera Co. of New York in 1926. For the Washington bi-centenary in 1932 he wrote *Song of Faith* for chorus and orchestra, and *Patterns* (piano and orchestra) was played by the Boston Symphony Orchestra in the same year. His symphonic poem, *Sea*

Drift, followed in 1933; concerto for violin and orchestra in 1937; and his symphony for the fiftieth anniversary of the Chicago Symphony Orchestra in 1940. In 1941 he wrote *Song of Freedom* for chorus and orchestra.

Carpenter, Dr Lant (1780-1840), Unitarian minister and theological writer, b. Kidderminster. He studied at the academy of Northampton (1797), and at Glasgow Univ. (1798-1801). He became an assistant master at a school in Birmingham, and subsequently librarian of the Liverpool Athenaeum (1802-5), when he was chosen as Unitarian minister of a boarding-school in Exeter (1805-17). From 1817 to 1829 he held a similar position in a school at Bristol. He was drowned in Italy off the coast of Leghorn. Dr C. pub. numerous sermons and polemical tracts, and wrote *Unitarianism, the Doctrine of the Gospel*, 1809, and *Systematic Education* (2 vols.), 1815, etc. His memoirs were ed. by his son, R. L. C., in 1842.

Carpenter, Mary (1807-77), philanthropist, b. Exeter, daughter of Dr Lant C., a Unitarian minister, and sister of Dr William Benjamin C. Educ. in her father's boys' school at Bristol. Her interest in poor children was aroused by Dr J. Tuckerman of Boston, and in 1835 she started a working and visiting society and later a ragged school with a night school in the poorest part of Bristol. The visit of the Hindu philanthropist, Ram-mohun Roy, 1833, aroused her sympathies with India, and the first of her journeys to the E. was taken, 1866, where she initiated sev. reforms for women and children. She wrote many books embodying her schemes for the education of destitute children and those on the border of a criminal or vagrant life. Her book *Juvenile Delinquents* was instrumental in the passing of the Youthful Offenders Act, 1854. She d. in Bristol. See life by J. E. C., 1879.

Carpenter, William Benjamin (1813-85), naturalist, son of Dr Lant C., b. Exeter. He graduated M.D. at Edinburgh, 1839, was made F.R.S. in 1844; gold medallist of the Royal Society, 1861; and was Fullerian prof. of physiology at the Royal Institute from 1845, being a most popular and admirable lecturer. His works include *Principles of General and Comparative Physiology*, 1839, and *The Microscope and its Revelations*, 1856. *Principles of Mental Physiology* (4th ed.), 1876. He was registrar of the univ. of London, 1856-79.

Carpenter Bee (*Xylocopa*), so named from its habit of boring holes in dry timber and forming little cells in which to lay eggs. The partitions between the cells are made of the wood-dust fastened together with saliva. *X. virginica*, a N. Amer. species, is as large as a humble bee.

Carpentier, Georges (1894-), Fr. boxer, b. Lens, near Calais, and worked in a coal-pit as a boy. At a boxing academy in the tn he attracted the attention of the proprietor, François Descamps. When 14 he won a fight against Salmon, one of the best-known boxers, at 7 st. 2 lb. He

won the championship of France in every weight and div. On 16 July 1914 he fought Gunboat Smith at Olympia, London, for the world's heavyweight white championship, and won it through the disqualification of Smith for a foul. His most sensational fight in England was with the heavyweight Joe Beckett on 4 Dec. 1919, for the championship of Europe, the Prince of Wales being present at the match. Only 2 blows were struck, Beckett being knocked out a few moments after the fight started. He won the light heavyweight championship of the world and fought Dempsey in New York, 3 July 1921, for the world's heavyweight championship, and was decisively beaten in the fourth round. He served in the Fr. Air Force during the First World War, and again on the outbreak of war in 1939 until the fall of France in 1940.

Carpentras, Fr. tn in the dept of Vaucluse, on the Auzon, and on the C. Cunal, 14 m. N.E. of Avignon (q.v.). It dates from Rom. times, and was formerly the cap. of Comtat Venaissin (q.v.). It has a fine Gothic church (1405-1510, formerly a cathedral), 17th-cent. law courts, an 18th-cent. synagogue, and walls, and a splendid 18th-cent. aqueduct. There is also a Rom. triumphal arch. There is a textile industry, and there is a market for fruit and vegetables. Pop. 14,000.

Carpentry may be defined as the craft of selecting, working, and jointing timber for structural purposes. In building C. covers all carcassing work: roofs, floors, partitions; centring, shuttering, and shoring. In furniture it provides the roughest types. Heavy work, ranging from case-making to bridge building, also comes within the sphere of C. The remainder of this article outlines the traditional processes of the craft, but shortage and high costs of timber are restricting its use in building and favouring the use of alternative structural materials.

Any assemblage of pieces of timber connected together is called a frame. The points of meeting of the pieces of timber in a frame are termed joints, and one of the first requisites in C. is a knowledge of the various ways of joining the pieces in order to stand different strains and pressures. When one piece of timber is not long enough, it is joined to another piece in the same direction by various methods. The roughest method of doing this is by fishing; the ends of the beams are placed together, and a piece of timber is placed on each side and secured by bolts passed through the whole. Another method is halving the beams so that they present a level face when joined together, and can be united by means of bolts. Scarf-joints are employed when it is necessary to maintain the same depth and width throughout the beam. In this method a part of the thickness of the timber is cut away from each beam; the parts cut away are on opposite sides, and correspond to each other, so that the beams will fit into

each other and can be bolted. Different varieties of scarf-joints are employed where the timber is subjected to compression, tension, or to a bending strain, etc. Hard-wood pieces called keys are inserted into the holes of a scarf-joint before the bolts in order to compress the beams closely together; they must not be driven in too hard or the fibres of the wood will be strained. In bolting together scarf-joints side plates of iron are used to protect the wood. Another mode of joining timber is by mortise and tenon, which is employed wherever one piece of timber meets another without crossing it. A hole called a mortise is made in one piece of timber, and a projecting portion called a tenon is left on the other. The tenon is driven into the mortise and secured in position by glue, or by a pin penetrating it laterally through the side of the mortised beam, or by an external iron strap which passes round the beam and is riveted in the other, the beam which has the tenon. When the two pieces of timber do not meet each other at right angles, modifications of the mortise and tenon joint are adopted, so that a bearing surface may be provided which is at right angles to the direction of the thrust exercised by the entering timber. Other operations performed when timbers cross each other are notching, cogging, and housing; these joints must be strengthened by bolts or straps. When greater strength is required than a single beam will give, the processes of building and trussing beams are used. Building beams is combining 2 or more beams in depth so as to have the same effect as one large beam; the beam is cut in two and supported with cross-beams in the operation of trussing.

The framework by means of which the covering of a building is supported is known as the roof. The simplest form of roof consists of a series of pieces of timber with their own ends resting on the walls and their other ends meeting at a ridge-pole. These are called rafters, and their lower extremities are connected by a piece of timber called a tie, as otherwise this framework would thrust out the roof when loaded with the weight of the covering. The whole frame is known as a couple; such a simple form of roof, however, can only be used when the building is less than 20 ft long. When the tie is longer than that, it is apt to sag in the middle, and a fourth piece, called a king-post, is added to unite it directly with the apex of the rafters. Cross-pieces, called struts, are added if the rafters are liable to sag; their centres are thus united to the centre of the tie. If the span is longer than about 30 ft it is inadvisable to leave the rafters unsupported for half their length, and the following formation is substituted: The centre of each rafter is joined to the tie by a piece which falls perpendicularly on it; the rafters are also joined to each other by a piece which runs parallel to and above the tie. The perpendiculars and the section of the tie enclosed by them thus form a parallelogram with the rafters. The

horizontal piece is called a collar-beam, and the suspending pieces queen-posts. The whole frame is known as a truss; the trussed frames are placed at intervals of about 10 ft. They support horizontal pieces known as purlins, which run the whole length of the roof, and support the common rafters and their covering. All roofs, of whatever size, are founded on the above models, unless it is not desired that there should be a tie-beam, as in churches, etc. The walls are then made stronger or the roof principals are modified in shape to meet the greater horizontal pressure.

The framing of timber supporting the floor of the room above and the ceiling of the room below is called the naked flooring; there are 3 main kinds of flooring—single, double, and framed. Single flooring consists of one series of joists which stretches right across from wall to wall without any support. The flooring boards are laid on the top of these joists, and to the under side is affixed the ceiling of the lower storey. Double flooring has a middle series of binding joists, resting on the walls in the same way as the joists of single flooring; above these joists are the bridging joists and below are the ceiling joists. Both these are notched into the main joists where they cross them, and support respectively the floor above and the ceiling below. Framed flooring has beams in addition to the binding, bridging, and ceiling joists; the binding joists do not cross the whole width of the room, but are framed into these beams at intervals. A double ceiling of lath and plaster is occasionally used to deaden sound; the most general method, however, is the insertion of plugging above the ceiling. Framed floors are used where there are large spans, double floors ensure evenness of floor and ceiling, and single floors give strength combined with lightness where the spans are not very great. If the span for a single floor exceeds 8 or 9 ft. the joists should be strutted together to prevent twisting. Rough wooden profiles of the cornices of a room are made, and afterwards lathed round and plastered. This process is known as cornice bracketing.

The frames of timber which are used to divide the upper storeys of a building into rooms are called partitions. When these are not required to bear any heavy weight they are formed as follows: A piece of timber, called a sill, is laid along the floor, and a corresponding piece along the ceiling joists. The lath is nailed to the vertical pieces, known as quarters, with which the space between is occupied. If the partition has to support any weight it has to be trussed with posts and braces, and brickwork or concrete may be used to fill up the space. When a staircase is made of wood, the pieces of timber upon which it rests, and which form the framework, are known as the carriage. They are 2 in number, and are inclined at the angle which it is desired that the steps should have; they are called technically rough strings. A piece of timber, which projects horizontally from the upper level to which the staircase leads, forms

the support for the rough strings and also for the joists of the landing; this is called a pitching or apron piece. When bridges or vaults are in course of construction, curved frames are needed to support the arch stones; these frames are known as centres. The ribs of which the centres are composed are built of a series of short timbers shaped to the curve required; they are placed about 6 ft apart, and are connected by horizontal ties as well as by diagonal bracing. The centres serve to support the narrow boards which carry the stones of the arch. When the arch is properly keyed the centres are struck gradually so that the arch takes its proper bearing slowly. Staging is built up of 2 rows of standards, or large square timbers, resting on a sill of timber on the ground. Longitudinal beams at the top support a platform, on which a small railway may run. If the staging is large and required for a travelling crane, it is known as a gantry. See also JOINERY. Consult R. Greenhalgh, *Practical Joinery and Carpentry*, 1923, and *Joinery and Carpentry* (4 vols.), 1939-40: C. Ellis, *Modern Practical Carpentry*, 1927; A. E. and T. R. Bridgwood, *Carpentry and Joinery* (Advanced), 1952.

Carpet (It. and Low Lat. *carpita*, a coarse cloth, from Lat. *carpere*, to pluck), heavy woven fabric, used as a covering on floors. C.s were first made and used in the E., where the custom of sitting cross-legged on the floor and of praying in a low, crouching position necessitated the use of some soft covering to the floor. When C.s were first brought to England, they were used as a rich covering for beds and tables, straw, dried rushes, or sand being spread over the floors. When C.s were first used for floors they were regarded as a great luxury, and only in keeping with a lady's boudoir. Hand-woven tapestries were commonly made during the Middle Ages in convents and by ladies of rank, and were sometimes spread over the floors. The industry first developed in France, where a factory was estab. in 1607 at the Louvre by Henry IV. Other C. factories were estab. in Chaillot, 1627, and at Beauvais, 1664. In 1695, with the revocation of the Edict of Nantes, most of the weavers—for the majority were Protestants—fled across the Channel, and thus the industry was started in England. The Flemish weavers first settled in Bristol, but the knowledge of the art soon spread to N. tns, and notably to Kidderminster, Dewsbury, and Glasgow. The chief varieties of C. are the Brussels, Wilton, Persian, Turkey, Indian, Kidderminster, and Axminster. Rugs also came to Britain originally from the E., where the rug or C. is the most important, often indeed almost the only, furnishing of the house. Indian, Persian, and Turkish C.s and rugs are the best examples of the art.

General principle of manufacture. The original method of C. making was by hand, and to this day C.s are made both in Europe and in oriental countries in precisely the same manner as of old. The principle is very simple. The warp threads forming the chain are wound on

2 horizontal beams and the weavers sit side by side in front, the C. as it is woven being gradually wound on the lower beam and the warp correspondingly unwound from the upper beam. The yarn for the pile is cut into tufts and knotted by the weaver. The interlocking of warp and weft forms the weave of the C. Hand-weaving is slow, and therefore the product is very expensive. The first type of machine-made C. to be made in England was the Brussels C.

Brussels carpet. This C. is composed of a mixture of linen and worsted, the cloth or reticulated part of the structure being entirely of linen, and the worsted only showing on the upper surface and making the pattern. Through the coarse linen fabric worsted thread of different colours is drawn and held in loops over the wires. When the work is complete the wires are removed, and the remaining loops give a soft pile and make the figured surface of the C. Brussels C.s were introduced into Kidderminster from Tournai in 1745.

Wilton carpet or velvet pile. This is made with longer loops, woven over sharp wires, which, when withdrawn, cut the worsted, leaving a full velvety pile; otherwise it is similar in manuf. to Brussels. The C. may afterwards be sheared to even the surface. In recent years many Wilton looms have been erected capable of weaving seamless C.s 12 ft wide or more.

Persian carpets. This manuf. dates from very early times. They are thicker and softer than ordinary C.s, are of great durability, and are renowned for their beautiful designs. They are made by knotting woollen yarn on warp threads, the tufts thus formed being firmly held in place by the wool yarn. Old Persian C.s are highly prized, and are of great value.

Turkey carpets. These are somewhat similar to Persian C.s, being made in the same fashion, but their designs are stiffer and more geometrical in character. The colouring is very rich. The industry flourishes chiefly at Uskah in Asia Minor; C.s of the same kind were formerly made at Axminster (1755-1835), and are still made at Wilton.

Indian carpets, like Persian, are woven by hand, the design being formed by knitting into the warp tufts of woollen threads of the proper colour one after the other. But modern Indian C.s are much inferior to the earlier Indian pile C.s in pattern owing to the debasing influence of W. designs.

Kidderminster carpet. This is made in the greatest quantities in Scotland and Yorkshire, and is the oldest kind of machine-made C. It is made by the intersection of 2 or more cloths of different colours, woven in stripes of different shades. They are made in layers, and are called accordingly 2-ply or 3-ply. The back of the C. is exactly the same pattern as the face-side, but the colours are reversed. There is no pile, the yarn lying flat on the surface, as in worsted cloth.

Axminster carpet. It was first made in England by Thomas Whitley in 1755. It is usually made to order, being made in one piece according to the dimensions of the room for which it is required. They resemble Turkey C.s, and are made in tufts of coloured worsted or wool tied under the warp, the linen threads being rammed down and concealed. As is the case with Turkey C.s, the difficulty lies in changing the colours so as to form the required pattern. In 1839 Mr Templeton of Glasgow patented a method of making *Chenille Axminsters*. The chenille is woven on a separate loom, cut into strips, and bound into tufts, and is then woven into the C., being used as the weft thread. The process of weaving the fur into the C. is performed on a setting loom. Chenille C.s are very popular, partly on account of the variety of colours which can be used, and partly owing to the comparative cheapness. *Loyal Axminsters* do not require the chenille to be woven separately; the tufts are cut by machinery and are threaded into the C. by the linen weft. The later types of loom for weaving the fabric can produce a C. 5 yds wide without a seam.

Seats of manufacture. Brussels and velvet-pile C.s are largely made at Kidderminster, and also at Durham and Halifax. Kidderminster C.s come from Kilmarnock and Bannockburn in Scotland, and from Dewsbury and other places in Yorks. Only a small quantity is made in Kidderminster itself. The finest Persian C.s are made at Kurdistan. The patent chenille Axminsters are made to a large extent in Glasgow. In the U.S.A. C.s are chiefly manuf. in Philadelphia, where the first factory was estab. in 1791, and in Lowell. The most famous Fr. C.s are the Savonnerie, made in Paris, and the Aubusson C.s. See PERSIAN ART. See also R. S. Brinton, *Carpets*, 1919; A. F. Kendrick and C. H. C. Tattersall, *Hand-woven Carpets, Oriental and European*, 1922; A. Hackwell, *Die chinesische Teppiche*, 1921; R. Beaumont, *Carpets and Rugs*, 1924; F. J. Mayers, *Carpet Designs and Designing*, 1934.

Carpet-bagger, slang political term for a candidate who stands for election in a locality to which he is a stranger. The term was used contemptuously after the Civil war in the U.S.A. for the N. politicians who, by the help of the Negro vote, controlled the S. administration.

Carpet Bedding, in gardening, the name of a certain formal arrangement of beds, adorned chiefly with bright-coloured foliage-plants or low-growing flowering ones, such as lobelia, cerastium, aubrieta, coleus, sedum, thrift, echeverias, saxifrages, or box, so arranged as to resemble a figured carpet. The patterns are usually geometrical designs, but sometimes birds, butterflies, coats of arms, or other objects are represented. Now only practised in public parks and gardens.

Carpi, Ugo da (1450-1533), It. painter and engraver, claimed to have discovered the art of *chiaroscuro printing* (see COLOUR PRINTING), but Ger. research would seem to have proved that the art

was practised in Germany in 1499 or before, whereas the earliest of C.'s prints is dated 1518. C. used 3 blocks in his famous engravings after Raphael.

Carpi, 1. It. tn, in Emilia-Romagna (q.v.), 10 m. NNE. of Modena (q.v.). It has a cathedral, and an anct castle, now a museum. Pop. (tn) 21,100; (com.) 37,800.

2. It. vil., in Veneto (q.v.), on the Adige (q.v.), SE. of Verona. Prince Eugène (q.v.) defeated the French here in 1701.

Carpine, Joannes de Plano (c. 1182-1252), Franciscan traveller, b. Umbria, W. Italy. He was a companion and disciple of St Francis of Assisi and was sent to China by Pope Innocent IV at the head of an embassy to negotiate with the Mongols, and to use his diplomacy to turn them from their avowed intention of devastating Europe. He set out from Lyons in April of 1245, and returned in 1247. Soon after C. was rewarded by the Pope with the bishopric of Antivari in Dalmatia, but it is probable that he did not long survive the hardships of his remarkable journey. He had a genius for recounting his adventures, and Hakluyt pub. portions of his original work; complete text first pub. 1839 as vol. IV of the *Recueil de voyages et de Mémoires* of the Geographical Society of Paris. Ed. for Hakluyt Society by C. R. Beazley, 1913.

Carpineto Romano, It. tn, in Lazio (q.v.), 37 m. SE. of Rome (q.v.). It was the bp. of Pope Leo XIII (q.v.). Pop. 5000.

Carpinio, It. tn, in Apulia (q.v.), 30 m. NE. of Foggia (q.v.). Pop. 6000.

Carpinus, see HORNBEAM.

Carpobalsamum, name given both to the dried fruit and to the oil obtained from the fruit of *Commiphora opobalsamum*, a species of Burseraceae which yields balm of Gilead. The oil is aromatic and volatile, and should be used while fresh or it becomes inert.

Carpocrates, or **Carpocras**, Alexandrian gnostic philosopher, probably of Hadrian's reign (AD 117-38). He founded the sect of Carpoctratians, who existed as late as the 6th cent. They were avowed eclectics, taught that Christ was a human being of pre-eminent goodness, and that the world was created by angels. The Supreme Deity was the Monas. They believed in pre-existence of the soul, and worshipped Zoroaster, Pythagoras, Plato, and others, as well as Christ, as benefactors of mankind.

Carpology (Gk *karpōs*, fruit; *logos*, word), name given to the div. of botany which comprehends all that relates to the structure of the fruit (q.v.).

Carpophore (Gk *karpōs*, fruit; *pherein*, to bear), botanical term used to indicate the prolonged axis of a flower which passes up between the carpels to the top, and which serves to attach the carpels to the plant when they have split apart, e.g. in a silique. Examples occur in the Umbelliferae, Geraniaceae, and Rosaceae.

Carpus (Gk *karpōs*, wrist), in anatomy, the series of bones between the forearm

and hand. In man there are 8 small bones in 2 irregular rows of 4. The upper row articulates with the radius, the lower with the metacarpal bones of the hand. Rudiments of carpal bones are found in all mammals.

Carpozov, Benedikt (1595-1666), Ger. jurisconsult, son of Benedikt C. (d. 1624), Privy Councillor to the Elector of Saxony, and author of *Practica nova Imperialis Saxonica rerum criminalium*, 1635, *Definitiones forenses*, 1668, and other works.

Carr, see SOMERSET, EARL OF.

Carr, Herbert William (1857-1931), philosophical writer. Educ. at King's College, London Univ., and became prof. of philosophy there. Pubs.: *The Problem of Truth*, 1912; *Henri Bergson*, 1912; *The Principle of Relativity*, 1920; *Gentile's Theory of Mind as Pure Act*, 1921; *The Scientific Approach to Philosophy*, 1924; *Changing Backwards in Religion and Ethics*, 1927.

Carr, John (1723-1807), architect, b. Horbury, Yorks, made his reputation as a designer of country mansions in the Palladian style. These included Harewood House (subsequently altered by R. Adam, q.v.), with its model vil.; Denton Park; Gledstone Hall; Heath Hall; Constable Burton; Kirkleatham Hall—all in Yorks; and Basildon Park, Berks. His other buildings included the Asylum, Assize Courts, and sev. houses in York; the Crescent at Buxton; tn halls at Newark and Chesterfield; and Horbury Parish Church (at his own expense). Though of humble birth, he was twice Lord Mayor of York, and left £150,000 at his death.

Carr, John Dickson (1905-), Amer. writer of detective stories, b. Uniontown, Pennsylvania. He studied law, but turned to journalism and then became well known as a writer of ingenious detective stories, which include *The Crooked Hinge*, 1938, *The Case of the Constant Suicides*, 1941, *The Sleeping Sphinx*, 1947, *Death Watch*, 1953, and many others. He also pub. a life of Conan Doyle in 1949, and with Adrian C. Doyle wrote *The Exploits of Sherlock Holmes* in an attempt to resuscitate the great detective. He also wrote a number of crime mysteries under the name of Carter Dickson, including *The Ten Teacups*, 1937, *The Judas Window*, 1938, and *So to Murder*, 1940, and *The Guided Man*, 1942.

Carr, Joseph William Comyns (1849-1916), art critic and dramatist; educ. at London Univ. He was one of the editors of the *Academy*. He became Eng. editor of *L'Art*, 1875. He was director and one of the founders of the New Gallery, Regent St. where many of Burne-Jones's works were first exhibited. Among his pubs. are *Drawings by the Old Masters*, 1877, *Examples of Contemporary Art*, 1878, *Essays on Art*, 1879, *Papers on Art*, 1883-4, and *Modern Landscape*. C. also wrote *A Fireside Hamlet*; *The United Pair*, *Forgiveness*, *King Arthur*, *Some Eminent Victorians*, and adapted various novels for the stage.

Carraca, La, see Cádiz.

Carracci, see CARACCI.

Carrageen Moss, otherwise known as Irish or Sea Moss, edible seaweed technically called *Chondrus crispus*, found on rocky shores of N. Europe and N. America. It is reddish-brown in colour, 2 to 12 in. long and repeatedly forked. It is bleached and dried to be sold. It may be boiled in milk as a health drink, or used for jellies. It is also used for making size and absorbent surgical dressings, stuffing mattresses, and feeding cattle. See SEAWEED.

CARRAGEEN MOSS

Carrantuohill (3414 ft), highest mt in Ireland, ascent from Gortbue School or Lough Acoose. It is one of the Macgillcuddy Reeks (q.v.) in co. Kerry (q.v.).

Carranza, Bartolomé (de Miranda) (1503-76), Sp. priest, b. Navarre. He entered the Dominican order, and became prof. of theology at Valladolid. Charles V sent him to the Council of Trent. He accompanied Philip II to England, and became Queen Mary's confessor, working zealously to establish Catholicism. Chosen Archbishop of Toledo in 1557, he was accused of heresy by the Inquisition, nominally owing to his *Comentarios sobre el Catechismo Christiano*, 1558, and spent the rest of his life in prison.

Carranza, Venustiano (1859-1920), President of Mexico, b. Cuatro Ciénegas, in the state of Coahuila, and educ. in Mexico City. In early life he cultivated his extensive farms in Coahuila. He made sev. attempts to enter Parliament, but was defeated through the efforts of President Diaz. In 1911 he sided with the revolutionary president Madero—to whom, however, he was not believed to be loyal. He was, under Madero, elected governor of Coahuila. When, after the murder of Madero, the presidency was seized by Huerta, in 1913, C. declared war against Huerta. In Aug. 1914 C. obtained the surrender of the administration; and in Oct. 1915 was recognised as President by the U.S.A. He was not formally elected, however, until the end of 1916. Another revolution broke out

in 1920; C. was defeated, captured, and shot 5 days later at Tlaxcalatongo in the state of Puebla.

Carrara, It. tn, in Tuscany (q.v.), at the foot of the Apennines (q.v.), 4 m. NNW. of Massa (q.v.). It has a Romanesque-Gothic cathedral (12th-14th cents.), and is famous for its marble quarries, which have been worked for over 2000 years. The marble used for sculpture is peculiarly white and flawless and of great durability, but few of the more than 400 quarries produce this variety. Nearly all the surrounding heights (Monte Sagro, 5684 ft) are of marble, and mt railways serve the quarries. The tn has an Academy of Fine Arts, founded in 1769. Marina di C., 3 m. SW. on the Ligurian Sea, is a port and bathing resort. Pop.: (tn), 27,200; (com.), 62,800.

Carré, Alexis (1873-1944), Fr. doctor of medicine, b. Sainte-Foy-les-Lyon, France. After studying medicine for a time when quite a youth and becoming a member of the Lyons Univ., went to the U.S.A., where he became connected with the Univ. of Chicago. In 1909 he was elected an associate member of the Rockefeller Institute for Medical Research. In 1912 he was awarded the Nobel prize (amounting to £7800) for medicine on account of his brilliant success in suturing of blood vessels and in transplantation of human organs. He conducted some remarkable experiments in 1913 on cats, keeping vital organs alive for some hours after their removal from the body. At the outbreak of war he returned to France, and became famous as the chief inventor of the C.-Dakin treatment of wounds by irrigation—very part of the wound being repeatedly sterilised with a solution chiefly of hypochloride of sodium, applied through a system of rubber tubes. In 1919 he returned to the Rockefeller Institute and continued his work there until his retirement in 1939. In the following year he returned to France, and was placed by the Vichy Gov. in charge of the Foundation for the Study of Human Relations, where he remained until the liberation of France in 1944. Charges made against him of collaboration with the Germans were denied. There was no trial and C. d. the same year on 5 Nov. See Sir Wm Macpherson (ed.), *Official Medical History of the War*, 1921-4.

Carrer, Luigi (1801-50), It. lyric poet and scholar, native of Venice. He gave up the law for literature, becoming prof. of philosophy at Padua, 1830; later, director of the Correr Museum, Venice. His poems, which reveal the influence of Foscolo and Byron, included idylls, epigrams, sonnets, hymns, and tragedies, but the best are ballads (introduced from Germany) and odes. His *L'anello di sette gemme*, 1838, told in poetical form the hist. and customs of Venice. Vols. of poems and ballads appeared in 1832, 1838, and 1841; prose and poetry, 1837; and odes and sonnets in 1868. See lives by Veludo, 1851, Venanzio, 1855, and Sartorio, L. Carrer, 1900.

Carrhae, ant. city of Mesopotamia, about 25 m. from Edessa, the Haran of

the Bible and Assyrian inscriptions. The crushing defeat of Crassus by the Parthians in 53 BC, when the Roman standards were lost, is frequently mentioned in classical literature.

Carriacou, is. of the Brit. W. Indies and the largest of the Grenadines, being 8 m. long, and from 2 to 4½ m. wide. Cotton is grown. Hillsborough, on the W. coast, is the tn and harbour. C. elects a member to the legislative council of Grenada. Pop. 3000.

Carriage (Lat. *carrus*, car, chariot, wagon), a means of carrying; any vehicle intended to convey goods, but especially passengers, by road or rail. Hence railway C., hackney C., gun C., and various other compounds. C.s are structures on 2 or more wheels, and vary greatly in size and shape. Possibly they were first developed from the Egyptian sledges and rollers used for conveying heavy loads. Chariots were known also to the anc. Israelites, Greeks, and Romans, chariot racing being a favourite sport at the public games of Greece and Rome. The covered C. of to-day dates from about the 15th cent. In 1555 the first Eng. C. (excluding the war-chariots of the anc. Britons) was made by Ripon for the Earl of Rutland. By the 17th cent. they were much used, and ousted the sedan-chair, being themselves replaced by the cab in 1820. The hansom cab was introduced in London in 1834 by Joseph Hansom. Other 2-wheeled C.s are the stanhope, tilbury, gig, and dog-cart. In the 18th cent. many improvements were made; the body was suspended on straps, attached later to 'C'-shaped springs. The use of the private 4-wheeled C. drawn by one or more horses (often the 'C. and pair', with 2 horses) was especially marked during the Victorian era. The brougham was introduced in 1839, other types being the landau, victoria, and four-in-hand. Open 4-wheeled C.s are the phaeton, wagonette, and brake. The drag and the omnibus have seats both outside and in. C.s have various different special names in different parts of the world, but the word is commonly used in England of the 4-wheeled, private, horse-drawn vehicle. See also CAB; CART; COACH AND COACHING. See H. McCausland, *The English Carriage*, 1948.

Carriage-building, see COACH-BUILDING.

Carriage Dog, see DALMATIAN DOG.

Carriage Licences, see MOTOR VEHICLE LICENCES.

Carriek, Thomas Heathfield (1802-75), a grammarist, b. near Carlisle, educ. at the grammar school there; a self-taught artist. He neglected his chemist's business for painting. In 1836 he moved to Newcastle; 1839 to London. From 1841 to 1866 he exhibited annually 8 miniatures. Among the most famous are those of Carlyle, Sir R. Peel, Rogers, Wordsworth, Longfellow, Charles Kean, Farren, Macready, Daniel O'Connell, and Robert Owen. In 1845 he was awarded a medal for his method of painting miniatures on marble; and a Turner annuity by the Royal Academy about 1868. See Royal Academy catalogues, 1841-66.

Carriek-on-Shannon, riv. port and co. tn. of Leitrim co., Rep. of Ireland, on the R. Shannon, 37 m. SE. of Sligo. There is trade in shipping, dairy produce, corn, and plastic electrical fittings. Pop. 1500.

Carriek-on-Suir, tn in co. Tipperary, Rep. of Ireland, connected with Carrickbeg, in co. Waterford, by 2 bridges over the Suir. It has an anc. castle and par. church. Tanning is the chief industry. Pop. 4800.

Carriekfergus, seaport tn. in co. Antrim, N. Ireland, on Belfast Lough. William III landed here before the battle of the Boyne. The castle of C., dating back to the 12th cent., is preserved as an anc. monument, and the par. church, the oldest still in use in Ulster, is of the same period. Salt and rayon are the chief industries, and wrought iron is a local handicraft. Pop. 3500.

Carriekmacross, mkt tn in the co. of Monaghan, Rep. of Ireland, with manufs. of leather and boots, industrial alcohol, mineral waters, a trade in grain, and a fruit processing industry. It is renowned for the manuf. of lace. Pop. 2100.

Carrier, Jean-Baptiste (1756-94), Fr. revolutionary, b. Yoleto. He was a lawyer. Elected to the Convention, 1792, he helped to form the Revolutionary Tribunal, voted for the death of the king, demanded the arrest of the Duke of Orleans, and helped in overthrowing the Girondists. C. was sent to Nantes, 1793, to repress the civil war started by priests and Royalists in La Vendée. He massacred over 16,000 Vendean and other prisoners without trial, sparing neither women nor children. After Robespierre's fall he was guillotined.

Carrier (Disease Carrier), in medicine a person who, recovered from an infectious disease, retains the germ for varying periods of time and is, therefore, capable of spreading the infection; notably in the case of typhoid, paratyphoid, cholera, and dysentery, diphtheria, scarlet fever, infantile paralysis, and meningitis. The germs are carried in the faeces, urine, throat, tonsils, and nose.

Carrier, Common, in Eng. law, one who undertakes for hire to carry goods or passengers from one place to another either by land or water. He is distinguished from the private C. by being ready to accommodate the public generally and has different responsibilities in law. Examples of land C.s are omnibus companies, railway companies, wagoners, firms such as Carter Paterson & Pickford and others; C.s by water are owners of steamships, ferry-boats, and the like. Up to 1933 the carriage of goods by road was uncontrolled and the Road and Rail Traffic Act of that year was passed as a result of a widespread feeling that the fierce and cut-throat competition in the industry which developed during the years following the First World War was becoming dangerous. This Act (which took effect as from 1934) imposed a measure of control by making it necessary for any person carrying goods for hire or reward to have a licence to do so, and to operate subject to specified

conditions and in certain cases within defined limits. Since 1934 no person may use a goods vehicle on a road for the carriage of goods for hire or reward, or for or in connection with any trade or business carried on by him, except under a licence. Licences are of 3 classes (see BRITISH TRANSPORT COMMISSION). The 'A' licence applies to the common C. or public C., and it entitles the holder to use his vehicle for the carriage of goods for hire or reward, but not for the carriage of goods in connection with any trade or business carried on by him except that of a C. of goods. It is a condition of the licence that the vehicles are maintained in a fit and serviceable condition; speed limits and regulations as to loading are complied with; requirements as to drivers' hours are observed; and that records of work, journeys, and loads are kept (Sect. 8 (b)). Under the Transport Act, 1947, it shall be a condition of every licence that, except under a permit granted by the Brit. Transport Commission, goods shall not be carried for hire or reward in any authorised vehicle if the vehicle, at any time while the goods are being so carried, is more than 25 m. from its operating centre, and the Road and Rail Traffic Act, 1933, shall have effect as if the said condition were included among the conditions specified in subsection 1 of section 8 of the Act. But this additional condition is not applicable where the goods carried are liquids carried in bulk in a tank permanently fixed to the vehicle, or in a tank not so fixed of which the capacity is not less than 500 gallons, or are goods of a special character which under any statutory provision may only be carried in a specially constructed vehicle, or where the carriage is an ordinary furniture removal, or the goods carried are meat or livestock; or the goods consist of felled timber carried in a specially constructed carriage. The general effect of this clause (52 of the Act of 1947) is that goods vehicles used under licence are not allowed to carry goods for reward more than 25 m. (measured as air miles) from their base, and that this becomes an additional condition of the licence.

A common C. of goods must transport any except specially dangerous articles to the place to which he professes to carry goods. A fixed rate of payment must be charged to all employers alike, payment being made beforehand if desired. Otherwise the C. has a lien on the goods taken for his charges. He is in the eyes of the law responsible for all acts of his employees. Also, unless his liability be limited by a special contract, he is responsible for all goods entrusted to him until they have been delivered, and must make good any loss or damage occurring through any cause except 'the act of God, or the public enemy' (in the narrowest signification). These stringent rules exist to guard the interests of employers, and prevent their being entirely at the mercy of the C. If goods are to be warehoused with C.s for a time previous to carriage, extraordinary liability is not incurred by

them until the actual time of carriage, though of course ordinary care and precautions must be taken. In England if a number of C.s are engaged in the transfer of goods, the first is held liable, as insurer, as being the party with whom the contract was originally made. Personal delivery is expected of land C.s. Water C.s can only take goods to the wharf, but notice must be given of the vessel's arrival and discharge of cargo. A special contract may be entered upon for the carriage of goods, but no C. can exempt himself from liability for goods not mentioned in the Carriers Act by a mere printed notice that he refuses to hold himself responsible. A definite contract signed by the employer is essential before the C. can shake off his responsibilities as insurer. The Carriers Act of 1830 granted certain exemptions from liability to common C.s by land. A ship owner's liabilities are much the same, except as limited by the Merchant Shipping Acts, and by the contract of affreightment. At common law railways are common C.s only of such goods as they profess to carry. But as regards other goods, etc., their liability for neglect or default is dealt with by the Railway and Canal Traffic Act, 1854, and amending Acts. A railway is a common C. of a passenger's personal luggage and therefore an insurer of its safety; but this is not so if the luggage has been taken by the passenger out of the control of the railway. Hence in the event of accidents the railway is only liable if negligence can be proved. By the Railway and Canal Traffic Act of 1854 liability as to animals was limited. Railways are not common C.s of the passengers they carry and therefore are not 'insurers' of their safety. Passenger C.s are not responsible for mishaps caused by the passenger's contributory negligence. They must accept as passengers all who comply with their rules (as to tickets, use of cars, etc.), except people of disorderly behaviour or those who have some contagious disease. See Carver, *Law of Carriage of Goods by Sea* (10th ed.), 1956; O. Kahn-Freund, *Law of Carriage by Inland Transport* (3rd ed.), 1956.

American Railways. There is a vital difference in the Amer. law as to common C.s, railways being considered common C.s of passengers, with the consequence that they are sued almost every day for accidents in which passengers are injured.

Carrier-current, or Carrier-wave, alternating current of a given frequency on which one or more high-frequency currents are superposed at the sending end, being filtered out from the carrier at the receiving end. Sometimes the power current on high voltage transmission lines is used as carrier for signals or internal telecommunication. See TELEPHONY.

Carrier Pigeon, variety of the family Columbidae, remarkable for the huge white wattle round the eyes and at the base of the beak. It is essentially a fancy bird, and the messenger pigeon proper is called the homer.

Carrière, Eugène Anatole (1849-1900),

Fr. genre painter, b. Gournay-sur-Marne, lived in Paris. He was a pupil of Cabanel, and was awarded a medal, third class, 1885. Edmond de Goncourt called him 'the modern Madonna painter,' for his frequent treatment of this subject. His famous 'Maternity' (1892) was bought by the Luxembourg. His portraits of Daudet, Edmond de Goncourt, Anatole France, Metchnikov, show ability to depict character, though his manner of painting was vague and melting. There is a decorative panel at the Sorbonne by C. (1898), and in the Hôtel de Ville, Paris. See G. Geffroy, *L'Œuvre d'Eugène Carrière*, 1902.

Carrière, Moritz (1817-95), Ger. philosopher and writer on aesthetics; studied at Giessen, Göttingen, Berlin, and in Italy; prof of philosophy at Giessen, 1849; secretary and prof. of anc. hist. at the Academy of Plastic Arts at Munich, 1853. At first a Hegelian, he later followed the system of Fichte more closely. He also ranked high as an art critic. Among his works are a treatise, *Aristotle the Friend of Plato* (in Latin), 1837, *Die Religion in ihrem Begriff*, 1841, *Die philosophische Weltanschauung der Reformationszeit*, 1847, *Die letzte Nacht der Girondisten* (a poem), 1849, *Das Wesen und die Formen der Poesie*, 1854, *Ästhetik*, 1859, *Die Kunst im Zusammenhang der Kultur-entwicklung*, 1887, and *Lebenserinnerungen* (ed. W. Diehl), 1914. See *Gesammelte Werke* (14 vols.), 1886-94.

Carrington, C. R. Wynn-C., see LINCOLNSHIRE, MARQUESS OF.

Carrington, Sir Frederick, Major-General (1844-1913), soldier, educ. at Cheltenham College, entered the army, 1864. He commanded the Light Horse in the Transkei war, 1877; led the colonial forces against the Sekukuni in the Transvaal, 1878-9; and in the Basuto war, 1881. Commandant of Bechuanaland police, 1893; K.C.B., 1897. In the S. African war (1899-1902) he commanded the Rhodesian field force, helping to raise the siege of Mafeking, 1900.

Carrington, Henry Beebe (1824-1912), Amer. soldier and military historian, b. Connecticut, graduated Yale, 1845, studied law, at Yale Law School, 1847. In 1869 prof. of military science in Wabash College. Among his many works are *Russia as a Nation*, 1849, *History of the Battles of the American Revolution*, 1876, and *The Washington Obelisk and its Voices*, 1887.

Carrington, Richard Christopher (1826-1875), astronomer, b. Chelsea, educ. Cambridge; from 1849 to 1852 observer at Durham Univ. After 1852 he conducted observations (especially of the minor planets, fixed stars, and the sun), at his private observatory at Redhill, Surrey. He showed that the period of rotation of sunspots varied with their lat. on the sun. Secretary of Royal Astronomical Society, 1857-62; F.R.S., 1860. He pub. *Catalogue of 3735 Circumpolar Stars*, 1857, and *Observations of the Spots on the Sun*, 1863, which greatly influenced the study of solar physics.

Carrion Crow (*Corvus corone*), Brit. species of Corvidae, closely connected with *C. cornix*, the hooded crow. In S. America and the U.S.A. the name is given to *Catharista atrata*, the black vulture, a species of Cathartidae which greatly resembles the turkey-buzzard. The colour of this bird is black, and its naked head is also dark of hue. Both species act as scavengers, but the former will also attack young living animals.

Carrion Flowers are those which attract short-tongued flies by means of their meat-like appearance or their foetid smell and so become pollinated. Two such species are *Amorphophallus titanum* and *Arum maculatum*, both belonging to the family Araceae. They both emit a very disagreeable odour, and the former is of a red and yellow colour, which serves as an additional attraction. The genus *Stapelia*, which belongs to the Asclepiadaceae, has the same property to induce flies to fertilise its flowers, and the flowers themselves are of a dark red colour.

Carroccio, large war-chariot drawn by oxen, used by the medioeval reps. of Italy to carry their banner into battle. On a rectangular platform, painted red, were set the city's standard and an altar, at which mass was said before battle. It was surrounded by the bravest soldiers in the army, and regarded both as a rallying point and as the palladium of the city's honour.

Carroll, Charles, of Carrollton (1737-1832), Amer. patriot, b. Maryland; educ. at Jesuit colleges of Saint-Omer, Rheims, and Louis le Grand; studied law in Paris and London. He returned to America, 1765, inheriting a large estate. He was a member of the Committee of Observation, 1775, and elected delegate to the Prov. Convention. In 1776 C. was sent to persuade the Canadians to war against England, and was delegate to Congress. He was the last surviving signer of the Declaration of Independence. In 1789 U.S. senator for Maryland; 1799, member of the Maryland and Virginia boundary commission. In 1810 he retired from public life. See biographies by K. M. Rowland, 1898; Joseph Gurn, 1932; Ellen Hart Smith, 1942; and L. A. Leonard, *Life of Charles Carroll of Carrollton*, 1918.

Carroll, John (1735-1815), Amer. Rom. Catholic prelate, cousin of above, b. Prince George's co., Maryland; educ. in Flanders; entered the Society of Jesus in 1753; became a priest in 1769, and a professed father in 1771. He returned to Maryland in 1774, and took a prominent part in Amer. politics. Estab. and endowed through his influence Georgetown Univ. (completed 1791). He was consecrated a bishop in 1790, and became archbishop in 1811; as a staunch Federalist he opposed the war of 1812.

Carroll, Lewis, pen-name of Charles Lutwidge Dodgson (1832-98), mathematician and author, b. Daresbury, Cheshire. Educ. at Rugby and Oxford, he took a first in mathematics, 1854; took orders, 1861; and was mathematical lecturer at Christ Church, 1855-81. He

lived a retired life at Oxford, but delighted in the company of little girls. A few of his witty pamphlets on univ. affairs were collected and pub. as *Notes by an Oxford Chiel*, 1865-74. His mathematical speculations were intricate and ingenious. Among such publs., under the name of C. L. Dodgson, are *A Syllabus of Plane Algebraical Geometry*, 1860, *Guide to the Mathematical Student*, *Elementary Treatise on Determinants*, 1867, *Euclid and his Modern Rivals*, 1879-85, and *Curiosa Mathematica*, 1888, 1894. But his fame rests chiefly on *Alice's Adventures in Wonderland*, 1865 (the first version of which was *Alice's Adventures Underground*, a MS. which Dodgson gave to Mrs. Reginald Hargreaves, d. 1934, who was then Alice Pleasance Liddell, daughter of the dean of Christ Church, Oxford, and the original of Alice); and on its continuation, *Through the Looking-glass*, 1872, both illustrated by Tenniel. These books are still the delight of children and grown-ups alike. They are full of whimsical fancies, grotesque absurdities, and unforgettable remarks and incidents. Though occasionally plagiarised, they are inimitable; and have become widely read classics, having been trans. into various tongues. The first dramatised version appeared in London, 1886, but the play of necessity loses much of the charm of the book. In 1928 the MS. of *Alice in Wonderland* was sold to Dr. Rosenbach, an Amer. dealer, for \$15,000, and later in the same year resold to Mr. R. E. Johnson of New Jersey for \$150,000, or £30,000. Later Dr. Luther H. Evans, librarian of Congress, paid \$50,000 (£12,500) for the vol. at an auction and in 1948 presented the MS. and C.'s own drawings to the Brit. Museum 'as a gift from America to the Brit. people.' A centenary exhibition of C.'s works, portraits, etc., was held in London, 1932. The sole available copy in England of the first version of *Alice in Wonderland* was that owned by Sir Leicester Harmsworth, who also possessed a copy of a skit called *American Telegrams*, only one other copy of which is extant. C.'s other works are *Phantasmagoria* and other Poems, 1869; *The Hunting of the Snark* (humorous verse), 1876; *Doublets, a Word Puzzle*, 1879; *Rhyme? and Reason?*, 1883; *Principles of Parliamentary Representation*, 1884; *A Tangled Tale*, 1885; *The Game of Logic*, 1887; *Sylvie and Bruno* (illustrated by H. Furniss), 1889; *Symbolic Logic* 1896; his *Diaries* were ed. by R. L. Green, 1954. See S. D. Collingwood, *Life and Letters of Lewis Carroll*, 1898; I. Bowman, *The Story of Lewis Carroll told for Young People by the Real Alice*, 1899; and studies by W. de la Mare, 1932; L. Reed, 1932; F. B. Lennon, 1947; D. Hudson, 1954.

Carrollton, formerly a post-vil. of Jefferson par., Louisiana, on Mississippi R., now suburb of New Orleans, U.S.A.

Carron, vil. near Falkirk in Stirlingshire, Scotland, on the R. C., celebrated for its old-estab. ironworks, founded in 1759. Carronades and other guns were made here until 1852, when more modern

armaments superseded them. Now an extensive manuf. of stoves, grates, boilers, and cast-iron goods, including intricate and specialised castings, is carried on, which supports a large part of the pop. Pop. 3200.

Carron Oil, limewater and linseed oil mixed in equal proportions, as a dressing for burns. The name is derived from the C. foundry in Scotland, where, from its frequent use in the ironworks, its reputation was made. It is a soapy, thick mixture, and in modern practice has been replaced by neater dressings, such as a solution of bicarbonate of soda and a thin smearing of vaseline, or oxide of zinc ointment, or, more usually, a saline dressing at first followed by one of the antibiotics.

Carronades, short cast-iron guns, attached to the carriage by loop and bolt instead of trunnions, were invented in 1752 by Gen. Robert Melville, and made at Carron by Gascoigne for use in the navy. The metal was not so thick as that of most guns of the same calibre, and the powder chamber was at the muzzle, as in mortars. Only small charges of powder could be used, and they were of short range. Smaller long-range guns have rendered them obsolete.

Carrot, plant of the genus *Daucus* and family Umbelliferae. The common C. (*Daucus carota*), originally a native of the E., has been naturalised in Europe and America, and is a biennial plant. In E. U.S.A. it is often a pernicious weed. The root of the cultivated variety is much thicker and pleasanter in taste than that of the wild. The leaves are pinnately compound, the flowers creamy-white to pink or purplish in the central ones. The foliage is beautiful for decorative purposes and in Charles I's reign ladies sometimes even wore the leaves instead of feathers. Introduced into England early in the 16th cent., it forms an article of food both

for cattle and for man. The roots are also used for poultices. C.s contain colouring matter used in some parts of Britain to colour butter. The white Belgian C. gives the largest crops. It has a thick white root, pale green above the earth. These are inferior to the red varieties for nutritive purposes. A deep, sandy soil, well drained and deeply trenched, suits best. It should be prepared and manured in autumn. The main crop is sown from late Mar. to April. The plants must be thinned out after sowing and kept free from weeds. During the winter the roots may be stored in a cellar or shed. Long-rooted kinds need about 3 ft. of soil; short horn varieties thrive in 6 in. of good compost on top of poorer soil.

Carrum, popular seaside resort in Victoria, Australia, 22 m. from Melbourne.

Carruthers, Robert (1799-1878), journalist and miscellaneous writer, b. Dumfries. In his youth he was apprenticed to a bookseller, becoming editor of the *Inverness Courier*, 1828, and proprietor, 1831. He collaborated with Robert Chambers to produce the *Cyclopaedia of English Literature*, 1843-4.

Carruthers, William (1830-1922), botanist. Educ. for the Presbyterian Church, he took up botany instead, becoming assistant in the botanical dept. of the Brit. Museum in 1859 and keeper in 1871. He was the pioneer in this country of seed testing, especially of pasture grasses. He wrote many papers on systematic, palaeontological, and agric. botany.

Carse, Scottish term for low, alluvial lands adjoining rivs., examples being the C. of Gowrie, C. of Falkirk, C. of Stirling. C. soils are usually very fertile, consisting of argillaceous deposits, but sometimes they are barren clays.

Carse of Gowrie, fertile dist. of Scotland, extending some 15 m. between the Tay and the Sidlaw Hills in Perthshire and Angus.

Carsebreck, loch in Perthshire, the great Scottish curling (q.v.) centre, 11 m. by rail from Stirling.

Carshalton, urb. dist. of Surrey, England, 3 m. from Croydon, and 11 m. S. of London. Has an old church, some fine old houses, and over 300 ac. of public park; but it is chiefly a residential dist. Pop. 62,800.

Carso, see KARST.

Carso Plateau, situated on the Gulf of Trieste, was the scene of fighting between the Austrians and the Italians during the First World War. The first campaign in this area commenced in Sept. 1916, when the Italians under Cadorna succeeded in capturing the heights at San Grado and other important positions. Further progress on the C.P. was made in Nov. 1916. The road to Trieste was, however, blocked by the Austrian strong positions on Mt. Hermada, and in the spring of 1917 plans were made for capturing these. In the middle of May operations commenced and much progress was made in the sector S. of Gorizia. After a lull fighting began again in Aug. 1917, but, though yet further progress was made on the C. P., the It.

debacle of Caporetto (q.v.) caused their forces on the C. P. to retreat hurriedly and no further fighting took place in this theatre.

Carso (anc. Carsoli), It. tn. in Abruzzi e Molise (q.v.), 23 m. SW. of L'Aquila (q.v.). The Palazzetto Orsini was destroyed in the Second World War, together with the medieval houses fronting the square. There is a trade in wine. Pop. 7500.

Carson, Christopher (1809-68), familiarly known as 'Kit' C., Amer. trapper, guide, and soldier. He emigrated from Kentucky to Missouri as a hunter and trapper. His knowledge of Indian languages and habits made him excellent as a guide in Frémont's Rocky Mts. explorations, 1842-5. C. served under Frémont during the conquest of California, 1846-7, and settled in New Mexico, 1853, becoming U.S. Indian agent at Taos. For his services in the Civil war he was breveted brigadier-general. He d. at Fort Lynn, Colorado. He figures in Willa Cather's *Death Comes to the Archbishop*. See lives by De Witt C. Peters, 1858; E. S. Ellis, 1899; S. Vestal, 1928, and B. C. Grant (editor). *Kit Carson's Own Story of his Life*, 1926.

LORD CARSON

Carson, Edward Henry, Baron (1854-1935), educ. at Portarlington School and Trinity College, Dublin. He represented Dublin Univ. in Parliament as a Conservative, 1892-1918; then sat for Duncairn div. of Belfast, 1918-21. In 1894 he was appointed queen's counsel at the Eng. Bar, having held that office at the Irish Bar since 1889. Having acted as solicitor-general for Ireland in 1892, he was knighted, and became solicitor-general in 1900, retaining the position till 1906. He led the Unionist campaign against the Parliament Act; and in 1912 he successfully engineered the signing of the

covenant by which, at Belfast, thousands bound themselves to refuse to recognise any Home Rule Parliament. The Ulster Unionist council became, in the latter part of 1913, a provisional gov., and C. was its head. During the First World War C. joined the coalition gov. in June 1915 as attorney-general, but resigned in Oct. as he disagreed with Grey's policy in the Balkans. Under Lloyd George C. was first lord of the Admiralty from 1916, and he supported the Irish Convention of 1917, in which year he quitted the Admiralty, but remained in gov. as a member of the War Cabinet. At the close of the war he agreed to dividing NE. Ireland from the rest of the country. Of commanding presence and magnetic appearance, C. was one of the most formidable orators of his day. He was given a life peerage, 1921, and became a lord of appeal. See *life* (2 vols.) by E. Marjoribanks and I. Colvin, 1932, and 1934.

Carson, Rachel Louise (1907-), Amer. writer on science, b. Springdale, Pennsylvania. Educ. at Pennsylvania College for Women and Johns Hopkins Univ., she joined the staff of the univ. of Maryland. Her best-known book is *The Sea Around Us*, 1951. She has received numerous awards for her scientific work.

Carson City, cap. of Nevada, U.S.A., and the co. tn of Ormsby co., 24 m. S. of Reno. It is a rail and trade centre and resort in a silver-mining and agric. area; cattle are slaughtered and there is a brewing industry. Pop. 3082.

Carstairs, par. of S. Lanarkshire, Scotland, 3½ m. S.W. of Lanark, with an important railway junction. Pop. 2623.

Carstairs, William (1649-1715), minister, son of a minister of Cathcart, near Glasgow, who had been taken prisoner at the battle of Dunbar by Cromwell and exchanged. He was educ. at the college of Edinburgh, and in Holland, where he studied under the most celebrated profs., and was probably ordained in the Dutch Church. He also made the acquaintance of William of Orange, and became his confidential adviser. In 1672 he came to London and was arrested by Lauderdale on petty charges of creating disturbances. Nothing was proved against him, and he was kept a prisoner in Edinburgh Castle for 5 years. He returned to Holland, and from there made frequent visits of investigation, acting as agent between Eng. and Scottish conspirators, in conjunction with Shaftesbury, Russell, and Argyll. After the Rye House Plot (q.v.), which he really did not uphold, he was arrested and again imprisoned, and on his release he sought security in Holland, where he became chaplain to William of Orange. In reconciling the Scottish Church his influence was invaluable, his advice having the greatest possible weight with William. Under Anne he was elected principal of Edinburgh Univ. and presented with a living.

Carstens, Asmus Jakob (1754-98), Ger. artist, b. near Schleswig. He was apprenticed to a wine merchant for 5 years, but at the age of 22 he went to Copenhagen to

study art. Then followed a period of great poverty in Lübeck and Berlin, during which he barely supported himself by portrait-painting. He was released from penury by the success of his large composition 'The Fall of the Angels,' which contains 200 figures, and which gained for him the patronage of the court, a professorship at the Berlin Academy, and a pension. He visited Rome in order to study the works of Michelangelo and Raphael, and gained a passion for the antique. This 'classicism' had much effect on Ger. art. His numerous drawings represent chiefly subjects from the ant. classic poets and from Ossian and Shakespeare. He d. at Rome in extreme poverty.

Carwell, Catherine Roxburgh (1879-1946), critic and novelist, b. Glasgow. Her maiden name was Macfarlane, and she was educ. at the Park School and Glasgow Univ. In 1915 she married Donald Carwell, also a writer, who was killed in an accident in 1940. Her first novel, *Open the Door*, 1920, was followed by *The Camomile*, 1922. In 1930 she pub. a 'debunking' *Life of Burns*, and in 1932 *The Savage Pilgrimage: a Narrative of D. H. Lawrence*, which was suppressed as libellous. Her autobiography, *Living Awake*, was pub. in 1950.

Cart (probably from Old Norse *kartr*, or O.E. *caet*, of doubtful meaning), term for various kinds of vehicle, strictly 2-wheeled, topless and springless, usually designed to carry heavy loads and to be drawn by 1 horse. It is the most primitive form of carriage or chariot (q.v.). C.s are generally for agric. or postal purposes, for transport of goods or luggage (farmer's C., tradesman's C., carrier's C.). Combined with other words it may denote special kinds of pleasure-carriages now largely of historical interest. Examples are the dog-C. (originally made for the conveyance of sporting dogs), a rather high, 2-wheeled carriage with seats back to back, in front and behind. These are particularly suited for tandem driving. The gadabout is a dog-C.; the Whitechapel C. and the gig (stanhopes and tilburies included) are other varieties. The governess C. is a very low, 2-wheeled pony-carriage with 2 side seats facing inwards. Other 2-wheeled C.s are the Irish jaunting car, the Canadian calash, and the Amer. trotting sulky.

Cartagena (ant. Carthago Nova—New Carthage), Sp. fortified seaport and naval station in the prov. of Murcia, built on a bay of the Mediterranean. Founded by Hasdrubal (q.v.), it became the chief tn of the Carthaginians in Spain. In 210 BC it was taken by Scipio Africanus Major (q.v.), and because of its neighbouring mines—in which they employed 40,000 men—was a tn of great importance to the Romans. It was sacked by the Vandals, and was, later, an independent principality under the Moors. In 1588 it was pillaged by Drake, was taken by the Duke of Berwick in 1707, and formed itself into an independent canton for a time in 1873. As the naval base of the republicans, it

was bombed during the civil war of 1936-9. C. is still Moorish in appearance, has 4 ruined castles, and has many fine buildings, including a 13th-cent. former cathedral. It has metallurgical and glass industries, and is surrounded by many mining tns. Pop. 117,350.

Cartagena, city, seaport, and the cap. of Bolivar dept, Colombia, on the Caribbean coast, was founded 1533. It has a fine harbour, and the Dique Canal connects the port with the Magdalena R. C. once the richest city in the New World, was taken by Drake, 1586; pillaged by Fr. buccaners, 1697; bombarded by Adm. Vernon, 1741; taken by Morillo, 1815, but surrendered to the Royalists soon afterwards. Freed from the Sp. yoke, 1821. It exports agric. products, oil, gold, and platinum. Pop. (including suburbs) 125,600.

Cartago: 1. Central prov. of Costa Rica on the Caribbean slopes of the Cordillera de Talamanca. The chief products are agric.; stock raising and dairying are carried on. Area 1000 sq. m.; pop. 100,700.

2. Cap. of the above prov., 12 m. ESE. of San José, on the transcontinental railway and Inter-Amer. highroad. It was the cap. of Costa Rica until 1823. It is situated on a fertile tableland, 5622 ft above sea level, at the base of the volcano Irazu (11,260 ft), near which are hot mineral springs, the resort of invalids. There is a cathedral with a stone figure of La Negrita, patroness of Costa Rica. An earthquake in 1723 caused the city to be flooded by water from the crater; in 1841 the greater part of the city was destroyed by earthquake. It is a market for live-stock and agric. produce. Pop. 14,737.

Carte, Richard D'Oyly, see D'OYLY CARTE.

Cartel, from the Ger. use of the word Kartell: a joint marketing agency estab. by a group of independent producers. The earliest Eng. C. was the Newcastle Vend (for selling coal) in the 17th cent. More generally a C. is a terminable association between independent firms to fix prices, output, etc. (a trust is permanent). The industrial C. arose out of the need to control the market in order to stabilise prices. From that it developed into an organisation which instituted a central selling office to dispose of the product for the benefit of all members of the C. In some C.s, however, each constituent member was left free to operate its own market, although the output and price were controlled by the C. In 1883 'Irma,' the International Rail Makers' Association, came into being, and was the first of the international C.s which became a feature of modern industry, especially after the peace treaties following the First World War. States at one time politically and still industrially united were then split up, making international industrial agreements essential. In small industries, such as the magnesia industry, the C. amounts to a close combine governing a monopoly. In larger industries, however, an international C. may be no more than an agreement between national

combines to respect each other's markets. International C.s have been engendered by the tariff system, and being liable to the abuses often allied to a monopoly, C.s have been from time to time subjected to political control.

International cartels. The meaning of C. in current usage has extended so as to include patent and process exchange agreements between firms in different countries—such, for example, as those concluded by Standard Oil, International General Electric, and other Amer. concerns with foreign interests. Often patent exchange arrangements contain marketing agreements and, in fact, the marketing agreements may be the reason for exchange of patents and processes. This type of C. arrangement is, probably, the one which primarily concerns Amer. firms. International C.s are sometimes formed under governmental auspices and with gov. participation, and indeed some of the most notorious international C.s have been negotiated by govts. This was true of the tin and rubber C.s; while, again, the U.S. Gov. entered into agreements for wheat and coffee. In the course of the Second World War anti-C. critics were loud in their condemnation of international C.s, regarding them as monopolistic, conspiratorial, and even fascist in character; whereas pro-C. critics, like Lord McGowan of Imperial Chemical Industries, have described C.s as a means of assuring orderly marketing, planned expansion of international trade, and elimination of cut-throat prices. Most of the big international C.s have sprung from the lack of balance between productive capacity and current consumption. Extensive Amer. participation in C.s would seem to require a considerable degree of co-operation between firms in the domestic market, but since the U.S.A. is committed to an anti-trust policy at home, such participation seems improbable, at least in those industries in which exporting firms are not only many in number but also occupied in producing for the domestic market. Amer. hostility to monopoly is not necessarily shared by other countries, and many European countries may favour international C.s, together with import restrictions, export bounties, and other measures designed to cope with excess production.

The menace of the great Ger. C.s which existed before the Second World War lay in the fact that these great combines were producers for the Ger. war machine. Most of them were excessive in size, were monopolists, and essentially anti-democratic. For these reasons decartelisation laws were made for the Amer. and Brit. zones of occupation in Germany early in 1947. Some 5 U.S. zone concerns, with about £25,000,000 assets, were automatically considered to be 'excessive' concentrations by employing 10,000 or more persons: the Opel motor works at Russelsheim; the Bosch works at Stuttgart; the Metallgesellschaft at Frankfurt; the Gute Hoffnungs Hütte, with H.Q. at Oberhausen (in the Brit. zone) and large subsidiary works at Nuremberg;

and the Degussa works. The trial in 1947 before an Amer. military tribunal at Nuremberg of Germany's vast chemical combine, I. G. Farben Industrie (Dye Trust) as war criminals showed that the combine participated in no fewer than 500 undertakings outside Germany, apart from its foreign manufacturing plants and holding companies. Working intimately with Nazi foreign policy its international affiliations and contracts ran into thousands, including C. agreements with major concerns in America, Britain, France, and many other European countries, which were used as an economic weapon in the preparation of war. From 1935 onwards all C. agreements were cleared by Farben through the military economic staff of the *Wehrmacht*. Their deliberate purpose was to restrict industrial development and scientific research outside Germany, especially in countries which Hitler designed to attack. It was also shown at the trial how a C. arrangement among Farben, the Aluminium Co. of America, and the Dow Chemical Co. greatly restricted the production of magnesium in the U.S.A. and prohibited exports to Europe except to Germany and, in negligible amounts, to Great Britain—so that Britain and the rest of Europe became completely dependent on Germany for magnesium, for which Britain was in a desperate situation on the outbreak of war. The trial also showed how, by means of C. agreements with the Standard Oil Co. of New Jersey, Farben delayed the development and production of buna rubber in the U.S.A. until 1940, while at the same time making Germany independent of rubber imports. See also COMBINE and TRUSTS (COMMERCIAL). See *International Cartels, Combines, and Trusts*, with essay by the Ger. authority, R. Leinmann, trans. 1927; also H. Levy, *Monopolies, Cartels, and Trusts in British Industry*, 1927, and A. P. L. Gordon, *The Problem of Trust and Monopoly Control*, 1928.

Carter, Elizabeth (1717–1806), poetess and translator, b. Deal. She was famous for her knowledge of languages, and pub. her *Poems upon Particular Occasions* at the age of 21. Her trans. of Epictetus, pub. 1758, won the admiration of Dr Johnson. See life by her nephew, M. Pennington, 1808, and D. Gardiner, *English Girlhood at School*, 1929.

Carter, Howard (1873–1939), Egyptologist, b. Swaffham, Norfolk, youngest son of Samuel John C., animal painter. Went to Egypt on the staff of the Archaeological Survey, 1891; engaged in excavation till 1899, notably with Sir Flinders Petrie at Tel el-Amarna. Became inspector of antiquities dept of Egyptian Gov., and made numerous excavations; and finally, working for the Earl of Carnarvon, on 17 Feb. 1923, opened the sealed door of the tomb of Tutankhamen (q.v.). Pubs.: *The Tomb of Thoutmôsis IV* (with P. E. Newberry), 1904; *Description and Excavation of the Tomb of Hâtshopstû*, 1906; *The Tomb of Tutankhamen* (with A. C. Mace), 1923–1933.

Carter, Robert Brudenell (1828–1918), ophthalmic surgeon, b. Little Wittenham, Berks, received his medical training at the London Hospital. During the Crimean War he served as staff surgeon, and won both Eng. and Turkish medals. In 1870 he was appointed ophthalmic surgeon to St George's Hospital, and from 1893 to 1903 still attended that hospital for consultations. He was Hunterian prof. at the Royal College of Surgeons (1881) and later delivered the Lumleian lectures to the Medical Society of London. His writings include *Practical Treatise on Diseases of the Eye*, 1875, *Manual of Ophthalmic Surgery*, 1887, and *Eyesight, Good and Bad*, 1880. In 1896 his report on the vision of London elementary schoolchildren was pub. as a parl. paper. He also trans. into English sev. Ger. works on ophthalmology.

Carteret, Sir George (c. 1600–80), naval officer and Royalist politician, nephew of Sir Philip C. (d. 1643). By 1633 he was a captain in the navy; comptroller of the navy, 1639. C. became lieutenant-governor of Jersey, 1643. He was knighted, 1646, and was one of the original proprietors of New Jersey in America, 1650. Forced to yield Jersey to the Commonwealth, 1651, C. served for a time under Vendôme in the Fr. Navy. He was treasurer of the Eng. Navy, 1661–1667. C. became sole proprietor of N. New Jersey, 1676; he was also one of the original proprietors of Carolina.

Carteret, John, 1st Earl Granville (1690–1763), statesman, educ. at Westminster School and Christ Church, Oxford. In 1711 he took his seat in the House of Lords as 2nd Baron C. As he was Whig by conviction, he followed the leadership of Stanhope and Sunderland. From 1719 to 1724 he distinguished himself for his diplomatic services. Dispatched by Stanhope as ambas. extraordinary to Sweden, he negotiated two treaties: one between Sweden and Hanover and Prussia, the other between Sweden and Denmark. From 1724 to 1730 he was lord-lieutenant of Ireland. From 1730 to 1742 he devoted his activities to the overthrow of Walpole's ministry, and having achieved his object, became the true leader of the subsequent Cabinet. When the Pelhams came into power in 1744, C. ceased to be an effective political force, though in 1751 he accepted the Lord Presidency of the Council. See life by W. B. Pemberton, 1936.

Carteret, Philip (d. 1796), navigator, commander of the second, and unseaworthy, vessel in Wallis's expedition to the S. hemisphere in 1766. Having accidentally lost sight of his leader, he was alone when he discovered Pitcairn Is. and when he gave his name to one of the Solomon Archipelago. He contributed considerably to contemporary geographical knowledge.

Cartesian Ovals, see OVALS.

Carthage, anc. city situated on a promontory at the N.E. extremity of the Bay of Tunis (Africa), the cap. of one of the most important empires of the anc. world. Known to the Romans as

Carthago and to the Greeks as Carchedon, its true name was Kirjath-Hadeshath, or New Town. This name was given either to distinguish it from Tyre or from an earlier settlement at Utica. The citadel (*Bosra*, Gk *Byrsa*) was approached by 80 steps. C. had 2 harbours, the outer for merchant ships and the inner for warships. Outside the walls of the city was the beautiful suburb of Megalia. C. was settled by the Phoenicians of Tyre, a branch of the great Semitic race, about the middle of the 9th cent. BC. There were already Punic settlements in the N. of Africa—Utica, Tunis, and Hadrumetum—but of these C. finally obtained the chiefdom. The story of the city's first struggles for power are unknown, for she does not enter hist. till the 6th cent BC, when she is already the centre of a prosperous commerce, and the ruler of extensive dominions, extending from Cyrene to the Straits of Gibraltar, with most of the W. Mediterranean is., and with settlements in Spain and Gaul. The pop. of the city and its dist. consisted of (1) pure Phoenicians; (2) Libyo-Phoenicians, the offspring of intermarriages between the settlers and Africans; (3) the Libyans themselves, reduced to servitude and forming a large part of the Carthaginian army; (4) the Nomads, wandering tribes which furnished the city with irregular cavalry. The extent of the commercial genius and maritime daring of the Carthaginians may be seen from the fact that Hanno, one of their admirals, is reported to have sailed, in the 6th cent. BC, round the NW. of Africa and up the Senegal R., returning then only through the failure of his provisions. The hist. of C. is mainly taken up by its wars with the Greeks and Romans, and to the first of these we must turn. The struggle was waged chiefly in Sicily, where C. came into conflict with the Greeks of Syracuse. In 480 BC a great battle was fought at Himera, between Hamilcar and Gelo of Syracuse, in which the former was defeated and slain. Some time later the war was renewed, and Hannibal, grandson of Hamilcar, entered Sicily to avenge his grandfather, which he did by storming Selinus and capturing Himera. In 405 a treaty was made, but 7 years later war broke out afresh, and Dionysius (q.v.), tyrant of Syracuse, was besieged in his city. He was saved, however, by the pestilence which broke out among the Carthaginians, and the latter were decisively beaten. The struggle continued, till in 344 Syracuse sent for help to the mother city of Corinth, and received auxiliaries under Timoleon, who inflicted a crushing defeat on the Carthaginians at the Crimissus in 340. There was peace for 30 years, until Agathocles (q.v.) was tyrant of Syracuse. Then C. again attacked, but Agathocles transferred his forces to Africa, and carried the war to the very walls of C., which he would have taken had he not been suddenly called home. In 277 BC, Pyrrhus (q.v.) was called to the aid of the Syracusans, but Rome and C. were leagued against him, and he could do

nothing permanent. More important even than this war was the mighty struggle with Rome. Treaties made between the two cities in 509 BC, and about 450 BC, show that C. was then the superior, and was gradually increasing her restrictions on Rom. commerce. The first war lasted from 264 to 242 BC, and once again Sicily was the cause. The Romans hastily built a fleet, and won 2 great sea-fights at Mylae (260) and at Ecnomus (256 BC). Regulus carried the war into Africa, but his army was cut to pieces. Peace was made after another naval victory for Rome. From 241 to 236 BC C. was engaged in a bloody civil war, which demonstrated the instability of her constitution (see Aristotle, *Politics*, ii). This led Hamilcar to establish himself in Spain, and to try to found there a new empire which should subdue Rome. After his death and that of his son-in-law Hasdrabal, his son Hannibal, sworn enemy to Rome, was chosen leader of the army. His attack on Saguntum in 219 BC was the commencement of the second Punic war (see HANNIBAL). The battle of Zama in 202 put an end to this war, and for the next 50 years the hist. of C. is mainly a record of political struggles. It was continually harassed by Rome, and in 149 BC C. was goaded into the third Punic war. It lasted for 3 years, C. being taken and utterly destroyed. It remained in ruins for nearly 30 years, at the end of which time a Rom. colony was estab. on the site. This continued until Julius Caesar and Augustus built a new city with the name Colonia Carthago. It became an important place in eccles. as well as in civil hist. C. was taken by the Vandals in 439, retaken by Belisarius in 533, and finally destroyed by the Arabs in 697. See R. Bosworth Smith, *Carthage and the Carthaginians*, 1878; F. W. Kelsey, *Excavations at Carthage*, 1926; H. P. Hurd, *The Topography of Punic Carthage*, 1936; *The Cambridge Ancient History*, vol. iv.

Carthage, Cape, promontory of N. Africa, jutting out into the Mediterranean. N. of Tunis lagoon are ruins of the anct city of C.

Carthage, Synods of: 1. In 411 a synod of C. condemned the Donatists, Augustine and Petilian being the protagonists, and Marcellinus (tribune to the Emperor Honorius) presiding.

2. In 413 a synod was held at the instance of Aurelius, Bishop of Carthage; Paulinus of Milan was invited to appear as the accuser of Coelestius, in whose person the Pelagian heresy was first recognised by the church and condemned. See PELAGIUS.

Carthago Nova, see CARTAGENA.

Carthamin ($C_{14}H_{11}O_7$), red colouring matter prepared from safflower. It was used as a dye (q.v.) for silks and cottons and requires no mordant.

Carthamus, genus of Compositae common to Asia, Africa, and the Mediterranean. *C. tinctorius*, the safflower, is an annual found wild in Egypt and the Levant; the flowers contain a colouring principle, and are used by dyers as the

source of delicate rose colours and rich scarlet, while mixed with tale they form the cosmetic known as rouge.

Carthusians, monastic order founded in 1086 by St Bruno (q.v.) and 6 companions. The constitutions were drawn up by the fifth prior, Gingo, in 1130 and received papal recognition in 1176. The order was estab. in England in 1180, and the London Charterhouse founded in 1371. The only existing Carthusian house in Britain is at Parkminster, Sussex. A Carthusian community includes choir monks and lay brothers. Each of the former occupies a separate 3-roomed house (including workshop) with a small adjoining garden, opening on to a central cloister; but they meet together in church daily for the conventional high mass and certain hours of the divine office, and in the refectory on Sundays and major festivals; there is also a weekly community walk lasting sev. hours, and a short period of recreation in the cloister on Sunday afternoon, at both which times conversation is allowed. Otherwise strict silence and seclusion are observed, the time being divided between prayer, spiritual reading or study, and manual labour. The habit is white with a black cloak; a hair-shirt is worn. A female branch of the order was instituted at Salette, on the Rhône, in 1220.

Cartier, Sir Georges Etienne (1814-73), Canadian statesman, entered the Canadian Parliament in 1848. A leader of a rebellion against Brit. rule in 1837, his political ideas underwent so radical a change as to prompt him to join the re-constructed Liberal-Conservative party in 1854. As attorney-general for Lower Canada, he promoted the codification of the civil law of that prov. (1857-64). His alliance as joint premier of Canada with Sir John Macdonald lasted from 1858 to 1862. As a statesman he was largely responsible for the entrance of Quebec into the federation (1864-7), for the removal of seigneurial tenure from Lower Canada, and for the Grand Trunk railway as well as for the final determination, to construct the Canadian-Pacific. C. received a baronetcy for his services.

Cartier, Jacques (1491-1557), Fr. navigator, famous as the discoverer of the great St Lawrence R., Canada. In 1534 he put out with 2 ships from St Malo with intent to find the NW. passage to Japan. Disappointed, he returned home, but in 1536 he set sail once more, landed in Pillage Bay, opposite Anticosti, which he named the Bay of St Lawrence—a name afterwards extended to the riv.—and learned from some Huron-Iroquois Indians that he was in the land of Canada—a native word for vil. Exploring the riv. in long-boats as far as the site of Montreal, he was able to look down from Mt Royal on to the Ottawa and St Lawrence stretching far to the W. The attempt in 1541-3 to find the mythical Saguenay, a wealthy kingdom, which, according to Indian story, lay up the Ottawa, ended in failure. The four-hundredth anniversary of his landing in the Bay of St Lawrence was officially celebrated in Canada in 1934.

Cartilage, gristly tissue existing at various parts of the body. It takes the place of bone where yielding is required, as at the joints and in various tubes. It is the precursor of bone, and in the foetus C. exists instead of bone, except in the case of some of the flat bones. It is of 3 kinds. Hyaline C. is glassy, and is found at the end-joints, such as the points where the ribs are connected to the breast-bone and in the nasal C.s. It contains no blood vessels. White fibrous C., in which there are white fibres arranged in layers, occurs in the knee-cap and vertebral column. Yellow elastic C. has a matrix of yellow elastic fibre, and is in the ear, epiglottis, and Eustachian tubes. None of these varieties of C. contains any nerves.

Cartilaginous Fishes, or **Elasmobranchii**, class of the fishes, so called on account of their gristly endoskeleton. They are, with a few exceptions, entirely marine, and include the sharks, dog-fishes, skates and rays. See **ELASMOBRANCHII**.

Cartmel, mkt tn of Lancs, England, 2 m. from Grange-over-Sands. It possesses a 12th-cent. priory, the only one in Lancs not destroyed at the dissolution, now used as a par. church. Pop. 300.

Cartography, see **MAPS**.

Carton, **Richard Claude** (real name Critchett) (1853-1928), Eng. dramatist and actor. His comedies enjoyed a considerable vogue for some 25 years from the appearance of *The Great Pink Pearl* and *The Treasure* (both of these with Cecil Raleigh) in the eighties. Other plays were *Liberty Hall*, perhaps his best, produced in 1892 and revived in New York 20 years later, and *Lord and Lady Algy*, 1898.

Carton-pierre, substance very similar to papier-mâché, used as a substitute for plaster in making mouldings for walls, roofs, ceilings, etc.

Cartoon (It. *cartone*, pasteboard; from Lat. *charta*, paper), design on strong paper, representing, in full size, some contemplated work of art, and intended to assist the artist in the composition of his work. The design when finished is transferred by tracing or pouncing to the surface finally to be worked upon. The most famous C.s are those of Raphael which were executed for the celebrated tapestry of the Vatican. These designs were purchased by Charles I, repurchased by Cromwell for the nation, restored by William III, who built for them a gallery at Hampton Court, and lent to the S. Kensington Museum, 1865, where they remain, though (long somewhat neglected) they have now been rehung with the care due to the great masterpieces they are. Unfortunately out of the original 25, only 7 remain. The C.s of Leonardo da Vinci ('The Battle of the Standard') and Michelangelo ('Soldiers attacked while Bathing') have perished, but others are preserved in the Ambrosia Gallery, Milan, and in the Sala Borgia. Modern Ger. artists have prepared accurate C.s, the most noteworthy being the designs of Cornelius for his fresco paintings in Munich. In England there was a revival of C. work in 1843-4, during the competition for the House of

Parliament paintings. Dyce and Maclise have left fine examples in this line. A large-sized drawing in a periodical may be called a C. The word C. is commonly used to-day as a synonym for a political or social caricature. See CARICATURE.

Cartouche (from Lat. *charta*, paper): 1. In architectural decoration, especially of the Renaissance period, any carved or painted panel resembling a sheet of paper with the corners turned over, or a scroll. Also applied to the small panels in Egyptian hieroglyphics, enclosing royal or divine names and titles.

2. Meaning originally 'a roll of paper,' was used of the wooden case enclosing cannon balls and later of the waterproof canvas case for cartridges. The word cartridge, meaning a case for explosive charge, is merely a corrupt form of C.

Cartridge, case containing the powder required to charge a fire-arm (q.v.), sometimes containing the bullet also. For small arms, the C. consists of a brass C.-case, containing bullet, powder, and primer. C.s originally came into use for muzzle-loading rifles, and in these bullet and powder were wrapped together in a paper cylinder. When required for use, the end of this was torn or bitten off and the powder poured down the muzzle. The bullet and the C.-paper were then rammed down on top. A somewhat similar C. was in use with the first breech-loaders, and the introduction of the steel, soon changed to copper, percussion cap marks the next stage in development. This cap, containing a detonating compound of chlorate of potash, sulphur, and charcoal, soon led to the introduction of the modern C. case, and made it adaptable for all kinds of rifles. The modern C. for breech-loading small arms consists of a solid brass cylinder at the base of which is the detonator, and most pistol and revolver C.s are constructed on the same pattern. In the case of breech-loading shot-guns, the C. generally consists of a stout paper case with a brass base, or else of thin brass throughout. Blank C.s, which are used for drill, salutes, etc., contain only powder and primer, but no bullet; while dummy C.s contain no powder. These last are used for drill purposes, where practice in the handling of C.s might sometimes lead to dangerous accidents. See also AMMUNITION.

Cartridge Paper, see PAPER.

Cartwright, Edmund (1743-1823), inventor of the power-loom, was b. Marnham, Notts. Educ. at Oxford, he afterwards obtained the rectorship of Goadby-Marwood, Leics. A visit to Arkwright's cotton mills resulted in his invention, and he set up power-loom factories at Doncaster, then at Manchester. He met with great opposition and no pecuniary gain, but in 1809 the gov. made him a grant of £10,000.

Cartwright, John (1740-1824), Eng. political reformer, known as 'the father of reform,' b. at Marnham, Notts. He entered the navy in 1758, and within 8 years had been advanced to the rank of first lieutenant. He retired from the service in 1777, his sympathies with the

Americans preventing him from joining Lord Howe's fleet. He had already begun to express his political opinions, and his first pamphlets were on the question of Amer. taxation. He pub. in 1774 his first plea on behalf of the colonists, entitled *American Independence the Glory and Interest of Great Britain*. He became an ardent political reformer, and held meetings and wrote many tracts in support of his views on ann. parliaments, universal manhood suffrage, etc. He was one of the originators of the Society for Constitutional Information in 1780. See F. D. Cartwright (his niece), *Life and Correspondence of Major Cartwright*, 1826.

Cartwright, Sir Richard John (1835-1912), Canadian statesman, entered the Canadian Parliament as a Conservative, but finally joined the Liberals in 1870, and became their minister of finance in 1873. He was remarkable for his strict economy, and during the years of opposition, 1878-96, acted as financial critic to his party. In 1896 he was appointed minister of trade and commerce under Sir Wilfrid Laurier, and from 1898 to 1899 represented Canada on the Anglo-Amer. Joint High Commission at Quebec and Washington.

EDMUND CARTWRIGHT
An engraving by J. Thomson.

Cartwright, Thomas (1535-1603), Eng. divine. During a stormy life of persecutions, he did much to strengthen and organise Puritan doctrines. In 1570-1 Whitgift deprived him of both his divinity professorship and his fellowship at Cambridge. The rest of his life was spent in visits to the Continent, to Geneva, Antwerp, the Channel Is., etc., and imprisonment, chiefly in the Fleet, for his pronounced Presbyterian views.

Cartwright, Thomas (1634-89), Eng. divine, grandson of the above. Educ. at Northampton and Oxford, he became

tabarder of Queen's College, and studied under Tully, 1650. Secretly ordained by Bishop Skinner, 1655, C. became vicar of Walthamstow, 1657. He was vicar of Barking, 1660; of St Paul's, 1665; prebendary of Wells and of Durham, 1672; dean of Ripon, 1675; Bishop of Chester, 1686. He was a staunch supporter of James II, and sympathetic towards the Rom. Catholics. After the king's flight he left England. His appointment as Bishop of Salisbury by James II was never confirmed. He *d.* in Dublin. See J. Hunter's ed. of *Diary of Thomas Cartwright, Bishop of Chester*, 1843.

Cartwright, William (1611-43), clergyman and dramatist, *b.* Northway, near Tewkesbury. Educ. at Westminster and Oxford, he took orders, was a zealous Royalist and a florid preacher. He wrote spirited lyrics and sev. plays, of which *The Royal Slave*, performed before the court at Oxford, was the most successful; others are *The Siege* and *The Lady Errant*. He was a friend of Ben Jonson. See life by R. C. Goffin, 1918.

Carum, an umbelliferous genus of sub-tropical and temperate plants, which are glabrous herbs with perennial tuberous roots, pinnate leaves, and white flowers. *C. carvi*, Caraway (q.v.), is the only important species, grown for its 'seeds.'

Caruncle, botanical term for a hard, small extra, seed-covering, or *rail*, also called a *strophole*. Examples may be seen in species of Euphorbiaceae, e.g. in *Euphorbia lathyris*.

Carúpano, port of Sucre state, Venezuela, on the N. of the peninsula of Paria, with a lighthouse and excellent harbour. Sulphur (particularly important), copper, silver, lignite, and lead are mined in the neighbourhood. Exports are cocoa, coffee, sugar, tobacco, hides, etc. Pop. about 30,000.

Carus, Julius Victor (1823-1903), Ger. zoologist, studied medicine at Leipzig, Würzburg, and Freiburg, and in 1849 became keeper of the museum of comparative anatomy at Oxford. His appointment to the chair of comparative anatomy at Leipzig dated from 1853. Though he was the author of sev. scientific text-books, such as *Handbuch der Zoologie* (with Gerstäcker, 1863, etc.), his splendid monographs on many problems in zoological research were his most valuable contribution to contemporary science.

Carus, Marcus Aurelius (AD 282-3), Rom. emperor, surnamed Persicus, elected by soldiers on the death of Probus. He was a scholar and a soldier, and immediately after his accession he set out against the Persians, first conferring on his 2 sons, Carinus and Numerian, the title of Caesar. He ravaged Mesopotamia, conquered the important cities of Seleucia and Ctesiphon, and advanced beyond the Tigris, when he was killed supposedly by lightning, though some suspicion attached to the praetorian prefect Aper.

Caruso, Enrico (1873-1921), It. tenor, *b.* Naples, one of a large family in humble circumstances. He began his study of singing at 18, under Guglielmo Vergine, and he made his first appearance on the

stage in 1894. He created tenor parts in new operas by Giordano, Oliva, Franchetti, and others. In the spring of 1902, at Monte Carlo, he sang with Melba in *La Bohème*. He was then engaged for Covent Garden, London, where he appeared as the duke in *Rigoletto*, 14 May 1902. Without any special musical training he early attained a worldwide fame. He sang at Covent Garden for some years prior to 1907, when he received the M.V.O. In the same year he went to the Metropolitan Opera House, New York, earning almost fabulous sums. He sang there throughout the years of the First World War, proving a tremendous draw. His most popular and characteristic roles were Canio in *Pagliacci*, Rodolpho in *La Bohème*, the duke in *Rigoletto*, the lover des Grieux in *Manon Lescaut*, Edgardo in *Lucia*, and Radames in *Aida*. The gramophone records of his voice brought him a colossal income. His voice was singularly free from strain and reached top notes of rare power and virility, yet always velvety and sympathetic. He ruptured a blood vessel in his throat while singing in 1920, and as the result of ensuing complications he *d.* in Naples the following year. See Dorothy Caruso, *Enrico Caruso*, 1945.

Carvacrol, phenolic liquid, Formula $C_{10}H_{14}O$, boiling point 236° . It occurs in the essential oil of *Origanum majoranoides* (the sweet majoram of Cyprus), but is generally obtained by heating carvone with phosphoric acid.

Carvel (for *caravel*, from Gk *karabos*, a light ship, through It. *carabella*): 1. Has been used in different countries of widely differing ships. Columbus discovered America in a caravel, that is a roundish galley-rigged vessel, with 3 towers on deck. The French use C. for a herring-boat; the Turks for a man-of-war. 'C. built' is applied to a boat 'whose planking is flush with edges laid side to side' as distinct from 'clinker built.'

2. Is used in Manx and Breton literature as a synonym for carol or ballad. Originally it always referred to a lyric set to some dance measure.

Carver, George Washington (1860-1943), Amer. Negro chemurgist and agric. experimenter. *B.* of slave parentage in Missouri, he none the less succeeded in taking the degree of Master of Science at the Iowa State College, working there as a botanist until 1896, when he went to the Tuskegee Institute in Alabama. He spent his life in agric. research for the betterment of the S. and of his people. Persuading farmers to vary their crops by planting soil-enriching peanuts and sweet potatoes instead of soil-exhausting cotton, he next solved the problem of finding new uses for these crops, which had become over-abundant as food-stuffs. From the peanut he made cheese, flour, coffee, milk, dyes, ink, soap, etc. From the sweet potato came flour, vinegar, molasses, rubber, etc. Years before plastics from wood waste were first attempted, C. was making synthetic marble from wood shavings. In 1940 he gave his life savings of £33,000 to establish the C. Foundation

to carry on his research. See R. Holt, *George Washington Carver*, 1947.

Carver, John (c. 1575-1621), Pilgrim Father who emigrated to America in the famous *Mayflower*, and was appointed the first governor of the sturdy Plymouth colony (1620-1). He had taken refuge at Leyden in 1609 as the result of religious persecution in England.

Carver, Jonathan (1710-80), Amer. traveller, served in the Fr. and Indian wars, and after the peace of 1763 set out on a journey of exploration westward. Finally he reached the Mississippi by way of the Fox and Wisconsin R.s. and obtained from the Indians a grant of land between the St Croix and the Mississippi. Explorer of the country of the Upper Mississippi, he was the first traveller to visit the falls of St Anthony (1766). His *Travels through the Interior Parts of North America in the Years 1766, 1767, 1768* was pub. in London in 1778. No narrative of early travel in N. America has ever outvalued the popularity of this work. C., however, was in serious financial straits and this success came too late to relieve his poverty. The sequel or second part of his work described the manners and customs of the Indians, but it is little more than a paraphrase of earlier Fr. accounts and even C.'s authorship has been questioned. This plagiarism in the second part and occasional falsification in the first do not justify doubts on the main facts of the first part of his work, for his original *Journal* or *Journal*, now in the Brit. Museum, fully bears these out.

Carvin, Fr. tn in the dept of Pas-de-Calais. It has a 13th-cent. church. Coal is mined, and there are sugar and brandy manufs. Pop. 20,300.

Carving, one of the oldest means of decoration and artistic expression. The word denotes cutting (A.-S. *ceorfan*; Gk *graphein*), and C. differs from mere draughtsmanship in that it secures relief and durability by incisions into the material and by the modelling of its surfaces. C. is thus a general term, and may be applied to sculptural work in wood, ivory, precious stones, terra-cotta, stone, marble, clay, wax, etc. (see **STONE-CARVING** and **SCULPTURE**), but C. is a term that applies in a special sense to decorative detail in architecture and furniture and is particularly associated with wood, the material dealt with in the present article. Oak, on account of its durability, is the most suitable wood for C.; mahogany, teak, chestnut, and Amer. walnut produce good work, whilst lime, sycamore, and the barks of fruit trees are employed for fine work. The fact that the fibres of wood run in a vertical direction and are deficient in lateral cohesion limits the scope of the carver. In all delicate work, such as tendrils or thin stems, the wise artist will take care to follow the grain instead of drawing across it; otherwise his detail will, in course of time, break away. The carver's kit consists of chisels for drawing lines, gouges for making hollows, etc., the 'V' tool for veining, and a smallet. Commercially many mechanical

devices are in use for cheapening and lightening his work. Thus in the case of fretted or scroll work the ornament is glued on the ground after being cut with a fret saw. This method often produces unsatisfactory work, as the 2 woods, being differently affected by the atmosphere, tend to separate. Another machine has a revolving drill which is directed over the ground of the decoration, whilst what is called the C. machine has a number of drills moving over the surface to be carved in accordance with a tracing-point which works over the ground of an iron model of the required design. After fixing his piece of wood to a bench the workman sketches or traces his drawing. Then he grounds out the spaces between the lines with his gouge. The next process of 'bosting' consists in shaping and modelling the details of his pattern, and finally he must clean up the whole. The success of his work largely depends on his appreciation of the appropriate relativity of light and shade. C. is one of the most primitive and popular forms of ornamentation. Among savages to-day there is often a just appreciation of the effective contrast of plain with decorated surface. They apply their skill to various objects. Thus the Ijos of the Niger adorn their paddles, the Kaffirs their spoon handles, and the N. Amer. Indian his wooden pipe stem or fish hook. The Egyptians from earliest times carved the faces of the dead in their mummy cases, and in the Cairo Museum is the statue of an elderly man, carved from a solid block of sycamore, which goes back probably to 4000 BC, and as a work of realism has never been surpassed in that country. In Greece the earliest sculptors worked in wood, and for a long time their *Xoana*, or images of the gods, were religiously preserved. In Scandinavian countries there is an ancient tradition of C. and the wooden doorways of Aal, Norway (c. 1200), may be cited. In Europe there are 2 great periods of C., the Gothic (12th to 15th cents.), and the Renaissance (16th to 17th cents.), but of the 2 the former produced work immeasurably superior. In the Gothic period the wood carver was a master craftsman, who travelled with his hand from church to church. He was actuated by high religious and social ideals, and was encouraged to respect the dignity of his craft by the prominence given to it in all church decoration. Thus pulpits, choir stalls, roods, roof screens, font-covers, lecterns, doors, and retables all owed much of their beauty to his skill. For the splendour of his architectural imagination, for the patient minuteness and accuracy of his detail, and for his loving and faithful imitation of natural forms, the Gothic workman is unsurpassed. The endless and fascinating diversity of treatment was due to the free play given to individual carvers. Colour has been used since ancient times to heighten the effect of C., and the splendid richness of Gothic work owed not a little to harmonious colour schemes of blues, reds, greens, golds, etc. The magnificent roof of

Westminster Hall and the elaborate pinnaced and canopied choir stalls of the Abbey both belong to this period. Italy is the true home of Renaissance work, and contains perhaps the finest illustrations. But, speaking generally, this period is characterised by dexterity and high finish at the expense of artistic essentials, and by extravagance in detail and over-elaboration. This tendency reaches its extreme after the Renaissance period in the furniture of the Louis XIV and XV periods. The most representative examples of Renaissance C., which is more ornate than Gothic, may be found in domestic work, and especially in oak chests, cupboards, mantelpieces, etc. Conventional leaves and patterns were substituted for the beautiful vine, oak, maple, and acanthus foliage of the earlier epoch. The great school of Grinling Gibbons, whose work can be seen at Hampton Court, Chatsworth, etc., dominated the 17th and 18th cents. in England. Yet the very flamboyance and profusion of his art detract from its obvious excellence in technical dexterity. It is certain that he is unequalled in the skill with which he carved drapery out of lime wood and modelled flowers, birds, fruit, foliage, etc., in the highest relief. In modern times the art of C. has fallen on evil days, but the decline in the art is due rather to the diminished demand for such costly ornament—costly in comparison with rival mechanical decorations—than to any assured decrease in the amount of talent available. The mosques of the Muslim world and also the Hindu temples of India contain some of the most intricate and delicate wood work. The Arab worker knew well how to combine foliage and geometrical designs, and to introduce animals and figures, and was possessed, above all, of unlimited patience, as the labyrinths of elaborate joinery on his screens alone suffice to show. Lack of restraint often spoils the effect of what is otherwise magnificent Indian C. The Hindu, however, has realised better than any other the value of the circle in ornament, just as the Japanese has best reproduced the lotus and water-lily, and as the Chinaman in all microscopic work has again and again proved his superiority. To-day the revival of direct C. in sculpture extends to wood, and sculptors like Eric Gill and Barbara Hepworth show their appreciation of its special texture and quality; but the virtual disappearance of decorative C. in architectural detail and furniture has followed necessarily from a drastic process of simplification in modern design. See F. Crallan, *Details of Gothic Wood Carving*, 1896; H. A. Tappin, *Grinling Gibbons and the Woodwork of his Age*, 1914; T. J. Beveridge, *English Renaissance Woodwork, 1660-1730*, 1924; A. Vallance, *English Church Screens*, 1936; E. J. Tangeman, *Design and Figure Carving*, 1940; E. O. Christensen, *Early American Woodwork Carving*, 1952.

Carvone, terpenic ketone. Chemical formula, $C_{10}H_{14}O$. Boiling point 230° at 755 mm. It occurs in caraway oil and in other essential oils. On heating with

acids it isomerises into carvacrol (q.v.), but with aqueous acids it forms a hydrate.

Cary, Alice (1820-71) and **Phoebe** (1824-71), Amer. sister poetesses, b. near Cincinnati. In 1849 they pub. a joint vol. of *Poems*, and in the following year moved to New York, where they became the centre of a literary circle, producing sev. collections of poems and hymns which were popular at the time.

Cary, Arthur Joyce Lunel (1888-1957), novelist, b. Londonderry. Educ. at Clifton and Oxford, he was in the Nigerian political service from 1913 to 1920, and then settled in Oxford. His novel *The House of Children* was awarded the Tait Black prize for 1941. Others are *The American Visitor*, 1933; *The African Witch*, 1936; *Miss Johnson*, 1939; *Charley is my Darling*, 1940; a trilogy, *Herself Surprised*, 1941, *To be a Pilgrim*, 1942, and *The Horse's Mouth*, 1944; *To the Moonlight*, 1946; *Prisoner of Grace*, 1952; *Not Honour More*, 1955. He also wrote 2 vols. of verse, *Marching Soldier*, 1945, and *The Drunken Sailor*, 1947, and sev. political studies.

Cary, Henry Francis (1772-1844), Brit. translator, b. Gibraltar. Educ. at Rugby and Oxford, he took orders in 1796, and from 1826 to 1837 was on the staff of the Brit. Museum. His great work was his trans. of the *Divina Commedia* of Dante, 1805-14, which became well known through Coleridge's lectures and is still counted one of the best renderings. He also trans. Pindar's *Odes* and Aristophanes's *Birds*. He was buried in Westminster Abbey. See memoir by his son, 1847, and life by R. W. King, 1925.

Cary, Lucius, see FALKLAND, second VISCOUNT.

Carya, genus of N. Amer. trees, family Juglandaceae, cultivated on account of their hard and elastic wood, which surpasses all other wood as economical fuel, and for the edible fruit. *C. cordiformis* is the Bitternut; *C. laciniosa*, the Big Shell-bark; *C. myristiciformis*, the Nutmeg Hickory; *C. ovata*, the Shag-bark Hickory; *C. pecan*, the Pecan; and *C. tomentosa*, the Mockernut.

Caryatides (Gk *Karyatides*, women of Caryae), draped female figures which take the place of pillars in architecture, and are comparable with the Atlantes (q.v.), or male figures with the same function. The most celebrated examples are those of the Erechtheum at Athens, as in the illustration, of which the C. of St Pancras Church, facing Euston Road in London, are reproductions.

Caryll, see CRAIL.

Caryocar, genus of evergreen trees, family Caryocaraceae, is peculiar to tropical America, and is noted for its fruit. The wood is very durable and is used in shipbuilding; it is reddish, hard, and compact. *C. nuciferum* yields the suwarrow, or sounari, nuts of commerce, and *C. butyrosa* the butter-nuts, which contain a thick oily substance.

Caryophyllaceae, large family of cosmopolitan Dicotyledons, many species of which occur in Britain; they have no economic use, but are often cultivated on

account of their pretty flower. The inflorescence is a dichasial cyme. The flowers are polypetalous and hypogynous, with usually 5 free or joined sepals, 5 petals, twice as many stamens, a syncarpous gynaeceum with 2 to 5 carpels, a unilocular ovary with free central placentation. The opposite leaves and swollen nodes are characteristic of this family. Genera include *Agrostemma*, *Arenaria*, *Cerastium*, *Dianthus*, *Gypsophila*, *Lychnis*, *Sagina*, *Saponaria*, *Silene*, *Tunica*, and *Viscaria*.

Caryophyllus Aromaticus, or *Eugenia Caryophyllata*, species of Myrtaceae which grows in the tropics as an evergreen shrub; the flower-buds of the plant are gathered before they are open, dried in the sun, and sold in the well-known form of cloves (q.v.).

Caryopsis, syncarpous fruit, usually composed of 2 carpels and having a dry, closely attached pericarp, as seen in grass seeds and oats.

THE CARYATIDES OF THE ERECHTHEUM,
ATHENS

Caryota, genus of Palmaceae, some of the species of which grow to a height of 60 ft in the E. Indies. The leaves are bipinnate, and the shape of the leaves has given the genus the name of fish-tail palms. The large green or purple flowers grow in groups of 3, 1 female between 2 males, and the fruit is a berry. *C. urens*, the wine-palm, is the best-known species; it is noted for the peculiarity of producing a burning sensation to the skin when the pulp is applied to it. The wounded flowers exude an enormous amount of juice, from which toddy and jaggery, a kind of sugar, are obtained. The leaf-stalks are made into fishing-rods, and

their fibres into ropes; the trunk yields a wholesome starch used as food.

Casa, Giovanni Della (1503-56), It. poet and translator, son of a great Florentine family. He was made Archbishop of Benevento and nuncio at Venice in 1544 by Pope Paul III. He was then made secretary of state, a post which he held till his death. He is chiefly known for his treatise on courtly manners called *Galateo*, written between 1551 and 1555. This work, like Castiglione's *Cortegiano*, gives a splendid portrayal of society at the time of the It. Renaissance. It was trans. into most European languages; the first Eng. trans. by R. Peterson appeared in 1576. He also wrote poetry, mostly humorous, compiled sev. biographies, and trans. Plato and Aristotle.

Casablanca, Louis de (1755-98), Fr. naval officer, b. Corsica. He was mortally wounded at the battle of the Nile, and went down with his son, who refused to leave him, in his ship when it caught fire. Mrs Hemans and André Chénier have celebrated him in their poems.

Casablanca, or *Dar-el-Beida*, seaport tn on W. coast of Morocco, with 682,388 inhab., of whom over 134,690 (1952) are Europeans. It is the economic centre of Morocco (q.v.). In 1907 C., a small tn trading in agric. products, was bombarded and occupied by Fr. troops. There are regular steamers to the ports of W. Europe and air lines to Toulouse and Oran, and railways and motor coaches to the interior. Its varied industries give it the appearance of a rapidly growing European tn. Its trade is more than half that of all the ports of W. Morocco. During the Second World War the tn was the scene of the C. Conference (q.v.) between President Roosevelt and Churchill, accompanied by the combined chiefs of staff (14-24 Jan. 1943). The pop. has been greatly increased by the influx of refugees during the war period from France, Tunisia, and Algeria, many of whom have remained. By 1957 C. had become a most important military and air base in which the Amer. Air Force was conspicuous.

Casablanca Conference, held on 14-24 Jan. 1943, between Churchill and President Roosevelt, together with their leading political and military advisers, to give precision to the plans for the immediate future of the military activities of the Allies in N. Africa and also to decide on broad strategic plans generally. Stalin was invited to attend, but neither came himself nor sent any responsible delegate. Full information of the proceedings was communicated to Moscow, but there were no reciprocal communications which might enable the W. Allies to measure the prospects in Russia in relation to their own plans, and Soviet secretiveness and suspicion remained a further barrier to the full co-ordination of allied efforts. But one of the immediate purposes of the conference was to draw as much of the weight as possible off the hard-pressed Russian armies by engaging the common enemy as heavily as possible at the best selected points. The conference did not

conceal the intention of the Allies to make an actual invasion of the continent of Europe. The conference adopted and pub. a formula regarding peace terms. It was that there must be unconditional surrender, not merely on the part of the dictators (with whom it had previously been declared that the Allies would never negotiate), but on that of the 3 Axis nations.

Casacalenda, It. tn, in Abruzzi e Molise (q.v.), 16 m. NE. of Campobasso (q.v.). Pop. 8000.

Casale Monferrato, It. tn, in Piedmont (q.v.) on the Po (q.v.). In 1474 it became cap. of the marquisate of Monferrato (q.v.), and it was for long an important fortress. The cathedral dates from the 12th cent., and there are other ant. churches and palaces. There are cement, textile, and footwear industries, and a large trade in agric. produce. The tn was once noted for its barrel organs. Pop. (tn) 25,500; (com.) 37,100.

Casalmaggiore, It. tn, in Lombardy (q.v.) on the Po (q.v.). It has a neo-classic cathedral, and manufs. glass and pottery. Parmigiano (q.v.) is buried here. Pop. 4500.

Casalnuovo, see MANDURIA.

Casalpusterlenigo, It. tn, in Lombardy (q.v.), 30 m. SE. of Milan (q.v.). It has textile manufs., and a trade in Parmesan cheese. Pop. 5000.

Casals, Pau (1876-), Sp. cellist and conductor, b. Vendrell, Tarragona, and educ. at Barcelona and Madrid Conservatories. His first public appearance in England was at Crystal Palace, 1898, and in Paris the same year, since when his playing has won him international fame. In 1906 he married Guilhermina Suggia, the Portuguese cellist (q.v.), and in 1914 Susan Metcalfe, Amer. singer. He married for the third time in 1957. He founded the Pau Casals Symphony Orchestra of Barcelona in 1920 and was its conductor. He was made Citizen of Honour of Madrid in 1935 and Member of Honour of the Sp. Academy the same year. He now lives at Prades in the Pyrenees, where he holds chamber-music festivals in the summer.

Casamance, riv. in the W. of Africa in the Fr. colony of Senegal. It forms an estuary which enters the sea at 12° 54' N., 15° W.

Casamare, see ARPINO.

Casamassima, It. tn, in Apulia (q.v.), 14 m. SSE. of Bari (q.v.). Pop. 8500.

Casamiciola, It. tn, on the N. side of the is. of Ischia (q.v.). The old tn was destroyed in an earthquake in 1883, and the present tn dates from then. It has hot mineral springs (150° F.). Pop. 4300.

Casanova de Seingalt, Francesco (1730-1805), It. artist, younger brother of the famous adventurer. B. in London, but gained his reputation in Paris as a painter of battle pictures and landscapes. His pictures can be seen at Rouen, Nancy, and Lyons.

Casanova de Seingalt, Giovanni Jacopo (1725-98), It. adventurer noted for his wit, accomplishments, and intrigues. He was b. in Venice, brother of Francesco

C. (q.v.). His father was of old and good family, but owing to his having adopted the theatrical profession he was alienated from it. Giovanni's mother was Zanetta Farusi, a shoemaker's daughter. At the age of sixteen he entered a seminary at Venice, but was soon expelled for immoral conduct. Through his mother he was given a situation in the household of Cardinal Acquaviva, but he quickly found it far too dull and took to travelling. His career of love affairs, intrigue, and hazard led, after wanderings to one cap. after another, often in the most aristocratic society, to his imprisonment in Venice. Escaping from Venice, he was appointed to manage state lotteries in Paris. After further European wanderings, including England, Poland, and Spain, he returned once more to Venice in the capacity of state spy, and later retired to Bohemia. His famous memoirs, 1876, throw a revealing light on the manner of life he led. See life by B. Dobřec, 1933.

Casariano, It. tn, in Apulia (q.v.), 23 m. S. of Lecce (q.v.). Pop. 7000.

Casas, Bartolomé de las, see LAS CASAS.

Casas, Ciudad de las, see SAN CRISTOBAL.

Casas Grandes, ancient city in the state of Chihuahua, Mexico, 130 m. from El Paso (Texas, U.S.A.). It has ruined buildings erected by Pueblo Indians and discovered in 1860 by the Spaniards. To-day there is a small agric. vil. on the site. Pop. 1126.

Casaubon, Isaac (1559-1614), Fr. theologian and classical commentator, b. Geneva, his family having come originally from Dauphiné. At the age of 24 he was appointed prof. of Greek at Geneva, and 3 years later he married the daughter of the great Fr. scholar, Henri Estienne. Henry Wotton, in the course of his continental tour, lodged with C. at Geneva. In 1596 C. accepted the Gk professorship at Montpellier. The univ. of Paris had closed its doors against all but Catholics and Henry IV dared not appoint a Calvinist. However, he gave a pension to C., with a promise of the royal librarianship when it became vacant, which was not until 1604. After the assassination of Henry, C. was forced to move to London, where he was made prebendary of Canterbury and given a pension. He was unjustly charged, after the pub. of his reply to the *Annals* of Cardinal Baronius, with having sold his conscience in order to gain the favour of James I. The truth was that he had for some time been drawing near to the Anglo-Catholic point of view. He devoted his life to classical study, and he helped to give a connected knowledge of the lives of the ancients. He pub. eds. of Athenæus, Aristotle, Diogenes Laertius, Theophrastus, Polybius, Theocritus, Persius, Suetonius, etc.; also the treatises *De Satirica Graecorum Poësi et Romanorum Satira* and *De Libérale Ecclesiastica*. C.'s *Correspondence*, in Latin, was collected by van Almeloven (1709). His diary, *Ephemerides*, ed. by his son Meric (q.v.), is preserved in MS. in the Chapter Library, Canterbury, and was printed by the

Clarendon Press, 1850. His life was written by Mark Pattison, 1875.

Casaubon, Meric (1599-1871), son of Isaac C. (q.v.), accompanied his father to England, and was educated at Christ Church College, Oxford. Was made prebendary of Canterbury and vicar of Monkton in Thanet, deprived of his appointments in 1644, but restored in 1660, and eventually became rector of Ickham. He inherited his father's taste for classical research, and vindicated the memory of Isaac C. in 2 Lat. works.

Casbeck, see KAZBEK.

Casca, Publius Servilius, tribune of the plebs at Rome in 44 BC. He was one of Caesar's assassins, and was killed at the battle of Philippi (42 BC).

Cascade Connection, a combination of amplifiers (q.v.) in which each amplifies the output of the preceding one. Also a combination of an alternating current induction motor with a commutator motor, the brushes of the latter being supplied from the rotor of the induction motor. Also a combination of capacitors in a high-voltage impulse generator. See ELECTRIC MACHINES and ELECTRO-STATIC MACHINES.

Cascade Range, mts in the U.S.A. situated in the NW. and stretching in a N. to S. direction in the states of Washington, Oregon, and California. It is composed of granite in N. Washington, but all the remaining part is volcanic, covered many times over with flows of lava. The range has either on its crest or sides many extinct volcanoes, such as Shasta in California, rising to 14,162 ft; Jefferson, 10,495 ft, and Hood, 11,245 ft, both of which are in Oregon; Adams, 12,307 ft, St Helen's, 9671 ft, Rainier, 14,408 ft, and Baker, 10,750 ft, in Washington. The general height of the whole range runs from 6000 to 8000 ft. The Klamath and Columbia R. cut E.-W. through the range. The chief resource is timber, and the rivers of the Pacific slope are used for hydro-electricity.

Casaca Bark, obtained from *Rhamnus purshiana*, the Californian bearberry or buckthorn, which is a N. Amer. species of Rhamnaceae. The bark is taken from the tree and dried, when it yields a fluid extract, known as *C. sagrada* (sacred bark), which is used as a cathartic (q.v.).

Cascarilla, which is a S. Amer. genus of Rubiaceae, is noted for its bark, which resembles that of cinchona, and is used as a valuable aromatic and tonic. It arrives in Europe in short, thin, brittle rolls, and so receives its name, which signifies little bark. The bark of *Crotan C.*, a species of Euphorbiaceae, is known as *C. bark*, and is used as a tonic.

Casolina, It. tn, in Tuscany (q.v.), on the Arno (q.v.), 7 m. ESE. of Pisa. It was the scene of a Florentine victory over the Pisans in 1364. There is a Romanesque cathedral, and parts of the old walls remain. The tn is known for its furniture. Pop. 27,000.

Case, Thomas (1844-1925), philosophical writer, educ. at Rugby and Oxford. In 1883 he was appointed

lecturer in Gk hist. at Christ Church, and in 1889 he was elected to the Waynflete chair of moral and metaphysical philosophy. His pubs. include *Realism in Morals*, 1877, and *Physical Realism*, 1888.

Case, in grammar, one of the forms of declension to which nouns, pronouns, and adjectives are subject. Means literally a falling, and was so applied because the subject of a sentence had to be imagined as an upright line, with the other words falling away from it. The Eng. language contains only the genitive and some trace of the dative (as in 'whilom,' 'seldom'); the Ger. language has 4: nominative, genitive, dative, and accusative; Latin has 6: nominative, genitive, dative, accusative, vocative, and ablative; Greek has no ablative; Sanskrit has 2 additional Cs, locative and instrumental. Eng., Fr., and It. nouns and adjectives have lost their C-endings, but their pronouns are still modified, while polysynthetic languages (as Finnish and Magyar) acquire very many C-endings.

Case, Action upon the, the obsolete name for one of the forms of action into which remedies for civil injuries were classified by the common law (q.v.) of England. In the early days of Eng. common law the remedies for civil injuries were few and rigid. Hence the chancellor and his subordinates, who had control of the office out of which writs were issued, initiated in right of an assumed equitable (see EQUITY) jurisdiction the practice of formulating writs to meet Cs unprovided for by the common law. This practice at length received legislative sanction in the Statute of Westminster, which permitted actions to be framed *in consimili casu*, i.e. by analogy with similar Cs or sets of circumstances for which there already existed a stereotyped form of action or writ. Hence the term actions *in consimili casu* or, more shortly, 'actions on the C.' The common law readers subsequently exercised considerable ingenuity in extending the action upon the C. to meet all manner of Cs bearing some analogy to existing forms. By the Judicature Act, 1873, all the old forms of action were abolished and no set style of pleading is now required at all, provided the plaintiff shows in his pleadings that the facts come within some legal principle. The fundamental importance of the evolution of forms of action out of actions upon the C. lies in the development of new and more equitable principles of law.

Case-hardening. In some parts of machinery toughness of material must be accompanied by durability of surface. These 2 conditions are satisfied by using wrought iron and transforming its external parts into steel. Such material is used for axles, pins, links, and the edges of cutters, the result being greater accuracy and durability. See *Metalurgical Heat Treatment*, under METALLURGY.

Case of Impositions, see BATES'S CASE.

Case-shot, or **Canister**, projectile of artillery, designed for use at close quarters.

A tin or sheet-iron cylinder is filled with bullets, varying in number and weight from $\frac{1}{2}$ oz. to 1 lb., the interstices between which are closed with sawdust. When this is fired it immediately breaks, scattering the balls considerable distances. As their velocity is small, they are ineffectual at a greater range than 300 yds.

Casein, a protein, an important constituent of milk and the prin. one of cheese. From the former it is precipitated by means of rennet, which is an extract from the mucous membrane of the fourth stomach of a milk-fed calf. It is a valuable food product containing phosphates. It is also precipitated by mineral acids, but is not coagulated by heat. It is allied to albumen and also to legumin found in the seeds of leguminous plants such as peas and beans. See also ADHESIVES.

Casella, Alfredo (1883-1947), It. pianist and composer, b. Turin, son of a teacher at the Liceo there. He studied at the Paris Conservatoire under Ditzner (pianoforte) and Fauré (composition). He then toured successfully as a pianist and orchestral conductor. From 1912 he directed popular concerts at the Trocadero, Paris. In 1917 he founded in Rome the Società Nazionale di Musica (afterwards Società Italiana di Musica Moderna); refounded, in 1923, as the Corporazione delle Musiche Nuove (It. section of the International Society for Contemporary Music). As a composer he reacted strongly against the too exclusive and melodramatic operatic tendencies in the Italy of his time and aimed at reviving what he called the classical Italian, predominantly instrumental music; but his music also shows various foreign, especially Fr. influences. His works include the operas *La donna serpente*, *La favola d'Orfeo*, *Il deserto tentato*; ballets *Le Couvent sur l'eau*, *La giara*, and 2 others; 3 symphonies, *Elegia eroica* for orchestra, various concertos; *Notte di maggio* (Carducci) for voice and orchestra, chamber and piano music, and songs.

Casemate, loophole gallery or caponier, under the protection of which the garrison of a fort may fire upon the enemy below. C.s. are utilised to protect guns, hospitals, stores, etc., from high-angle or vertical fire; or they may be used as barracks. In architecture, a hollow moulding, such as the cavetto.

Casement, Sir Roger David (1864-1916), Irish rebel, b. Kingstown, co. Dublin, the younger son of Capt. Roger C. of Ballymena, co. Antrim. He became travelling commissioner to the Niger Coast Protectorate in 1892, and in 1895 Brit. consul at Lourenço Marques. Later he was at Loanda and then at Boma, in the Congo. He reported in Dec. 1903 on the cruelties practised in the rubber plantations of the Upper Congo. Subsequently he held consular posts in S. America, and in 1910 he made a report (pub. 1912) on the inhumanities in the rubber stations of the Putumayo It. in Peru. In 1911 he was knighted. He retired to Ireland in 1913, and soon after the outbreak of the First World War his sympathy with the cause

of Irish republicanism led him to go to Germany, where he urged Irish war prisoners to form a brigade for service against the Allies. In April 1916 he set out for Ireland in a Ger. submarine, his mission probably being to try to stop the 'Easter Rising' (see SINN FEIN). On landing at Banna, co. Kerry, he was arrested. He was tried in London for high treason, 26-29 June, and, having been degraded from all his honours, was hanged at Pentonville, 3 Aug. 1916. Before his death he was received into the Rom. Catholic church. There has been much controversy about C.'s character. In recent years the Irish Gov. has asked vainly for the return of his remains to Ireland. See G. de C. Parmenter, *Roger Casement*, 1936; R. MacColl, *Roger Casement: a New Judgment*, 1956; A. Noyes, *The Accusing Ghost, or Justice for Casement*, 1957.

Casement, wooden or metal window frame which is hung by one of its edges—top, bottom, or sides—to open outwards or inwards. A window hung on pulleys to slide up and down is a sash-window, a type invented during the 17th cent.

Casentino, name given to the valley of the upper Arno (q.v.) in the prov. of Arezzo (q.v.), Italy. Tourists frequent it, as the scenery is very picturesque. It was celebrated by Dante (q.v.).

Caserta: 1. Prov. of Italy, in NW. Campania (q.v.). It has a coastline on the Tyrrhenian Sea, and has a plain in S. and W. The mts of the NE. are broken up by the wide, fertile valleys of the Volturno (q.v.) and its trib., the Calore. Cereals, olives, fruit, wine, and timber are produced, and marble is found. This part of Italy was once called *Terra di Lavoro*. Area 1040 sq. m.; pop. 623,000.

2. It. tn, cap. of the prov. of C., 15 m. NNE. of Naples (q.v.). It was only a vil. until the King of the Two Sicilies built the magnificent royal palace here in 1752. The palace was an allied headquarters during the Second World War, and it was here that the Ger. forces in Italy surrendered on 29 April 1945. At Caserta Vecchia (Old Caserta), 5 m. NE., there is a 12th-cent. cathedral. Silk, chemicals, and soap are manuf., and there is a trade in agric. produce. Pop. (com.) 51,500.

Cash denotes primarily ready money, money in a bank, in a chest, strongbox, or coffer; but since the institution of banks it has come to denote also bank-notes, cheques, money orders, and other documents containing an order to pay on demand as opposed to bills of exchange or other credit instruments (see also CURRENCY).

Cash Credit. A C. C. is simply an advance by way of a debit balance in current account, secured to the bank by a bond entered into by a couple of solvent parties who are guarantors for the borrower. It was invented in 1729 by the Royal Brit. Bank (which, though not strictly a Scottish bank, was promoted by Scotsmen with the object of transplanting to Eng. soil the peculiar system of Scottish banking), and designed to get its superfluous capital into circulation by

Inducing parties to borrow and embark in business.

Cash on Delivery System is an arrangement whereby the postal authorities, railway companies, and other common carriers undertake on behalf of the vendor to collect the price of goods delivered by them from the recipient and to transmit the money to the vendor. This system is highly popular in most European countries and in India and Japan, but, except between the U.K. and certain Brit. possessions and foreign countries, the system was not, until 1926, introduced into England, owing to the apprehensions of local retail traders. In the face of a long experience of the service between the U.K. and overseas countries participating in the scheme, these fears disappeared, and in 1926 the inland C.O.D. service, limited to parcel post, was introduced, with such successful results that in 1928 the system was extended to packets sent by registered letter post as well as to goods sent by rail to any part of Great Britain. By this service a sum (the trade charge) up to £40 can, under certain conditions, be collected from the addressee and remitted in the form of a Money Order to the sender of a parcel or registered letter or a parcel consigned by rail. Fees: for trade charge or value up to £1, a fee of 1s. 2d.; up to £2, 1s. 4d., £5, 1s. 6d., and for each further £5 or less, 2d., by rail 6d. extra. The fees charged in the U.K. on C.O.D. packets sent abroad are from 4½d. when the trade charge is not over £1, with 2½d. extra for each additional £1 of trade charge up to the maximum, which is usually £40 (the fee for the collection of which would be 8s. 6d.), but to some countries is less. If trade charge cannot be collected, the rules for undeliverable parcels apply.

Cash Register, machine, used principally in retail businesses, for recording the amounts of money received and controlling other transactions. Most are supplied with a number of keys, each representing a particular sum. On pressing these keys, or a combination of them, representing the sum of the purchase, a record is made of the purchase and the amount is also shown to the customer by means of an indicator. There are many elaborations of this idea.

Cashel, Tipperary, Rep. of Ireland, the see of a Rom. Catholic archbishop and of a Church of Ireland bishop. Built on the S. slopes of a great height (the Rock of C.), it was the stronghold of the anc. kings of Munster, and contains many interesting ruins, a stone-roofed chapel built by Cormac McCarthy, 1127, a cathedral founded 1169, the palace of the Munster kings, etc. Dean Swift, the author of *Gulliver's Travels*, was born here. Pop. 3200.

Cashew Nut, or *Anacardium occidentale*, species of Anacardiaceae which is largely cultivated in tropical America. The fruit is a kidney-shaped nut with a hard shell containing an acrid black juice, but when this has been removed the kernel is found to be oily, pleasant, and wholesome. It is usually roasted

for eating, and is often put into old Madeira wine in the W. Indies to improve the flavour. It is also prepared commercially as a 'butter.' The fleshy stalk has an agreeable flavour.

Cashiering (Fr. *casser*, to break), term in military law denoting the annulment of an officer's commission and his dismissal from the service. It may be awarded by a court martial as a punishment for a number of offences by way of alternative to imprisonment. In the words of the Army Act 'scandalous conduct unbecoming the character of an officer and a gentleman' is met by sentence of C.

Cashmere (India), see KASHMIR.

Cashmere, silky woollen fabric originally manuf. from the hair of the Tibetan and Bokhara goats, and woven in C. (Kashmir). The hair is spun by women, afterwards dyed, and made into the famous shawls, one of which requires the wool of 7 or more goats. These were sold in Europe at prices varying from £100 to £300, but since 1870 the demand for them has not been so great. Imitations are made in France, and attempts have been made to acclimatise the Kashmir goat in Europe and the U.S.A. The name is also given to a fine woollen stuff, made in imitation of the shawl fabric.

Cashmere Goat, see KASHMIR GOAT.

Caslinium, see CAPTA.

Casimir (properly *Kasimierz*), name of sev. kings of Poland who ruled at the following periods:

Casimir I, the Restorer (1034-58), succeeded his father Mieszko II. The early part of his reign was disturbed by civil war plots, and from 1037 to 1040 he was forced to leave the country. His reign proper dates from his return in 1040, when he recovered Silesia from the Bohemians.

Casimir II, the Just (1177-94), was a popular ruler and curbed the power of the nobility.

Casimir III, the Great (1333-70), was b. in 1310. He added Red Russia to his dominions (1341), estab. a code of Polish law and subdued and won the friendship of the Teutonic knights and the Bohemians. He founded the univ. of Cracow (1364), and encouraged commercial relations between Poland and other countries.

Casimir IV (1447-92) was, by birth, Jagiello, Grand Duke of Lithuania, but by his marriage to Jadwiga, the daughter of Louis, King of Poland and Hungary, united Lithuania and Poland. He waged war against the Teutonic knights, and by the treaty of Thorn recovered from them W. Prussia in 1466. During his reign the nobility increased their power and privileges.

John Casimir (1648-68) succeeded his brother, Wladyslaw IV. Brandenburg won her independence in 1657, and the Cossacks rebelled against Poland and finally joined Russia in 1654. Poland also suffered frequent attacks from Sweden and Russia, and C. was forced to take refuge in Silesia. Poland lost Livonia to Sweden (1660), and the ter. beyond the Dnieper was ceded to Russia

(1667). C. abdicated in 1668, and lived in retirement in France till his death in 1672.

Casimir-Périer, Jean Paul Pierre (1847-1907), Fr. politician, fifth president of the Third Rep. He was b. in Paris, the grandson of Louis Philippe's premier, Casimir Pierre Périer. His first appointment in public affairs was that of secretary to his father, who was minister of the interior under Thiers. In 1876 he was elected deputy for the Aube dept, being re-elected continuously thereafter until he became president of the chamber of deputies in 1893. In 1894, after the assassination of Carnot, he became President of the rep. His presidency only lasted 6 months, as he resigned in Jan. 1895, saying that he had not received adequate support from his ministers. He then abandoned politics completely; but gave evidence on behalf of the defence at Dreyfus's trial.

Casino, tn in New S. Wales, Australia, 500 m. N. of Sydney. Pop. 8000.

Casino: 1. (or *Kursaal*) Many seaside and holiday resorts on the Continent have a C., the most noteworthy being Monte Carlo, Ostend, and Boulogne. The building itself generally contains rooms for gaming-tables, conversation, music, reading, billiards, and dancing.

2. C. is also the name of a card game played all against all or 2 against 2 with a full pack of 52 cards, the dealer dealing 4 cards, 2 at a time, to each opponent, then 2 to the lay-out, then 2 to himself. The lay-out is turned face up and the stock face down beside it. The aim is to collect the 10 of diamonds, scoring 2 points; the 2 of spades, 1 point; the majority of cards, 3 points; the majority of spades, 1 point; any ace, or a sweep of all cards on the table, scoring 1 point. Play is by 'pairing' (a player taking cards on the table by laying down from his hand one of like value), 'combining' (taking a combination of cards on the table by laying down one of like value—e.g. taking a 5 and 2, or 4 and 3, with a 7), and 'building' (playing a card from the hand to combine with one on the table and making an aggregate equal to a larger card in the hand to take both on the next round). Any following player can take the build with a card of like value or 'raise the build' by laying on another card. If a player cannot pair, combine, or build he simply plays a card on to the table. When each player has used his 4 cards, 4 more are dealt round, and so on until the pack is exhausted.

Casiquiare, deep, rapid, navigable riv. of Venezuela, S. America, forming the Orinoco's S. bifurcation. Issuing from R. Orinoco it enters R. Guainía, a branch of Rio Negro, near San Carlos, widening from 300 to 600 yds. It establishes water communication between the Amazon and Orinoco R.s. this stretch being known as the C. Canal.

Casket Letters, famous collection of documents which, if genuine, proves the responsibility of Mary Queen of Scots for the murder of her husband, Darnley. The Earl of Morton, afterwards regent of

Scotland, asserted that he had found the documents in a silver casket in June 1567, after Bothwell had fled from Edinburgh Castle. The casket is supposed to have contained letters, professedly written by Mary to Bothwell, some Fr. sonnets, a signed but undated promise by Mary to marry Bothwell, and a marriage contract between the two. The documents were produced by Murray in the commission, held at York and later at Westminster, in the same year, 1567. It was alleged that the documents were written by Mary, and the handwriting was compared with that of the queen. Mary herself vehemently denied the charge, and her request to see the original documents or copies of the same was never granted. The documents passed into the hands of the successive regents of Scotland and were lost, apparently after the execution of the Earl of Gowrie (1584). The genuineness of the letters has been doubted by many historians. Three theories have been held with regard to the letters: that they are wholly genuine, that they are wholly forged, and that they are genuine in parts, with interpolations by another hand. Much of the information in the C. L. cannot be traced elsewhere, and much differs from statements found in other documents, but it is practically impossible to tell where the truth lies. In general, however, present-day historians accept the C. L. as substantially authentic. The mystery of Mary's character can never be fully solved, but it has always been an attractive subject to historians and men of letters. The controversy round the C. L. has produced books too numerous to mention, and only a short list of the most prominent books on the subject can be given here: W. Goodall, *Examination of the Letters said to have been written by Mary Queen of Scots to James, Earl of Bothwell*, 1754; F. Mignet, *Histoire de Marie Stuart*, 1854; T. F. Henderson, *The Casket Letters and Mary Queen of Scots*, 1890, and *Mary Queen of Scots*, 1905; M. Philippon, *Histoire du règne de Marie Stuart*, 1891-2; A. Lang, *Mystery of Mary Stuart*, 1900-4; R. H. Mahon, *Indictment of Mary Queen of Scots*, 1923, *Mary Queen of Scots: a Study of the Lennox Narrative*, 1924, and *The Tragedy of Kirk o' Field*, 1930; and articles by R. Chauvigné in the *Revue historique*, vols. clxxiv, 1934, and clxxv, 1935.

Caskets, or Casquets, group of rocky ls. in the Eng. Channel, 8 m. NW. of Alderney, so named because they look like a helmet. They are very dangerous to shipping: here the *White Ship* was wrecked in 1120, and the *Victory* in 1744, and many other vessels. There is a lighthouse on the C. See Swinburne's poem, *Les Casquettes*.

Casks (wine), see WINE and METROLOGY.

Čáslav (Ger. *Tschaslau*), Czechoslovak tn in the region of Pardubice (q.v.). The tomb of Ziska (q.v.) in the church here was destroyed in 1623. Near by is Chotusitz where Frederick II (q.v.) of Prussia defeated the Austrians in 1742.

There are sugar and alcohol industries. Pop. 8800.

Caslon, William (1692-1766), notable typefounder, *b.* Cradley in Worces. In 1720 he estab. a small business in St Luke's, London, in partnership with Bowyer and some other printers. For many years there were very few books of importance that were printed with any other type than that of C. He took as his model types of the Dutch pattern. The business continued until 1937, when it was acquired by Stephenson, Blake & Co. Ltd. See *Two Centuries of Type-founding*, 1920.

Casoli, It. tn. in Abruzzi e Molise (q.v.), 18 m. SSE. of Chieti (q.v.). It was the scene of much fighting during the Second World War. Pop. 7000.

Casoria, It. tn. in Campania (q.v.), 4 m. NNE. of Naples (q.v.). It has wine and silk industries. Pop. 19,500.

Caspari, Carl Paul (1814-92), Ger. scholar and theologian, *b.* Dessau; was prof. of theology at Christiania from 1857 till his death. He wrote many theological and philological studies, and an Arabic grammar. He also pub. *Quellen zur Geschichte des Taufsymbols und der Glaubensregel*, 1866-75, and *Kirchen-historische Anekdoten*, 1883.

Caspe, Sp. tn in the prov. of Zaragoza, near the junction of the Guadaloupe and the Ebro. Its castle was the scene of the 'Compromise of Caspe' in 1410, by which the delegates of Aragón, Catalonia, and Valencia chose Ferdinand of Antequera as king (see FERDINAND I OF ARAGÓN). There are sulphur springs near by. Pop. 9400.

Casper, second largest city in Wyoming, U.S.A., a rail and distribution centre with large oil refineries, amidst a rich oil, agric., and livestock region. It manufs. tents, torpedoes, bricks, beverages, and awnings. An air force base is near by. The Kendrick project irrigates 66,000 ac. in the vicinity. Pop. 23,673.

Caspian Sea (anc. *Mare Caspium*, or *Mare Hyrcanum*, Gk *Kaspia thalassa*), the largest inland sea in the world, on the boundary between Europe and Asia, extending from 36° 40' to 47° 20' N. lat., and 46° 50' to 55° 10' E. long. Its length from N. to S. is 680 m., and its breadth varies between 130 and 270 m.; total area 170,000 sq. m. It lies mostly in Soviet ter., having Persia on the SW. and S. The present sea formed part of a vast ocean which probably extended at one time to the Arctic Ocean, and united with the Black Sea in the W. More recently the C. and Aral waters constituted a distinct Aralo-C. Sea, traces of whose existence are the high-level terraces (beaches) which surround part of the C. shore-line, and deposits of the C. type of fossil shells which are scattered over the Post-Pliocene Karakum sands eastward as far as the meridian of Mary (Merv). The coastline is irregular. The C. has no tides, but its navigation is difficult because of violent storms. Greatest depth in N. basin, 2526 ft. and in S., 3006 ft. Its chief tribs. are the Volga, Ural, Emba, Terck, Kura, and Atrek R.s. Communication with the

Black, Baltic, and White Seas has been estab. by means of canals connecting with the Volga. It abounds in fish, notably salmon and sturgeon, which also supply the caviare and isinglass manufactories on its shores. Many lines of steamers navigate the C., the chief ports being Astrakhan, Baku, Gur'yev, Makhachkala, and Krasnovodsk in Soviet ter., Astara, Meshed-i-Sar, Pahlevi, and Bandar-i-Gaz in Persia.

Casquets, see CASEKETS.

Cass, Lewis (1782-1866), Amer. statesman, *b.* Exeter, New Hampshire. He was U.S. marshal for Ohio, 1807-12, and became a colonel in the regular army in 1813, and later a major-general of volunteers. For sev. years he was Governor of Michigan and in the year 1831 was made secretary of war. For a long period he was a senator, and in 1857 he obtained the position of secretary of state, which he held until 1860. Democratic candidate for president in 1848, he was beaten by Gen. Taylor. He wrote a hist. of the traditions and language of the Indians of the U.S.A.

Cassagnac, Bernard Adolphe Granier de (1806-80), Fr. politician and journalist, *b.* Avéron-Bergelle in the dept. of Gers. He started his career in Paris in 1832 as a literary critic, but soon became better known as a fervent Orleanist. Subsequently he became an equally fanatical imperialist. In 1868 he accused the Liberal party of having received money from the King of Prussia, but was unable to produce other than false evidence when called upon to do so. He fled to Belgium in 1870 after the proclamation of the rep., but returned in 1876 for the elections, and was elected deputy.

Cassagnac, Paul Adolphe (1843-1904), Fr. journalist, *b.* Paris, son of Bernard Adolphe C., in early life was associated with his father in politics and in journalism. He joined the army upon the declaration of war in 1870, was taken prisoner at Sedan, and imprisoned for some time in Silesia. He returned to Paris in 1872, once more associated himself with *Le Pays*, the jour. of which his father was editor, and in his articles fanatically upheld the Bonapartist cause against the Royalists and Republicans. In 1876 he was elected deputy for the dept. of Gers. He was the founder of the jour. *L'Autorité*, and wrote a life of Napoleon III. His violent views involved him in numerous gov. prosecutions, and in sev. duels.

Cassana, Niccolò, generally called *Nicoletto* (1659-1714), It. painter, *b.* Venice. The best of his many fine historical paintings, especially 'The Conspiracy of Catiline,' are in the gallery of Florence. He painted a portrait of Queen Anne of England and of various Eng. noblemen. He d. in London. His father, who was a pupil of Strozzi, also painted historical subjects, one of his best pictures being 'St Jerome' in the Miranda church.

Cassander (354-297 BC), son of Antipater (q.v.). His father, on his deathbed in 319, appointed Polyperchon

regent of Macedonia and conferred upon C. the inferior dignity of chiliarch. Aided by Ptolemy and Antigonus, C. declared war on his hated rival; he took Athens and other Gk cities, invaded Macedonia, and put to death not only Olympias (316), the mother of Alexander, but also (311) the latter's widow Roxana and her son. In 306 C. assumed the title of king, and soon afterwards joined the alliance against Antigonus I. It was not, however, until 301 that the battle of Ipsus gave him control of Macedonia and Greece. He *d.* of dropsy.

Cassandra, daughter of Priam and Hecuba, loved by Apollo, who promised her the gift of prophecy if she would yield to him. But on obtaining the promised gift, she refused him. Thereupon Apollo added the curse that none of her prophecies should be believed. Vainly she foretold the fall of Troy, in which she was captured, ravished by Ajax Oileus, and afterwards murdered by Clytemnestra.

Cassandra, the anc. Pallene, the most W. of the 3 fingers of the Chalcidice Peninsula, between the Gulfs of Salonica and C.

Cassano: 1. (or **Cassano all' Ionio**) It. tn, in Calabria (q.v.), 35 m. NNE. of Cosenza (q.v.). It is overlooked by a castle-crowned rock. There are warm, sulphurous springs in the vicinity. Pop. 8000.

2. (or **Cassano d'Adda**) It. tn, in Lombardy (q.v.), on the Adda (q.v.). It was the scene of 3 battles: a victory of the Guelphs over the Ghibellines (q.v.) in 1259; a victory of Marshal Vendôme over Prince Eugène (q.v.) in 1705; and a defeat of the French by the Russians and Austrians in 1799, during the absence of Napoleon (q.v.). Pop. 5000.

Cassano delle Murge, It. tn, in Apulia (q.v.), 16 m. SSW. of Bari (q.v.). Pop. 7000.

Cassation (*casare*, in the Lat. of the jurists, to annul), Fr. word denoting 'the reversal of a judicial sentence.' The Cour de C., which received its full organization under Napoleon, became under the Third Rep. the highest tribunal in France. It sits in Paris and hears appeals from all other courts except the administrative courts. It may also receive appeals from courts martial. The court, constituted as the *conseil supérieur* of the magistracy, has power to remove any judge nominated by the president of the rep. It consists of 49 members who, by the charter of Louis XVIII, are appointed by the head of the state, but hold office for life. The members include the first president, 3 sectional presidents, and 45 councillors with a parquet, i.e. ministerial staff, including a procureur général and 6 advocates-general. The court is divided into 3 sections: (1) Section des Requêtes, which examines whether the petitions or appeals are to be received; (2) Section de C. civile, which decides upon appeals in civil cases; (3) Section de C. criminelle, which decides upon appeals in criminal matters. The court does not decide upon the main question at issue, but only on the competency of the other courts to hear the

particular case; and the legality of the forms and soundness of the legal principle by which the case has been already tried. Thus the functions of the Cour de C. are ordinarily restricted to errors of law and procedure, and strictly it is not a court of appeal at all; but in cases where evidence is adduced before it which was not available in the court below, it may send the case back for a new trial or enter the appropriate judgment. This was the course followed in the Dreyfus case in 1906. If the law is found to have been violated, the decision of the inferior court is annulled and the case sent to be tried again by another court. If this second court decides the case in the same manner as the first, and a petition is again laid before the Cour de C., then the 3 sections unite in order to examine the case anew, and if they in their turn annul the decision, the case is sent to be tried before yet another court. Should this third court decide in the same way as the other courts, and a petition against the decision be again presented to the Cour de C., that court requests a final explanation of the law on the point at issue from the legislature. If the court refuses the demand for a re-hearing its refusal is final. If the court grants the demand the case is heard by the civil section, where, after the point is argued, annulment is granted or refused. Three judges of the Cour de C., elected for 3 years by the other judges of the court, are a constituent part of the Tribunal des Conflits. The institution of the Cour de C. proved highly beneficial to France. Placed by the nature of its office out of the immediate influence of political passions, it has maintained its reputation for strict impartiality throughout all the changes of gov. and administration. Many of the most distinguished jurists of France have been and are numbered amongst its members.

Cassatt, Mary (1855-1926), Amer. painter, b. Pittsburgh, Pennsylvania. She went to Spain and afterwards to Paris to study art, where she came under the Impressionist influence. She had her first exhibition of paintings in Paris in 1893, and exhibited for many seasons in Paris and New York. She specialised in painting women and children, and ranks high among the followers of the Impressionists. Most of her works have found their way into permanent art collections in the big cities of the U.S.A.

Cassava, **Mandioc**, or **Manioc**, name given to 2 varieties of *Manihot*, a genus of Euphorbiaceae. The plants are shrubs which grow to a height of about 6 ft in tropical S. America, and their various products are very valuable. *M. utilis*, the bitter C., contains a poisonous juice, but when it has been driven off the plant is wholesome; the roots are ground to make mandioc or C. meal, also called Brazilian arrowroot, and the poisonous juice, or cassareep, is used as a condiment and preservative. The roots are also specially prepared to make tapioca. *M. dulcis* var. *api*, the sweet C., has also edible tuberous roots; they are non-poisonous and are grated directly into

food, both for men and cattle. Both varieties are rich in starch.

CASSAVA

Cassel, Sir Ernest (1852-1921), financier and philanthropist, son of Jacob C., a banker in Cologne, where he received his education. He started life in a corn merchant's office in Liverpool, and then went to London. In 1878 he married Annette, daughter of R. T. Maxwell, who d. in 1881. He financed the great Asswân dam in Egypt, also the Swedish railways, and the central London tube railway, which was opened in 1900. He raised a loan for China after the war with Japan, and assisted in the negotiating of 3 state loans for Mexico. In 1902 he presented King Edward VII with £200,000 for the building of sanatoria for consumptives, and in Aug. 1910 he gave another £200,000 for the benefit of poor Eng. people in Germany and the poor Germans in England. He retired from active business in 1910. He was one of the largest subscribers to war loans, and in Sept. 1915 went to America in support of the Anglo-Fr. loan there.

Cassel, Gustav (1860-1945), Swedish economist, educ. at Stockholm and Uppsala, where he took his doctorate in mathematics. Became prof. of political economy at Stockholm Univ. in 1904. Member of the gold delegation of the League of Nations, 1929-32, and, in 1933, Swedish delegate to the monetary and economic conference in London. He was an outstanding figure in economic science during the inter-war period, playing an important part in interpreting the abnormal monetary phenomena of the years between the wars and contributing to the theories of interest and of the trade cycle. His *Theory of Social Economy* (1923) ranks as an outstanding work on economic theory, but he was first and foremost a monetary specialist, and was the leading theoretical expert on foreign exchange during the chaotic period after 1918. After 1914 he advanced the theory that under a system of inconvertible paper currencies the exchange rates tend to represent the ratio between the internal price levels of the

countries concerned; in other words, they tend to adjust themselves towards what he called their 'purchasing power parities.' This conception was regarded as almost revolutionary in face of the old theory according to which exchange rates are determined by the trade balance; but he lived to see the general acceptance of his principle. Other works: *Grundriss einer elementaren Preislehre*, 1899; *Nature and Necessity of Interest*, 1903; *Money and Foreign Exchange after 1914*, 1922; *The Downfall of the Gold Standard*, 1936.

Cassel, see KASSEL.

Cassell, John (1817-65), publisher, b. Manchester. During his apprenticeship to a joiner he studied Eng. literature and the Fr. language, and in 1836 he came to London to work at his trade. He became interested in writing and publishing, and in 1848 he founded the publishing firm which still flourishes under his name. See S. Nowell-Smith, *The House of Cassell*, 1958.

Cassia, genus of Leguminosae consisting of about 400 shrubs, trees, and herbaceous plants found in Asia, Africa, and America. The leaves are paripinnate, the flowers zygomorphic, some of the stamens are often reduced to staminodes or absent, and the pods have often a bitter, nauseous taste. Many of the species contain purgative properties, and yield the drug called senna, obtained either from the leaves or from the pulp of the fruit. *C. fistula*, the purging *C.* or pudding-pipe tree, is a small tree with large yellow flowers, in long racemes, having the appearance of a laburnum, and is found wild in India and tropical Africa. This plant yields the *C.* pods or purging *C.* of commerce; *C. acutifolia* and *C. angustifolia* yield the senna sold by chemists. *C. lanceolata*, the Alexandrian senna-plant, is found wild in Arabia, whence it is exported under the name senna of Mecca. *C. marilandica*, the Maryland senna plant, is valued for the purgative properties of its leaves.

Cassia, Via, one of the highways of ancient Italy. It led from Rome through Etruria to Florentia (Florence) and by way of Arretium and Luca. Though the date of its construction and the origin of its name are uncertain, it was evidently a well-known road in Cicero's time (see *Philippics*). In the *Antonine Itinerary* (q.v.) it is confused with the Via Clodia.

Cassia Buda, believed to be the immature fruits of *Cinnamomum cassia*, which yields the aromatic *C.* bark used in the adulteration of cinnamon. In appearance they resemble cloves and in taste cinnamon, for which spice they are often used in confectionery.

Cassianus, Joannes Eremita, or **Joannes Massiliensis** (c. 360-448), monk and theologian, one of the first founders of monasteries in W. Europe, usually referred to in English as Cassian. He was probably born in Provence, but spent his early life in a monastery at Bethlehem. With his friend Germanus he went to Egypt, Constantinople, and Marseilles, at which place he founded 2 religious houses, one a convent for nuns, and the other the abbey of St Victor, which is

said to have sheltered 5000 inmates during his lifetime. After his death he was the object of a popular cultus. He wrote *De Institutione Coenobiorum*, and *Collationes Patrum*, treatises on monastic life.

Cassianus Bassus, Gk writer of the 6th cent., to whom have been ascribed *Geoponika*, agric. treatises on rural economy (see GEOPONIC). An ed. with notes and index was pub. by N. Niclas at Leipzig in 1781. According to Seyffert, however, he was a Bithynian who lived about the middle of the 12th cent. AD

4 generations had charge of the observatory at Paris.

Giovanni Domenico Cassini (1625-1712), b. Perinaldo near Nice, and studied at the Jesuits' College, Genoa. In 1650 he was nominated prof. of astronomy at Bologna Univ. In 1657 he was made inspector of fortifications by Pope Alexander VII, and in 1669 he was made director of Paris Observatory. He determined the rotation periods of Jupiter, Venus, and Mars, discovered 4 of Saturn's satellites, and the div. of that planet's rings, named after him, etc.

Imperial War Museum: Crown Copyright

THE MONASTERY OF MONTE CASSINO, AFTER ITS
DESTRUCTION IN 1944

and undertook the work at the suggestion of Constantine VII.

Cassius, genus of passeriform birds of the family Icteridae to which belong the Amer. orioles, or starlings. The species are distinguished chiefly by their long, straight, large, and sharply pointed bills. They are gregarious and feed on insects and fruit.

Cassides, group of coleopterous insects of the family Chrysomelidae, are often known as shield- or tortoise-beetles from their habit of withdrawing the head into the thorax. They are smallish, oval in shape, brightly coloured, and often metallic in appearance. The larvae cover their bodies with dried excrement, so as to take from themselves all semblance of insects, e.g. some look like a tiny nest and some seem covered with lichen.

Cassini, name of an It. family of astronomers and geographers, of whom

Jacques Cassini (1677-1756), son of the former, b. Paris, and at the age of 17 admitted as member of the Academy of Sciences. Two years later he was made fellow of the Royal Society of London. In 1712 he succeeded to his father's position, and pursued various researches on the figure and size of the earth, on the rotation of the planets, and on Saturn's rings, which, he suggested, were composed of small particles.

César François Cassini, de Thury (1714-84), son of the preceding, b. Paris, and succeeded to his father's position. He also continued the latter's surveying operations. He began the great topographical map of France, which was later completed by his son.

Jacques Dominique, Comte de Cassini (1748-1845), fr. mathematician and geographer, b. Paris. He took an active part in the div. of France into depts and

helped to found the institute. He was the last of the line of C.s who had occupied the post of directors of the Paris Observatory for more than 120 years. Owing to difficulties with the authorities he gave up astronomy in 1794 and lived in retirement.

Cassini's Ovals, *see* OVALS.

Cassino, It. tn, in Lazio (q.v.), 26 m. SE. of Frosinone (q.v.). It is at the foot of the hill on which stands the famous abbey of Monte Cassino (q.v.). The tn was destroyed during the Second World War (*see* CASSINO, BATTLE OF), and has been reconstructed S. of its former site.

Allies prised the Germans out of the fortified basements of C. prison, and 2 days later Amer. forces held about one-third of the tn. Having discovered that the Germans were using Monte C. as a stronghold, the Allies prepared to bomb the monastery in the hope of removing the strongest enemy defence of the road to Rome and of C. itself; and on 15 Feb. the monastery was subjected to an aerial bombardment, accompanied by an artillery assault on the Ger. positions in and around C. and far back in the Liri valley S. of C. But no decision was reached on the possession

By courtesy of the Italian State Tourist Office

THE MONASTERY OF MONTE CASSINO NOW REBUILT
SINCE ITS DESTRUCTION

There are remains in the vicinity of the Rom. tn of *Casinum*. Pop. (tn) 13,500; (com.) 18,700.

Cassino, Battle of (Feb.-May 1944), protracted battle for the tn of C. and the Benedictine monastery known as Monte C., fought by the Fifth Army of Amer., Brit., and Fr. troops, and later also by troops of the Brit. Eighth Army and some Polish troops, against the Ger. forces under von Kesselring, in the course of the allied invasion of Italy during the Second World War. The Allies having on 1 Feb. crossed the Rapido R., Amer. and Fr. colonial troops of the Fifth Army broke through the Ger. Gustav line—a strongly fortified line running through Castel di Sangro, C., Castellforte, and Minturno—and bore down on C. There followed four house-to-house fighting in the tn, and by 11 Feb. part of it was in ruins. On 13 Feb. the

of C. and the situation remained a stalemate, with only desultory artillery exchanges, until 15 Mar. On that date C. was heavily bombed, the Allies dropping some 1400 tons of bombs on an area of less than 1 sq. m. Immediately the bombing ceased, Brit. and Amer. artillery shelled Ger. positions in and around C., and infantry pressed forward in the C. area, while aircraft bombed enemy centres of communication. On 16 Mar. allied tanks and infantry entered C. and penetrated enemy positions in the hills NW. of the tn. But the Allies found their advance held up by the terrible devastation wrought by the air assault. The Germans took full advantage of the masses of rubble as sites for mortars against Brit. efforts to clear a path for tanks; and thereafter the battle for C. pursued a grim course among the ruins and rubble of the tn. On 17 Mar.

New Zealand forces led an assault on the tn, while Indian forces took some hill positions overlooking it. By now, however, remnants of buildings and masses of debris, much of it resistant to high explosive, had been improvised by the enemy as strong-points and snipers' nests. It was obvious to the Allies, ironically enough, that an immense amount of rapid repair work was necessary to enable tanks and transport to advance at all through C., where there were driers 40 ft deep and full of water. Some

progress was made by the New Zealanders on 19 Mar, but such progress as the Allies made was always delusive because the Germans were still in possession of many heights overlooking C. By 26 Mar., though continual and bitter fighting was still in progress, the battle for C. was more or less a stalemate once again, and, for some time, the struggle died down to desultory artillery duels. Throughout the ensuing 6 weeks before the tn fell in May, the allied positions and those of the enemy in the tn were so close upon each other in a series of loosely formed lines—reminiscent of the opposed forces at Stalingrad—that the least observable momentary movement of head or limb generally meant death or wound from snipers. Meanwhile the Brit. command spent the interval in further preparations, regrouping their forces and secretly moving the Eighth Army to the W. side of the front. The Fifth and Eighth Armies resumed the offensive on the whole It. front on 11 May, and the brunt of the most violent fighting fell on the C. sector after large forces had crossed the Rapido R. The Germans again resisted stubbornly, and N. of C. 5 abortive counter-attacks were delivered by them on 14 May. But Brit. troops were now advancing on C. up the Liri valley towards the Via Casilina, and NW. of the tn Polish forces had gained vital positions, while, as part of the general pattern of the offensive, Fr. colonial and Amer. forces were breaking through the Gustav line along the SW. of the front. The Germans defending C. now found themselves in danger of being outflanked by the British and the Poles and so began to withdraw from the Gustav line between the coast and C. while still struggling to keep their hold on the Via Casilina. On 18 May C. fell, at last, to Brit. troops, and the abbey was captured by the Poles. The Via Casilina had been cut and a large proportion of the Ger. 1st Parachute Div. destroyed in its efforts to escape at the last moment. A few prisoners were taken by the incoming Brit. troops, who were faced with a scene of almost total desolation. After the war there was some controversy on the question of whether the destruction of the monastery was an Amer. or a Brit. responsibility, and if, in fact, it could have been avoided. A memorial to the allied soldiers who d. at Monte C. was unveiled in 1956. See Gen. Mark W. Clark, *Calculated Risk*, 1950; F. Majdalany, *Cassino*, 1957.

Cassiodorus, Flavius Magnus Aurelius

(c. 490–c. 585), Rom. historian and statesman, b. Soylaceum in Calabria. He rose to positions of great authority under Theodoric and his successors, being sole consul in 514. About 540 he retired from public life, and probably became a monk. He is a leading contemporary authority for the hist. of the Gothic kingdom of Rome. His most important work, *Variae Epistolae*, contains the decrees of Theodoric and his successors, and his own edicts when chief minister, etc.

Cassiopeia, constellation in the N. hemisphere, not far from the N. Pole and close to Cepheus. In Nov. 1572, according to the observations and records of Tycho Brahe, a new star of great brilliancy was seen here for 10 days. Its brilliancy then diminished, and at the end of 16 months it disappeared. According to the Gk fable, C. was the wife of Cepheus and mother of Andromeda, placed in the heavens with her head from the pole, so as to turn round apparently upside down because, according to Hyginus, she boasted of her own beauty as superior to that of the Nereids.

Cassiterides, group of is. first mentioned by Herodotus as the place where the Phoenicians exchanged their wares for tin. They were fixed to the W. of Spain, and have been identified with the Scilly Is. and Cornwall, or the Brit. Is. as a whole. Others have suggested various small is. off the Sp. coast.

Cassiterite, or Tin-stone, prin. ore of tin, is the dioxide of that metal contaminated with other minerals. Its common name is tin-stone. It is a black or brown crystalline substance, the crystal form being tetragonal prisms terminated by tetragonal pyramids. It has a brilliant adamantine lustre. To obtain the metal from the ore it is crushed and washed and then heated in a furnace with charcoal and lime to remove the oxygen. The metal so obtained is purified by first heating it upon the hearth of a reverberatory furnace until the more fusible tin melts and flows away from the alloys mixed with it as impurities. Afterwards it is stirred with green wood, when the other impurities are carried off with the scum so formed. Those consist generally of copper and arsenic. The Malay States (Negri Sembilan, Pahang, Perak, and Selangor), the Dutch E. Indies, and Bolivia supply over three-fourths of the world's tin-ore. The rest is produced chiefly in Cornwall (where the matrix has to be crushed to concentrate the finely divided ore), Siam, China, S. Africa, and Australia.

Cassius, Avidius (d. AD 175), Rom. general under Marcus Aurelius (q.v.). He distinguished himself in the Parthian war, and was therefore made military governor of Asia. In 175 Aurelius was ill, and C. proclaimed himself emperor on the strength of a rumour of his death. He was slain by his own soldiers before steps could be taken against him.

Cassius, Galus, called *Parmensis* from Parma, where he was b. He was one of Caesar's murderers, later sided with Antony, and was put to death by order of

Octavian in 30 bc. C. was a poet, and his work was esteemed by Horace.

Cassius Longinus, Gaius: 1. Rom. soldier and politician. In 53 bc he served as quaestor in the Parthian war under M. Licinius Crassus (q.v.), and earned fame by his masterly withdrawal of the remnants of the Rom. forces after Carrhae. He sided with Pompey on the outbreak of civil war in 49, but surrendered to and was pardoned by Caesar after the battle of Pharsalus (48). In 44 he led the conspiracy against Caesar. Following the Ides of March, C. disputed the prov. of Syria with Dolabella, whom he crushed at Caesarea in 43. But in 42 he was himself defeated by Mark Antony at Philippi, and committed suicide.

2. Rom. jurist, Governor of Syria, AD 50, in the reign of Claudius. He was banished by Nero in AD 66, because he had, among his ancestral images, a statue of C., the murderer of Caesar. Recalled by Vespasian. He wrote 10 books on the *jus civile*, and some other works.

CASSOWARY

Cassius Viscellinus, Spurius, Rom. soldier and statesman; sponsor of the first agrarian law. He was 3 times consul, in 502, 493, and 486 bc. His agrarian law so offended the patricians and other wealthy citizens that he was put to death by them: some say the deed was committed by his own father. But according to Mommsen, the story is pure invention.

Caesivellaunus (fl. 54 bc), Brit. chieftain who ruled the dist. N. of the Thames at the time of Caesar's second invasion. After some Brit. successes, Caesar took the camp of C., and the chief was compelled to promise tribute and make submission.

Casack (Fr. *casaque*), military cloak. Originally the costume worn by soldiers, it was not until a comparatively recent date that the word was used in an eccles. sense. It is a long robe usually buttoned down the front; but the anct style of

Eng. C. was double-breasted and fastened at the shoulder, with a girdle at the waist. In Italy it is called the *solana* (skirt), in France also, a *soutane*. The colour varies according to rank, season, purpose, and in many cases to the regulations of religious orders.

Casson, Lady Lewis Thomas, see THORNDIKE, SYBIL.

Cassowary, or Casuarium, typical genus of the ratite family Casuariidae, which are found only in the Australian regions, and are closely related to the emus. About 6 species exist, which are generally divided into 2 groups, those with the helmet laterally compressed and those with a pyramidal helmet. The plumage of both sexes is a glossy black, the wings and tail are very small, and the hen is larger than the cock. They are running birds with great powers of leaping, and when attacked they kick forward with their feet. They live in pairs in wooded dists, and the cock usually incubates the eggs, about 6 in number, which the hen lays in a nest of leaves and grass. *C. bennetti*, the mooruk, is the most common species.

Cast (moulding), see CASTING.

Cast Iron, see IRON and STEEL.

Castagno, Andrea del (1423-57), It. painter, b. Castagna, in the dist of Mugello. He was a member of the Florentine school, whose work has a somewhat harsh power. There are works by him in the Castagno Museum, Florence, the cathedral, Florence, and a 'Crucifixion' in the National Gallery is ascribed to him. He d. of the plague at Florence.

Castaldi, Pamfilo (1398-c. 1479), It. poet and humanist, b. Feltre, Lombardy. He founded a school there, which earned great renown among foreign nations, and in which he became the teacher of the It. language and literature. Some It. writers, amongst them Bernardi, say that C. was the real inventor of printing with movable types, and that Johann Fust, who is supposed to have been one of C.'s pupils, and intimate friend, gave away the secret to Gutenberg. It is also alleged that in 1472 Galeazzo Sforza gave C. the authority to establish a printing press at Milan. See J. Bernardi, *P. Castaldi e l'invenzione dei Caratteri Mobili per la Stampa*, 1865.

Castalia, fountain in Greece on Mt Parnassus, sacred to Apollo and the Muses, now the Fountain of St John. It was named after C., daughter of Achelous, who threw herself into it to evade pursuit by Apollo.

Castillon, or Chasteillon, Sebastián (1515-63), Swiss Protestant theologian and humanist, b. near Bresee. In 1541 he visited Calvin at Strasburg, and the latter made him head of the college at Geneva. He was compelled to leave on account of small differences with Calvin, and lived in great poverty at Basel, till appointed prof. of Greek in 1553.

Castanea, small genus of Fagaceae found in N. lands, the fruit of which is the edible chestnut. In Spain, S. France, and Italy the fruit of *C. sativa* and varieties is eaten raw, roasted, or ground into flour, and is extremely nutritious. The wood

resists well the influence of water, and is well suited for mill-timber, water-works, and palings; the bark is used in tanning. *C. crenata* is the Jap. chestnut; *C. dentata* the Amer. chestnut; and *C. mollissima* is a Chinese species.

Castanets (Fr. *castagnettes*; Sp. *castañuelas*), musical instruments of percussion, introduced into Europe from the E. by the Moors, and used in dancing. They are made of 2 hollow shells of chestnut wood (hence the name), fastened together by a cord, which is passed over the thumb and first finger. They are used in pairs, one in each hand, and the 2 shells of each are struck against one another, which produces a series of clicks, thus marking the rhythm of the music.

CASTANETS

Castañas, Don Francisco (Xaver) de, Duke of Bailen (1756-1852), Sp. general, b. Madrid. In early youth he entered the army, and went to Berlin in order to study military tactics under Frederick the Great. In 1808 he defeated 80,000 French under Gen. Dupont de l'Étang at Bailen, but was himself defeated by Lannes at Tudela the same year.

Castanospermum Australe, Australian chestnut, constitutes in itself a genus of the Leguminosae. The plant is a tree 30 to 40 ft high, its foliage affords an excellent shade, and the fruit when roasted resembles a chestnut in flavour.

Caste (from Portuguese *casta*, breed; Lat. *castus*, pure, chaste), term generally employed to denote the div. of Hindu society into various sections or C.s. It has also been employed for any distinctions of class in any nations which have a similar exclusive effect, such as 'colour caste' based on colour differences. It was found strongly marked in Peru, and ancient Persia had its threefold div. of the followers of Ahura Mazda into Atharvas (priests), Rathaevyas (warriors), and Vastryas (husbandmen), as the Zend Avesta tells us. Similar distinctions are even now found in parts of Africa and Polynesia. It is in India that C. is found in its most fully developed form, and here it is most intimately connected with religion. According to a somewhat late hymn of the Rîg-veda, possibly interpolated, the origin of the C.s is to be carried back to their birth from Brahma,

when the Brahmans sprang from his head, the Kshatriyas from his arms, the Vaisyas from his thighs, and the Sudras from his feet.

The C. system of India is probably tribal in origin. The Aryans and their retainers gradually resolved themselves into 4 classes: (1) Brahman or priestly C., composed of the *Kishis*, their descendants and disciples, to whom was entrusted the expounding of the Vedas and the conduct of religious ceremonies; (2) the Kshatriya, that is, Rajput or governing and military C., composed of the maharajahs and their warrior kinsmen and companions, whose duty was to rule and fight, and administer justice and protect the community in general. This C. is represented in modern times by the Rajput and the Khatri; (3) the Vaisya, a trading and agric. C. which, assisted by the conquered aborigines, tilled the land, raised cattle, and manuf. the arms and implements and household utensils required by the Aryan commonwealths. This C. is now represented by the Banya. (4) Besides the 3 Aryan C.s, but immeasurably beneath them, there was the servile or Sudra C., composed of captured aborigines whose lives had been spared, and of progeny of marriages between Aryans of different C.s and between Aryans and the women of the country, all of whom, by the rigid exclusiveness of the C. system, came to be regarded as degraded. Every vocation is occupied by its own C. or C.s, which may not marry or even eat with other C.s. But no C. of occupation is general throughout the country, for each prov. has a separate gradation of its own. The one C. that pervades all India is the Brahman, which is subdivided into innumerable sections, between whom there can be no marriage. There are Hindu C.s, such as the Sikh, which have originated as the disciples of religious reformers. Certain C.s, too, claim to be hybrids, having originated from intermarriages between men of a higher and women of a lower C.; thus, for example, the Eurasians, a community of the larger cities, sprang in modern times from alliances between Europeans and Indians. Mixed alliances have not always been prohibited, and the marriage of men with women of lower grades of society (hypergamy) is found. Members of a C. are isolated from all others by their marriage laws, social customs, religious practices, and precedence. Marriage outside the C. is an abomination, while within the C. it is limited by strict rule. Each C. contains groups, and bride and bridegroom should come from different groups. Even in matters of eating and drinking and social intercourse the C. has become an isolated unit, and eating and drinking are ceremonial and symbolic rites. Internal affairs of a C. are controlled by a C. council, which can fine a member for breaches of discipline, and even out-caste him, thus placing him outside society itself. It is generally accepted that the C. system in its present rigidity is a development of comparatively recent Hindu hist., and in the present day the process of C. subdivision still

continues, old C.s producing new as offshoots. The rise of some separate C.s may correspond to a rise in social status, but in other cases the reverse holds good, as when, for example, the Rajputs took to the cultivation of vegetables or the Brahmins used the plough. Amalgamation of different C.s only arises from religious reform, and it is to such influence that the Sikhs owe their separate identity; and this, too, is the explanation of the development of the theistic community which in recent years grew up in Bengal under the name of the Brahma Samaj (q.v.). But apart from these religious revivals, which have had no great effect as consolidating influences, the tendency is still towards the isolation of the C. unit. However, the present awakening of autonomous aspiration, coupled with the demand of educ. Indian women for greater freedom of outlook and opportunity, and the process of urbanisation in India, may modify the rigidity of the C. system.

See E. Thurston, *Castes and Tribes of Southern India*, 1908; K. Mayo, *Mother India*, 1927, 1931; C. S. Ranga Iyer, *Father India: a Reply to 'Mother India'*, 1927; E. Senart, *Caste in India*, 1930; Report of the Simon Commission, 1930; S. S. Nehru, *Caste and Credit in the Rural Area*, 1932; Dr G. Chand, *India's Teeming Millions*, 1939; J. H. Hutton, *Caste in India*, 1946; A. M. Hocart, *Caste: a Comparative Study*, 1950.

Castel di Sangro, It. tn, in Abruzzi e Molise (q.v.), on the Sangro, 55 m. SE. of L'Aquila (q.v.). It has been rebuilt after being severely damaged by Ger. mines during the Second World War. There is a cathedral. Textiles and fireworks are manuf. Pop. 5000.

Castel Gandolfo, It. tn, in Lazio (q.v.), 12 m. SE. of Rome (q.v.). It is situated on a volcanic slope 400 ft above Lake Albano (q.v.). A castle built here by Pope Urban VIII in the 17th cent. was used by the popes as a summer residence until 1870. It reverted to the papacy under the Lateran Treaty (q.v.) of 1929, and is again used as a summer residence. Pop. 4400.

Castel San Giovanni, It. tn, in Emilia-Romagna (q.v.), 13 m. W. of Piacenza (q.v.). Pop. 11,000.

Castel San Pietro, It. tn, in Emilia-Romagna (q.v.), on the Sillaro, 12 m. SE. of Bologna (q.v.). It is a spa, and has a large trade in agric. produce. Pop. 16,000.

Castelar, Emilio (1832-99), Sp. writer and statesman, b. Cadiz, and educ. at Madrid Univ. In 1864 he founded *La Democracia*, in which he wrote bitterly against the gov., and thereby lost his professorship. After an insurrection in 1868 he was condemned to death, but was able to escape to Paris, returning when the revolution of 1868 began. When Alfonso XII was proclaimed King of Spain, he retired into exile for 15 months, and was then elected deputy for Barcelona. The remainder of his life he devoted to the study of hist. and philosophy.

Castelbuono, tn in Sicily (q.v.), 43 m. SE. of Palermo (q.v.). It has an anct. Benedictine monastery, and there are mineral springs in the vicinity. Pop. 11,300.

Castelfidardo, It. tn, in the Marche (q.v.), 10 m. S. of Ancona (q.v.). Near by the Piedmontese defeated the papal troops in 1860 (see ITALY, History). Pop. (com.) 8000.

Castelfiorentino, It. tn, in Tuscany (q.v.), on the Elsa, 17 m. SW. of Florence (q.v.). It suffered much damage during the Second World War. In the Chapel of the Visitation are fine frescoes by Benozzo Gozzoli (q.v.). Pop. 13,000.

Castelfranco: 1. It. tn, in Emilia-Romagna (q.v.), 7 m. SE. of Modena (q.v.). It has an anct. fortress, and fine churches. Matches are manuf. Pop. 16,000.

2. It. tn, in Veneto (q.v.), on the Musone, 15 m. W. of Treviso (q.v.). Once an important fortress, it was the scene of an Austrian defeat by the French in 1805. It has an 18th-cent. cathedral, and was the bp. of Girolamo (q.v.). Textiles are manuf. Pop. 17,000.

Castellammare Adriatico, see PESCARA. **Castellammare del Golfo**, tn in Sicily (q.v.), 19 m. E. of Trapani (q.v.). It is on the NW. coast, on the Gulf of Castellammare, an inlet of the Tyrrhenian Sea (q.v.). It has a trade in cotton, wine, cereals, olive oil, and anchovies. Pop. 17,000.

Castellammare di Stabia, It. fortified port and tourist resort, in Campania (q.v.), on the SE. coast of the Bay of Naples (q.v.), 16 m. SE. of Naples. It was pillaged in the 15th cent. by Pope Pius II (q.v.) and again in 1654 by Henry II of Guise (q.v.). Its name is taken from the castle built here by the Emperor Frederick II (q.v.) in the 13th cent. It has an 18th-cent. cathedral, a naval yard, railway yards, and manufs. of cotton, aeroplanes, and food-stuffs. There are 28 hot springs in the vicinity. The site of the anct. Stabiae (q.v.) is near by. Pop. 56,200.

Castellamonte, It. tn, in Piedmont (q.v.), 20 m. N. of Turin (q.v.). It has a school of ceramics, and a trade in agric. produce. Pop. 6000.

Castellan, keeper of a castle in medieval times. In different countries his rank and office varied. In France and Flanders the owners of certain domains held the title, which ranked next to that of bailiff.

Castellana, It. tn, in Apulia (q.v.), 23 m. SE. of Bari (q.v.). Pop. (com.) 12,000.

Castellaneta, It. tn, in Apulia (q.v.), 19 m. NW. of Taranto (q.v.). It has a cathedral. Pop. (com.) 10,000.

Castellazzo Bormida (anct. Gamondio), It. tn, in Piedmont (q.v.), 5 m. S. of Alessandria (q.v.). Motor-cyclists hold a rally here every year at the shrine of the Madonna del Centauri. Pop. 6000.

Castelleone, It. tn, in Lombardy (q.v.), 16 m. NW. of Cremona (q.v.). It has a 15th-cent. church and a 13th-cent. tower, and is an important agric. centre. Pop. 10,000.

Castellesi, Adriano (1460-1521), It. cardinal and writer. Came to England on a papal mission and was made Bishop of Hereford and, later, of Bath and Wells. Recalled to Rome by Pope Alexander VI and made a cardinal. C. was a good Lat. scholar and wrote *De Vera philosophia ex quatuor doctoribus Ecclesiae*, 1507, *De Venatore*, 1512, and *De Sermone latino et modo latine loquendo*, 1513.

Castello, Sebastiano (1513-63), originally **Sebastien Châtillon**, b. Savoy. He studied at Lyons, and in 1540 became a teacher at Geneva. His religious views, however, did not coincide with those of Calvin, to whom he owed his position, and he was obliged to resign. He went to Basel, 1544, where he was appointed prof. of Greek, 1553, and there he d.

'Castello, De,' see VERGIL, POLYDORÉ. **Castellón de la Plana:** 1. Sp. prov., in Valencia (q.v.), with a coastline on the Mediterranean. It is watered by the Mijares and its tribs., and is fertile and populous on its coastal plains, but barren in the hilly dists. of the interior. The orange groves of this area are well known, and cereals, olives, and almonds are also produced. Area 2497 sq. m.; pop. 328,350.

2. Sp. tn, cap. of the prov. of C. The tn itself is 4 m. from the Mediterranean coast, but it has a port, called El Grao. It has sev. interesting churches, a museum, a library, and beautiful gardens. It manufs. textiles, paper, porcelain, and brandy, and it is surrounded by a fertile irrigated dist. producing oranges, onions, and carobs. Pop. 55,100.

Castelnau, Noel Marie Joseph Édouard, Vicomte de Currières de (1851-1944), Fr. general, b. Saint-Affrique, Aveyron, where he attended the Jesuit school. After taking a science degree at Paris, he entered Saint-Cyr military school in 1869. He became general of div., 1910; assistant chief of staff, 1911. On outbreak of war, 1914, he commanded the Second Army in Lorraine. Afterwards employed between Somme and Oise, and in Champagne, and in Dec. made chief of staff. In Dec. 1915 he was sent on a mission to Salonika. When the Ger. attack was concentrated on Verdun (Feb. 1916) C., sent thither with overriding powers, safeguarded the r. b. of the Meuse. In Jan. 1917 he went on a mission to Russia. The great offensive planned in 1918 was to have taken effect under his command in Nov., but the armistice forestalled this plan. C. later entered the Chamber of Deputies as member for Aveyron (1919-24).

Castelnaudary (Rom. *Sostomagus*, later *Castrum Novum Arianorum*), Fr. tn in the dept. of Aude, on the canal du Midi. It commands the gap between the Central Plateau and the Pyrenees, and has been frequently under siege. It was captured by the Black Prince in 1355. There are flour mills and manufs. of pottery, wines, and preserves. Pop. 8,100.

Castelnuova, see HERCONOVI. **Castelnuovo Berardenga**, It. tn, in Tuscany (q.v.), 9 m. E. of Siena (q.v.). Pop. 10,000.

Castelnuovo-Tedesco, Mario (1895-), It. composer, b. Florence. He never held an official post, and in 1939, being a Jew, he was forced by Mussolini's racial laws to leave Italy and settled in the U.S.A., later becoming an Amer. citizen. His works include the operas *La mandragola* (on Machiavelli), *Bacco in Toscana*, and *Aucassin et Nicolette*; 2 ballets, film and choral music; 7 overtures on plays by Shakespeare; violin, piano, cello and guitar concertos; chamber music; instrumental sonatas; piano music and songs, including all those in Shakespeare's plays.

Castelo-Branco, Camilo, Visconde de Correia Botelho (1825-90), Portuguese author, b. Lisbon. Studied in Oporto and Coimbra. Early an orphan bereft of both parents, he began his career of letters in order to gain a livelihood. Later on he went to the Episcopal Seminary in Oporto with the intention of entering the priesthood. He took orders, but his restlessness and want of stability forbade his keeping to one thing for any length of time, and in due course he resumed his former occupation. The best of his imaginative romances, written in the manner of Victor Hugo, are *O Romance de um Homem Rico*, *Retrato de Ricardina*, and *Os mysterios de Lisboa*. Recognised as a master of Portuguese prose style, he asserted himself as a polemist of acid temper and powerful literary gifts. He was pioneer of novels of Portuguese social life and was excelled only by E. de Queiroz. Among his historical and biographical books are *Noites de Lamego* and *Memoirs d'a Bipo do Grdo Para*. Created viscount, 1885, in recognition of his service to letters. See Y. P. Coelho, *Introdução ao estudo da novela camiliana*, 1946.

Castelo Branco: 1. Dist. of E. central Portugal, almost co-extensive with Beira Baixa prov. (q.v.). It is bounded on the E. by Spain, on the S. by Spain and the Tagus, and on the NW. by the Serra da Estrêla (q.v.). The dist. is mainly agric., but has a woollen industry. The largest tn is Covilhã (q.v.). Area 2588 sq. m.; pop. 320,300.

2. Tn of Portugal, cap. of C. dist. and of Beira Baixa prov., 120 m. NE. of Lisbon (q.v.). It is the seat of a bishopric, and has Rom. remains and the ruins of a castle of the Templars. The tn has a woollen industry, and a trade in agric. produce, cork, wine, and olive oil. Pop. 9600.

Castelo de Vide, tn of Portugal, in Portalegre dist., on the N. slope of the Serra de São Mamede, 9 m. N. of Portalegre (q.v.). It has a 14th-cent. castle and many other old buildings. Olive oil, pottery, and cork are produced. Pop. 3900.

Castelsarrasin, Fr. tn, cap. of an arron., in the dept. of Tarn-et-Garonne, on the Canal - Latéral. It has metallurgical industries and manufs. of wooden goods. Pop. 8,400.

Castelvetro, tn in Sicily (q.v.), 27 m. SE. of Trapani (q.v.). It has a notable 16th-cent. church. Fine white wines are produced, and there is a timber industry.

The ruins of the anct *Sellinus* (q.v.) are 7 m. S. Pop. 29,700.

Casti, Giovanni Battista (1724-1803), It. poet, b. Prato, Tuscany, and early took orders. He taught for some time in the seminary of Montefiascone, but then gave up his hope of advancement in the Church and his canonry of the cathedral for the sake of travel. In the service of Joseph II of Austria, he visited most of the European caps., and on his return that monarch gave him the position of *poeta cesareo*, or poet laureate. In later life he resigned this position to avoid political strife, and settled in Paris as a private gentleman, to remain there till his death. His chief works are *Novelle galanti* (1793), a collection of tales in *ottava rima*, of which the plots are chiefly taken from La Fontaine and Boccaccio, and *Gli animali parlanti* (1802), an elaborate poetical allegory.

Castiglione Fiorentino, It. tn, in Tuscany (q.v.), 10 m. SSE. of Arezzo (q.v.). It was severely damaged during the Second World War. It has a castle, and there are notable paintings in the churches and picture gallery. Alcohol, wire, and fire-works are manuf., and there are lignite mines. Pop. (com.) 16,000.

Castiglione, Baldassare (1478-1529), It. statesman and man of letters, b. Casatico, near Mantua, and received his education at Milan. About the year 1500 he entered the service of Guidobaldo da Montefeltro, Duke of Urbino, whose court was one of the best in Italy. This prince sent him on an embassy to Henry VII of England in 1506, and in 1524 he was charged by Pope Clement VII with the difficult task of arranging a dispute between the sovereign pontiff and Charles V. This carried him to Spain, where he was later naturalised and became Bishop of Avila. He d. at Toledo, broken-hearted, it was said, at imputations of treachery which had been made against him. He was universally mourned, and Raphael's painting of him is well known. C.'s greatest claim to fame rests on his book, *Il Cortegiano*, pub. in 1528, which describes, in the form of dialogues, the composition of the ideal courtier. It is one of the noblest expressions of the Renaissance spirit, and has been trans. into most European languages. It is not only a valuable social document, but also a great work of art. See R. Roeder, *The Man of the Renaissance*, 1933; M. Rossi, *B. Castiglione*, 1946; V. Cian, *Un illustre nunzio pontificio del Rinascimento*, Baldassare Castiglione, 1951.

Castiglione, Duke of, see AUGEREAU.

Castiglione, Giovanni Benedetto (1616-1670), It. painter of the Genoese school, known in Italy as Il Grechetto (the Little Greek), and in France as Le Bénédette, b. Genoa, and studied under Vandyck. He painted landscapes as well as historical places. His etchings are distinguished by light and shade effects. His best-known work is 'The Animals entering the Ark.'

Castiglione, tn in Sicily (q.v.), on the N. slopes of Mt Etna (q.v.), 27 m. N. of Catania (q.v.). It is noted for the filbert nuts grown in the vicinity. Pop. 15,000.

Castiglione del Lago, It. tn, in Umbria (q.v.), on the W. shore of Lake Trasimeno (q.v.), 17 m. W. of Perugia. It has an anct castle, and suffered considerable damage during the Second World War. Pop. 17,000.

Castiglione delle Stiviere, It. tn, in Lombardy (q.v.), 22 m. NW. of Mantua (q.v.). Napoleon and Augereau (q.v.) defeated the Austrians here in 1796. Pop. 8,000.

Castile (Sp. *Castilla*), former kingdom of Spain, occupying the central tableland of the peninsula, so named because of the number of its frontier castles. It emerged as a kingdom in the early 11th cent. Alfonso VI (q.v.) united C., León, and Galicia, and captured Toledo from the Moors. This union dissolved, but León and C. were finally united in 1230 by Ferdinand III (q.v.). In 1479 the succession to the throne of Aragon (q.v.) of Ferdinand V (q.v.), who was married to Isabella of C. (q.v.), united C. and Aragon and was the foundation of the kingdom of Spain (see SPAIN, *History*). C. is divided by the Castilian Sierras into old C., or Castilla la Vieja (q.v.), and New C., or Castilla la Nueva (q.v.). The literary language of Spain is Castilian (see SPAIN, *Language and Literature*).

Castilho, Antonio Feliciano, Visconde de (1800-75), Portuguese poet, b. Lisbon. He was blind from the age of 6. In 1821 he pub. *Cartas de Echo e Narciso*, which attracted much attention. *Amor e melancolia*, 1828, *A Primavera*, 1837, and *O Outono*, 1863, the poems on which his reputation stands, paved the way for the Portuguese Romantic movement. During the revolution of 1845 he was obliged to take refuge in the Azores, and did not return to his native land till 1863. His play *Camoens*, adapted from the French, was completed in 1849. C. won a high reputation for scholarship. He trans. the *Metamorphoses* of Ovid in 1841, and the *Georgics* of Virgil in 1865, and also Molière, Shakespeare, and Goethe's *Faust*. See the *Memórias* by his son, Julio de C., 1881.

Castilla la Nueva (New Castile), region of Spain, the S. part of Castile (q.v.). It comprises the provs. of Ciudad Real, Cuenca, Guadalajara, Madrid, and Toledo (q.v.), and extends S. from the Castilian Sierras in the form of a plateau, the average height of which is about 2900 ft. The climate is very harsh. Area 27,985 sq. m.; pop. 3,679,900.

Castilla la Vieja (Old Castile), region of Spain, the N. part of Castile (q.v.), so called because it was the first part to be recovered from the Moors. It comprises the provs. of Ávila, Burgos, Logroño, Santander, Segovia, and Soria (q.v.), and extends N. from the Castilian Sierras in the form of an elevated plateau (2600-3000 ft.). The countryside is very open. Area 18,962 sq. m.; pop. 1,663,000.

Castillejo, Cristóbal de (c. 1494-1556), Sp. poet, b. Ciudad Rodrigo, Salamanca. He was attached to the Emperor Ferdinand I, brother of Charles V, first as a page and later as secretary, and spent many years in Germany. His poems were

first ed. in 1573. He strongly opposed the poetical innovations of the school of Boscan, which sought to introduce It. metres, such as the sonnet and the *terza rima*, into Sp. literature. His poems, such as *Sermón de amores* and *Diálogo de mujeres*, are written in a gay or satirical vein, and have plenty of verve. See C. L. Nicolay, *The Life and Works of C. de Castillejo*, 1910.

Castillo de Locubín, Sp. mkt tn in the prov. of Jaén. Pop. 7500.

Castillo Solórzano, Don Alonso de (c. 1580-1643), Sp. novelist, remembered chiefly for picaresque stories which have formed the foundation of stories by far better known authors like Le Sage and Scarron. Le Sage's *Gil Blas* is much indebted to C.'s *Las Aventuras del Bachiller Trapaza*; Scarron's *Don Jophet d'Arménie* is based on C.'s *Marqués del Cigarral*, while Thomas Cornelle's *Bertrand de Cigarral* is only an imitation of C.'s story. Other works include a Seville romance, *La garduña de Sevilla*, 1634, *Jornadas alegres*, 1626, and *Teresa de Manzanaro*, 1634 (novels); *Las Harpías en Madrid* and *Fiestas del Jardín* (plays).

Castillon (-la-Bataille or -et-Capitoulain), Fr. tn in the dept of Gironde, on the Dordogne. It was the scene of an Eng. defeat in the last battle of the Hundred Years War (q.v.) in July 1453. Near by is the château where Montaigne (q.v.) was b. and d. Pop. 3100.

Casting, name given to the process of manufacturing articles of given shape by pouring a molten substance into moulds and allowing it to solidify and take up the shape of the moulds. The art finds its application in the manuf. of iron C.s (founding) of every description, of statues (in which case bronze is the metal usually employed), of type for printing purposes, of plaster casts, and in a somewhat different manner in the manuf. of chinaware and pottery. The C. of bronze vessels and images is a metallurgical process of great antiquity. It was a well-known art in auct Egypt, many bronze statues belonging to this period having been discovered. From many passages in the O.T. it is evident that the Israelites were familiar with the arts of metallurgy, vessels and ornaments being cast in bronze for the furnishing of the temple. Little is known, however, of the methods employed by the ancients in the C. of metal articles, and it is probable that the treatment of metal by smiths' work was more common. The manuf. of cast iron is of comparatively recent date, one of the most important uses to which the latter was first put being the manuf. of cannon. In the reign of Elizabeth I several large foundries existed, wood furnaces being exclusively used. Owing to the use of wood as fuel the first foundries were always built near forests, and it is on this account that Sussex became the site of the iron-smelting industry. Although this industry has long been extinct, many relics of it occur in Sussex cottages and farmhouses in the form of old-fashioned fire-grates, originally cast in the locality. Wood

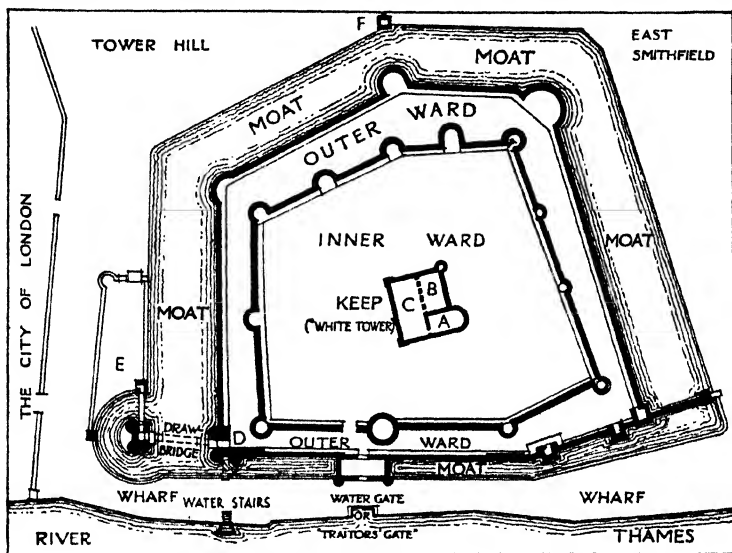

furnaces are particularly well adapted for smelting purposes, as wood does not contain the chemical constituents which cause coal to react in a harmful way with the molten metal.

The increasing demand for cast-iron articles and the limitations of the timber supply, however, resulted in the introduction in the beginning of the 17th cent. of the use of coal for smelting purposes. The iron being reduced from its ores and procured in a molten condition, the process of C. is in brief as follows: To construct a mould it is first necessary to obtain a pattern of the article to be cast, and pattern-making forms of itself an important craft. An exact model of the article to be cast having been made, this is pressed down into sand in a moulding box which has neither top nor bottom. The sand is rammed tightly around it so that on withdrawing the pattern a cavity the exact shape of the article required remains. Often a complicated shape is moulded in 2 moulding boxes placed one upon the other so that on separating the boxes sections of the pattern remain in each box. These sections are withdrawn and the boxes replaced one upon the other as before ready to receive the molten metal. In this case the upper box is called the cope and the lower box the drag. Precautions are taken to ensure the mould's retaining its shape, special qualities of sand or loam being employed, and in the case of large C.s the mould is built up with metal bars. The mould is provided with flues to admit the molten metal and also to allow for the escape of the air displaced by it, the metal being allowed to run in until it overflows the flues. The work is covered with a layer of sand and left to cool and solidify. The mould is then scraped off, and the cast is chased and worked up for the purpose for which it was designed. The prin. defects likely to be found in C.s are blowholes, shrinkage cavities, porous places, and cracking resulting from the trapping of gas in the metal, the use of feeding heads which are too narrow, or excessive ramming of the sand.

The making of patterns is one of the most important crafts connected with the C. industry. The object to be aimed at is the making of a pattern which can be easily taken out from the mould without damaging it. It is evident that in many cases the shape of the pattern would render this impossible were it made in one whole piece. The pattern is therefore carefully constructed in sections, with joints so situated that the parts can be extracted from the mould without fracturing the latter. In many cases a core is used by means of which the thickness of the cast may be regulated. On allowing the molten metal to enter, it fills up the space between core and mould and a cast of the required thickness results. The introduction of *machine moulding*, in which the mould and pattern are manipulated by machinery, has resulted in the attainment of a higher degree of accuracy in the manuf. of C.s than was formerly the case. In *shell moulding* a thin shell mould

is produced by covering a hot metal pattern with a mixture of sand and phenol-formaldehyde resin binder. The thin shell mould may be produced in various ways, i.e. by blowing, sprinkling, or by the use of an inverted box, and the thin mould so formed is then capable of being hardened completely by heating for approximately 3 minutes at 300° C. After baking, the thin sand shell is then lifted from the pattern and 2 such shells are clamped together for C. The advantage of the shell moulding process over the

if the members in a div. are equal, the Speaker must give the C. V., otherwise he never votes. Since 1848 the chairman of a standing committee of the House has been entitled to a C. V. The chairman of a select committee has a C. V., but no other vote. In regard to all questions before private Bill committees the chairman has a second or C. V. In the House of Lords the chairman of committees may record a vote like any ordinary member; he has no C. V., the result being that the question is decided in the

ordinary sand moulding technique is the production of C.s of high dimensional accuracy and high surface smoothness. For cast iron see IRON AND STEEL. See also METALLURGY; POTTERY; TYPE AND TYPEFOUNDING. See J. S. Gardner, *Ironwork*, 1927-30, and H. L. Campbell, *Metal Castings*, 1936.

Casting Vote, vote given by the chairman of an assembly when the votes for and against a proposition and resolution are equal, therefore the deciding vote. Where the chairman has already voted he may be entitled to a second or C. V. The privilege is given to the chairman of a bor. council, an urb. or a rural dist. council, and a vestry meeting; and to a person occupying the chair at a meeting, whether the chairman or not, in the case of a par. council or par. meeting under the Local Gov. Acts. In the House of Commons,

negative. See also PARLIAMENT; HOUSE OF COMMONS; HOUSE OF LORDS.

Castle, Egerton (1858-1920), novelist, b. London. He was educ. at the univs. of Paris, Glasgow, and Cambridge; was entered at the Inner Temple; went to Sandhurst and served 3 years with the colours; and represented Britain as an international at fencing. With his wife Agnes he produced a series of romantic novels which include *The Pride of Jennico*, 1898, *The Bath Comedy*, 1900, *The Secret Orchard*, 1901, *The Incomparable Bellairs*, 1904, *If Youth But Knew*, 1905, *The Lost Iphigenia*, 1911, and *The Ways of Miss Barbara*, 1914.

Castle (Lat. *castellum*, dim. of *castrum*, a fort; Fr. *chastel*, later *château*; It. *castello*), fortress or fortified building. The term is usually limited to medieval buildings, and in England to those erected

after the Norman Conquest; but is applied loosely to certain ancient strongholds such as Maiden C. in Dorset, fortified c. 350-100 BC. Long before that date, massively fortified palaces such as Tiryns and Mycenae in Greece (see ARCHITECTURE, 1c) had been built of colossal masonry; but at Maiden C. the defences consisted of earthen ramparts and rows of palisades on a naturally strong eminence, difficult of access, and commanding extensive views in all directions. Richborough C. in Kent, Pevensey C. in Sussex, and Portchester C. in Hants are all Roman fortresses built in the 3rd-4th cents. AD as part of

surviving *motte* in England is at Thetford in Norfolk. When a tower came to be erected on the *motte*, it was called the *donjon* or 'keep,' hence the name 'Dane John' at Canterbury. The site of a Norman C. was always carefully chosen for its defensive strength, and was usually on raised ground and, where possible, on the bank of a river.

Norman C.s in England resembled those erected in France (e.g. Falaise) at about the same period. They are generally classified according to the type of keep: viz. (i) rectangular (C. Hedingham, C. Rising, Dover, London, Middleham, New-

RHUDDLAN CASTLE, FLINTSHIRE, NORTH WALES
An English (or Edwardian) castle built by Edward I in 1277.

a chain known as the 'Forts of the Saxon Shore,' to defend the SE. coasts of England against Saxon incursions.

The building of C.s in England began in earnest immediately after the Norman Conquest, under orders from William I, as a means of establishing stable gov., each under one of his Norman barons, but in some cases a C. became a centre of oppression as well as a refuge in case of hostile risings. Up to 1100, out of some 85 C.s erected in England since 1066, only 6 or 7 were of stone. These included the C.s of London (the White Tower), Pevensey (rebuilt), Colchester, and Richmond (Yorks). All the rest followed the normal types then in vogue: viz. either the *motte* type (the *motte* being not a moat but a truncated conical mound of earth surrounded by a ditch and crowned with a timber palisade) or the '*motte* and bailey' type (i.e. having a *motte* provided with an outer court or bailey, enclosed by walls of earth or stone). The finest

castle upon Tyne, Norwich, Portchester as rebuilt, Rochester, Scarborough), (ii) polygonal (Orford in Suffolk); (iii) circular (Conisborough, Pembroke), (iv) irregular 'shell-keep,' following the natural shape of the site (Arundel, Carisbrooke, Clifford, Exeter, Ludlow, The Peak, and especially Windsor, where the famous 'Round Tower,' which forms the keep proper, owes much of its present height to an extension at the beginning of the 19th cent.).

Among other notable C.s of various types are those at Beaumaris, Caernarvon, Caerphilly, and Harlech in Wales, Edinburgh and Stirling in Scotland, Carrickfergus in N. Ireland. Important Fr. examples are Château Gaillard in Normandy (1196), Carcassonne (11th-13th cents), and Pierrefonds (1390).

The keep, which formed the last refuge of the garrison after the outworks had been captured, also served as the lord's dwelling. It generally had store-rooms

and a dungeon (prison) at ground level. Stone steps led up to the first floor, which was occupied by the soldiers of the garrison, and had very narrow windows or arrow-slits. The next storey was usually higher, and contained the baronial hall where the lord dined with his family and retainers. A chapel was often provided in the keep (e.g. at Dover). Latrines in the thickness of the outer wall (e.g. at Orford) were called *garderobes* (q.v.). The top of a keep was often crowned with crenellated parapets or battlements, consisting of solid portions ('merlons') alternating with narrow openings ('embrasures') through which a defending soldier could shoot arrows while taking cover behind a merlon. Often this crenellated parapet projected on a row of stone corbels or brackets, and between each pair of these was a square hole closed by a lid. When opened the defenders could pour boiling liquids, etc., on to the heads of enemies attempting to mine the base of the wall far below. This arrangement is called 'machicolation' (q.v.), and is one of many military devices learned from the Saracens during the Crusades.

The outer walls of the bailey were also strongly fortified in the same way, and every important entrance gateway was provided with one or more portcullises (q.v.). The outer enclosing wall (*enceinte*) was often furnished with towers or bastions ensuring cross-fire on all parts of the wall; and the entrance to the C., by a drawbridge across a moat, was further defended by an outwork or tower known as the 'barbican' (q.v.). (See also *BAR-TIZAN* and *POSTERN*.) Somewhere within the C. was a deep well. The military effectiveness of C.s had greatly diminished before the end of the Middle Ages; and those built in the 14th-15th cents. were fortified houses rather than C.s: e.g. Bodiam, 1383; Tattershall and Hurstmonceux, 1440; Raglan, 1465. Few of the older C.s were convertible into comfortable houses, so many were demolished and the material sold in the 16th cent., e.g. Wallingford. Of the remainder a number were deliberately 'slighted' (i.e. blown up) by both the contending armies during the Civil war of 1642-5. See Sir C. Oman, *Castles* (English and Welsh), 1926; H. Braun, *The English Castle*, 1936; M. S. Briggs, *Goths and Vandals*, 1952; B. H. St J. O'Neill, *Castles of England and Wales*, 1953; R. A. Brown, *English Medieval Castles*, 1954; S. Toy, *A History of Fortification*, 1955.

Castle Bromwich, dist. of Birmingham, England, on the extreme N.E. boundary, and well known for the British Industries Fair, engineering and hardware section, which is held annually in May. The vil. itself is outside the city.

Castle Cary, tn of Somerset, England, 12 m. N.E. of Yeovil, manufacturing twine, horse-hair seating, etc. Pop. 1600.

Castle Donington, rural dist., tn and par. of Leics, England, at the confluence of the Rts. Trent and Soar, 7 m. from Ashby-de-la-Zouch. The dist. is still largely agric., though C. D. has a large

hosiery factory, and manufs. of springs, trimmings, and lace. Basket making is also carried on. Pop. (of rural dist.) 9958; (of par.) 3404.

Castle Douglas, burgh and mrkt tn of Kirkeudbrightshire, Scotland, near the border with England, on Carlingwark Loch. The sheep and cattle sales held here are noted. Pop. 3320.

Castle Rising, vil. near King's Lynn, Norfolk, England, and formerly an important tn and seaport. It is notable for the ruins of a fine Norman castle, for a beautiful 12th-cent. church, and for Bede House, founded in 1614 for a few poor women, whose successors even to-day wear the original Jacobean dress. Pop. 200.

Castlebar, co. tn of Mayo, Rep. of Ireland. C. was captured by the Confederate Irish in 1641, and in 1798 the Fr. Gen. Humbert routed the Eng. forces under Gen. Lake in an engagement known since as the 'C. Races.' C. is an important mrkt tn for agric. products, and carries on bacon curing and hat making. Pop. 5300.

Castleblayney, mrkt tn of co. Monaghan, Rep. of Ireland; on the shores of Lough Muckno. Pop. 2200.

Castlecary, par. of Stirlingshire, Scotland, 6 m. S.W. of Falkirk, the site of a fort which defended the Antonine Wall.

Castlecormer, tn of Rep. of Ireland, in the co. of Kilkenny, and 10 m. from the tn of that name. It is situated on the R. Dinin. Pop. 900.

Castleconnell, vil. and spa on the R. Shannon in co. Limerick, Rep. of Ireland, noted for salmon fishing.

Castleford, urb. dist., incorporating Whitwood, in Yorks, England, situated at the confluence of the R.s Aire and Calder, 10 m. S.E. of Leeds. Rom. relics have been discovered within the dist. The Rom. road, Watling Street, passes through C., and the tn is on the site of the Rom. camp formerly known as *Legiolium*. It is a colliery dist., and the centre of chemical, glass, pottery, clothing, and confectionery manufs. Pop. 43,620.

Castlegregory, vil. in co. Kerry, Rep. of Ireland, 15 m. W. of Tralee. The Seven Hogs or Magharee Is. are off the coast of the C. peninsula. Pop. 260.

Castleisland, par. and tn of co. Kerry, Rep. of Ireland. Pop. (par.) 5000; (tn) 1491.

Castlemaine, Lady, see CLEVELAND, DUCHESS OF.

Castlemaine, tn of Talbot co., in the state of Victoria, Australia, on Forest Creek, and on the railroad from Melbourne to Echuca. The gold-mines near by were among the first to be opened in the colony. Pop. 6000.

Castlepollard, vil. in co. Westmeath, Rep. of Ireland, 12 m. N. of Mullingar. Pakenham Hall, the residence of Lord Longford, is associated with Maria Edgeworth. The fort near by is the site of numerous early Christian antiquities. Pop. 500.

Castlereagh, mrkt tn, co. Roscommon, Rep. of Ireland. Pop. 1244.

Castlereagh, Robert Stewart, Viscount,

2nd Marquess of Londonderry (1769-1822), statesman. He was the second son of Robert, 1st Marquess of Londonderry, and was educ. at St John's College, Cambridge. He sat in the Irish Parliament in 1790, and entered the Brit. House of Commons in 1794. He was appointed keeper of the privy seal in 1797, and chief secretary for Ireland in 1798. C. actively supported Pitt in bringing about the union between England and Ireland. He was secretary of state for war, 1805-6. On the death of Pitt, he resumed office under Portland. The failure of the Walcheren expedition (1809) brought about a quarrel between C. and Canning, the foreign secretary, which resulted in their retirement from office, and in the duel which took place the latter was wounded. In 1812 C. became foreign secretary under Lord Liverpool; it was during his period of office that Wellington won his brilliant victories, the success of the campaign of 1812-14 being largely due to C.'s steadfast and energetic policy. He represented England at the Congress of Vienna (1814-1815), the treaty of Paris (1815), and the treaty of Aix-la-Chapelle (1818). Though his foreign policy after 1815 was based on non-intervention, so that he refused to help Metternich in crushing European liberal movements, at home he was popularly regarded as a tyrant and considered responsible for the 'Peterloo massacre' and the 'Six Acts' (1819). He eventually committed suicide. As his coffin was being carried to Westminster Abbey a shout of joy came from the crowd in the streets. C.'s position as one of England's greatest foreign secretaries has subsequently been generally recognised. See lives by Lady Londonderry, 1904, and J. A. R. Marriott, 1936. See also C. K. Webster, *The Foreign Policy of Castlereagh*, 1931, and H. M. Hyde, *The Rise of Castlereagh*, 1933.

Castleton, vil. in Derbyshire, England, 16 m. W. of Sheffield. It is situated at the foot of a hill, on the summit of which stands Peak Castle, erected by Wm Peveril, the natural son of William the Conqueror. In the neighbourhood are Peak and Speedwell Caverns and the Blue John Mine. Notable also for its fluorspar. Pop. 650.

Castletown, formerly the cap. of the Isle of Man; in the extreme S. of the is., on the W. coast of C. Bay, 9 m. SW. of Douglas. From a rock in the centre of the tn rises Castle Rushen, said to have been erected in 960 by Guthred II of the Orrys kings of Man. It was once the residence of kings, and was besieged for 6 months by Robert Bruce in 1313. The Isle of Man Airport lies immediately on the tn boundaries. King William's College, in the vicinity, is a noted school for boys. C. is a popular resort for tourists. Pop. (1954) 1800.

Castletown Bere, tn in W. co. Cork, Rep. of Ireland, in Berehaven, Bantry Bay. Opposite the tn is Bere Is., largest is. off Cork coast. Pop. 648.

Castor, abbreviation for **Castoreum** (Gk *kastōr*, beaver), reddish-brown substance

obtained from the beaver, being contained in 2 pear-shaped pouches near the organs of reproduction. It contains a crystalline substance *castorin*, *salicin*, *benzolic acid*, and other substances, has a bitter taste and a strong, penetrating, and enduring odour. Formerly it was much esteemed as a medicine, being used in the form of a tincture as a stimulant and antispasmodic, but it is now used only in perfumery as a fixative. See also **PERFUMERY**.

Castor (**Alpha Geminorum**), fainter of the 2 bright stars in the head of the Twins. It is thought that C. has decreased in brilliance since the stars received their Gk names and this would explain why Alpha, which was used to denote the brightest star, was given to Castor—now fainter than Pollux. It is a very fine double, the component stars, magnitudes 2.7 and 3.7, about 6" apart, giving a greenish light, and being easily seen through a small telescope. Actually C. is a binary, the period of revolution being about 350 years. Each component is a spectroscopic binary, with periods of 3 and 5 days respectively. A third faint star which is also a close binary forms part of the same system.

Castor and Pollux (Gk *Polydeuces*), twin gods of Greece and Rome, known as the Dioscuri. Homer makes them the sons of Leda and Tyndareus, King of Lacedaemon, and brothers of Helen and Clytemnestra. In another version, Zeus embraced Leda in the form of a swan, and she bore 2 eggs, from one of which came Pollux and Helen, children of Zeus, and from the other Castor and Clytemnestra, children of Tyndareus. Pollux was immortal, while Castor was subject to old age, sickness, and death. They were Argonauts, and Pollux slew Amycus, and so became famous as a boxer and wrestler. Castor was renowned for his horsemanship. They fought the Athenians to recover their sister Helen, when carried away by Theseus. C. and P. seized the intended brides of Lynceus and Idas, sons of Aphareus, and in the ensuing battle Castor was slain by Idas. Pollux thereupon killed both the Apharidae, and besought Zeus to grant immortality to his brother. Zeus allowed them to share immortality, each dwelling in the abode of gods on alternate days. It was also said that Zeus placed them among the stars as Gemini. They were worshipped as protectors of sailors. The Romans ascribed to them the victory at Regillus, and built them a temple opposite that of Vesta. They were always represented as riding white steeds, with a star shining on their helmets. See J. Rendel Harris, *The Cull of the Heavenly Twins*, 1906.

Castor Oil is obtained from the seeds or 'beans' of the plant *Ricinus communis*, which grows wild in most tropical and sub-tropical regions, but is cultivated mainly in Brazil and India. The seeds, containing 40-50 per cent of oil, are first 'cold pressed' in hydraulic presses to remove a portion of the oil for medicinal purposes, and the cake residue is solvent-extracted to recover most of the remaining

oil for a variety of industrial uses. It is used in medicine as a safe non-irritating purgative, particularly suitable for young children. It should not, however, be given for constipation, especially when this is accompanied by abdominal pain, except on medical advice. The dose varies from a teaspoon to 2 tablepoons, and as the cheaper varieties have a disagreeable taste, it is generally advisable to mix it with something more palatable, such as milk or lemon juice. Apart from its medicinal use, it is a raw material from which is derived sodium ricinoleate, used for treatment of gum troubles. C. O. is used industrially for soap-making, as a high-temp. lubricant, in fluids for hydraulic systems, and in the manufacture of plastics; it is sulphated to give a product called 'Turkey Red Oil', for use in the textile industry, and it is dehydrated by heating with a catalyst to produce a drying oil for use in the preparation of paints, varnishes, inks, linoleum, and oilcloth. It is also used as a raw material for chemical manufacture, notably of sebatic acid and sev. aldehydes of strong odour for use in perfumery. The main fatty acid constituent of the oil is ricinoleic (82-8 per cent), the only fatty acid in nature having an attached hydroxyl group. The residue cake or meal is unfit for cattle food, as it contains a poison named 'ricine' and is used almost exclusively as a fertiliser. It has been shown that it can be detoxified in case of need for use in dairy foods, and quantities have been used for this purpose, but it is not common practice.

Castor Ware, variety of Rom. pottery made on the Continent but chiefly in the region of Castor, Northants. It has usually a black or brown polished surface with an applied slip ornament of animals or naturalistic scroll pattern, and the most common shape is the bulbous beaker. In the Castor dist. it was made from late in the 2nd cent. until the end of the Rom. occupation.

Castoreum, see CASTOR.

Castoridae, name of the third family of the sub-order Simplicidentata of the rodents. It contains a simple living genus, *Castor*, the beaver, one species of which is European, the other N. Amer. Many extinct forms of this family are found as fossils.

Castration, operation of removing the testicles or reproductive organs of the male for various purposes. In human beings it is generally performed when these organs are injured or diseased, while in the E. it is a precautionary measure practised on slaves destined to become eunuchs or guardians of the harem or seraglio. The operation is also performed on horses, pigs, sheep, and cattle. The effect is much the same in all male animals treated in this manner. If it is done before puberty the masculine qualities are not developed. In human males the voice does not break nor the hair grow upon the face; in sheep and cattle the horns are either not formed or they take a shape similar to those possessed by females. A castrated cock does not crow,

and its feathers are changed in character. Reproduction is quite impossible. If the operation is performed after puberty, it is often dangerous in its effects; the change is slow in the masculine qualities, and procreative power is not immediately lost. It was in the 17th cent. that the Sistine Chapel in Rome substituted castrati for the imported adult male sopranos or 'falsettists' of Spain, whose effects were obtained by some process which is now unknown. The artificial male soprano or contralto was obtained by an operation in boyhood on the sexual organs which hindered the development of some of the characteristics of manhood and thereby perpetuated the boy's type of voice. Perhaps the most celebrated castrato singer of all time was Farinelli (q.v.). C. is sometimes carried out in modern surgery as a treatment for cancer of the prostate gland (see CANCER).

Castrén, Mathias Alexander (1813-52), Finnish linguist and ethnologist. In the years 1838, 1839, and 1841 he journeyed through Lapland collecting lexicographical notes. In 1841 he was invited by the St Petersburg Academy to take part in an expedition to Siberia for the study of Samoyed language and ethnology. In spite of tuberculosis, he travelled to Siberia in 1845 and for 4 years collected there vast scientific material. He returned to St Petersburg physically exhausted, but his health improved and in 1851 he was appointed prof. of Finnish at Helsingfors Univ.; soon afterwards he d. Main works: *Dissertatio academica de affinitate declinationum in lingua fennica, esthonica et lapponica*, 1839; *De nominum declinatione in lingua syryena*, 1844; grammars of the Syryan (1844), Chereniss (1845), Ostyak (1849), Samoyed (1854) languages. After his death, the material by him collected in Siberia was published in Helsingfors (in Swedish, 6 vols., 1852-8, 1870) and partly in St Petersburg (in Ger., 12 vols.).

Castrense Peculium (Lat. *peculium*) literally denoted property in cattle (from *pecus*, cattle), but came to be used of the private property of a wife, or that which is given by a father or master to his child or slave. According to Rom. law a man had no property independently of his father, but C. P., that is, money acquired by military service (Lat. *castra*, a camp), was regarded as the private property of a son. Later a man was allowed to be sole possessor of any professional earnings, and of property inherited through his mother, in which cases it was known as quasi-C. P.

Castres, Fr. tn. cap. of an arron., in the dept of Tarn, on the Agout. It grew up around a 7th-cent. Benedictine abbey, possibly on the site of a Rom. camp (*castra*). In the 16th cent. it was a Huguenot (q.v.) stronghold. There are textile, metallurgical, mechanical, and pottery industries. Dacler and Jaures (qq.v.) were b. here. Pop. 30,800.

Castries, cap. of the is. of St Lucia, Brit. W. Indies, situated in Carénage Bay. The port of C. is one of the best harbours in the W. Indies, being land-locked and

providing facilities for fuelling and watering ships and for loading and discharging cargo which are unequalled in those is. C. handles about 945,000 gross tons of shipping annually, and has a large trade in sugar, coco-nut products, bananas, and cacao. The tn was largely destroyed by fire on the night of 19 June 1948. There was no loss of life, but some 20,000 people were made homeless. Rebuilding, in which the high level of the water table posed special problems, was completed in 1952. The estimated pop. of C. (excluding the dist.) is 8600.

Castro, Alfonso (c. 1495-1558), Sp. theologian, b. Zamora. He entered the Franciscan order, and became private chaplain to Philip II, whom he accompanied to England in 1554 for the purpose of negotiating a marriage between that monarch and Queen Mary. He wrote a Lat. work on heresy, entitled *Adversus omnes haereseis libri xiv*, 1534. His pub. sermons on heretics include *De justa haereticorum punitione*, 1547, and *De potestate legis poenalis*, 1550. C. became Archbishop of Compostella, 1557.

Castro, Cipriano, or Cypriano (c. 1858-1924), Venezuelan military leader and president, b. in the Andean prov. of Tachira. His parents were Sp. mestizos of the peasant class. He early took an active part in local politics in Capacho as a Liberal, forming a party called 'Castristas.' In 1866 C. was successful in the 'battle of Capacho' against Morales, who was local representative of the López gov. In 1899 C. headed a rebellion against President Andrade. After engagements in Las Pilas, at Zumbador, and San Cristóbal, he pushed his way on to the cap., Caracas. Andrade fled to Curaçao, and C. declared himself *jefe supremo* (supreme military leader). He was made provisional president of Venezuela by the constituent assembly (1901), and in 1902 was formally elected president for 6 years. His administration was marked by numerous uprisings, first that of Hernández, then that of Peraza, and finally that headed by Matos (1902-3), who tried to win the support of foreign govs. C. went to Europe in Dec. 1908, leaving his powers in the hands of the vice-president Gómez, who seized the presidency in 1909, and was popularly confirmed. In 1913 C. unsuccessfully tried to regain power. He remained a wanderer, chiefly in Germany. He d. at San Juan (Puerto Rico).

Castro, Inez de (d. 1355), Sp. noblewoman, whose sad story has been used by poets and dramatists. In 1340 she lived with her cousin, Costança de Paza, the betrothed wife of Dom Pedro, the son of Alfonso IV of Portugal (q.v.). On the death of her cousin in 1345, she secretly married Dom Pedro. Alfonso, fearing that this union would be injurious to Ferdinand, the young son of Costança, ordered her to be put to death. When Dom Pedro ascended the throne in 1357 he avenged her death and, according to one tradition, ordered his nobles to pay homage to her exhumed body. See COIMBRA. See also Camoens, *Lusiadas*.

Castro, João (Juan) de (1500-48), Portuguese admiral, b. Lisbon, the son of Alvaro de C., Governor of Lisbon. He had the same tutor as Emanuel I's son, the Infant Dom Luis, who had a life-long attachment for his young playmate. They were both present at the siege of Tunis in 1535. Upon his return to Lisbon C. received from the king a commission for the command of San Pablo de Salvaterra in 1538. C. was a man always contented with small means, but thirsted to do deeds of bravery and married a noble Portuguese lady who was equally indifferent to wealth. He sailed to the Indies and joined the *aventurciros* for the relief of Diu. In 1543 C. undertook the task of clearing the sea of pirates, and later on again he was sent out to the Indies, where he ultimately received the appointment of viceroy, but d. soon afterwards.

Castro, José Maria Ferreira de (1901-), Portuguese novelist who is considered the pioneer of the 'new realist' movement in the country. A former journalist, he brought to the novel a racy and vivid style. *Emigrantes*, 1927, and *A Selva*, 1929, in which he exposes a case of hard conditions of labour in the Brazilian jungle, estab. his literary reputation. See *Jungle* (trans.), 1934.

Castro, i.e. 'castle', name given to the chief tns of certain is. in the Gk Archipelago, e.g. Lemnos, otherwise known by the name of the is.

Castro del Río, Sp. tn in the prov. of Córdoba, on the r. b. of the Guadajoz. Part of the old walls and a Moorish castle remain. There are manufs. of woollens, leather, and earthenware. Pop. 14,000.

Castro Urdiales (Rom. *Flaviobriga*), Sp. port in the prov. of Santander, on the Bay of Biscay. It has a ruined Templars' castle, and fisheries. Pop. 12,000.

Castro y Bellvis, Guillén de (1660-1631), Sp. dramatist, b. Valencia, chiefly famous for his *Las Mocedades del Cid*, the source of Corneille's masterpiece. From 1619 he lived at Madrid, and was very friendly with the famous Sp. dramatist Lope de Vega, to whom he was greatly indebted for his style. He wrote some 40 plays, chief among which may be reckoned his *Pagar en propia Moneda* and *La Justicia en la Piedad*. C. has the characteristics of the Sp. writers of romance. His style is vigorous and passionate, and there is the romantic atmosphere so peculiar to the old Sp. *romanceros*. He d. in great poverty.

Castrogiovanni, see ENNA.

Castroreale, tn in Sicily (q.v.), 19 m. SW. of Messina (q.v.). It has hot sulphur springs. Pop. 9400.

Castrovillari, It. tn, in Calabria (q.v.), in the fertile valley of the Coscile, 35 m. N. of Cosenza (q.v.). It has a trade in agric. produce and olive oil, and casks are manuf. Pop. 13,800.

Castruccio Castracani (1281-1328), It. general and soldier of fortune, b. of noble family in Lucca. In the early years of his career he served successively in France, England, and Lombardy. He was a staunch Ghibelline, and the people of

Lucca made him the chief of their rep. In return for his services as adviser in his campaign against the Guelphs, the Emperor Louis of Bavaria made him Duke of Lucca, Pistoja, Volterra, and Lunigiana, as well as count palatine. At the head of the Ghibelline party he carried on a war against the Florentines for 15 years, at the end of which he d., on the very point of winning for himself a magnificent position as supreme authority in Tuscany, 1329. His death was a fatal blow to the Ghibelline party in Italy. Machiavelli's book, *Castruccio Castracani*, is more a work of imagination than a hist. of facts.

Castrum Lucii, see CHALUS.

Castrum Novum Arianorum, see CASTELNAUDARY.

Castuera, Sp. tn in the prov. of Badajoz, with a trade in wine and fruit. Pop. 8000.

Castulo, see LINARES.

Casualties. In Scots law 'C. of superiority', now virtually obsolete, were certain occasional payments analogous to ancient feudal dues, paid to the superior lord by a feuar for the recognition of his tenancy. The only C. that survived until recent times were those payable to the superior in consequence of the transmission of the feu (fief or tenancy) by sale or succession to a new vassal. The payment made by an heir on taking up his estate was known as a casualty of relief (Lat. *relevare*, to take up). The Conveyancing Act, 1874, made C. fixed, and not 'casual' or accidental, payments in the absence of express stipulation to the contrary. C. were abolished by the Feudal Casualties (Scotland) Act, 1914.

Casualties in the First World War (1914-1918). 1. *British Empire Casualties*: The total number of officers and men of the Brit. Empire forces who lost their lives in

and through the First World War was approximately 1,089,900, of whom 1,048,850 were military C. and 41,050 were naval. These C. were distributed as shown below.

The number of wounded was approximately 2,401,000, and the number of prisoners was approximately 191,650. The 'missing' naturally presented a problem in a war which in the character and extent of its operations had no precedent. There were, at the armistice, about 130,000 cases of Brit. officers and other ranks of whom no trace had, till then, been found; but as a result of the excavation work carried on in the war area, some 70,000 of the bodies were found during the first decade after the armistice. In spite of the scale on which operations were conducted, it is certain that few if any cases are on record of any man returning after being officially posted as dead. A year or two after the armistice the great majority of the 'missing' were, though not till after exhaustive inquiry, 'presumed dead,' and their names accordingly transferred to the official rolls of the dead.

Comparative figures of Brit. and Ger. C. on the Brit. sector of the W. front during the 4 years of hostilities, as compiled with the aid of the Federal Archives at Potsdam, give the following results: (i) the total Brit. officer C. were 115,741; Ger., 47,256; i.e. British: German = 5:2; (ii) Brit. other ranks, 2,325,932; Ger., 1,633,140; i.e. British: German = 3:2; (iii) total Brit. C. to all ranks during the period in question was 2,441,673; Ger., 1,680,396; i.e. British: German = 3:2.

(See *Statistics of the Military Effort of the British Empire during the Great War*, issued by the War Office in Mar. 1922, a detailed but incomplete document.)

1. British Empire Dead:

Brit. Isles (including Ireland)	812,300
Indian Empire (Brit. and Indian)	73,450
Dominion of Canada	62,800
Commonwealth of Australia	60,450
Dominion of New Zealand	18,200
Union of S. Africa	9,050
Newfoundland	1,600
Colonies	52,050
Total	1,089,900

2. Allied and Associated Nations' Casualties:

	<i>Killed and Died</i>	<i>Wounded</i>
France	1,393,388	1,490,000
Belgium	38,172	44,686
Italy	460,000	947,000
Serbia	127,535	133,148
Rumania	335,708	not recorded
U.S.A.	115,660	205,690
Portugal	7,222	13,751

3. Central Empires' Casualties:

	<i>Killed and Died</i>	<i>Wounded</i>
Germany	2,050,466	4,202,028
Austria and Hungary	1,200,000	3,620,000
Bulgaria	101,224	152,400
Turkey	300,000	570,000

(The figures for Turkey are approximate.)

Casualties in the Second World War (1939-45). 1. To *All Ranks of the Armed Forces of the British Commonwealth and Empire, reported from 3 Sept. 1939 to the End of the War, excluding Deaths from Natural Causes*: This statement gives the total number of C. reported up to 14 Aug. 1945. It includes all men reported prisoners of war and, in the case of the armed forces of the U.K., New Zealand, S. Africa, and the colonies, all men reported missing during the war. The figures exclude (i) civilian C. due to enemy action, (ii) C. to merchant seamen, and (iii) C. to members of the Home Guard while on duty.

The total number of officers and men of the Brit. Empire forces who lost their lives in and through the Second World War was 373,372. These C. were distributed as shown below.

The number of missing was 91,000 and the number of prisoners, including service internees, was 326,000. The figure includes 20,000 officers and other ranks missing but presumed to be prisoners of war, and prisoners of war who were repatriated or liberated or who escaped.

2. *Casualties to Merchant Seamen reported from 3 Sept. 1939 to End of War*:

Deaths	30,248
Missing	4,654
Wounded	4,707
Internees	5,720
Total	45,329

3. *Casualties of the United States Armed Forces between 7 Dec. 1941 and 31 Dec. 1946.* Department of Defence statistics list the number of deaths as 414,000, of which 295,000 were incurred in battle, and the total number of wounded as 670,000.

4. *U.S.S.R.* No reliable figures exist for Soviet C. It is generally considered that the military dead must have been at least over 4,000,000, while civilian losses were equally heavy.

5. *Enemy Casualties during the Second World War.* There are no completely accurate figures for Ger. and Jap. C. Ger. military dead have been estimated as over 2,100,000. In addition, a further 2,900,000 men were listed as captured or missing, and of these a large proportion were almost certainly killed. There were over 4,000,000 wounded. Jap. killed have been estimated at nearly 1,175,000; their wounded at over 4,600,000. The Italians lost 389,000 killed and over 200,000 men were reported missing.

Casuarinaceae, Australian family of Dicotyledons containing the single genus *Casuarina*. The species are trees somewhat resembling the *Equisetum* in appearance, the branches being all long, drooping, green, and wiry, with channelled interodes and very small, scale-like sheaths in place of leaves. The flowers are in male and female catkins, the male flower consisting of a single stamen and 2 perianth-leaves, while the female consists of 2 syncarpous carpels, which form a unilocular ovary. The stamens and styles both hang out over their bracts and are wind-pollinated. The male flowers are borne in terminal spikes and the females resemble a pinecone in appearance. The wood of the plants is called beef-wood, and young shoots afford fodder for cattle. Also known as Sheokes.

Casuarinus, see **CASSOWARY**.

Casulistry (Lat. *casus*, instance, point of law), art of bringing moral principles to bear in particular cases—applied morality. From the 7th to the 11th cent. *The Penitential Book* was used as a guide for conscience. Moral theology began with the schoolmen of the 13th cent., and has steadily developed ever since. C. is also used in a derogatory sense to denote sophistical or false reasoning in moral matters, particularly that kind which makes for laxity of conscience. See Pascal, *Les Lettres Provinciales*, 1656-7; H. Sidgwick, *History of Ethics*, 1892; H. Rashdall, *Theory of Good and Evil*, 1907.

Casus Belli (Lat. 'cause of war'), grounds which, by international law, are sufficient for declaring war. The causes for war were strictly defined, so that war might be used as the last extremity in conflicts between nations. See **HAGUE CONFERENCE AND INTERNATIONAL LAW**.

Cat, Christopher (fl. 1702-33), keeper of the Cat and Fiddle Inn, London, and, subsequently, of the Fountain Tavern, in which the Kit-Cat Club (q.v.) held its meetings, 1703-20.

Cat, in general, any member of the mammalian family Felidae, including the lion, tiger, panther, leopard, lynx, jaguar, etc., but the name is more usually limited to the smaller species. Cs. are typical aeluroid, carnivores, distinguished by wonderful flexibility and strength of spine, perfect mechanism of the claws, a small, supple head, looseness of skin, swiftness of movement, grace, and muscularity. They are mostly splendid climbers and jumpers. They have 30 teeth, rough tongues, and long whiskers or feelers

(*vibrissae*), to assist the eyesight at night. The pupils of their eyes expand and contract according to the light about them. The origin of the domestic C. is not certainly known, but it is probably descended from the *Felis ocreata* of ancient Egypt, which was worshipped at a very early period as an object of veneration. C.s are more prone than dogs to revert to a wild or semi-wild state, but no true wild species exactly resembles them. They are hardly mentioned in ancient writers of Greece, Rome, or Judaea, and it is known that in the earlier medieval period of

BLUE PERSIAN

T. Fall

Europe C.s were rather rare and costly. They have been long known in China (from AD 500), whence comes a fine variety with soft, beautiful fur and pendulous tufted ears. The Manx, with merely a rudimentary tail, is supposed to have come from Japan, but is also called the Cornish C. In the widest sense the C. section (*Aeluroidae*) of carnivores includes, besides *Felidae*, civets (*Viverridae*), aardwolves, and hyaenas, (*Hyaenidae*). Of domestic C.s the most fancied breed is the long-haired (Persian). The most valued are of a very uniform pale silver or chinchilla colour, without marking or shading, and with green eyes, but to-day the championship award generally goes to a blue or cream, while the blue bring the highest prices and command the highest fees. Blue Persians should have deep orange or amber eyes. Other popular varieties are pure whites with blue eyes, deep coal-blacks with dark yellow eyes, red tabby, Siamese (fawn), brown tabby, and silver tabby. They

may also be tortoiseshell or smoke colour. Markings are an important point in judging short-haired varieties. Usually there is little difference between males and females. Pure sandy C.s are nearly always males. They are difficult to train and inclined by nature to be treacherous. Anger is shown by lashing of the tail, pleasure by a deep, rumbling purr in the throat. Russia, Iceland, India, Madagascar, and Ethiopia all have fine breeds of domestic C. Notable varieties are the Angora (long-haired), Maltese and Chartreuse (bluish-slate colour), Siamese (pale cream, with feet, lower legs, muzzle, and ears all black), and the Paraguay domestic C. of America. As a race C.s are not gregarious or co-operative, but prefer to live or hunt alone (see Kipling's *Just So Stories*, 'The Cat that Walked by Himself'), or in small family parties. The small species (especially the domestic C.) have young very frequently, often as many as 4 or 5 at a birth. For about 10 days after birth a kitten's eyes remain unopened. The eyes are always blue at first changing gradually later on to green or yellow in most varieties. C.s soon grow attached to particular spots or corners of a house. They are good mousers if not spoilt by too much petting. Most kinds are not very affectionate. In Persians the kittens' playfulness gives place to extreme dignity. C.s should be given 2 meals a day; the diet consisting of meat, rabbit, cooked fish, or fowl, bread scraps soaked in milk, and cooked green vegetables. Cooking of certain meats or offal is necessary because of the possibility of worm infestation. Small bones should be avoided. Water should always be available for the C., and it should have at least 2 drinks of milk daily. C.s are subject to numerous ailments; among the more serious are canker of the ear, diarrhoea, inflammation of the bowels, influenza, mange, and worms. Methods of treatment are described in the pubs. of the manufacturers of C. medicines, but in serious cases a veterinary surgeon should always be consulted. House C.s both male and female, are improved if rendered sexless by operation. 'Spaying' (i.e. castration of female C.s) is now a common feature. Female C.s retained for breeding are termed 'queens.'

Shows. The earliest C. show in Britain was at the Crystal Palace, 1871; the first in Scotland soon after in Edinburgh. The National C. Club was instituted under Weir's presidency, 1887. Its ann. exhibition is usually held in autumn. The Scottish C. Club, formed 1894, holds an ann. show in Edinburgh or Glasgow. Besides the National C. Club shows, the shows recognised in England for championship purposes are those held at Newbury and Croydon, the Midland Cos. show held at Worcester, Malvern, or Cheltenham, and the S. Cos. show. The Siamese C. Club (founded 1901) holds a championship show each autumn in London. See E. B. H. Soame, *Cats, long-haired and short*, 1934; E. B. Simmons, *Cats*, 1935; M. Mellen, *A Practical Cat Book*, 1939, and *The Science and Mystery*

of the Cat, 1940; M. H. Clarke, *First Aid to Dogs and Cats*, 1941; M. Joseph, *Cat's Company*, 1946; P. M. Soderberg, *Cat Breeding and General Management*, 1948; L. F. Whitney, *The Complete Book of Cat Care*, 1954; M. F. Schrody, *Cats in Your Home*, 1957.

Cat-bird, popular name of 2 very different species of birds which resemble one another only in that they emit a curious mewing sound. One of these, *Ailuroedus crassirostris*, is an Australian bird closely allied to the bower-birds. The other is an Amer. member of the family Turdidae, is related to the mocking-bird, and is called technically *Galeo-*

the earth's past hist. was governed by processes similar to those in action to-day, takes its place.

Catacombs (Gk *kata*, down; *kumbē*, a hollow), excavations forming subterranean galleries for the burial of the dead. The original term, *catacumbae*, was at first applied to a particular burial place only—that of the basilica of St Sebastian—and the word did not refer to the excavations for the tombs, but to the conformation of the ground in the locality. The full title of this burying-place was *caemeterium ad catacumbas* (the burial place in the hollow), often shortened to *catacumbas*. In time the term became

E.N.A.

A NICHE IN THE CATACOMBS AT ROME

scoteles carolinensis. The colouring of the two is also different, the former being a bright green, the latter a slate-grey.

Cat Island, see BAHAMAS.

Catabrosa, inconspicuous genus of Gramineae which grows in temperate countries. There is only one Brit. species, the whorl-grass, *C. aquatica*, found in ponds, ditches, and wet sands.

Cataclysmal Action, theory of world hist. in vogue among geologists in the early part of the 19th cent. and thereabouts, to account for the revelations which had been made with regard to fossil remains. It attempted to explain the great differences in the fossiliferous remains in consecutive beds by assuming violent catastrophes which swept over the earth, killing the inhab. and altering its character. The theory is now abandoned, and the uniformitarian theory brought forward by Lyell, which supposes that

applied to all burial places in general, and so, in the 9th cent., to the *crypta* or *caemeterium* of the Christian vaults now known in England as the *C*. There are *C*. in many places, but the most remarkable are those of Rome. These are the *C*. of the Christians, and the earliest belong to the 2nd cent., though by far the greatest number belong to the 3rd and 4th. After the 4th cent. inhumation in *C*. became more and more rare, burial in churches taking its place. But the great respect of the Christians for the dead caused the *C*. to be still held in extreme reverence; people continued to visit them in remembrance of their dead, and to do homage at the tombs of the martyrs. There remain curious notices to visitors, itineraries of pilgrimages, etc., belonging to this time. The faithful took with them precious perfumes, which they poured through the cracks at the top of

the martyr's tomb, and of which they carefully collected again every tiny drop as it passed through the cracks at the bottom, after having touched the body of the saint. With the invasion of Alaric in AD 410, this cult ceased, the C. sharing in the general devastation. Indeed, at this time many of the holy relics were removed and deposited in the various churches for greater safety. There was, therefore, no longer any reason to visit the C.; all trace of them was lost and they were forgotten. Towards the end of the 16th cent. the study of anct writings brought about by the Renaissance turned people's attention again towards the C., and in 1578 they were accidentally rediscovered by Padre Bosio. This 'Columbus of the subterranean world' devoted 30 years of his life to exploring them, working out their plan, and restoring and studying their monuments. He wrote an account of his work in *Roma Sotterranea*. Ever since the C. have been the object of curiosity to millions, and the work has been continued by Aringhi and Boldetti in the 17th cent., Seroux d'Agincourt about 1825, and the devoted workers of modern times, Padre Marchi, his pupil De Rossi, J. H. Parker, and others. Valuable illustrations have been prepared by Raoul Rochette. The C. consist of an interminable series of long and narrow galleries, 3 to 4 ft wide and 4 to 12 ft high, crossing each other in all directions, forming multitudes of cross-roads, and constituting an inextricable labyrinth. In these galleries hewn in the volcanic rock, the dead are buried in niches or *loculi*, tier above tier, from a short space above the ground to the arched ceiling, in 5, 6, or 7 rows. There is no masonry, the ground supporting itself. Many of the galleries are in 2 or 3 stages, communicating with each other by stairs. The galleries are interspersed here and there by spaces much larger than the ordinary galleries; these are the chambers or *cubicula*. Boissier believes that the tomb of Joseph of Arimathea, with its horizontal niche surmounted by an *arcosolium*, served the early Christians as a model for these tombs. At various distances—sometimes 300 paces—are vertical shafts for light and air. The *loculi* were closed by slabs of marble or huge tiles, and cemented with great exactness. On them was painted or incised a name and a date, with sometimes one or more of the Christian symbols, a dove, an olive-branch, or the sacred monogram. The *cubicula* were decorated with simple fresco-paintings, a curious mixture of pagan and Christian traditions in style and subject. The chambers were family burial places, or contained the tombs of martyrs. The C. are entered from churches above them, and sometimes from simple openings in the ground. The old belief that the C. were secret places of worship of the early Christians is true only to a limited extent. There was no need for secrecy except during the fiercest of the persecutions when Christian worship was penal. There is every evidence, indeed, that at those

times they were used for congregational worship. As places of refuge for any number of people or for any length of time, the C. must always have been impossible, though a hunted refugee may occasionally have found safety there. It appears to be estab. that the C. were entirely the work of the early Christians, and not disused sand quarries, as was once believed. The strata quarried for building purposes were quite unsuitable for the construction of C., which required strata of the hard volcanic rock. Among the more famous of the C. outside Rome are those of Naples, Syracuse, Palermo, Tuscany, Etruria, Malta, and Alexandria. The C. of Paris are improperly so called—they are mere charnel houses. See Hertling and Kirschbaum, *The Roman Catacombs and their Martyrs*, 1956.

Catafalque (Fr. from It. *calafalco*, a word of unknown origin), temporary draped structure, representing a cenotaph (q.v.), used for the lying in state and for the funerals of royalty and notable persons.

Catalan, group of the Romance languages, spoken to-day by over 5,000,000 people in the Sp. provs. of Gerona, Barcelona, Lérida, Tarragona, Alicante, Valencia, and Castellón de la Plana; in the Fr. dept. of Pyrénées Orientales; in the Balearic Is.; in the dist. of Alghero, Sardinia; and in parts of the Argentine Rep. There are 2 main dialects: E. (Roussillon, Balearic Is., and Alghero) and W. (Lérida and Valencia). C. dates from the 12th cent., and closely resembles Provençal. During the 12th cent. it came to be regarded as a literary language (*Homelies d'Organyà*), and still enjoys that dignity, the revival of *jocs florals* at Barcelona in 1859 having aroused much popular enthusiasm. The greatest C. poet of the 15th cent. was Ausiàs March (c. 1397–1459) from Valencia, who wrote beautiful *Cants d'amor* and *Cants de mort*. Balaguer and Perdaguer are the chief modern poets. Joan Maragall, Emili Guanyabens, Jeroni Zanné, Josep Lleonart, Josep Pijoan, Michael Costa i Llobera, Josep Carner, and Josep Maria López-Picó, among others, are contemporary poets. Among prose writers are Raimon Lull (Raymond Lully), Muntaner, Desclot, Pujols, Alomar, Ruyra, Paradís, Sagarra, Corominas, and many others. See M. Mila y Fontanals, *Estudios de lingua catalana*, 1875; Morel-Fatio, in Gröber's *Grundriss der romanischen Philologie*, 1888; J. Folguera, *Les noves valors de la poesia catalana*, 1919; A. Grier, *Contribució a una dialectologia catalana*, 1921; W. Meyer-Lübke, *Das Katalanische*, 1925; L. Nicolan d'Oliver, *Resum de literatura catalana*, 1927.

Catalani, Alfredo (1854–93), It. composer, b. Lucca, where he first studied, afterwards going to the Paris and Milan conservatories. Apart from a symphonic poem, *Ero e Leandro*, C. was an almost exclusively operatic composer, and at least one of his operas, *La Wally*, has remained in the It. repertory.

Catalani, Angelica (1780–1849), famous It. singer, the daughter of a tradesman, educ. at the convent of Santa Lucia at

Gubbio. Her glorious voice soon attracted attention, and she made a tour of Europe, receiving enormous fees, soon squandered through extravagance of her husband, Capt. Valabrégue. Her first appearance in London was in 1806 and she remained in England, a prima donna without a serious rival, for 7 years. In 1813 she obtained the management of the Théâtre Italien in Paris, together with a large subsidy; but on Napoleon's return in 1815 she left Paris and toured a number of European cities, arousing the wildest enthusiasm. Later she returned to the Théâtre Italien, but followed the same ruinous system there as in London, every expense on orchestra, other singers, and scenery being cut down so that the receipts might go into the hands of her husband. To suit this state of things the operas were arranged in such a way that little of the original save the name survived; while the rest consisted of variations by Rode, and similar items, with the celebrated *Son regina* introduced instead of the concerted pieces and songs which had been excised. But though she came to financial grief over the Paris opera-house owing to her husband's carelessness, she was unquestionably one of the famous operatic stars of all time with a voice of singular purity and power. She gave up public life in 1828. She was most liberal and generous in her subscriptions to charities, and a woman of fine character.

Catalaunian Fields or Plain, scene of the battle in which Attila, King of the Huns, was defeated by the forces under the Rom. general Aetius in AD 451. The plain was thought to have been situated round Châlons-sur-Marne, in the old prov. of Champagne, France, and the battle is still generally known as the battle of Châlons, but modern authorities place it round Troyes.

Catalca, formerly Chatalja, tn of European Turkey, 25 m. NW. by W. of Istanbul. To the eastward are the Heights of C., upon which are extensive fortifications. C. was the scene of much heavy fighting between the Bulgarian and Turkish forces in the Balkan war (q.v.) of 1912 and 1913. Here, too, in Nov. 1912, occurred the heavy mortality from cholera among the Turkish troops. This outbreak commenced about 7 Nov., and during the height of the epidemic about 1000 fresh cases were reported each day. It was also at C. that the *pourparlers* took place which led up to the truce in the war. The delegates of the Balkan allies and Turkey first met on 25 Nov., and on 3 Dec. all the parties, with the exception of Greece, signed the armistice. During this armistice, which lasted till the end of Jan. 1913, the delegates of the belligerent countries met in London. The C. lines were much strengthened in the First World War.

Catalectic, metrical term applied to a line of verse lacking a syllable in the last foot, e.g. Keats's 'Ever/let the/fancy/room,' which has only the first syllable of the last trochee.

Catalepsy (Gk *katalēpsis*, seizure, or a taking possession of), term applied

to a morbid psychological condition, in which the patient becomes insensible, and there is a sudden suspension of all voluntary motion, the body becoming rigid and fixed, and so remaining until the end of the attack. In some cases there is complete insensibility, so that the person appears to be dead. In other cases the patient appears to be labouring under great mental excitement, and gives utterance to vehement ejaculations, or will even break out into song. The duration of the attack varies; sometimes the patient recovers after a few minutes, sometimes after sev. hours, but in more serious cases the attack will run into weeks or months. In such cases recourse has to be had to tube-feeding to obviate the danger of starvation. It occurs in certain types of schizophrenia as *flexibilitas cerea*, a condition in which the limbs remain fixed in any position they are made to assume and in which there may be general insensibility to pain. C. constitutes in effect, a retreat or abstraction from reality and an attack may be the result of severe emotional conflict, the existence of which may not have been previously recognised. It is a condition that lends itself to fraud and has been deliberately simulated to avoid punishment or responsibility (e.g. military service). See also ECSTASY; HYSTERIA; TRANCE.

Catalogue, in astronomy, the name given to a list of stars, to which various additions are made, depending on the purpose for which the C. is required. Amongst these additions may be mentioned their spherical co-ordinates, that is, right ascension and declinations, proper motions, magnitudes, spectrals, types, etc. Other kinds of C.s are compiled which deal with binary stars, nebulae, comets, meteor showers, etc.

Catalogues and Classification (Gk *katalogos*, register). A catalogue is a list or enumeration, generally in alphabetical order, of persons or things (sale C., picture C.), especially of the contents of a library or exhibition. Library C. of a kind have existed since the earliest times. They list the books gathered together in one library or, in the case of 'union' C., the contents of a group of libraries; bibliographies are usually lists of books written on any subject, person, or period regardless of their actual location. (See also BIBLIOGRAPHY.) The value of a literary collection may largely depend on good C. to make it of practical assistance. To meet ordinary reasonable demands 2 C. are essential, one arranged by authors, one by subjects. Some libraries have various other C. such as title C. The catalogue entry has these distinct parts: (1) Author; (2) Title; (3) Imprint (publisher and date); (4) Collation (number of pages, illustrations, etc.); (5) Notes, and other bibliographical details if necessary. Most cataloguers follow the Anglo-Amer. Code of Rules, which should ensure uniformity of method.

Card or sheet C. with typed entries are in most common use to-day, as they are the most convenient method when additions to or withdrawals from the C. are

made. The cards stand on edge in drawers or trays; the sheaf entries are held in loose-leaf binders. There is also a tendency to return to the original printed C., and visible indexes are becoming more widely used. Both these types of C. have the advantage of exhibiting a number of entries at a time, and are mostly in use for the C. of periodicals or gramophone records.

Most libraries now compile their C. either in dictionary or classified form irrespective of whether the catalogue is on cards or in sheaf form. The dictionary catalogue arranges in one alphabetical sequence the author, title, and subject entries, whilst the classified form is arranged according to the classification symbol taken from the classification system in use in the library, with author and subject indexes. With a classified catalogue a logical arrangement of subjects is assured as the catalogue is based on a system which shows what books are grouped together on the shelves, but the reader has to be guided to the arrangement by an alphabetical subject index, whereas the more obviously simple dictionary catalogue is inclined to be misleading because of the multiplicity of words to choose as subject entries, and an elaborate system of cross-references has to be introduced.

The first to make definite scientific rules for compiling book C. was Panizzi (q.v.) in 1839. In that year appeared his 'ninety-one rules' to be observed in making the library catalogue for the Brit. Museum. Every book was to be catalogued from information contained in itself; exact rules as to the entry of the author's name, the title of the book, and the imprint details were laid down. The *General Catalogue of the British Museum* is arranged under authors. The revised Brit. Museum rules were reprinted in 1936. Subject indexes are pub. periodically, in which the subject headings are in alphabetical order.

Classification. The original rigid system of keeping books in certain presses or cases and referring to them by their press numbers has given way in all but the oldest and largest libraries to a system of classification by which books on the same subject are drawn together on the shelves, and related subjects are in close proximity. Numbers marked against the entries in the catalogue lead the reader to the correct part of the classification system, with which the shelves correspond.

The best-known modern book classification system is Dewey's *Decimal Classification*. It was drawn up by Melvil Dewey in 1876 (14th revised ed. 1942, 15th ed., very much shortened, but little used, in 1952, and a 16th ed. in preparation). Dewey divides subjects into 10 numbered groups: 000, general works; 100 philosophy; 200, religion; 300, sociology; 400, languages; 500, pure sciences; 600, applied science; 700, fine arts; 800, literature; 900, travel, hist., and biography. Each group is divided into 10 sections, and these are again subdivided,

and by means of a decimal point further subdivision is made possible. A recent survey showed that 97 per cent of the libraries in the U.K. and the U.S.A. use this system. The Universal Decimal Classification is an adaptation and expansion of Dewey's system. The International Federation for Documentation at Brussels adopted the scheme in 1895 for the arrangement of its enormous card bibliography, and it is responsible for its continuation and revision. Two important libraries using this scheme are the Science Library in London and the Engineering Sciences Library in New York. A *Subject Classification* was evolved in 1894 [by J. D. Brown (the only Eng. scheme produced)] but it is only used by a few public libraries. The *Expansive Classification* of C. A. Cutter (1891), designed to meet at all points the needs of a growing library, has also suffered an eclipse.

The Library of Congress, the national library of the U.S.A., has constructed its own classification system, and although no thought was given by its authors to its adoption by other libraries, many univ. and special libraries are to-day using this scholarly scheme. A recent classification system, now becoming more widely known, is the *Bibliographical Classification* of H. E. Bliss. Based, like the Library of Congress scheme, on the letters of the alphabet, it is capable of a wide interpretation and a short notation, as there are 26 classes into which to divide knowledge, each of which classes is divided 26 times, and then again. Invented by an Amer. who d. in 1955, it is not used in any library in the U.S.A., but is being adopted by many special and univ. libraries in Great Britain and the Commonwealth, notably by the National Library at Canberra, at London Univ., and by the National Book League Library, of which a printed catalogue was pub. in 1955. The Indian *Colon Classification* of S. R. Ranganathan is not yet widely used, but seeks to be comprehensive and to show related subjects by means of a colon. See M. Dewey, *Decimal Classification*, 1876; J. D. Brown, *A Library Classification*, 1912, 1939; H. E. Bliss, *Bibliographic Classification*, 1953; S. R. Ranganathan, *Colon Classification* (4th ed.), 1953; W. C. B. Sayers, *Manual of Classification* (3rd ed.), 1953. See also BIBLIOGRAPHY and INDEXING.

Catalonia (Sp. *Cataluña*; Catalan *Catalunya*), region in NE. Spain containing the provs. of Barcelona, Gerona, Lérida, and Tarragona (qq.v.). It was formerly a principality which comprised these modern provs. and Roussillon (q.v.). One of the first parts of Spain to be colonised by the Romans, it was overrun by the Visigoths (see GOTHs) in the 5th cent. Later it was part of the march between the Moors (q.v.) in Spain and the Franks (q.v.). An independent co. was formed in Barcelona in the 8th cent. In 1137, by the marriage of Ramon Berenguer IV to the daughter of the King of Aragón, C. and Aragón (q.v.) were united, and in 1479 both were united with Castile (q.v.).

C. was, however, a restless part of the united Sp. kingdom, and was involved in the Carlist (see CARLISTS) and other troubles. In the 19th cent. the sense of Catalan regionalism was stimulated by a revival of the study of the Catalan (q.v.) language and literature. After the Sp. revolution of 1931 (see SPAIN, History) C. prepared an autonomous constitution for itself, and in 1932 the Madrid Gov. recognised C. as an autonomous *generalitat* within the Sp. state. This recognition was suspended, however, in 1934 when the Catalan president and ministers declared C. a federal rep. When the civil war broke out in 1936, C. supported the gov. side, and was again given autonomy. In Dec. 1938 the insurgents succeeded in driving a salient deep into C., and within a few months had taken the greater part of the region. Thousands of refugees from C. crossed the mts into France.

C. is much broken up by spurs of the Pyrenees (q.v.). Its 3 mt ranges, one in the N. and one running parallel with the coast, are separated by a rift valley. It is drained by sev. rivs., including the Ebro (q.v.), Segra, Llobregat, Ter, and Noguera Ribagorçana. The highlands are well forested, the olive is grown in all parts, and vines, cereals, and nuts are grown on the plains. Swine and goats are raised, but there is little other livestock. Woollens, cotton, paper, and cork are included among the extensive manufs., and there are many hydroelectric installations. Area (modern region) 12,333 sq. m.; pop. 3,335,200.

Catalpa, genus of Bignoniaceae, occurs in Asia and more abundantly in N. America. *C. bignonioides* is a native of the E. states of America, where it gains a height of 40 to 50 ft along the banks of rivs. The flowers are large, trumpet-shaped, and white, variegated with yellow and purple; it grows as an ornamental tree in Britain. *C. speciosa* is a valuable timber tree in U.S.A. *C. fargesii* is a Chinese ornamental species.

Cataluña, see CATALUNYA.

Catalunya, see CATALUNYA.

Catalyst, see CATALYST.

Catalyst. Catalysis is a term introduced by Berzelius (1835) to account for the change in the velocity of a chemical reaction produced by substances, called C.s, which do not undergo any permanent change. Investigation and research on catalysis has been vigorously pursued owing to the immense range and use of the principle in industry. Catalytic reactions may be homogeneous when they occur in one phase, e.g. the action of acid in the hydrolysis of cane sugar, or heterogeneous when more than one phase is present, e.g. the action of platinum in the formation of SO₂ from O₂ and SO. Reactions may be catalytically retarded or accelerated, e.g. the decomposition of H₂O₂ is retarded by an acid, the latter being a negative C., whilst the thermal decomposition of KClO₃ by metal oxides is accelerated, the latter being positive C.s. Catalysis may be brought about by one of the reacting substances or by one of the products of the reaction, i.e.

autocatalysis. In some cases C.s favour different reactions so that the action of a C. may be specific. Thus the combination of hydrogen and carbon monoxide can yield methane and carbon dioxide by using a nickel C., whereas with the use of zinc oxide and chromic oxide, methyl alcohol is obtained. This latter reaction is the Fischer-Tropsch process. In the cracking of petroleum (q.v.) it is possible to obtain gases rich in olefinic hydrocarbons, but by using a copper C. high proportions of aromatic hydrocarbons can be obtained. The oxidation of naphthalene to phthalic anhydride is achieved in the vapour phase by the use of vanadium pentoxide, thus providing an example of catalytic oxidation. In most catalytic reactions the C. and chemicals have to be in a high state of purity or the impurities present inhibit the reactions by 'poisoning' the C. Thus the poisoning of the platinum C. by arsenic compounds from the sulphur in the contact process for the manuf. of sulphuric acid led to the use of vanadium pentoxide which is far less susceptible to poisoning. Sometimes catalytic poisoning can be turned to practical advantage, e.g. in the oxidation of ethyl alcohol vapour to acetaldehyde using a copper C., the acetaldehyde tends to decompose into methane and carbon monoxide, but if water is present in the alcohol this latter reaction is inhibited by partial poisoning of the C., thus increasing the yield of acetaldehyde. Acetylene can be made to undergo various reactions under selective catalytic conditions, many of which are of industrial importance. With a mercuric salt in the presence of sulphuric acid, acetylene forms acetaldehyde from which a variety of compounds can be produced, e.g. acetic acid, acetic anhydride, acetone, and ethyl alcohol. Acetylene polymerises under the catalytic influence of spongy copper to give a cork-like substance, cuprene, which serves as a basis for explosives. By using a red-hot tube acetylene polymerises to form benzene. With cuprous chloride and ammonium chloride in acid solution, acetylene condenses to vinyl acetylene and divinyl acetylene. The former is important in the production of Neoprene, an artificial rubber. Acetic acid adds on to acetylene in the presence of mercuric salts as C. to give vinyl acetate, used in the production of vinyl resins for the manuf. of synthetic rubber and plastics.

Catamaran (from a Tamil word derived from *catta*, to tie; *marana*, wood), name given to a vessel or raft used by the Hindus of Madras. It is formed of 3 logs lashed together. The central log is longest, with a curved surface at the fore-end which terminates in a point. It is from 20 to 25 ft long, and is managed by 2 men, who squat upon it and work paddles. The special use of the C. is that it can pierce through the surf on the beach at Madras, and so reach a vessel in the bay when any other kind of boat would founder.

Catamarca: 1. NW. prov. of the Argentine Rep., bounded on the W. by the

Andes and on the E. by the Sierra Aconquija. The country is mountainous, with short streams and many salt lakes. The valleys are fertile, and in addition to producing red pepper, tobacco, and all kinds of grain and fruits support stockraising and dairying. Copper is found in great quantities; many other minerals are ruined, including gold, silver, lead, tin, tungsten, iron, and mica. Area 45,829 sq. m.; pop. (largely Indian) 147,200.

2. Cap. of the above prov., on the Rio del Valle, 250 m. NW. of Córdoba, with which it is connected by rail. It has a Franciscan monastery, a national college, and a normal school for women. It is an agric. and dairying centre, with poncho-weaving the chief industry. The chief church, Our Lady of the Valley, is a famous place of pilgrimage. Pop. 30,200.

Catamount, see PUMA.

Catana, see CATANIA.

Catanduanes, or Katanduanes, is. of the Philippines, E. of Luzon, from which it is separated by the Maugda Channel. Area 552 sq. m.; length 401 m. It is a fertile is., producing coco-nuts, hemp, etc. There is also copper mining. Pop., including is. offshore, 98,216.

Catania: 1. Prov. of Italy, in E. Sicily (q.v.). It has a long coastline on the NE. (the Gulf of C.), and has, in the centre of the prov., the only extensive plain in Sicily, and the most fertile dist. in the is. There are mts in the SW., and in the NE. is Mt Etna (q.v.). The chief riv. is the Simeto. The prin. tns include C., Acireale, Bronte, Adrano, and Caltagirone (q.v.). Area 1,370 sq. m.; pop. 832,000.

2. (anc. **Catana**) Seaport in Sicily, cap. of the prov. of C., on the Gulf of C., near the S. foot of Mt Etna. It was founded by Gk colonists in 728 BC, became a Rom. colony in the reign of Augustus (q.v.), and was occupied successively by Goths, Vandals, and Saracens (qq.v.). It has been severely damaged by volcanic eruptions and earthquakes on 8 occasions; in the earthquake of 1693 it was almost completely destroyed. During the Second World War it was the scene of heavy fighting during the Allied invasion of Sicily in 1943; C. being a key point in the 'Etna line'—the Ger. defence line from C. to San Stefano (q.v.)—was subjected to bombardment and air attack. There was much damage, but the tn was finally taken by the Eighth Army (q.v.) on 5 Aug. 1943. C. is 18th cent. in appearance, and has an archiepiscopal cathedral (11th–18th cents.) with a baroque façade, a fort (begun 1237) which is now a museum, and a univ. (1434). The monastery of S. Nicolò has the largest church (17th–18th cents.) in Sicily. The immediate environs of the city are desolate, but there is a large trade in agric. produce, wine, cotton, vegetables, and fruit from the plain beyond. There are textile, engineering, sulphur, and food-stuff industries, and manufs. of articles of lava and amber. Pop. 292,600. *See ITALIAN FRONT, SECOND WORLD WAR, CAMPAIGNS ON.*

Catanzaro: 1. Prov. of Italy, in central

Calabria (q.v.). It is the central part of the 'toe' of Italy, and is bordered on the W. by the Ionian Sea (q.v.) and on the E. by the Tyrrhenian Sea. The prov. is mainly mountainous with high ranges of the S. Apennines (q.v.), much broken up by riv. valleys. Livestock is raised, and wines, olives, and fruit are produced. The prin. tns include C., Nicastro, and Crotone (qq.v.). Area 2080 sq. m.; pop. 746,000.

2. It. tn, cap. of the prov. of C., standing on a hill, 75 m. NE. of Reggio di Calabria (q.v.). It was damaged in the Second World War. There is an archiepiscopal cathedral, and an interesting museum. Silk and velvet are manuf., and there is a trade in olives and wine. Pop. (com.) 54,400.

Cataphoresis, synonymous with Electrophoresis (q.v.), but the latter term is generally preferred.

Catapult (Gk *kata*, down; *pellein*, to hurl), anc. military engine for throwing stones, arrows, and darts. Some say that it was invented by the Syrians in 200 BC, others that Dionysius, the tyrant of Syracuse, invented it in 399 BC. It was used by the Greeks in the time of Philip, King of Macedonia, by the Carthaginians, and by the Romans. It disappeared at the beginning of the Middle Ages. The C. had a bow of wood or steel, which was bent by means of a windlass, the cord being finally released by a spring. *See also BALLISTA*, and fig. on p. 170. *See Sir R. Payne-Gallwey, Projectile Throwing Engines of the Ancients*, 1907.

Cataract, disease of the eye caused by the clouding of the liquid contents of the crystalline lens. This is situated with its anterior surface 3.6 mm. behind the anterior surface of the cornea and is the prin. image-forming part of the visual apparatus, the alteration of the curvature of its anterior surface giving accommodation, i.e. focusing for objects at varying distances. The cloudiness which is caused by lack of nutrition occurs at all ages, but more often in the cases of old people and young children. It is sometimes present at birth, exists in connection with some general diseases such as diabetes, in senile decay, or when the eye is subject to local injury caused by a blow. Irradiation C. may occur in those exposed to intense heat rays from a furnace or similar source, and in those exposed to X-ray and radium radiations. Heredity plays little or no part in its formation. It is painless and unaccompanied by inflammation. One eye is often affected alone, and blindness is caused for all general purposes, but the patient is able to distinguish light from darkness. The lens itself is not homogeneous, but consists of numerous concentric layers increasing in density from the outer to the central portion, the whole being encased in a transparent capsule. The formation of the C. is gradual, either starting from the centre or from the edges, and when it has covered the whole of the lens, the latter is filled with a homogeneous pearly white or amber-coloured opacity. In its early stages it is seen by the ophthalmoscope

FORMS OF
CATAPULT

Hulton Picture Library

invented by Helmholtz for examining the interior of the eye. C. may be either hard or soft; the latter, however, is the general condition for cases occurring in young people. Treatment must consist of an operation. As a palliative, however, a mydriatic such as atropine increases the opening of the pupil and so allows more light to reach the retina; but it is no cure, and has no power to arrest the progress of the malady. The operation can be performed by means of a puncture of the lens by a fine needle passed through the cornea at the margin and stirring the lens contents, when the substance of the lens passes into the aqueous humour of the eye and dissolves. This form of operation is generally performed on soft C. When the lens is hard it is extracted entire. With a narrow knife an incision is made in the upper part of the cornea at its junction with the sclerotic, the lens, with or without its capsule, is taken out, the cut edges put together, and the eye bandaged. In either case strong convex glasses must be worn after the operation to replace the missing lens. Some cases of operation for C. are unsuccessful, because the retina also is diseased. See BLINDNESS.

Catarmán, tn on the N. coast of Samar, Philippines, on the Philippine Sea. Corn and rice are grown. Pop. 33,153.

Catarrh, see COLIC.

Catarrhini, name given to a group of monkeys which comprises the families

Cercopithecidae (baboons, macaques, etc.) Colobidae (langurs and guerezas) and Simiidae (anthropoid apes). They differ from the Platyrrhini, which comprises the remaining 2 families, the Hapalidae and Cebidae, chiefly in having their nostrils close together and looking downward as opposed to those looking outward and separated by a broad cartilaginous septum. The C., moreover, have often ischial callosities or patches of brightly coloured skin on the buttocks, cheek pouches, 32 teeth, and their tails when present are never prehensile. The other species have 36 teeth, no ischial callosities or cheek pouches, and their tails are frequently prehensile. The former are denizens of the Old, the latter of the New World.

Catauxi, warlike, cannibal tribe, living in W. Brazil. They go naked, and wear bangles and anklets. The men are very handsome, with fair complexions, and are extremely strong. They mould and ornament pottery and cultivate manioc extensively.

Catawba, pink grape, probably an accidental hybrid of the native and European vines grown on the Catawba R. in N. Carolina. It is the Amer. grape best known in Europe owing to Longfellow's unfortunate poem which extolled a sparkling wine made from it as 'more divine, more delicious and dreamy' than champagne.

Catbalogan, tn of the Philippines, cap. of the prov. of Samar. Coco-nuts, rice,

and hemp are grown, and copra and hemp exported. Pop. 26,839.

Catch, musical form, a round in which each singer in turn catches up, as it were, the words from his predecessor and which is so contrived that this catching at each other's words distorts the sense, giving it a humorous or an absurd turn.

Catchfly, name applied to many species of the Caryophyllaceae genera *Silene* and *Viscaria* which are very common in N. lands. They obtain their name from their ability to catch insects by means of a glutinous substance which is exuded from the calyx and glandular hairs on the stalks. In both genera the calyx is gamosepalous and the stamens are 10 in number, but in the genus *Silene* there may be only 3 styles, while *Viscaria* has 5 styles and 5 carpels. *S. conica*, Striated C., *S. dichotoma*, Forked C., *S. anglica*, Small-flowered C., *S. armeria*, Sweet William C., are ann.; *S. otites*, Sp. C., *S. italica*, Italian C., and *S. nutans*, Nottingham C., are all found in Britain. *V. alpina*, Red Alpine C., and *V. vulgaris*, Red Ger. C., are rare tufted perennials of rocks.

Catching Bargain (also **Snatching Bargain**) means a purchase made from an expectant heir of his reversionary interest in real or personal property for an inadequate consideration. The law was formerly very stringent in setting aside such bargains, but mere undervalue will not now operate to nullify a bargain 'if made in good faith and without fraud or unfairness.'

Catchment Area, area in which water from rainfall, springs, etc., collects to form the supply of a riv., stream, or drainage area. The boundaries of a C. A. are the heights or ridges of land which divide it from other drainage areas. A certain proportion of the rainfall is always lost by evaporation and absorption. The 'run-off' is that water which actually reaches the stream or riv. Also called a catchment basin.

Catchpoll (Low Lat. *chassipullus*, lit. 'chase-chicken'), obsolete term of reproach used to denote the assistant of a bailiff whose duty it was to make arrests. It was also used to mean a tax-gatherer.

Cateau, Le, or Le Cateau-Cambrésis, Fr. tn in the dept of Nord, on the Selle. It was held by the English for a time in the 15th cent. but later surrendered to Dunois (q.v.). A treaty between Henry II of France and Philip II of Spain was signed here in 1559. There are breweries and metal-works, and soap and textiles are manuf. Pop. 7700.

Cateau, Le, Battle of, name given to the action fought on the W. front in the First World War on 26 Aug. 1914, during the retreat of the Brit. forces before the Ger. invasion of Belgium and France. The Brit. forces comprised the 3rd, 4th, and 5th Divs., or 2nd Army Corps, under Maj.-Gen. Sir Horace Smith-Dorrien. The battle resolved itself into a desperate resistance by one half or the Brit. Army temporarily cut off from the other half, against a Ger. attack by no fewer than 7 Ger. divs., bucked by a superior force of

artillery. Sir John French, the Brit. Commander-in-Chief, abandoned his plan of holding a position behind the Le C. road, preferring to withdraw further, towards the Roisel-St Quentin railway. He therefore ordered the 2 corps commanders, Sir Douglas Haig and Sir Horace Smith-Dorrien, to conform to this change of plan. Haig accepted, but Smith-Dorrien's situation was too precarious to permit him to do anything else but face the Germans. No support from the 1st Corps being possible, his 3 divs. had to make the best of a situation which, on paper, seemed to point to annihilation. The precise location of the battle was near Troisvilles, thence N. of Audencourt, Hautcourt, and N. of the Cambrai-St Quentin railway. The battle was mainly an artillery duel, in which the Brit. guns were outnumbered by 5 to 1. After 6 hours' continuous bombardment, many of the Brit. batteries were out of action, and a couple of hours later the right flank of the 5th Div. under Sir Charles Ferguson, was turned, and the enemy were pouring through the gap between the 2 army corps. Smith-Dorrien then ordered a general retirement. Two battalions however, the 2nd Batt. King's Own Scottish Borderers and the 2nd Batt. King's Own Yorkshire Light Infantry, either misinterpreted or ignored the order to retire and, continuing their dour resistance, were all but annihilated. Terrible losses were also sustained by the 1st Batt. Gordon Highlanders and the 2nd Batt. Royal Scots, who found their retreat by road cut off by the blazing vil. of Audencourt, so that they were forced to take to the open country and carry out a series of desperate rearguard fights. The extrication of the Brit. corps reflected the highest credit on the skill of Smith-Dorrien.

Catechism (Low Lat. *catechismus*, from *catechizare*, to catechise; from Gk *katechein* to catechise, instruct; all from a root word meaning echo): 1. Religious instruction given by means of questions and answers. See also SUNDAY SCHOOL.

2. A book of elementary instruction containing, by means of questions and answers, an exposition of religious dogma.

3. Elementary instruction, oral or written, in any branch of knowledge. In the primitive Church it was the instruction given to pagans, Jews, and others in preparation for baptism. The pupil was called the catechumen, and the instructor the catechist. The catechumens occupied a special place in the church, either under the portico or in the anterior gallery. They were not allowed to remain after the gospel at the mass, the eucharistic sacrifice itself being a mystery into which they were initiated only after baptism. The first part of the mass therefore became known as the mass of the catechumens. During the first cents. after the apostolic age the catechumenate of pagans was long, taking at first 3 years, then 2; but with the conversion of the empire, adult conversions became rare, and infant baptism (always usual for the children of Christian parents)

became the norm, the instruction being given afterwards and (in the west) followed by confirmation which was detached from baptism and first communion with which it had hitherto formed one rite of Christian initiation. The primitive C. has only survived in a few fragments that scholars claim to detect in the N.T. epistles, notably in 1 Cor. xi. 23 ff. and xv. 3 ff. The earliest Christian C.s are those of Kero, a monk of St Gall in the 8th cent., and of Otfried, a monk of Weissenburg in the 9th. From the time of the Reformation little books of doctrinal questions and answers called C.s spread and multiplied, springing from the emulation between Catholics and Protestants. The Catholic Church pub. in 1566 the *Summa Doctrinarum* of Peter Canisius, in opposition to the Protestant C.s of Luther. A little later came the C. of the Council of Trent, laying down a uniform plan of instruction, and priests were enjoined to teach it at least on Sundays and feast days; they were instructed to make the teaching as attractive as possible, by the use of gentle and maternal language, the offering of little rewards, and so on. Later came the C.s of Bellarmine, 1603, Bossuet, 1687, and the *Schema de Parvo*, 1870; among the Protestants, the *Geneva Catechism* of Calvin, 1536, the *Catechism of Heidelberg*, 1563, the *Zürich Catechism*; and in 1549 the C. which, with additions by Bishop Overall in James I's reign, forms the Anglican C. of the present day. The Scottish Presbyterians have Craig's C., 1592, and that of the Westminster Assembly of Divines, 1648 now in use. Jewish C.s also exist which include *The Thirteen Articles of Belief* (12th cent.) of Maimonides, Rabbi Levi's *Book of Education*, and those of Leser and Piscotto in use at the present day.

Catechol, see PYROCATECHIN.

Catechu, or Cutch (*cate*, tree, *chu*, juice; Malay *kachu*), extract obtained from sev. plants, especially from the wood of *Acacia catechu* and *Acacia suma*, natives of India. This kind is known as 'black C.' and is used in tanning and dyeing. The best quality, called 'Pegu C.' is obtained in blocks covered by large leaves. The 'pale C. of pharmacy,' or 'gambir' (*terra japonica*) of commerce, is a similar extract produced from the leaves of *Uncaria gambir* and *U. acida*, plants of the E. Indian Archipelago. It is sold in dry cubes about 1 in. square, and is used medicinally as an astringent, and also largely in tanning and dyeing, yielding a variety of drabs, browns, and olives. It is often used for colouring stout canvas. Its main ingredients are catechuic acid or catechin, and a peculiar variety of tannic acid. 'Areca C.' is obtained from the fruits of the areca or betel palm.

Catechumen, see CATECHISM.

Categorical, term in logic. Aristotle used it in its merely literal signification of that which is affirmative as opposed to negative. In later logic it denoted a proposition which is asserted absolutely in contradistinction to one that is hypothetical or involves a condition. It still

has this connotation, but the distinction between C. and hypothetical judgments is considered in modern logic to be one of substance or content, and not one that is merely dependent on the grammatical form of the words used. See A. Wolff, *Essentials of Logic*, 1926; B. Bosanquet, *Logic*, 1931; W. V. Quine, *A System of Logic*, 1934.

Categorical Imperative, name by which Kant in his system of ethics designates the fundamental principles of all moral laws. He held that the will or reason was guided in any given direction by an *a priori* cognition of what we ought and what we ought not to do in a particular set of circumstances; and that we were free to obey or disobey, morality being neither empirical nor a question of self-interest. This unconditional rule of duty which is valid because innate, Kant calls the C. I., and contrasts it with a command, the validity of which is dependent on some presupposed end, e.g. self-interest. Schopenhauer attacked the theorem of the C. I. by saying that Kant confused reason with virtue and that in reality he made all actions depend upon self-interest.

CATECHU

Category (Gk *kategoria*, predication), term in logic and philosophy applied to certain general classes under which objects of knowledge can be arranged. The name was first used by Aristotle for the classification of all kinds of predicates. His C.s are 10 in number: substance, quantity, quality, relation, place, time, situation, possession, action, and suffering. This arrangement was disputed by the Stoic philosophers, and various alterations and reconstructions have been made since. The term was applied by Kant to the conceptions which the mind forms to raise the matter of knowledge received from the senses into an intelligible notion. His C.s are (1) quantity, including unity, plurality, totality; (2) quality, including reality, negation, limitation; (3) reality, including substance, causality, reciprocity; (4) modality, including possibility,

existence, necessity. These C.s only deal with the *a priori* conceptions of the understanding, and later philosophers have extended the use of the term to cover any necessary conception under which reality may be thought, and have given them an objective instead of only a subjective significance. Hegel completed this work, which was begun by Fichte, and he divides all C.s into 3 main classes—being, essence, and concrete thought—each subject to much subdivision. J. S. Mill classifies all describable things as (1) feelings or states of consciousness; (2) the minds which experience these feelings; (3) the external objects supposed to excite sensations; (4) the successions and co-existences, likenesses and unlikenesses between feelings or states of consciousness.

Catel, Charles-Simon (1773–1830), Fr. composer, b. Aigle, Orne, studied at the school in Paris that was to become the Conservatoire, on the foundation of which in 1795 he became prof. of harmony. In 1802 he pub. a treatise on the subject and in 1810 he became inspector of the Conservatoire. The same year he produced the most successful of his 10 operas, *Les Bayadères*. He also composed military music, symphonies for wind instruments, choral works, chamber music, etc.

Catelectrotonus, *see* ANELECTROTONUS. **Catena** (properly Vincenzo di Biagio) (c. 1470–1531), It. painter, a disciple of Giovanni Bellini. His works include 'Madonna between St Francis and St Jerome' (Venice), 'Count Raymond Fugger' (Berlin), but the fine 'Warrior adoring the Infant Christ' (National Gallery) once ascribed to him has been thought beyond his abilities and worthy of Giorgione. There are many examples of his work at Venice.

Catenary (Lat. *catena*, a chain), name given to the curve assumed by a perfectly flexible inextensible string suspended at each end and hanging under the action of gravity. (This definition will be extended later.) The figure shows the form of the curve, *A* and *B* being the points of suspension, which need not be in the same horizontal line but are shown to be in the figure. The lowest point *V* of the C. is known as the vertex and the line *PT* is the tangent at a point *P* on the curve; the horizontal line through *V* and the perpendicular to it, *Vy*, can be taken as axes of coordinates, but another line is usually taken as axis of *x* and is determined as follows.

Along the tangent at the point *P* measure off *PT* equal to the arc *PV*, then draw *TD* perpendicular to *PT* meeting the line *PD* drawn perpendicular to the *x* axis at *D*. The line *TD* is constant in length, wherever *P* is taken, and if through *D* a line is drawn parallel to the *x*-axis, meeting the extension of the *y*-axis in *O*, *TD* is always equal to *OV*. Each of these is denoted by *c*, and if the tangent *PT* makes an angle θ with *Ox*, the new axis of *x*, it can be shown that $s = c \tan \theta$, or since $\tan \theta = dy/dx$, this is easily reduced to the form $s = c \sinh \frac{x}{c}$.

Also, it can be shown that $y = c \cosh \frac{x}{c}$.

These hyperbolic functions (q.v.) can be expressed in the forms

$$s = \frac{1}{2}(e^{x/c} - e^{-x/c}),$$

$$y = \frac{1}{2}c(e^{x/c} + e^{-x/c}).$$

The axis of *x* is known as the directrix of the C. Some of the properties of the C. are as follows: Since at any point *P* on the C. the length *DT* is equal to *c*, it follows that the length of the perpendicular on the tangent drawn from the foot of the ordinate is constant. The tension at any point *P* of the C. is the same as the weight of a portion of the string whose length is equal to the ordinate *PD*. The length of the radius of curvature at any point *P* is equal to the length of the normal between that point and the directrix. From this it follows that the length of the radius of curvature at *V* is equal to *VO* or *c*. The involute of the C. starting from its lowest point is the tractory (q.v.). A.C. is developed by the focus of a parabola which rolls along a right line without sliding.

Cateran (Gaelic and Irish *ceatharnach*, a soldier), originally an Irish or a highland irregular soldier, a kern; now usually meaning a highland freebooter or reaver.

Caterham and Warlingham, urb. dist. of Surrey, England, 6 m. SE. of Croydon and 18 m. S. of London. The dist. is spread out over sev. hillsides ranging in altitude from 300 to over 800 ft above sea level, with many ac. of natural open space. It adjoins the N. Downs. The Brigade of Guards depot is here. Pop. 32,000.

Caterpillar, name given to the larvae of the Lepidoptera, or butterflies and moths. It is a worm-like animal which consists of a head and 13 segments, the first 3 being thoracic and the last 10 abdominal. On the first 3 segments there are 6 true legs, each of which is jointed; and the abdominal segments often bear a varying number of tubular *pro-legs*, each ending in a circlet of small hooks, the last 2 being claspers. These larvae are curiously dissimilar from the perfect insect in that they possess large mandibles, while their maxillae and labial palps are

small. The spinneret, or the organ by which the silk is exuded, opens on the middle of the labium, and sometimes projects as a spine. The sense of sight is very rudimentary for, though half a dozen pairs of simple eyes (ocelli) are present on the sides of the head, they are probably merely sensitive to the difference between darkness and light. The other senses also are but feebly developed, since this larval stage is essentially a feeding period in the life-hist. of the insect, and every effort is made in the direction of storing up food ready for the resting stage. As might be expected in this voracious creature, the stomach is extremely large,

CATERPILLAR

A, small antennae; E, simple eyes; H, 'horn'; ST, stigma; S, segments; 1, first pro-leg; 5, fifth pro-leg.

and it is also very simple in structure. The skin often contains odoriferous and other glands; it is very thin, and a slight wound will cause it to break and exude so much blood that the larva soon dies. The sexual organs are rudimentary and cannot be seen externally, but that they do exist has been fully proved, and in a few cases the sexes are said to differ in colour. The C. is frequently a brightly coloured creature, more especially when its unpleasant taste gives it no cause to fear birds or other enemies, but at other times it is colourless, or takes on the hue of the plant on which it lives. It may be smooth or covered with hairs. Mimicry prevails very greatly among the various species, and the appearance of some, which resemble twigs, is most remarkable in its perfection. A serious enemy to the larvae is the ichneumon fly, which has the unfeeling habit of depositing its eggs in the soft bodies of the feeding lepidoptera; as the eggs hatch the resulting larvae use up the reserve material in the bodies of their host, so that when the resting-stage comes the creature has no stored up food and consequently dies. A C. should be distinguished from a grub, which is a legless larva.

Catesby, Mark (c. 1679-1749), naturalist, b. London. From 1710 to 1719 he travelled in N. America and gathered together a remarkable collection of plants. From 1722 to 1726 he visited Carolina, and on his return he pub. *Natural History*

of Carolina, Florida, and the Bahama Islands, *Hortus Britanno-Americanus*, and a work on the fishes, reptiles, and insects of the is. of Providence (1731-1743).

Catesby, Robert (1573-1605), conspirator, b. Lapworth, Warwick, son of a wealthy Rom. Catholic squire, and possibly educ. at Douai and Gloucester Hall, Oxford. He was heavily fined for his part in Essex's rising in 1601 and was imprisoned in 1603. A fanatical Catholic, C. was the author of the Gunpowder Plot of 5 Nov. 1605. On its discovery he fled to Holbeach in Staffs, where he was shot while resisting arrest.

Catfish, name given to any member of the sub-order Siluroidea, the species of which are characterised by having a naked skin without true scales, a small maxillary bone, and the presence of barbels about the mouth. They inhabit temperate and tropical freshwaters and some live in the sea. Over 1000 species are known to exist, and these vary greatly in nature and habit; among them may be mentioned *Malapterurus electricus*, the C. of the Nile which gives an electric shock, *Silurus glanis*, the wels of Ger. rive, which weighs 300 to 400 lb., *Ictalurus ponderosus*, the white channel-cat of the Mississippi, which is one of the largest fresh-water fishes, and the genera *Callichthys*, *Doras*, *Oxydoras*, and *Rhinodoras*, which travel overland in dry seasons for new ponds. *Amiurus nebulosus*, the common C. of N. America, has now been introduced to sev. places on the European continent. Species of the S. Amer. *Corydoras* are often to be seen in tropical aquaria. The term C. is also applied to the genus *Anarrhichas*, marine in habitat and not closely related to the above. *A. lupus* is common on the Brit. coasts; in spite of its forbidding appearance, it provides excellent food.

Catgut, name given to the cord made from the intestines of the sheep, ox, horse, mule, and ass—never from those of the cat. It is supposed that the proper word was *kitgut*, *kit* meaning a small fiddle, and that it has become confused with the word *kit* used for cat. C. is made into strings for harps, violins, and other musical instruments, for bow-strings, whipcord, for hanging weights of clocks, suturing wounds, and for belts for driving lathes. The intestines are thoroughly cleansed, scraped, rendered aseptic, and drawn through a perforated brass thimble. The advantage of C. as a suturing material in surgery is that it is slowly absorbed by the tissues, thus obviating the need to remove it after use.

Cathari, Cathars, or Catharists (Gk, 'the pure'), gnostic heretics who menaced the Church and society in the Middle Ages. They seem to have come from Armenia to Bulgaria, where they were called Bogomils or Paulicians, and eventually spread to W. Europe. In the S. of France they were known as Albigenses (q.v.). The heresy first appeared in the 10th and lasted until the middle of the 14th cent., when it was finally extinguished by the Inquisition. Its doctrines were closely akin to those of Manichaeism (q.v.), from

which they were perhaps derived. The C. were divided into 2 classes: the 'Perfecti' or inner and strict adepts, and the 'Credentes' or Believers. The latter only had to promise to become 'Perfecti' before their death, i.e. to receive the initiatory rite called the *consolamentum* conferred by laying on of hands. Infant baptism was rejected. The 'Perfecti' had to renounce sexual intercourse and marriage as evil and the source of evil. The *Endura*, or ritual suicide, was in certain circumstances recommended. See Daniel-Rops, *Cathedral and Crusade*, 1957.

Catharine's (St) College or Hall, Cambridge, founded by Dr Robert Woodlark, who had been chancellor of the univ. in 1459 and 1462. It was opened on St C.'s day, 1473. The rebuilding, begun in 1634, and completed during the 17th and 18th cents. was largely encouraged by Dr Eachard, Master 1675-97. Robert Grumbold was stonemason throughout the major part of this work, and Wm Talman was consulted about the Chapel, completed 1704.

Catharometer, instrument used for ascertaining the rate of flow, or any change in the composition of a gas at a given point. An electrically heated wire is put into the gas and the changes in its resistance consequent on cooling are indicated. The instrument can also be used for measurements on liquids.

Cathartic, medicine used to produce evacuation of the bowels. The term is often used to describe a purgative moderate in its action, more forcible than a laxative, but more gentle than a drastic purgative. The action usually is to cause an increased flow of secretion from the lining of the alimentary canal and so aid in the removal of irritating matter.

Cathay, name by which China was commonly known in Europe during the Middle Ages, introduced by Marco Polo and derived from Khitai or Khitan, the earliest Mongolian tribe known to have conquered N. China. It disappeared early in the 12th cent. The Russians still call China 'Khitai'.

Cathcart, Charles Murray, 2nd Earl (1783-1859), soldier, son of Sir Wm Schaw C. He joined the Life Guards in 1800 and served as lieutenant-colonel at Salamanca and Vittoria. Took part in battle of Waterloo (1815), and received the C.B. Of a scientific disposition, he discovered the mineral greenockite. Succeeded to the earldom in 1843. Sent to Canada in 1846 as commander-in-chief; general, 1854.

Cathcart, Sir George (1794-1854), third son of the 1st Earl C., likewise a brilliant soldier, who took part in the European campaigns. He was aide-de-camp to the Duke of Wellington, and served at Quatre Bras and Waterloo. He was present with his father at the Congress of Vienna (1814). Appointed commander of King's Dragoon Guards in 1838. In 1852 he was made governor of the Cape and brought the Kaffir war to a speedy termination. K.C.H., 1853. Commanded the 4th Div. in the Crimea and was killed

at Inkerman. Wrote *Commentaries on the War in Russia and Germany*, 1850.

Cathcart, Sir William Schaw, 1st Earl (1755-1843), soldier and diplomatist, son of Charles, 9th Baron C. He first studied the law, then entered the army, and took part in the Amer. campaign. Major-general, 1794; lieutenant-general, 1801; commander-in-chief in Ireland, 1803-5. Took part in attack on Copenhagen, 1807. Created earl, 1814. Ambassador at St Petersburg, 1814-21.

Cathcart, dist. and tn in S. Africa, in the SE. of Cape Prov., 109 m. NW. of E. London by rail. Good sheep and cattle country. Pop. (tn) Whites, 902; Bantu, 2134; Coloureds, 277.

Cathedral (Lat. *cathedra*, a seat or throne), prin. church of a diocese where the bishop's or archbishop's throne was placed. In early basilican churches, this was in the apse, behind the altar, so that the bishop faced the congregation; later the usual position came to be on the S. side of the choir. The term C. has no reference to the mere size of the church: some Eng. par. churches are larger than the smallest C.s.

Of 45 Anglican C.s in England, only 18 are medieval foundations. They were either *secular*, i.e. served by canons (Chichester, Exeter, Hereford, Lichfield, Lincoln, London, Salisbury, Wells, York), or *monastic*, i.e. served by monks (Bath, Canterbury, Carlisle, Coventry, Durham, Ely, Norwich, Winchester, Worcester). After the dissolution of the monasteries, 1536-9, new C.s were estab. in formerly monastic churches (Bristol, Chester, Gloucester, Oxford, Peterborough). During the 18th and 20th cents. new C.s have been estab. in formerly monastic churches (St Albans, Southwark); formerly collegiate churches (Manchester, Ripon, Southwell); and numerous former par. churches, mostly enlarged or rebuilt. Guildford C. is, however, a new foundation. Liverpool C. (q.v.), begun in 1904, will be the largest eccles. building in England when completed; a Rom. Catholic C. is also in course of construction there. Coventry C., which was destroyed during an air-raid in 1940, is being rebuilt. The administration of a C. is carried out by a chapter, i.e. an assembly of canons. Reference is made to many C. buildings under ARCHITECTURE (See figure, p. 176).

Cathelineau, Jacques (1759-93), poor linen merchant who led the Vendéens in their opposition to the Fr. Revolution; called by peasants the Saint of Anjou, on account of his great piety. He took a leading part in the storming of Cholet, and after the seizure of Saumur was made general of the rebel forces. In 1793 he was mortally wounded when attempting to capture Nantes.

Cather, Willa Sibert (1876-1947), Amer. authoress, b. Winchester, Virginia. When about 8 years old she was taken to a Nebraska ranch. She graduated from Nebraska Univ. in 1895, and became Eng. mistress in Alleghany High School. Entering journalism, she became associate editor, and eventually managing editor, of *McChure's Magazine*, 1906-12. Her best

PLAN OF A TYPICAL ENGLISH CATHEDRAL: SALISBURY
A, West Door; B, North Porch; C, High Altar; D, Sacristy.

novels are of the pioneering life in the W., and as she acknowledged herself a follower of Henry James, her work is notable for its form and style, which owe something, too, to Turgenev and Flaubert. *Death Comes for the Archbishop*, 1927, which depicts with sympathy and insight the facts of a priest's life in New Mexico a cent. ago, is probably her finest novel. *Shadows on the Rock*, 1931, is a very good story of 18th-cent. Quebec. She also pub. a number of short stories, and in 1936 a vol. of essays entitled *Not under Forty*. Other works: *April Twilights* (verse), 1903; *The Troll Garden*, 1905; *Alexander's Bridge*, 1912; *O Pioneers*, 1913; *The Song of the Lark*, 1915; *The Bohemian Girl*, 1917; *My Antonia*, 1918; *Youth and the Brighi Medusa*, 1920; *One of Ours*, Pulitzer prize novel, 1922; *A Lost Lady*, 1923; *The Professor's House*, 1925; *My Mortal Enemy*, 1926; *Lucy Gayheart*, 1935; *Sapphira and the Slave Girl*, 1940.

Catherine, St. 1. Virgin martyred at Alexandria in 310. Before her execution she is said to have disputed successfully with a group of pagan philosophers. In art she is generally depicted with the instrument of her death, a spiked wheel. The Orthodox monastery on Mt Sinai claims to possess her body which was translated thither by angels in the 10th cent. Her feast is on 25 Nov.

2. *St Catherine dei Ricci* (1522-89), b.

Florence, of noble parentage. Entered the convent of Dominicans at Prato, where she d. Canonised in 1746; her feast is on 13 Feb.

3. *St Catherine of Bologna* (1413-63), joined a community of Augustinian nuns who afterwards became Poor Clares. Later she was appointed abbess of the Poor Clares at Bologna. Celebrated for her visions, in which she beheld the details of our Lord's Passion, she was canonised in 1712. Her feast is on 9 Mar.

4. *St Catherine of Genoa* (1477-1510), a member of the Fleschi family. After an unhappy marriage she devoted her life to nursing the sick and poor. She was canonised in 1737; her feast is on 15 Sept. See F. von Hügel, *The Mystical Element of Religion*, 1908.

5. *St Catherine of Siena* (1347-80), twenty-fifth child of a dyer. Subject to ecstatic visions from her earliest childhood, she belonged to the order of St Dominic, and her confessor, Father Raimondo of Capua, wrote a detailed account of her life and visions. She worked among the poor and for the conversion of sinners, assisted by a band of devoted followers. Although an illiterate girl, she exercised great religious and political influence; for she was instrumental in bringing Pope Gregory IX back to Rome from Avignon, and she succeeded in reconciling Florence to the

Holy See. During her short life she was at times subject to the most terrible temptations, but Christ appeared to her and comforted her. Over 400 of her letters have survived, together with her famous *Dialogue*. Canonised in 1461, and declared the patron saint of Italy in 1939, her feast is on 30 April.

6. *St Catherine of Sweden* (1331-81), daughter of Prince of Nierck and St Bridget. Placed in a nunnery of Rusborg when 7. After marriage with Eggard Lydersson, with whom she lived in continency, she became, as a widow, abbess of Vatzen. Her feast is on 24 Mar.

Catherine I (1684-1727), Empress of Russia, second wife of Peter the Great, was of obscure birth. She was taken prisoner by the Russians during the Northern war, but in 1711 married the tsar. After his death in 1725 she succeeded him on the throne and ruled through her favourite, Menshikov. Energy, good sense, and a lively interest in science and art characterised her rule. The Academy of Sciences was officially founded by her.

CATHERINE II OF RUSSIA

Engraving of a print by Caroline Watson, after a picture by Rosselin.

Catherine II, often called the Great (1729-96), Russian empress, b. Princess of Anhalt-Zerbst, daughter of a Prussian field marshal. In 1745 she married the future Emperor Peter III; she succeeded to the throne in 1762 after the overthrow and murder of her husband by her supporters in the Guards. She had a succession of lovers, many of them prominent soldiers or administrators such as Potemkin (q.v.). C. was herself extremely intelligent, though totally immoral and unscrupulous, and throughout her reign corresponded with Voltaire and other Encyclopaedists; an indefatigable worker, she was an outstanding administrator and diplomat. Though some of her ideas

were over-ambitious, such as ousting the British from India or reviving the Byzantine Empire, she was usually a realist who understood the art of the possible. In 1766 C. called a Great Commission of elected representatives from all social classes (except squire's peasants) and nationalities (except nomadic ones) which was to prepare the ground for a new legal code. C. herself drew up instructions for the guidance of this Commission, largely based upon Montesquieu. The work of the Commission exposed the evils of the existing administration and showed the universal desire for greater efficiency and for the extension of local gov., but few reforms were in fact achieved, the most notable being the reorganisation of the prov. administration and the extension of self-gov. in the towns. On the other hand she granted the famous Charter to the Gentry (1785), which greatly increased their privileges. This exacerbated discontent in the country, which had already led to the peasant revolt under Pugachév (q.v.) in 1773. The outstanding events of C.'s reign in foreign affairs were 2 successful wars with Turkey, a war with Sweden, and the 3 partitions of Poland, in which Russia made great territorial gains. See G. S. Thomson, *Catherine the Great and the Expansion of Russia*, 1947.

Catherine de' Medici (1519-89), Queen of France, daughter of Lorenzo de' Medici, and wife of Henry II of France. She married, in her fourteenth year, the second son of Francis I. For many years she lived childless and obscure, being overshadowed by Diane de Poitiers, her husband's mistress, and she played little active part in state affairs until the accession of her son, Charles IX, in 1560, when she became regent. A born intriguer, she attempted to play off the Guise and Huguenot factions against each other in order to ensure the supremacy of her own family, and probably in the hope (unsuccessful, as it transpired) of preventing civil war. When she considered the Huguenot power to be increasing to the detriment of her own influence, she instigated the murder of Coligny and thus precipitated the Massacre of St Bartholomew (1572); though it is doubtful if C. had intended to encourage a massacre of these proportions. During the religious wars she tried to curb the power of the Guises, but at her death the country was in a state of anarchy and confusion. C. had all the Medici love for art, and she found time to take an active part in planning the Tuileries, in enriching the Bibliothèque Nationale, etc. See life by R. Roeder, 1937.

Catherine Howard, see HOWARD, CATHERINE.

Catherine of Aragon (1485-1536), Queen of England; first wife of Henry VIII (q.v.). She was b. at Alcalá de Henares, the daughter of Ferdinand and Isabella of Spain. She first married Arthur, Prince of Wales, elder son of Henry VII, in 1501, but he d. in 1502. The following year she was betrothed to Arthur's

brother, Henry, 6 years her junior, papal dispensations for the union being obtained. But the marriage did not take place until after Henry's accession, 1509, and between 1504 and 1509 C. was virtually a prisoner in England. The marriage seems to have been happy at first, though the royal couple differed widely in temperament as well as age; but of C.'s 5 children only one, a daughter (later Mary I), survived infancy and Henry had already had a number of illicit love affairs before his meeting with Anne Boleyn (q.v.). Henry's infatuation for Anne, and his genuine desire for a male heir which C. now seemed unlikely to bear him, made him determined to have his marriage with C. annulled and to marry Anne instead. In 1526 Henry informed C. that until the validity of their marriage was confirmed their relationship should cease; in 1529 annulment proceedings opened before Campeggio. C. appealed to Rome and the court was adjourned. In 1531 Henry finally left C. who spent the rest of her life strictly confined in various country houses, forbidden to see her daughter, and provided only with the slenderest resources. Meanwhile Henry repudiated papal supremacy and an Eng. eccles. court pronounced his marriage with C. null; in 1534 the Pope pronounced it valid. To the end of her life C. refused to acknowledge the annulment. She is buried in Peterborough Abbey. *See* lives by F. Claremont, 1939, and G. Mattingly, 1942.

Catherine of Braganza (1638-1705), Queen of England, daughter of King John IV of Portugal. She married Charles II of Great Britain in 1662. C. brought Charles an enormous dowry, together with Bombay and the fortress of Tangier in Africa, and commercial privileges for Eng. merchants in Portugal, but the marriage was unpopular in England largely on account of C. being a Rom. Catholic, though in fact she had no apparent influence on her husband's policies. Charles appears to have been fond of her, while neglecting her for his many mistresses, and supported her against Whig criticism, 1678-80. She returned to Portugal in 1693. *See* life by J. Mackay, 1937.

Catherine of Valois (1401-37), Queen of England, daughter of Charles VI of France. In 1420 she married Henry V at Troyes. Their son became Henry VI. After Henry's death C. came under the influence of Owen Tudor, gave him a position in her household and is said to have married him secretly, though this is not certain. Their son Edmund was the father of Henry VII. When Tudor was imprisoned, 1436, C. retired to Bermondsey Abbey, where she d.

Catherine Parr, *see* PARR, CATHERINE. **Catheter**, instrument used in surgery for the purpose of allowing the passage of fluids through tubes in the body which for some cause have ceased to allow passage naturally. Thus it is introduced into the urinary bladder of persons unable to pass their urine or into the Eustachian tube

when it is stopped up by catarrh. It is a hollow tube made either of metal or of a more flexible material such as gum elastic or rubber. The urinary C. in the male is about 10 in. long and curved into a requisite shape, which in the case of the flexible materials can be produced by warming and bending. In the female the tube is shorter (being only 5 in.) and straighter. The introduction of the instrument must be carefully performed. The Eustachian C., which is generally of metal, is curved slightly at one end and about 7 in. in length.

Cathetometer, instrument for the accurate measure of small differences of height or of level between 2 near points. It consists of an upright graduated bar, carefully levelled in a vertical position. The 2 points or levels are observed in a horizontal telescope which traverses on the vertical bar, and the distance between the levels is the difference between the scale readings for the 2 positions of the telescope. As constructed for the physicist, with numerous additional arrangements to ensure accuracy, such as cross-wires and the micrometer eyepiece of the telescope, the C. records with a high degree of accuracy. One of the most common uses is in the measurement of the difference between the levels of the mercury in the tube and in the cistern of a barometer.

Cathode, or **Kathode**, negative pole of an electric cell, the conductor by which an electric current leaves an electrolyte; the opposite of the anode, which is the positive conductor. *See* ANODE and ELECTROLYSIS.

ELECTRODE ARRANGEMENT OF AN
ELECTROSTATIC CATHODE-RAY TUBE

Cathode-Ray Tube, or **Braun tube**, originally vacuum tube with large bulb ending in fluorescent screen (*see* diagram). At the narrow end is a cathode K heated by a filament, H. The heated cathode emits a stream of electrons accelerated by a perforated anode, A; the stream is focused by a second anode, F, and produces a luminous spot on impinging on the screen, S. The electrode G controls 'brightness.' In this simple form the C.-R. T. is an excellent tool for experimental demonstrations. The action of magnets, and coils or wires carrying current, on the electron stream (i.e. the current in the tube) can be shown by simple appliances outside the tube; 3 coils placed against the tube with their axes 120° apart and connected to a 3-phase supply show the rotating field: the spot becomes a circle.

In its modern form shown in the diagram the tube has deflecting plates and a more elaborate anode system. See OSCILLOGRAPH and TELEVISION.

Cathode Rays, streams of very swiftly moving particles emitted normally from the surface of the cathode in a vacuum discharge tube. The particles have been demonstrated to possess a negative charge and considerable momentum, and the work of J. J. Thomson in 1897 showed that the ratio of their charge to mass is a constant. This and other evidence was sufficient to identify them as fundamental constituents of all atoms, and they were called electrons (q.v.) because they had a charge equal to that found on a single ion in electrolysis, which unit had been called an electron by Stoney in 1891. A beam of C. R. is deflected by a magnetic field precisely as a wire carrying an electric current would be, i.e. it moves in a direction at right angles to the beam and to the field. See also RADIOACTIVITY and ELECTRON.

Catholic Apostolic Church, designation of a body of Christians who are mistakenly known under the name of Irvingites, given to them on account of their connection with the Rev. Edward Irving (q.v.). Irving, when a minister of the Scottish Church, Regent Square, London, turned in the direction of mysticism. He insisted that the miraculous gifts of the early church were to be continued throughout the new dispensation. In 1832 Irving was deposed from the ministry, and, when ejected from his church, his congregation went with him to become the first of the 'catholic apostolic' churches in London. At meetings held for prayer, certain persons having prophetic gifts indicated 6 others as 'called to be apostles of the Lord.' In 1835 6 others were designated in the same manner to complete the number 12. These 12, having the special spiritual powers of apostleship, could alone ordain and interpret the sayings of the prophets. As time went on others were ordained to the ministries of prophets, evangelists, and pastors, and deacons also were ordained to look after temporal affairs. The last of the 12 apostles d. on 3 Feb. 1901. The liturgies of the C. A. C. are based on those of the Anglican, E. Orthodox, and Rom. Churches (qq.v.). The church possesses a fine Gothic building in Gordon Square, London.

Catholic Church (Gk *katholikos*, universal), name adopted in the 2nd cent. by the Christian Church to indicate the whole body of believers. It arose in special distinction from the Jewish Church, which was intended for one nation alone, whereas Christianity (q.v.) was for the whole earth. As heresies arose, the great test of the truth came to rest in the unanimity which the various churches founded by the apostles showed as regards the apostolical traditions which had been handed down. Hence the C. C. was the term used to denote the body of orthodox Christians, in opposition to local sectaries. This notion of orthodoxy acquired prominence in the E. where the Holy Orthodox

Church claims to maintain the ancient faith. In the W. the growth of the papacy as the centre of church gov. led to the word Catholic meaning 'in communion with Rome.' When the Reformation came, the Reformers did not all repudiate the term Catholic, and the Eng. Church retained the word in her creeds. But by common consent the word Catholic continued to be applied to the Rom. Church, and this usage continues on the Continent. See ROMAN CATHOLIC CHURCH.

Catholic Creditor, in Scots law, where X has a prior security over two or more subjects belonging to a debtor and Y has a postponed security over one of these subjects X is termed the catholic and Y the secondary creditor. A C. C. may realise simultaneously all his securities if necessary for fully satisfying his debt. But he is bound to allocate his catholic (Gk *katholikos*, universal) debt proportionally against all the secondary creditors affected by it, and not in such a way as to prefer one co-creditor to another. If he takes full payment out of one security to the exclusion of the other securities, he must assign the other securities to the secondary creditors.

Catholic Emancipation, the freedom from civil disabilities which was granted to Rom. Catholics in the U.K. and Ireland at the end of the 18th cent. and beginning of the 19th. After the Reformation Rom. Catholics in both kingdoms suffered under many disabilities and were harassed by numerous penal restrictions and regulations. The saying of mass in England was made felony for a foreigner and high treason for a native. Rom. Catholics were not allowed to purchase land, and persons educ. in the Rom. faith were incapable of inheriting property. In Ireland Rom. Catholics so holding land could be dispossessed without ceremony by the nearest Protestant relative. Rom. Catholics were not allowed to undertake the guardianship even of Rom. Catholic children. In 1778 a Bill by Sir George Saville was introduced to repeal the most oppressive of these regulations in the case of those Rom. Catholics who would submit to a certain test. This test required the denial of various doctrines subversive of the State, such as: that no faith is to be kept with heretics; that princes excommunicated may be deposed or put to death; and that the Pope has a temporal jurisdiction in England. The Bill was passed at the cost of the Gordon Riots in England. In 1791 another Bill was passed still further alleviating the Rom. Catholic burden, and in 1792 this Act was made to include Scotland. Irish Catholics had had some of their disabilities removed in Acts of 1774, 1778, 1782, and 1790. But Catholics still could not sit in Parliament. In 1824 a Rom. Catholic Association was formed in Ireland under the influence of O'Connell, stimulated by the fact that many of the reforms which had been promised in order to bring about the Union in 1801 had not been carried out. In 1829 the Duke of Wellington reluctantly came to the conclusion that the

peace of the empire would be imperilled if the numerous disabilities were not removed, and the Catholic Emancipation Bill was carried, followed in the same year by the Catholic Relief Bill. This gave Rom. Catholics the right to sit in the Houses of Parliament, and gave them admission to most civil offices. At the present time no Rom. Catholic may be sovereign, regent, lord chancellor, lord keeper, of Great Britain, or lord high commissioner to the Church of Scotland.

Catholic Epistles, or Epistles General, name given to 7 epistles in the N.T. which are addressed to the Church Universal and not to the Christians at particular tns, a title which distinguishes this group of epistles from those bearing the name of Paul. Of the 7 epistles (James, Jude, Peter (2), and John (3)) only John I and Peter I were at first generally received as canonical.

'**Catholic Herald**,' weekly Catholic newspaper, founded in 1887 by the late Charles Diamond. It was reorganised, after its founder's death in 1934, as a religious jour. especially concerned with the Catholic view on current world and home news and on the prin. formative influences cinema, etc. It makes a special feature of our days: education, literature, art, of readers' own views.

Catholic Truth Society, founded in 1884 in London by the late James Britten (1846-1924) in order to assist all Catholics to a better knowledge of their religion and to spread amongst non-Catholics information about the Catholic faith. The society is dependent on the voluntary subscriptions of its members. From humble beginnings it has grown into a world wide organisation with over 30,000 members. There are nearly 500 titles in the current C. T. S. catalogue, including the cheapest complete Bible in the world, pub. in 1956 at 6s. The society distributes over 2,800,000 of its pubs, every year throughout the Eng.-speaking world.

Catholic University of America, opened at Washington, D.C., in 1889 with papal sanction from Leo XIII, under the direction of the bishops of the U.S.A. In addition to the college of arts and sciences, it has schools of engineering and architecture, philosophy, law, social science, nursing education, sacred theology, and canon law, and social service. The teaching staff numbered 381 in 1955; the students 3835. The univ. library contained 450,000 vols.

Catholic University Question (Ireland). The demand of Irish Rom. Catholics for the estab. of a Rom. Catholic univ. in the 19th cent. met with parliamentary opposition for many years. Disraeli (q.v.) basing his personal opposition to the estab. of such a univ. on the fact that the Irish Catholic members had supported the disendowment of the Protestant Church of Ireland. The univ. of Dublin (see TRINITY COLLEGE, DUBLIN) was a Protestant foundation, and the Irish Rom. Catholics did not feel that their requirements were met either by it or by the Queen's Univ. (founded 1850), which was reconstituted as the Royal Univ. in 1880;

there were also Queen's Colleges at Belfast, Cork, and Galway. A royal commission was appointed in 1901 to inquire into the C. U. Q.; no Irish Catholic layman sat on the commission. Its report pointed out that the Rom. Catholic pop. of Ireland which was in an overwhelming majority, was without any adequately endowed foundation, and that some scheme satisfactory to the majority would have to be formulated. The report recommended the estab. of a properly endowed and equipped univ. college for Catholics in Dublin. Notwithstanding these recommendations the C. U. Q. remained in abeyance for 2 years, until, in 1905, the matter was fully discussed in the debate on the civil service and revenue estimates. A scheme for the reorganisation of univ. education in Ireland was put forward by James Bryce (q.v.) in 1907, but was not accepted. Finally, in 1908, the Irish University Act passed (after pressure from Augustine Birrell, q.v.). The Act left Trinity College intact, while 2 new univs. were created, one in Dublin (now the National Univ. of Ireland, see IRELAND, NATIONAL UNIVERSITY OF) and one in Belfast (see QUEEN'S UNIVERSITY). The former involved the endowment of another college, and the incorporation of the Queen's Colleges at Cork and Galway. The majority of the Senate of the new univ. (in Dublin) was Rom. Catholic. There were to be no religious tests.

Catholics, Old, members of a group of self-governing national Churches, possessing valid episcopal orders and united by their acceptance of the Declaration of Utrecht (1889) as their dogmatic (Jansenist) basis. They include (1) the Old Catholic Church of Holland, which separated from Rome in 1724; (2) the Old Catholic Churches of Germany, Switzerland, Austria, and Czechoslovakia, which originated in a revolt led by Dollinger (q.v.) against the Holy See in 1870; and (3) the Old Catholic Churches which sprang up later among the Slavonic nations. The Old C. have retained some elements of Catholic doctrine; but they reject papal infallibility and jurisdiction, and clerical celibacy. They also insist on voluntary confession, on the use of the vernacular in public worship, and on communion in both kinds. They have close relations with the Orthodox Churches of the E., and (since 1931) intercommunion with the Church of England. In 1948 the Archbishop of the Polish Old C. was received into the Rom. Catholic Church. The sect was estab. in Britain (1908) by a mission from Utrecht. In April 1957, when the Brit. branch had only 7 clergy and 1 public place of worship, negotiations were in progress for its re-union with Rome. See C. D. Moss, *The Old Catholic Movement*, 1948.

Catholikos: 1. The title of the head of the Armenian Church (q.v.) and of the Nestorian (q.v.) Patriarch.

2. In the later Rom. Empire the title was given to the receiver-general, or deputy receiver, in a civil diocese. In its general sense it seems to have been applied to the superintendent-general of

missions or of churches on and beyond the borders of the Rom. empire.

Catilina, Lucius Sergius (c. 108-82 BC), member of an impoverished patrician family. He first appears as a partisan of Sulla (q.v.), taking part in the proscriptions of 82 BC. Though possessed of high intellectual qualities, his life presents a compound of cruelty and intrigue. Praetor in 68, he was governor of Africa in 67-66 BC. Disqualified from suing for the consulship by an impeachment for extortion in his prov., C. embarked on his first conspiracy, which failed owing to his own impatience. Having been acquitted on the charge of extortion, he failed to win the consulship for 63 BC. When Cicero was elected he took advantage of the prevailing unrest to organise a more extensive conspiracy, which was defeated through the vigilance of Cicero. Immediately after the latter's first Catilinarian oration (8 Nov.), C. left Rome. In the first days of 62 his army opposed the gov. forces near Plautia. C. fell in action. See E. G. Hardy, *The Catilinarian Conspiracy*, 1924.

Catkins, see **IONS**.

Catkin, or **Amentum**, deciduous, crowded, often greenish, more or less pendulous spike-bearing male or female apetalous flowers. In the oak, hazel, and sweet chestnut there are male catkins, and both male and female in the willow, poplar, and birch.

Catmint, or **Catnip**, name applied to sev. plants on account of the fondness of cats for their odour, particularly applied to *Nepeta cataria*, a species of Labiatae which is related to the ground-ivy; the flowers are white, spotted with pink, and are arrayed closely together. Other species of *Nepeta* are also called C., while *Antisomeles malabarica* and *Calamintha officinalis*, both belonging to the Labiatae, receive the names of Malabar C. and medicinal catmint or C. respectively.

Cato, Dionysius, reputed author of *Dionysii Catonis Disticha de Moribus ad Filium* (3rd or 4th cent. AD), a book of moral injunctions and precepts which was very popular in the Middle Ages. It was trans. into many languages, and Caxton printed a version at Westminster in 1483. Each apophthegm is enclosed in a couplet of dactylic hexameters. The tone of the book may be described as monotheistic rather than Christian. There is an amusing reference to it in Chaucer's *Nonne's Priest's Tale*. Nothing at all is known of the writer. There is an ed. with trans. by A. M. Duff in *Minor Latin Poets* (Loeb Library, 1934). See W. J. Chase, *The Disticha. A Famous Medieval Textbook*, 1922.

Cato, Marcus Porcius (234-149 BC), 'the Censor,' Rom. statesman, b. at Tusculum. He was brought up, like his plebeian forefathers, as a farmer; but in consequence of the patronage of L. Valerius Flaccus he became successively quaestor (204), aedile (199), praetor (198), and consul (195) with Flaccus. As a soldier he was distinguished for his valour and for his extreme severity both during the Punic war and his command in

Sardinia. Both in the final defeat of Hannibal at Zama (202) and in the battle of Thermopylae (191), he played a conspicuous part, whilst his cruel subjection of the Celtiberians in Spain (194) earned him a triumph. In his projects of reform and in his enmities he showed a like passion and sincerity. It seems certain that he was largely responsible for the prosecution of the Scipios for corruption—during the Carthaginian war he had often reproached the famous general for his luxury—and his incessant cry of 'Delenda est Carthago' shows how much the prosperity of the rival city had aroused his hatred. His reforms were largely in the shape of sumptuary laws, designed to check the growing extravagance of dress and banquets. These were carried out during his censorship (184), when he also thoroughly revised the senatorial and equestrian lists so as to keep out upstarts and foreigners. Both Cicero and Livy are fond of citing C. as the model of a Rom. citizen in the republican days. His personal integrity and rugged simplicity, his stern sense of duty and rigid discipline, his frank hostility towards the new Hellenic culture, and his narrow patriotism became proverbial. In his contemptuous dismissal of Carneades and the other Gk philosophers, and in his jealous championship of the family, he showed his extreme conservatism. His *De Re Rustica*, a treatise on agriculture, has literary merits and an historic interest, which cause the reader to regret that his *magnum opus*, entitled *Origines*, which was a comprehensive hist. of Rome, should have been lost.

Cato, Marcus Porcius (95-46 BC), known as Cato the younger, surnamed Uticensis (from the place of his death), Rom. statesman and Stoic philosopher. After serving as a military tribune in Macedonia (67), he accepted a prov. appointment in Asia, where he learnt so to appreciate the merits of Lucullus, that he gladly supported his claims to a triumph against the vainglorious ambitions of Pompey. C. opposed Caesar's candidature for the consulate in 59, and, later, his agrarian law for rewarding his veterans. Nevertheless it was at Caesar's instigation that he was dispatched to settle the affairs of Cyprus in 58. C.'s praetorship in 54 was characterised by his sturdy effort to suppress bribery. He opposed Caesar during the civil war. After the battle of Pharsalus, he led a small force into Africa, eventually shut himself up in Utica, and there committed suicide after Thapsus. His last hour was spent in reading Plato's dialogue on the soul's immortality. Posterity has perhaps magnified his fame because he was the last of the old order of Romans to die for a national ideal which he could not realise was an anachronism. Nothing gives greater insight into his character than a remark of Cicero's to the effect that he acted as if he were in the rep. of Plato instead of in the drags of that of Romulus.

Cato Street Conspiracy, plot formed in London in 1820 to murder Castlereagh and the rest of the gov. at a dinner at

Lord Harrowby's on 23 Feb., to set fire to London, to seize the Bank and the Mansion House, and proclaim a provisional gov. The plot was revealed to the police by one of the conspirators named Edwards, and the ringleaders were arrested. Thistlewood, the chief, Ings, Brunt, Tidd, and Davidson were hanged, and 5 others transported for life. The plot was so called from the place of meeting in Cato St, Edgware Rd.

Catoptrics, that part of the science of light or optics which deals with the laws of reflection. See REFLECTION AND REFRACTION and LIGHT.

Catorce, tn of Mexico, in the state of San Luis Potosí, 120 m. N. of the tn of that name. It produces silver and antimony, and has gold, lead, and copper deposits. Pop. 2000.

Catostomus, genus of fishes of the family Catostomidae, which are peculiar to the rivers of N. America. They are distinguished from their ally, the carp, by having their lips thick and pendent, no barbels, a long dorsal and a short anal fin.

Catrine, tn in Ayrshire, Scotland, situated on R. Ayr, 2½ m. SE. of Mauchline. The main industry is cotton manufacturing. Near by are Ballochmyle House and Catrine House, both associated with Robert Burns. Pop. 3000.

Cats, Jakob (1577-1660), Dutch poet and humorist, studied law at Leyden, and later won renown as an advocate for his defence of a witch. Part of his life was spent on a farm at Grijskerke in Zeeland. Driven from his farm by the collapse of the dykes, he was for some time stipendiary magistrate at Middelburg and Dort, whilst in 1636 he became grand pensionary of Holland, and 12 years later keeper of the great seal. A knighthood was one result of his embassy to Charles I of England in 1627. The somewhat archaic character of his style and subjects has deterred many a student from reading his poems. He gained great popularity, however, and his many disciples called him 'Vader Cats.' His *Houwelijck* (1625), and the *Trouw-Ringh* (1637), a collection of tales about curious marriages, as well as his *Spiegel van den ouden en nieuwen Tijd* (1632), well represent the purity of his morals and diction, his homely wit and power of shrewd observation. His *Complete Works*, in 19 vols., were issued in 1790-1800. See G. Kalf, *Jakob Cats*, 1901, and H. Smilde, *Jakob Cats in Dordrecht*, 1938.

'Cat's-eye,' see TRAFFIC REGULATIONS AND SIGNS.

Cat's-eye, stone so called from its likeness to a cat's eye. It is another variety of chrysoberyl, and is found in Ceylon, China, Brazil, and Malabar. The stone, when cut only but not polished, if the structural arrangement is perfect, produces a narrow and distinct line of light which much resembles that emanating from the interior of the eye of a cat. The colour of the stone varies: it is grey, brown, and black, with yellowish or greenish tints, or sometimes it is the palest apple-green or a deep olive colour. The

line of light when held in front of the eye should cross the centre of the dome and be narrow and well defined. The chatoyant line is usually white. The hardness of the C. is 8-5, and the sp. gr. 3-5 to 3-8. The lustre is brilliant with iridescent ray—the cleavage is imperfect, the fracture conchoidal. It is, moreover, doubly refractive. It is soluble with borax or salts of phosphorus, but untouched by acids. There are 3 varieties of C. Quartz C. is softer, 7 instead of 8-5, and less lustrous than the C. belonging to the chrysoberyl variety. There is also Croci-lite C. or tiger's-eye, which is out and artificially coloured. It is a much softer stone and of a silky lustre.

Cat's-tail Grass, the popular name of *Phleum nodosum*, slender perennial grass, with cylindrical, blunt panicles, native to Britain, Europe, Algeria, and N. Asia, in pastures and grassland.

Catskill Mountains, large range of well-wooded mts belonging to the Appalachian system of N. America; they are situated chiefly in Greene and Ulster cos. and form one of the most beautiful situations in America. Their sides are very steep, and they attain to a height of nearly 4000 ft in some places. The chief peaks are Slide Mt (4204 ft) and Hunter Mt (4025 ft). The vil. of C. lies in the state of New York, and is 34 m. distant from Albany. It is the cap of Greene co.

Catt, Carrie Chapman (1859-1947), Amer. suffragist, b. Ilipon, Wisconsin, U.S.A. She organised the Iowa Woman Suffrage Association in 1890, and then transferred her activities to the National Amer. Woman Suffrage Alliance. She served as president of that body, 1900-4, and was again elected in 1915. Later she became the leader in the campaign to submit a woman suffrage amendment to the Federal Constitution. This was adopted by Congress in 1919 and ratified in 1920. It gave the franchise to every female in the U.S.A. aged 21. Mrs C. was president of the International Woman Suffrage Alliance, 1904-23. She won an award in 1933 for bringing about a better understanding between Jews and Christians. In 1935 the Turkish Gov. issued a postage stamp bearing her portrait in honour of her position as head of the International Woman Suffrage Alliance. Awarded medal of the National Institute of Social Science, 1940.

Cattaro, see KOTOR.

Cattegat, arm of the N. Sea, some 150 m. in length, joining the Skagerrak on the N. and the Baltic on the S., and bounded E. and W. by Sweden and Denmark respectively. Its sand-banks endanger navigation.

Catterick, vil. of Yorks (N. Riding), England, 4 m. SE. of Richmond. Near by is a large army camp; there is also a race-course. Pop. 2167.

Cattermole, George (1800-68), painter, b. near Diss in Norfolk. He became an associate of the Water-Colour Society in 1822; also exhibited at the Royal Academy, but is best known for his illustrations, with an antique flavour, to works by Scott, Dickens, and others.

Catti, or **Chatti**, Ger. tribo, mentioned by Tacitus, who lived in a dist. round the higher reaches of the Weser, etc., corresponding roughly to the modern Hesse. In the first 2 cents. AD they frequently fought against Rome and were finally incorporated with the Franks in Clovis's kingdom.

Cattle. The influence of Brit. breeds of C. has been felt in all parts of the world, which in itself is evidence of their value. The Shorthorn is the most cosmopolitan breed, and the most widely distributed in these is. In most parts of the world, except its place of origin, the Shorthorn is called the Durham breed—a more suitable description since the term Shorthorn is equally applicable to a number of other breeds. In many other breeds valuable characteristics have been developed since the first great improvement wrought in the Longhorn breed by Bakewell in the latter half of the 18th cent. There is little use in discussing breeds previous to this period, for the origin of Brit. breeds from the earliest periods is still a subject of debate. Gradually, in accordance with soil and climate, local breeds—some widely spread—had estab. themselves, and where the locality, dist., or area was very similar over a sufficiently extensive country, animals acquired indigenous features and characteristics which stamped them as breeds recognisable by certain peculiarities. There were, however, many parts of the country where the soil was so diversified that no special type was found. In dists. where the soil varies frequently, and consistency in breed is met with in only small areas, outside breeds have to be adopted, whether for meat production, milk producing, or both. The Shorthorn, in particular, adapts itself to such areas, and it is found in all parts of the country. These dists. are also much associated with the breeding of cross-breeds.

C. are kept with 2 main objects, production of beef and of milk, or both, and a very common div. of the breeds is made in accordance with these. In this connection the term improved C. may be explained. Unimproved C., as a rule, fatten, and mature slowly, and yield a moderate supply of milk. The object of the breed maker or breed improver is to select animals which conduce to one or both of these purposes. To a great extent these 2 purposes are antagonistic, and where the objective is the development of beef, with its necessary accompaniment of early maturity, the milking properties usually suffer; whilst it is only the exceptional animal which combines high milking properties with good meat-making qualities. The fusing of these 2 properties, especially in the Shorthorn, has met with success. It may be noted here that some continental breeds have superior milking properties to the generality of Brit. breeds. Brit. breeds have always shown an aptitude to produce meat, and whilst the pop. of these is, was comparatively small, and beef rather than milk was needed, Brit. breeders were right in paying more

attention to beef. But the increase in pop. and in milk consumption has caused the modern farmer to direct his efforts towards increasing the milking properties. At one time only the Shorthorn, Red Polls, and perhaps Dexters were regarded as dual purpose breeds, but now a 'beefy' type of Friesian is being bred which is tending to displace many Shorthorn herds. The animals of heavy build, emphasising the features of meat-producers, are the Hereford, Aberdeen Angus, Devon, Sussex, Longhorns, Welsh C., Galloways, and W. Highlanders. The dairy breeds yielding exceptional quantities of milk in ratio to their weight are the Jerseys, Guernseys, Ayrshires, Brit. Friesians, and Keries. Among minor breeds with little influence outside the dist. to which they are indigenous are Zetland or Shetland C.

Pure breeds are in relatively small proportions to cross-breeds, or the animals of which the pedigree cannot be traced, though classed as belonging to the breeds to which they approximate. Animals, however, may be pure bred, although the pedigree may not have been kept, provided the dam is the offspring of 5 generations of dams sired by a pedigree bull. A pedigree is valuable when it records skilled mating and selection over a long period, but if it records the results of unskilled mating it may be harmful; for if bad features are perpetuated for a long series of generations, they become estab. to the prejudice of the offspring. It has been said that the Shorthorn is the most cosmopolitan breed. This results from the sev. breeds, including some of continental source, which went to form the Durham breed, subsequently known as the Shorthorn. As a grazing beast the Shorthorn is seen at its best on rich pastures. It is really a very highly bred animal, and if pasturage is very good is sure to do well; but it is not the best breed on many poor pastures. It is difficult to draw hard and fast conclusions, because experience affords conflicting evidence; but except on the richest pastures, the Shorthorn is not so well adapted to very heavy land as are the native breeds of middle horns. This is illustrated by the Sussex breed in Sussex, the Devon in Devon, the Hereford in Hereford, and on the Red Sandstone generally. Climatic conditions also have their influence, and the short-coated Shorthorn does not thrive so well under the same exposure as the long-coated W. Highlander. Nor is the Shorthorn generally so well suited to the high and wet hills as local breeds which have become acclimatised. It is evident, therefore, that where the animals have to spend a considerable portion of the year on pasturage, no one breed can be regarded as universally the best; though it may be said that the Shorthorn is the best over the greatest area. The Hereford, the Welsh, the Sussex, and the W. Highlanders may be taken as examples of breeds which thrive well on rough grazing in winter-time, even outside their indigenous dists. But the grazing value of a breed does not altogether

settle its commercial value for the farmer: the yarding capabilities have to be taken into consideration, more especially where the grazing season is short and the yarding season is long, as in the bigger arable dists., where winter grazing is almost impossible, and where C. must feed on swedes or mangold and hay. Here the Shorthorn makes its special value felt, as does the Polled Angus, another splendid beefier. The Hereford, Devon, Sussex, Galloway, Red Poll, and Welsh (both the N. and S. Wales or Anglesey and Castle Martins) yard well. The grazing cos. are the rearing homes of the greatest number of calves, though, of course, dairying dists. are the chief breeding grounds. At the same time large numbers of calves are taken from their mothers very soon after birth, and are sent long distances to be weaned. The calves from the great milking dists. of the Vale of Aylesbury, Somerset, Cumberland, and other places are in great demand among raisers of heifers in other parts because of the good type of cow kept there. Farmers raising their own stock are as a rule very careful in their breeding; but the methods of the dairyman and small-holder have not always been above criticism. There is no economy, and great harm may lie, in using other than well-bred bulls. The application of artificial insemination to C. breeding has been taken up in recent years in many countries. By this means the services of the best pedigree bulls are available for breeders, resulting in calves being superior to their dams, and herds developing into first-class C. The artificial insemination centres of the Brit. Milk Marketing Board provide inseminations for both beef and milk breeds.

The cow carries her young about 9½ months, and it is regarded as being best to arrange the date of her first calving about May, so that by gaining about 2 months in each year the calving will work back into the winter months (when the price of milk is highest) by the time she is in full profit. A cow is regarded as at full profit at her third calf, and if she is bred from regularly the next 4 calves go further back, so that the period when she gives her fullest yield will be at the time of year when milk is most valuable. Ordinarily the lighter-framed milking breeds, which have little value comparatively when fat, are bred from when youngest, many stock-raisers thinking that from 2 years to 2½ years is best; but some keepers of heavier breeds think 3 years the optimum age. Where animals are bred from when young more attention must be paid to their keep than when they are older and have less growth to make. Heifers need to be strong when they breed, and should not be allowed to get into poor condition. Some cows dry off very early, and have a long off-lying period, during the first part of which they may be kept on moderate diet, but cows which milk but a short period (except through some special cause, such as illness prematurely stopping the milk flow) are rarely worth keeping on. On the other hand, some of

the very highest-bred beef-making cows, valuable for that very purpose, often milk but a short time. As the time for calving approaches the udder and teats enlarge and become firm. The appearance of the 'water bladder' indicates that calving is imminent. After calving, a thin bran mash, or water containing a little oatmeal, should be given, though when greatly distressed, gruel well fortified by a stimulant should be administered. The cow-keeper's great fear is that his cows may abort or present their calves when immature. This often takes a contagious form, causing severe loss over years, but it can be overcome by preventive inoculation. When the weather is at all fair, it is well to let the cow calve in the open, as on grass the calf is less liable to contract diseases through contact with germs, which may accumulate about buildings where cows frequently calve. The navel is often the site of such infection in newly born calves. To guard against infection the calf should have its navel dressed with antiseptic, such as carbolic oil, iodine, lysol, etc. The calf should be allowed to suckle the cow as soon as it can stand, and weakly calves should have the milk squirted or spooned into the mouth, for it rapidly invigorates them. The first milk, called colostrum or beistings, is specially suited to the digestion of the infant calf, and is very rich; and certain calves which have the colostrum are less liable to constipation and other troubles than those fed on milk from staler cows. The cow will instinctively lick a newly born calf whilst it is in a slimy condition. This acts as a form of massage, stimulating the vitality of the calf, and is generally accepted as being beneficial to the cow also. Cows sometimes become very excited on first seeing the calf, and maternal solicitude and pleasure may take the dangerous and unpleasant form of tossing or kneeling on it, frequently with fatal results. It is advisable, therefore, to be acquainted beforehand with the hist. of the animal. Until more recent years there was great loss of cows which 'dropped' after calving; i.e. had milk fever or parturient apoplexy. This is caused by the sudden and dangerous lowering of the content of calcium and other minerals in the blood stream, and the intravenous injection of suitable minerals usually brings about spectacular recoveries. When calves are brought up by suckling their mothers, rearing is comparatively simple. It is expected of a cow that she will maintain her calf and give a considerable quantity of milk besides; in fact, it is a poor milker which will not rear 2 at once. Many farmers make a cow rear 5 or more calves during the course of a milking period: 2 during the first 3 months, 2 during the next 3, and 1 subsequently. A calf at 3 months can be maintained without milk, as by that time it has a good digestion, and will do well on fresh grass and a little additional food, such as finely broken linseed cake, though skim or separated milk, if available, will be greatly to its advantage. Many farmers now withhold milk

from a very early age and feed gruels (either mixed in warm water or fed dry). Proprietary brands are manu. by sev. commercial firms and appear to be fairly satisfactory. Hay can be fed from about 3 weeks of age when the calf's digestive system begins to develop, and may improve the animal's ability to deal with bulky foods in later life. The most essential factor in rearing healthy calves is thorough cleanliness of all the buildings and utensils used. A large number of calves die from being too generously fed when they have been unduly fasted; this often occurs when newly born calves are exposed in markets, or are sent long journeys to be reared. In such cases, allowing them as much milk as they will take amounts to killing by kindness. Scour is always the dread of the calf-rearer, whether it results from chill, injudicious feeding, over-exercise, fright, or from contagion.

The treatment of the calf after weaning, and when it is independent of the cow and hand-feeding, may differ considerably, according to the object in view. The practice of allowing the calf to suckle until it is a year old, as is done with some of the highly bred animals intended for show purposes, is not possible with ordinary stock intended to be sold as beef; though those animals which are brought to considerable weights at a year or a few months older necessarily require to be fed at high pressure from birth to butcher. Winter calves do well at grass during the early summer, and in mild climates, where there is no fear of the husk or stomach worm, they may remain out until Oct.; but in cooler dists., where the land is wet and liable to husk (q.v.), it is found advisable to take them in by Sept., or as soon as fogs keep the grass wet. Many rearers prefer to keep the calves in throughout summer, but provided there is shelter from sun there is no objection to even young calves being out in June and July. When calves from 6 months upwards come into the yards they naturally receive winter fare of hay, roots, and finely ground cake; though if they receive chaffed hay or oat straw, a small quantity of meal can be given to encourage them to eat it. In the second year's grazing it is not necessary to give any extra food during summer. In some dists. young stock on grass receiving a little cake, with a small quantity of hay in severe weather, will thrive well up to Jan. if provided with shelter against wet or bad weather. In other dists. young stock is rarely seen on the grass after the early part of Oct. In the second winter, when run as stores, the animals often get nothing but the browsing of straw with roots, and 2 or 4 lb. of cake, and will do well on it. Some pastures will fatten out two- to three-year-old C. during summer without any help, and a pasture reaches the high-water mark of grazing if it will fatten out a big beast to the acre without aid. It is customary to put those most forward in condition on to the richest grazings, so that they will come on the market as quickly as possible, because early summer

meat generally sells well, as there is often a gap between the time when the yarded beasts are finished and that when the grazed beasts are ready. The second grade of C. will be fattened out after July, and up to the time when those to be fattened in the yards in winter are taken in. The falling powers of the grass will generally occasion the need for help as the season advances. The winter feeding does not materially differ from that of the previous year, except that the animals require more, and will consume, according to size, 50 to 80 lb. of roots or silage per day, and in some cases as much as a hundredweight is satisfactorily given. The hay allowance may run to a stone per day, and chaffed straw to about the same weight or more. The cake allowance may start at 6 lb., and be increased to 8 lb., adding as much meal. Very much higher quantities are occasionally given, but there is no compensatory equivalent in return for the outlay. It is certainly a mistake to increase the quantity of a rich cake, such as linseed, beyond 8 lb. Such increase as is made should be in the starchy or carbohydrate foods, otherwise there will be great liability to scour, which is nature's method of relieving the system from overfeeding. Linseed cake is highly nitrogenous, and if too much is fed can cause digestive and other metabolic upsets; also it contains a compound of prussic acid which occasionally causes poisoning in stock.

In all matters of C.-keeping the farmer has to be guided by his purpose and the nature of the food available. For this reason hard and fast rules cannot be laid down. The farmer considers whether it will pay him best to maintain his animals mainly on the raw material the farm provides, keeping them to an older age and then fattening them out, with a short period of healthy feeding, or whether he will rely largely on purchased concentrated foods. In the one case he keeps his animals as stores in good going condition; in the other he feeds them at high pressure, giving much concentrated food throughout their lives. Often the relative value of store stock and fat stock will make him alter his ordinary course. The buying of cattle at their proper value, of course, has a great effect on the profit of feeding. In some places animals are bought on their live weight, being weighed before being offered for sale. The weigh-bridge is an undoubted aid to the ordinary purchaser, but though he knows the weight, he still has to recognise the growing capabilities, the feeding powers, and the quality of the meat which will result. As regards indications of growth, animals that will grow well are generally long in the frame. Furthermore the skin and hair as results of breeding and selection indicate thriving or lack of power to thrive. In the thrifty animal the skin is loose on the ribs when gripped by the fingers, readily lifting; moreover when the lifted portion is rubbed between the tips of the thumb and finger it has a soft unctuous feel. A skin of this sort, as a rule, carries a nice soft hair, plentiful and

not harsh. A good thriving animal has a big heart girth—that is, the measurement round the body behind the shoulders is big, the ribs are well sprung, and the hinder quarter from the shoulder back to the tail is full, as should be the round and buttocks—that is the parts below the tail to the hocks. The top line and the belly line should be parallel, and from the setting on of the neck the fore part of the carcass should be well square with the hind quarter, giving the impression of a long, deep parallelogram. The fore part of the animal carries the least valuable meat, but beasts poorly developed in front rarely make good beefers. The strictly milking breeds are light in the fore quarters and full in the hind, gradually deepening from front to rear, thus providing ample room for digestion and for milk making—suggesting a wedge in shape. Looked at from behind over the back, the milking cow runs fine over the withers or shoulders, gradually widening, so as to show great width over the hips, suggesting yet another wedge shape. These two are described as giving the double wedge which a milking cow should possess.

Tuberculosis in cattle was formerly very common in Great Britain, resulting in heavy losses to the dairy farmer and butcher. Much of the milk supply was contaminated with the bovine tubercle bacillus, which was responsible for illness and deaths in young children. Happily this state of affairs is now considerably improved. Before the Second World War it was usual to estimate that 40 per cent of the C. were infected in some degree, but it is hoped and expected that at the present rate of progress the disease will be totally eradicated from Brit. C. within the next 5 or 6 years. This progress is closely related to the advances made in recent years in the manuf. of tuberculin and in the use of the tuberculin test which detects infection in apparently healthy animals. Measures for the slaughter of C. which were spreading the disease to other animals or infecting the milk supply, and for the compensation of their owners, were originally introduced in 1913, but the great stimulus given to the production of tubercle-free milk was provided by the estab. of tuberculin-tested herds and, later, of attested herds which qualified for bonus payments for milk and beef production. After the Second World War the ministry embarked on area schemes designed totally to eradicate the infection, and the official policy has already been attended with outstanding success which bids fair to reach full fruition in the near future.

Scientific methods of finding feeding standards. Different methods have been employed by investigators in order to determine the maintenance requirements of C. The Gorman Thøer, about a cent. ago, evolved a feeding standard by the simple process of feeding an animal on hay, weighing it at intervals, and so arriving at its rate of growth. The hay ration was then partly replaced by some

other feeding stuff and the amount of the substituted ingredient increased or decreased until the original rate of growth was again obtained. In this way Thøer was able to measure the hay equivalents of many feeding stuffs, and then to state, empirically, the hay ration necessary to keep up a normal rate of growth. These standards were useful in their day, but when, later, chemical analysis was applied generally to the investigation of feeding stuffs, it was seen that what animals required was not a certain quantum of food per head a day, but such an amount as would ensure a certain rate of protein, carbohydrate, and fat. Rations stated in these terms were proposed by Grouven in 1859, and 5 years later, Wolff, the leading Ger. authority on feeding stuffs for animals, prepared a series of standard rations in terms of digestible protein, carbohydrate, and fat for different animals under different conditions. These standards, annually revised, were pub. in the Ger. Agric. Calendar until 1906, and were then modified by Lehmann, and these modified standards gave place 10 years later to the Kellner standards. Kellner, by the balance method of investigating metabolism, determined that the maintenance ration of a 1000-lb. steer should provide 6 lb. of starch equivalent, which should comprise a minimum of between 0.5 and 0.7 lb. of digestible protein. Previously Lawes and Gilbert, at Rothamsted, had used the comparative slaughter method for determining the relation between the consumption of fodder and the amount of vendible flesh produced, and the sources of fat in the animal body. This method definitely estab. that the chief source of fat in the body is the carbohydrate in the feeding stuff; and, further, that a fattening animal retains only about 5 per cent of the protein consumed, while a young growing beast may retain as much as 25 per cent for conversion into flesh. This method is costly and involves a great deal of labour in sampling and analysing carcasses, but after some years' intermission was once again employed in Cambridge and elsewhere in the investigation of difficult problems connected with the process of winter fattening of C. Kellner devised the apparatus known as the respiration chamber for the purpose of sampling and analysing the gaseous excreta, with the view of striking a complete balance between the constituents of the fodder consumed and the total excreta of the animal. From these and other experiments, he determined that the proportions of the main food constituents required to produce 1 lb. of fat in the animal body were: protein, 4.25 lb.; fat (in cereals) 1.90 lb.; carbohydrate, 4.00 lb. Latterly more intensive research work has modified these views and the feeding of C. has now become an estab. science (see Ministry of Agriculture pubs.).

Cattle statistics. The chief C.-raising countries are the Argentine Rep., the U.S.A., Canada, and Australia, each having a large export trade in live animals or meat or both. A general estimate of

the actual number of head of C. in the various countries of the world gives the following figures: All India, 151,000,000 (oxen), plus 45,000,000 buffaloes; U.S.A., 95,400,000; Brazil, 57,600,000; U.S.S.R., 56,800,000; Argentina and Uruguay, 53,000,000; France, 17,300,000; Australia, 15,800,000; W. Germany, 11,800,000; Union of S. Africa, 11,700,000; U.K., 10,700,000; Canada, 10,200,000; Poland, 7,700,000; Rep. of Ireland, 4,500,000. European C., however, are used chiefly for domestic consumption, and, in a less degree, for the export trade in hides and skins. Among the essentially stock-raising countries for the export trade, Argentina leads the world, as may be deduced from the fact that its production is nearly 46,000,000 C., with a pop. of 20,000,000, whereas the U.S.A., while producing 95,400,000, has a pop. over 8 times as great. More than 250,000,000 ac. in the Argentine Rep. are used for C.-raising, and production has almost doubled in the present cent. While Argentina owes its great and characteristic industry to a large extent to the introduction of C. by the Spaniards, the importation of Brit. breeds in later years has greatly fostered the industry. Over 3000 bulls, chiefly from England, were imported in the first 2 or 3 years of the present cent., and bulls to the value of over \$2,000,000, chiefly from England and the U.S.A., were imported in 1907, huge prices being paid by wealthy Argentines for the best stud bulls. Again, a large number of *estancias* are in the hands of Englishmen, and throughout the Pampas are a great many Eng. managers of estates. The favourite breed is the Durham, and it may be remarked here that Bovril C. are Durhams, a preference due, it is said, to the C. being fed on lucerne. The next favourite breed is the Hereford, almost pure bred, which have long usurped the place of the semi-wild animals of over 70 years ago. There are also some fine specimens of Aberdeen Angus, a useful breed which is a better milker than the Hereford, stands the cold, and yield beef of a high quality. For C. in Africa see TSETSE FLY. See J. Anderson, *The Semen of Animals and its Use for Artificial Insemination*, 1945; F. H. Garner, *The Cattle of Britain*, 1948; E. R. Cochrane, *The Milch Cow in England*, 1948; S. J. Watson, *The Feeding of Livestock*, 1949; C. Tyler, *Animal Nutrition*, 1950; J. Hammond, *Farm Animals, their Breeding, Growth, and Inheritance*, 1952.

Cattle Plague, see RINDERPEST.

Cattleya, genus of Orchidaceae, the species of which grow wild in tropical America. It is noted for the large and beautiful flowers, and *C. bicolor*, *C. dowiana*, *C. granilosa*, *C. guttata*, *C. labiata*, and *C. mossiae*, and their many varieties, are easily grown in warm green-houses in Britain.

Cattolica, *Eraclea*, tn in Sicily (q.v.), 14 m. NW. of Agrigento (q.v.). It has sulphur works and salt-mines. Pop. 8000.

Catton, Bruce (1899-), Amer. historian,

educ. at Oberlin College, Ohio. After a career in journalism and gov. service he devoted himself to historical writing, and he is an authority on the hist. of the Amer. Civil War. Publs. include *Mr. Lincoln's Army*, 1950; *A Stillness at Appomattox*, 1953 (Pulitzer prize); and *U.S. Grant and the American Military Tradition*, 1954.

Catullus, Gaius Valerius (c. 84-c. 54 bc), greatest of the Lat. lyric poets, b. of a wealthy family and came to Rome about 62 bc. He took little part in public life; but in 57 he accompanied the propraetor C. Memmius to Asia, and it was on this occasion that he visited his brother's tomb near Troy and wrote the celebrated lament *Mullas per gentes*. C.'s splendid and impassioned love poetry is addressed to 'Lesbia,' who may safely be identified with Clodia, sister of P. Clodius Pulcher and wife of Q. Metellus Celer. His political outbursts include a disgusting attack upon Caesar, who nevertheless treated him with the utmost courtesy. As a poet C. is remarkable for his mastery of the Lat. language, which he endows with the sweetness, flexibility, and melody of Greek, for his beautiful imitations of many Gk metres; for his sympathetic expression of every phase of feeling; and for his consummate art. His epic narrative of the marriage of Peleus and Thetis contains some fine descriptive passages. A paraphrase of Callimachus's *Lock of Berenice* and the wild pulsating *Attis* are among his masterpieces. See *Catulli Carmina*, edited by M. Schuster, 1919. There is a verse trans. in the original metres by F. A. Wright, 1926. See also A. L. Wheeler, *Catullus and the Traditions of Ancient Poetry*, 1934, and E. A. Havelock, *The Lyric Genius of Catullus*, 1939.

Catulus, Gaius Lutatius, Rom. general in the first Punic war; consul, 242 bc. In 241 he commanded a fleet of 200 ships which defeated the Carthaginians off the Aegates Is.

Catulus, Quintus Lutatius, Rom. general, and consul with Marius, 102 bc. The following year the united armies of C. and Marius defeated the Cimbrs, but C.'s part in the victory was ignored. This led to resentment, and C. joined Sulla in the civil war. He was among those proscribed by Marius in 87 bc, and committed suicide. He was a cultured man, being both a poet and an orator.

Catulus, Quintus Lutatius (c. 120-61 bc), son of the preceding; consul in 78 with M. Aemilius Lepidus, whose attempt to overthrow the Sullan constitution he opposed. His unshakeable devotion to the state led him unsuccessfully to resist the growing influence of Pompey, and also of Caesar, whom he tried to implicate in the conspiracy of Catiline.

Caub, see KAUB.

Cauca: 1. Riv. of Colombia, rising in the Andes and flowing 600 m. N. to join the Magdalena near Magangué. Its valley is fertile, healthy, and very beautiful, and is rich in minerals and forest trees. It is one of the country's main lines of communication.

2. Dept. of Colombia with an area of

11,660 sq. m. and a pop. of 454,200. Gold is found there in moderate quantities. It is a rich cattle-raising and agric. area. The cap. is Popayán, an old colonial city.

Caucalis, family Umbelliferae, genus of ann. herbs with pinnate leaves. *C. lappula*, Small Bur-parsley, and *C. latifolia*, Great Bur-parsley, are introductions to Britain from S. and central Europe, and rather rare.

Caucasus, name of the great mt range extending for some 750 m. from the peninsula of Taman on the Black Sea to that of Apsheron on the Caspian. The breadth at the widest is some 150 m. From the luxuriant plateau of grasses and forests to the N., the mts rise in a succession of terraces, the parallel chains being divided by high plains cut up by deep fissures. The S. slopes towards Georgia present magnificent scenery; towards Kur they are often sheer precipices. From the central ridge, where the perpetual snow-line is 10,500 ft, 6 peaks are thrown up to over 16,000 ft. Mt Elbruz is 18,480 ft, and next to it come Dikhtau, Koshtantau, and Kazbek. One of the most famous mts is the twin-headed Ushba (15,410 ft), often called the Matterhorn of the Caucasus. Whilst the central spurs are granitic or pure granite, mica- and talc-schists and other metamorphic rocks are found. The 4 chief rivs. are the Kuban and the Rion, flowing to the Black Sea, and the Terek and the Kur, flowing to the Caspian. Wolves, lynxes, panthers, and jackals, wild boars, and the aurochs (*Bos urus*) are still found. Forests cover 56 per cent of the C. area. The flora is characterised by its arborescent growths, the variety of aquatic plants, and the preponderance of pines. Through the deep fissure of Dariel Gorge the Russians with great difficulty constructed a military road, which rises to 8000 ft above sea-level. The name C. is also often used to denote the whole large area comprising the C. mt range, the Kuban, Kuma, and Manych basins in the N. (the N. C.), and Transcaucasia in the S. In this sense C. includes a number of administrative divs. of the Russian Federal Rep.: Krasnodar and Stavropol' Krays, Chechen-Ingush, Dagestan, Kabarda-Balkar, and N. Ossetian Autonomous Reps., and the constituent reps. of the U.S.S.R.—Armenia, Azerbaijan, and Georgia—with a total pop. (1956) of c. 17,000,000.

The main mineral resources of C. are oil (Baku, Grozny, Maykop), natural gas (Stavropol'), manganese (Chiatura), copper (Armenia), lead and zinc (N. Ossetia); there are also some coal (Georgia) and iron ore (Azerbaijan) deposits. The chief industries of the area are concerned with the extraction and processing of these minerals. At the turn of the cent. C. was the foremost oil-producing area in the world. Engineering has been developed largely since the 1930's. Food industries are important throughout C. Wheat and maize are the main crops, and horticulture and viticulture are widely practised. Sunflowers and tobacco are grown in N.

C., and cotton, wool, tea, and citrus fruits in Transcaucasia. The latter has long been the home of sericulture.

History. From the earliest times C. had a turbulent hist., with continual incursions of various peoples both from the S. and the N.; consequently the ethnical composition is very complex (see **RUSSIA, Population**). Parts of C. were conquered in antiquity by Scythians, Persians, the Macedonians under Alexander the Great, Romans, and Parthians, and later by the Arabs, by Byzantium, by Khazars, Cumans, Mongols, and Turks. In the 18th cent. C. became a bone of contention between Turkey, Persia, and Russia.

Paul Popper

GEORGIAN PEASANT

From the end of the 18th cent. till the 1870's Russia gradually extended her rule over the whole of C. There was much fighting in the C. during the Russian Civil war (see **CIVIL WAR, RUSSIAN**) and the Second World War (see **EASTERN FRONT**), and much discord between the various people inhabiting it. A number of peoples (Chechens, Ingushes, Balkars, Karachays, and Kalmyks) were deported from N. C. to Central Asia in 1943 for alleged collaboration with the Germans, and only rehabilitated in 1957. See further under **BOSPORAN KINGDOM**; **CIRCAESSIA**; **COLCHIS**; **COSSACKS**; **SHAMIL**; **TRANSCAUCASIA**; and the names of the individual peoples and administrative units. See A. F. Mummery, *My Climb in the Alps and Caucasus*, 1895; D. W. Freshfield, *The Exploration of the Caucasus*, 1896; E. A. Martel, *Côte d'Azur russe*, 1908; F. Nansen, *Through Caucasus to the Volga*, 1931; D. Tutacoff, *The Soviet Caucasus*, 1942; F. Kazemzadeh, *The Struggle for Transcaucasia*, 1951; W. Kolarz, *Russia and Her Colonies*, 1954;

R. Pipes, *The Formation of the Soviet Union*, 1954.

Cauchon, Pierre (d. 1443), Bishop of Beauvais. Famous for the part he played in the trial of Joan of Arc. He seems to have been a member of the Burgundian faction but violated the obligations of his ministry by cruelty, besides espousing the Eng. cause. He was expelled from his see in 1429 and betook himself to the Eng. court. On the capture of Joan of Arc in his diocese, C. asserted his right to put her on trial, and, it is said, he resorted to the meanest infamies in order to secure her condemnation. In 1456 Joan's case was retried by Calixtus III, C.'s judgment declared null and void, and C. himself solemnly condemned.

Cauchy, Augustin Louis, Baron (1789-1857). Fr. mathematician, b. Paris. Received instruction first from his father, and was afterwards educ. at the École des Ponts et Chaussées (1807). Began his career as an engineer, but took up the study of mathematics, and was appointed to the chair of mathematical physics at the univ. of Turin (1831). He was loyal to the deposed king, Charles X, who made him tutor to his grandson (1833), and then created him baron. C. is renowned for his memoir on wave-propagation, for which he received the Grand Prix of the Institute of 1816. So prodigious was his productivity that he founded a jour. of his own, *Exercices de Mathématiques*, 1826-30.

Caucus, derivation uncertain. About 1725 it appeared in Boston as the name of a political club. In America it means a meeting of party managers to choose the candidates to be proposed at the forthcoming election or to select delegates for a nominating convention. In England the term is applied in a derogatory sense to such a rigorous system of party organisation as Joseph Chamberlain introduced at the foundation of the Birmingham Liberal Association in 1878, when it was almost a principle that voters must vote with their party.

Cauda-Galli Grit, term applied in N. Amer. geology to the lowest subdivision of the Devonian system. The name (literally cock's tail) is derived from a common fossil of this name, with a feathery form, and supposed to be a seaweed. See CORNIFEROUS PERIOD.

Caudata, see URODELA.

Caudebec, name of 2 places in the dept of Seine-Inférieure, France. C.-en-Caux, on the Seine, is famous for its 15th-cent. church; pop. 1600. C.-lès-Elbeuf manufs. cloth; pop. 8900.

Cauderan, Fr. tn in the dept of Gironde, a suburb of Bordeaux (q.v.). It has distilleries, and a large trade in wines. Pop. 24,000.

Caudillo, Sp. for commander, a title applied especially to Gen. Franco (q.v.).

Caudine Forks (*Furculae Caudinae*), pass in auct Samnium, near the tn of Caudium, formed by 2 narrow wooded gorges, between which lay a plain, grassy, and well watered, but entirely enclosed by mts (Liv., ix). Here the Romans suffered a crushing defeat by the Samnites in the second Samnite war (321 BC).

Caudium, auct tn in Samnium, Italy, on the road from Beneventum to Cupua. It was probably once of great importance as the cap. of the Caudini, but at the period of its first mention in hist., at the time of the Samnite wars, was quite insignificant. See CAUDINE FORKS.

Caudry, Fr. tn in the dept of Nord; has breweries and distilleries and manufs. textiles. Pop. 12,000.

Caul (from O.F. *cale*, a cap), close-fitting cap of network worn by women in the 15th and 16th cents.; hence a portion of the amnion or thin membrane covering the foetus which sometimes remains round the head of a child after birth. Many superstitions are connected with this retention of the C. To be born with a C. (Byron was an example) was considered lucky, and still is in out-of-the-way places. It was considered a protection against drowning either to the original owner or to any future purchaser. A C. used to fetch large sums, from £10 to £30 sometimes, among seafaring men.

Caulaincourt, Armand de (1772-1827). Fr. general, who served under Napoleon. He suffered the vicissitudes of fortune in his earlier career, for he was degraded from the rank of captain in the army and had to serve as a private. He was afterwards reinstated through the intervention of Lazare Hoche. C. was accused of being instrumental in the arrest of the Duc d'Enghien, but he stoutly denied it. He tried to dissuade Napoleon from embarking on the Russian war; he accompanied him to Poland, but was recalled to Paris. He took an active part in diplomatic service during Napoleon's regime, and was appointed minister of foreign affairs, but retired from service after the second restoration. See *Mémoires du général de Caulaincourt, duc de Vicence, grand écuyer de l'Empereur* (2 vols.), containing accounts of Napoleon's conversations, Paris, 1933 (Eng. trans. by H. Miles, 1935).

Caulfield, tn in the co. of Bourke, Victoria, Australia, 6 m. SE. of Melbourne by rail. Pop. 41,000.

Cauliflower, *Brassica oleracea botrytis cauliflora*, variety of cabbage. It is formed of a fleshy inflorescence modified into a flattened head of abortive flowers and it differs from the broccoli (q.v.) in being whiter and less hardy. It is said to have been imported from Cyprus in the 16th cent., but it is now naturalised in Britain, growing in a rich soil under more careful conditions than cabbage. When the head begins to show, the large surrounding leaves are drawn up and tied around it to make it of a very white appearance. There are sev. varieties of C., but they differ negligibly in quality.

Caulking, in wood shipbuilding, the process of driving oakum, or untwisted rope, into the seams of the outside and deck planks of a ship, and finally coating the oakum-filled seam with tar or resin, in order to render the joints of the planking watertight.

Caulonia, It. vill., in Calabria (q.v.), 45 m. NE. of Reggio di Calabria (q.v.). It is believed to be on or near the site of the

anct C. or Aulonia, a colony of the Achæi (q.v.). The exact site is unknown, and depends upon the identification of the R. Sagra, N. of which, according to Strabo and P'liny (q.v.), was C.

Caunt, Benjamin (c. 1815-61), pugilist of Hucknall-Torkard, Notts, son of a tenant of Lord Byron. In 1835 he was defeated by 'Bendigo' (W. Thompson). In 1837 he attracted attention as a fighter by defeating W. Butler. His style was never very scientific, but he was resolute, powerful, and courageous; over 6 ft in height; 14 st. 7 lb. in weight. He became champion of England in 1838, after beating Bendigo in 75 rounds. In 1843 he became proprietor of the Coach and Horses public-house, St Martin's Lane, London.

Caunus, anct city on the S. coast of Caria, in Asia Minor, opposite the is. of Rhodes, to which C. belonged for a long period. It was the bp. of Protogenes, the painter, a contemporary of Apelles, and was noted for its fruit.

Cauquenes, tn in Chile, S. America, cap. of the prov. of Maule, 75 m. NE. of La Concepción. It is a rural market centre, famous for its wines. Since an earthquake in 1939 it has been rebuilt. Pop. 13,000.

Caura, riv. of S. Venezuela, rising at the Merevari in the sierras of the S. and flowing 465 m. NNW. to the Orinoco.

Caus, or Caux, Solomon (1576-1626), Fr. engineer, b. Dieppe; appointed mathematical tutor to the Prince of Wales in 1612. He entered the service of the elector palatine in 1613, and laid out the gardens at Heidelberg Castle. He returned to France and became engineer and architect to the king in 1623. His books include *Institution harmonique*, 1615, and *Raisons des forces mouvantes avec diverses machines*, 1615, in which he describes the process of machine movement propelled by steam with so much resemblance to that of Della Porta that the invention of the steam engine has been ascribed to him by some writers.

Cause, Causation, Causality. In physical science the truths to be discovered generally relate to the connection of C. and effect, and we usually call them 'laws of causation' or 'natural laws.' By the 'cause' of an event we mean the circumstances which must have preceded in order that the event should happen. Nor is it generally possible to say that an event has one single cause and no more. There are usually many different things, conditions, or circumstances necessary for the production of an effect, and all of them must be considered C.s or necessary parts of the C. Aristotle distinguished 4 kinds of C.s for the existence of a thing: (1) The Material C., the substance of matter composing it. (2) The Formal C., the pattern, type, or design, according to which it is shaped. (3) The Efficient C., the force employed in shaping it. (4) The Final C., the end, motive, or purpose of the work.

Causality is considered in the problem whether reality exists at all beyond our own thoughts. Thus Descartes held that the certainty that reality exists could be

reached through the medium of causality. Empiricism maintains that the supposed truth that every event must have a C. is derived in a sense from experience; for it could not very well be supposed to be in the mind of anyone who had not witnessed instances of causation. But critics of empiricism ask whether it be really true that every event must have a C., in the future as well as in the past, and affirm that all that mere experience could tell us would be that certain particular events in the past have had a C. Locke includes causation among the truths that are necessarily and universally true, i.e. truths that are due to some capacity of the mind that goes beyond the mere collection of past experiences. The Idea of C. enters into the consideration of the belief in an identical self, another important problem in the growth of empirical philosophy. The necessity of the causal relation conditions Berkeley's advance from the mere existence of ideas to his conception of the world as a universal and rational system of signs, dependent upon God. He found, as he thought, a basis for the reality of causation, in that free activity of Spirit, which is rationally intelligible, though not picturable to the imagination. But this position still leaves unanswered the question: What is the impression from which the idea of C. is derived? Again, if the belief in the necessity of a C. does not go back to any intuitive or demonstrative truth, it must come from observation and experience, a position which Hume considers in the form: Why do we believe that any particular C. will necessarily be followed by some particular effect? And the only reason there can be is that we have found this effect to follow in the past. Kant agrees with Hume, that necessary and universal judgments go beyond experience; but Hume denies the existence of such judgments, whereas Kant affirms their existence and demonstrates that in mathematics and physics necessary *a priori* judgments are constantly made and that therefore their possibility is satisfactorily explained. Hegel partly supports Kant's phenomenalism, agreeing that causality is a category (q.v.), but holds that a series of C.s never goes back to an original C., but only to an infinite regress of finite C.s, none affording an ultimate explanation. See also KNOWLEDGE and SENSATION AND SENSATIONALISM.

Cause Célèbre, term used to signify any lawsuit of great public interest or importance apart altogether from any question of legal principle, e.g. the Tichborne claimant case, the Joyce treason trial, the Dreyfus case, the 'Brides in the Bath' case. The expression 'C. C.', according to Wharton, was the title of a series of reports collected by Gayot de Pitaval of decisions of interest in Fr. courts in the 17th and 18th cents.

Causerie (Fr.), short, informal article or lecture on any subject of literary interest, whether art, the drama, or literature itself. The name owes its origin to the *Causeries du lundi* (Monday Talks) of Sainte-Beuve

(q.v.), which, however, often cease to be informal and become very elaborate essays. Matthew Arnold frequently used the C. form of essay, and it has become a regular feature of many periodicals and newspapers.

Causse, *Les* (Lat. *calx*, lime), plateau in France, sloping westward from the Cévennes (q.v.) in the depts of Lozère, Aveyron, Gard, and Hérault. They are of limestone formation, dry, sterile, and cut by numerous streams, the Tarn, Jonte, and Dourbie among others, into deep canyons which divide the main plateau into 4 main and sev. smaller C. The chief are the C. of Sauveterre, Méjan (4200 ft at its highest point), Noir, and Larzac. Surface pits, underground streams, and stalactite caves are a great feature of the dist. Owing to the sterility of the soil and the rigours of the climate there are few industries; the chief is the rearing of sheep from whose milk Roquefort cheeses are made. On the S. border of the Causse Noir is 'the dolomite city,' Montpellier-le-Vieux.

Caustics: 1. In chem., the name given to substances which have the power of corroding or burning up living tissues. This they do through their avidity for water, which is necessary to the tissues, and the extraction of which causes death. The most commonly used is silver nitrate or lunar caustic, which is employed to destroy warts, cancerous growths, poisons, etc., and leaves the surface black after operation. The caustic alkalis are caustic potash and caustic soda, the hydroxides of potassium and sodium respectively.

2. In optics, are curves or surfaces of increased illumination formed by the reflection or refraction of light at a surface. They are produced by spherical aberration. When a narrow pencil of rays of light is incident at the centre of a lens or mirror, all the rays are brought to one focus, but if the pencil is broad this is not the case, the rays from the periphery or margin coming to a focus at a different point on the axis from those from the centre. Thus, if we take 2 rays arriving at points in the lens at different distances from the centre, after refraction they will cross one another before crossing the axis. At this point of intersection there will be increased illumination, and the surface formed by the intersections of the whole series of rays is a surface of increased illumination known as a caustic surface, and converging at a point on the axis known as the focus. If a section of this surface is taken through the axis in any plane it will take the form of a cuspidal curve, called a caustic curve, with its point at the focus. A similar effect is produced when a broad pencil of light meets a reflecting surface, and the curve is then more easily seen and generally observed. Thus, when light is shining on a cup of tea, the tea surface cuts the caustic surface in a caustic curve seen as a bright curve on the tea culminating at the bright focal point at the cusp.

Cauterets, Fr. spa in the dept of Hautes-Pyrénées, in the Lavedan valley. It has warm sulphur springs, and is a

climbers' centre for the Pyrenees. Pop. 1000.

Cautery, name given to an instrument or a process for heating or burning the tissues of the body. It provides counter irritation over an inflamed part, destroys diseased or dead tissue, or, in some cases where a white heat is applied, is useful for performing operations in parts which are either difficult to get at or vascular in nature. Its application near a bleeding artery is very efficient to check the flow of blood. There are various forms of C., and the heat applied in them varies according to the nature of the operation to be performed. The *actual* C. is an instrument with a blade or head of steel or platinum heated in a lamp or fire before application. The *thermo*-C., as in the form called Paquelin's C., has a hollow head kept hot by means of a contained benzol lamp or the passage of hot vapour. Galvano-C. contains a wire or wires along which an electric current passes, so that the heat emitted can be varied by altering the strength of the current. The Galvano-C. is used in modern practice.

Cautin, prov. of S. Chile, producing wheat, cattle, lumber, tan-bark, and fruit. It is traversed by the Rio Toltén, forming its S. boundary, and the C. or Rio Imperial, which rises in the Andes and flows 100 m. westwards to the Pacific. Cap. Temuco on the Rio C. Area 5519 sq. m.; pop. 321,600.

Caution, or **Cautionry**, in Scots law, means an obligation by which one person becomes pledged as security or surety for another, either to do a certain act or pay a sum of money, or as guarantor for the good conduct or fidelity of the other. Such obligations must always be in writing, otherwise they are unenforceable. As in the Eng. law of suretyship so in the Scots law respecting a C. the *cautioner* is under no greater liability than the prin. debtor or person for whom he answers. The cautioner where sued by the third party or creditor has a right to obtain relief against the prin. debtor. The cautioner, where bound as full debtor for the prin. debtor, or jointly and severally with the latter, may be sued for the whole debt, and no longer, in the absence of any stipulation to the contrary, has any 'benefit of discussion,' i.e. right to call upon the creditor to demand payment from the prin. debtor besides registering the debt or charge. The cautioner is exempt from any further liability where the prin. debt comes to an end or where the creditor alters the position of the prin. debtor without obtaining the cautioner's consent, as, for example, by giving him time to pay or discharging him altogether.

Cautley, Sir Proby Thomas (1802-71), soldier and engineer, b. Suffolk. He served for some years in the Bengal artillery until he undertook the reconstruction of the Doab Canal. His great work was the construction of the Ganges Canal, a masterpiece of engineering, opened in 1854.

Cauvery, see Kaveri.

Caux (so called from the chalk soil) is the name of an old dist. corresponding to

that of the modern Havre, Dieppe, and Yvetot. It is in Normandy, facing the Eng. Channel. Its people live by pasturage and agriculture.

Cava de' Tirreni, It. tn, in Campania (q.v.), 3 m. NW. of Salerno (q.v.). It stands 980 ft. above sea level, in a fertile and beautiful valley surrounded by high hills, and is a popular holiday resort. It has a cathedral, and 1 m. SW. is the famous Benedictine abbey of La Trinità della Cava, founded 1025, which possesses valuable archives. C. has a cotton-weaving industry and other textile manufs. Pop. (com.) 39,000.

Cavaignac, Jacques Marie Eugène Godefroi (1853-1905), Fr. politician, son of Louis Eugène C. He became republican deputy for Saint-Calais (Sarthe) in 1882; served as under-secretary of war (1885) and as minister of marine and of the colonies under President Loubet (1892). He was minister of war in the Brisson Cabinet, 1898, when he played a prominent part in the Dreyfus (q.v.) case. He discovered the document, which incriminated Dreyfus, to be a forgery, but resigned his position rather than consent to a new trial of Dreyfus, in whose guilt he was a firm believer.

Cavaignac, Louis Eugène (1802-57), Fr. soldier and politician, b. Paris. He entered the army as an engineer in 1824; served in Morea and afterwards in Algeria, where he won great distinction. In 1848 the provisional gov. made him Governor-General of Algeria, but soon afterwards he was recalled to Paris as minister of war. He crushed the revolutionaries with considerable severity and was made president of the council. He was defeated as a candidate for the presidency of the rep. by Louis Napoleon and became a prominent member of the republican opposition, which led to his imprisonment at the *coup d'état* of 1851. On his release he retired into private life until his death.

Cavallon, Fr. tn in the dept of Vaucluse, on the Durance, 15 m. SE. of Avignon (q.v.). There is a fine church (12th-18th cent., formerly a cathedral), and a beautiful 18th-cent. synagogue. The tn is a market for fruit and vegetables, and has a silk trade. Pop. 13,800.

Cavalcanti, Bartolommeo (1503-62), Florentine noble and orator, who led a revolt against the Medici, and was afterwards employed by Pope Paul III.

Cavalcanti, Guido (c. 1250-1300), It. poet and philosopher. His father was one of those whom Dante mentions in the *Inferno* as condemned to torture among the Epicureans and atheists, but Guido himself was a friend of the great poet, who dedicated his *Vita Nuova* to him. By his marriage with Beatrice, daughter of Farinata Uberti, C. became head of the Ghibelline faction in Florence, and when the leaders of both Guelphs and Ghibellines were driven out by the people of Florence, he was banished to Sarzana and returned to Florence only to die. He wrote in prose on philosophy and oratory, but his most famous work is the 70-line metaphysical *Canzone d'Amore*, beginning 'Donna mi prega.' He wrote many

ballate, canzoni, and sonnets of great beauty, his favourite theme being the anguish of love, and this gives his poetry a tragic note. Most of his poems are addressed to a lady called Giovanna. C. is certainly one of the most striking poets of the 13th cent. The best ed. of his works is Ercole's *Guido Cavalcanti e le sue Rime*, 1885. See also D. G. Rossetti's rendering of sev. of his poems in *Dante and his Circle*, 1892, and J. E. Shaw, *Guido Cavalcanti's Theory of Love*, 1949.

Cavalcaselle, Giovanni Battista (1820-1897), It. author and art critic, b. Legnano. In 1846 he went to Germany, where he met J. A. Crowe (1825-96) (q.v.) and returned to Italy with him. In 1848 he was banished for his share in the It. revolution; he accompanied Crowe to London and collaborated with him in *Early Flemish Painters*, 1857. In 1858 he returned to Italy and pub. his *History of Painting in Italy*, 1864-71, and the lives of Titian, 1876, and Raphael, 1883, in all of which he was assisted by Crowe. In 1861 he became secretary to Giovanni Morelli (1816-91), the art critic and patriot (q.v.), then engaged as president of a commission appointed to bring all works of art, which could be considered public property, under gov. control. In 1878 he was appointed chief of the National Art Gallery at Rome. The great *History of Painting* was under revision by Crowe until his death in 1897, when it was continued by S. A. Strong (*d.* 1904) and Langton Douglas; vols. i and ii appearing in 1903, and vol. iii in 1909.

Cavalier Jean (1679-1740), Camisard leader, b. Ribante, the son of a peasant. In 1702, when the persecuted Protestants of the Cévennes rebelled against Louis XIV, C. became one of their outstanding leaders, and sev. times defeated the royal generals, finally obtaining excellent terms from Villars in 1704. He joined the Brit Army and fought at Almanza, 1707.

Cavalier (Low Lat. *caballus*, poor horse), originally a horseman, horse-soldier, hence knight, gallant. In Eng. hist. the name is familiar as that applied (firstly, c. 1641) to the adherents of the Stuarts in the struggle between Charles I and Parliament, their opponents being nicknamed Roundheads (q.v.). The name survived till the extinction of the C. (Parliament Exclusion) Bill, 1679, being then replaced by Tory (q.v.). The variant 'chevalier' was used as a title in certain orders of knighthood and was also a name particularly applied to the Young Pretender.

Cavalieri, Buonaventura (1598-1647), It. mathematician, b. Milan, devoted his life more especially to the study of geometry. From his youth upward he was the victim of a cruel disease, which his work helped him to forget. He became a Jesuit at an early age, and on the recommendation of the order he was made prof. of mathematics at Bologna in 1629. In his *Geometria indivisibilibus continuorum nova quadam ratione promota*, 1635, he expounded his celebrated 'theory of indivisibles,' which has been invaluable

in the determination of centres of gravity and volumes, and has contributed not a little to the development of the integral calculus. According to his conception all space may be regarded as made up of an infinite number of parts, which represent the limit of decomposition which the mind can imagine any time to undergo.

Cavalieri, Emilio de' (c. 1550-1602), It. composer, b. Rome, where he was organist at the Oratorio del Crocifisso in 1578-84. He then went to Florence and became a member of the group which aimed at the new monodic style. His most famous work is *La rappresentazione di Anima e di Corpo*, a kind of staged oratorio or mystery play with allegorical figures, from which a single step of development led to opera. It was produced at St Philip Neri's church in Rome in 1600.

Cavalla (Kavalla), tn and port in a gulf of the same name, in the dept of C., Gk Macedonia. Cap. of that dept and centre of a tobacco-growing dist. Mehmet Ali was born here. It was Turkish ter. until the Balkan war, 1912-13. C. has been identified with Neapolis (Acts xvi). Pop. (dept) 136,350; (tn) 42,100.

Cavalli, Francesco (1602-76), It. musical composer, b. Crema, his real name being Pier Francesco Caletti-Bruni. He took the name of C. from his patron, a nobleman at Venice, where he became a singer at St Mark's in 1617, rising eventually to be *maestro di cappella* (1668). He wrote over 40 operas, the most famous of which are *Giasone (Jasón)*, 1649, and *Il Ciro (Cyrus)*, 1654. On the occasion of the marriage of Louis XIV in 1660 C. was invited to France to produce his opera *Serse (Xerxes)* and 2 years later he returned to produce *Ercolo amante (Hercules as Lover)*. C. therefore did something to acclimatise opera in France and his recitative won the admiration of Lully.

Cavallini, Pietro (c. 1250-c. 1330), It. painter, a fellow worker of Giotto at Rome. Like many of his contemporaries he was also a master of mosaic work, a sculptor, and an architect. His great 'Crucifixion' fresco at Assisi is still fairly well preserved, and recently some valuable paintings of his at the church of Santa Cecilia, in Rome, have come to light. It is said he helped Giotto in the mosaic of the Navicella at St Peter's (q.v.).

Cavallo, Tiberius (1749-1809), It. electrician, settled in England about 1771, and remained there for the rest of his life. He invented chemical apparatus, and many extremely sensitive and accurate electrical instruments. In his *Treatise on the Nature and Properties of Air* he discussed Dr Priestley's recent discoveries, rejected the phlogiston hypothesis, and noted for the first time the nature of the influence of light and air on plant life. His *A Complete Treatise of Electricity*, 1777, proved him also to have been a natural philosopher of no mean order. He was elected a fellow of the Royal Society.

Cavallotti, Felice (1842-98), It. politician, poet, and dramatist, b. Milan. In 1860 he pub. a tract, *Germania e*

Italia, against foreign rule, and joined the Garibaldian forces, fighting with them again in 1866. In this year he became editor of the *Gazzettina Rosa*, and both there and in the *Gazzetta di Milano* wrote numerous bitter lampoons against the monarchical national gov., his policy being always democratic and radical. In 1872 he entered Parliament as deputy for Corticolona, and in 1886 became leader of the party of the extreme left. He was a violent adversary of Crispi, and was famous for the frequent lawsuits and duels in which he was involved. He was killed in a duel with Count Marcola, editor of the *Gazzetta di Venezia*. He wrote some beautiful lyric poetry, including *Anticaglie*, 1879, and *Il Libro dei Versi*, 1898, and among his dramas are *Alcibiade*, *Messeni*, and *Cantico dei Cantici*. His works in 9 vols. were pub. at Milan in 1896.

Cavalry. The use of C. began with organised warfare itself, though not at once in all parts of the world. C. tactics developed initially upon the Asiatic plains, and cents. of tradition lay behind the Parthian horsemen who annihilated the legions of Crassus at Carrhae (53 BC). Philip of Macedon was the first W. ruler to discern the value of a mounted arm in support of heavy infantry. His son, Alexander the Great, was a brilliant C. commander, and C. proved decisive at the Granicus (334), Issus (333), Gaugamela (331), and the Hydaspes (327). Hannibal made equal use of C. at Trebia (218) and Cannae (216); nor did the legions (see ROMAN ARMY) establish their superiority and become almost invincible until they had learned how to employ C. as an auxiliary arm. The best of these troops were recruited in Gaul, Germany, and Spain; and Caesar's Ger. C. more than once saved a perilous if not desperate situation. By the 3rd cent. AD, however, the Rom. C., though greatly increased in numbers, had become separated from the infantry, and many historians consider this separation of the 2 arms as a principal cause of the decline of Rome's military power. The empire was gradually overrun by barbarians, who relied almost exclusively on C. and for whom the imperial squadrons were no match. But from about the year 1000 C. resumed its importance in European warfare, not so much as an aid to swift manoeuvre as a weapon whose effectiveness was derived from its sheer weight.

In the age of chivalry we discover that a battle resolved itself very largely into a matter of C. charges. The knights in armour, mounted on great chargers which were themselves at a later date clad in armour, swept down upon the infantry and usually carried the position. This was more or less the state of affairs during the 15th cent., but the overthrow of the feudal C. had by then become largely a matter of time. The new tactics had shown that bowmen and infantry could disperse and rout a C. force. Thus at Stirling Bridge the 'schiltrons' of Wallace, at Crécy the use of archers protected by stakes, and at Bannockburn

the tactics of Robert Bruce had broken the furious charges of feudal C. Other tactics would have to be adopted by the C. before they could again vaunt their superiority over the infantry. Further influences also were at work at this time. The introduction of gunpowder and the consequent use of fire-arms had led to many innovations in the art of war. The C. began to be armed with fire-arms in addition to the lance which they carried, and their greater speed and mobility gave them a great advantage over the foot soldier. For the next cent. a duel was waged between the C. and the infantry. First was invented some means of attack

exceedingly great advantage. The Ironsides of Cromwell showed their fearlessness and courage in the charges against the pikemen and musketeers. They had certain advantages over the C. of modern times, but on the whole their work was as dangerous as it was until comparatively recent times, and they proved themselves to be the most useful 'arm' that a general had. But again C. declined: during the wars of the early years of the 18th cent. they found insufficient employment, and during the Seven Years War they were found to be lacking in dash and ignorant of manoeuvring. Under Frederick the Great the Prussian C. again reached a

Harris

A painting by R. Caton Woodville.

to give the C. an advantage over the infantry, and in turn the infantry were equipped to overcome the new tactics of the C. By this time both were armed with fire-arms, and also the use of cannon had become common to both. The C. again triumphed, since their mobility gave them a great advantage. Again, the influence of the religious wars of the 17th cent. on C. cannot be overrated. It was essential that the C., having charged the enemy, should not go too far either in pursuit or in search of plunder. The battle of Lewes may be quoted as an example where the C., having overthrown the enemy, lost the day owing to too prolonged a pursuit. The mercenary soldiers had already shown their superiority to feudal levies, but they had also shown that they were not to be depended upon in the matter of a quick return to the battlefield. The C. of the Protestants in the Thirty Years War, however, showed that, actuated by the highest motives of patriotism, they could be used with

high standard, only to decline at the end of the Seven Years War. During the early stages of the revolutionary wars C. was practically non-existent. A species of mounted infantry was used, but this was mounted only for the advantages of mobility. Under Napoleon the work of the C. was revived, and the C. were used in combination with the artillery. The mass of infantry to be charged were first of all riddled by a heavy artillery fire, and then the C., which had been massed within easy striking distance, were launched against it, to continue and finish the work made easy by the disorder and confusion created by the fire of the artillery. During the campaigns of the 19th cent. the C. did not on the whole play an important part. Following immediately on the Napoleonic wars they were practically disbanded, although in the Crimean war the C. were conspicuous for their gallantry in the famous charge of the Light Brigade (q.v.).

During the latter part of the century

the question of substituting to a large degree mounted infantry was mooted, and the plan found strong advocates, for it was argued that the conditions of warfare had changed in such a degree that the use of C. in the sense that it was used by Napoleon was no longer possible or necessary. One of the principal advantages of mounted men is mobility, and a large number of supernumerary C. were, until the First World War, always necessary at the beginning of a campaign. It was always found to be easier to recruit efficient riflemen for mounted infantry than it was to recruit trained C. men. The S. African War of 1899-1902 again saw a great revival of C. owing to the ideal nature of the area of operations for their employment. On the Brit. side many yeomanry regiments were sent to the front and many C. units were raised in S. Africa. The Boer force was practically a mounted infantry army. Just before the First World War it was maintained by a large number of authorities that we had again reached a normal stage in the evolution of C., and that the concentrated fire of shrapnel and quick-firing guns would make it possible for the C. to support the work of the artillery and penetrate the masses of infantry confused by the artillery fire, i.e. that it was possible to return to the evolutions of Napoleon. In the First World War, however, C. played only a minor part on the W. front. At the outset they performed their traditional function of moving well in advance of the infantry as a protective screen and then drawing off to a flank as the opposing infantry drew towards each other. On the W. front, however, the early settling down to trench warfare precluded C. action in any form, but on the E. front all combatants were able to employ C. at all times. The best C. exploits of the war were those of the Brit. in Palestine and Mesopotamia. But C., as an effective arm, has all but ceased to be of importance in a 'major' war. The experience of the First World War showed that tanks and armoured cars, being far less vulnerable and far speedier, should take over some of the duties of reconnaissance, pursuit, and protection previously performed by C. C. played no part in the defeat of the Sp. Republicans by Franco (1936-9), the chief factor in his victory being the Ger. and It. air forces. Similarly, in Poland, the Ger. air-raids on that country ended the campaign in 3 weeks (1939), combined with attack by massed tanks and motorised units. There were C. units on the Polish side, but they may almost be said to have been reminiscent of the Middle Ages. In the Brit. service the C. estab. was greatly reduced in the first decade after the First World War, and later most C. regiments were converted into armoured car or light tank units (see also ARMY). Armoured cars have in recent years been found invaluable in such differing types of country as the plains of Iraq and the mts on the NW. frontier of India. A Brit. C. regiment was divided into 4 'squadrons,' each of which had 2

'troops.' In the field each brigade of C. was supported by a battery of horse artillery.

In the U.S.A. C. first came to the fore during the Civil war. It was efficient in all branches and adaptable to all circumstances. Sheridan's pursuit of Lee in 1865, Stuart's impenetrable screen in 1863-4, the C. battle of Brandy Station (9 June 1863), and Sheridan's destruction of Early's army in the Shenandoah were all first-class operations. The wide spaces of America provide a natural theatre for C. action which the C. was not slow to demonstrate in Indian wars.

It is often said that the experience of the First World War sounded the knell of C., and that the fundamental duties of C. can now be more efficiently performed by the aeroplane and the armoured fighting vehicle. On the W. front C. was of the first importance in the earliest phase when the opposing armies were as yet feeling their way. Afterwards, during the protracted period of position warfare, it could act only as infantry and as a mobile reserve. It is clear from a report of Sir Douglas (later F.-M. Earl) Haig to his gov. that during the period of infantry and artillery action the true function of the C. was to move on the flanks, and he makes the implicit admission that as there were no flanks, or, in other words, as the flanks rested on neutral states or impassable obstacles, that function was in abeyance. In the final period the C. were ready to revert to their historic role of pursuers, but by that time the morale of the Ger. armies was broken. Many of the foremost allied leaders testified to the great service performed by the C. in the early weeks of the operations on the W. front; Sir Douglas Haig stated that 'it has been proved that C., whether used for shock effect under suitable conditions, or as mobile infantry, have still an indispensable part to play in modern war.' Gen. Pershing observed that 'the splendid work of the C. in the first few weeks of the war more than justified its existence and the expense of its upkeep in the years preceding the war.' Gen. von Kluck, the commander of the First Ger. Army, lamenting his lack of C., stated that during the Brit. retreat of Aug. 1914, the chief factor that enabled the Brit. Army to escape was that his (von Kluck's) forces did not possess the effective means of compelling it to turn and resist, namely, the 3 divs. of Marwitz's C. (*Journal of the U.S. Cavalry Association*, April 1920). More favourable opportunities occurred in Palestine, where the Brit. yeomanry co-operated with the Australian and New Zealand mounted infantry. The former were, of course, armed like the regular Brit. C., but the dominion forces were armed with rifle and bayonet, and it was only later that the Australian Light Horse Div. was trained in the use of the sword, and that the dominion troops became gradually assimilated to C. proper. At the commencement of the operations in Palestine, the yeomanry attacked with the sword, advancing in the customary

double rank formation; whereas the dominion troops advanced at a rapid walking pace only, with rifle slung and bayonet held in the hand. The success of the attacks was due largely to the thorough preparation by machine-gun and field-gun fire. Later, under Gen. (later Lord) Allenby, the greatest C. leader of modern times, the C. reverted, with *éclat*, to their appropriate role of pursuer, and in this theatre of operations met with entire success. It is important to bear in mind that the Fr., Belgian, and Ger. military authorities, almost of necessity from the geographical position of their nations, considered a warfare of position as the most probable form for the next war in which their nations were likely to be concerned. In the training of Fr. C. the tactical principles on which emphasis is laid are rapidity, mobility, and ability to manoeuvre, always with a view to actual fighting on foot; and these tactics must conform to the modern development of fire power. In the frontal attack dismounted C. units should, according to the Fr. theory, act in co-operation with units armed with machine guns, the function of the whole force being to turn the enemy's flanks and to cover the advance of reserve units. As a result of the Russo-Jap. war, where the C. of both belligerents was so obviously inferior, continental opinion, especially that of the Ger. general staff, was that only a first-class and highly trained C. would be of any real use in a modern major war. Again, the view of the Ger. staff was that while charges by regiment and brigade were still feasible the charge by div. was a past chapter. They regarded the lance as superior to the sword, but argued that only shaken and surprised infantry were really vulnerable to C. attack. Finally, they held that C. must be able to fight mounted as well as dismounted, and not be relegated to the role of secondary infantry. The view of one school of Brit. thought after the First World War was that while C. had to some extent been superseded, as a primary factor of strategical reconnaissance, by the air arm, this supersession really operated to help the C., and permitted it to develop still more fully its capabilities in tactical reconnaissance—a function which the aeroplane could not perform at all. Modern Brit. cavalry experts were opposed to mixed brigades and favoured the adoption of divs. of 3 brigades of C. instead of 4, each brigade to consist of 3 regiments, so that the unit could be easily controlled by 1 leader, the regimental commander. Light guns, such as the 13-pounder rather than the 18-pounder, were considered the most suitable weapons for artillery of the C. div. of the future, the essential requirement being that the guns should keep up with the C. A proportion of howitzers should be added for the purpose of overwhelming enemy detachments which could not be reached by field guns of flat trajectory. Finally, each machine-gun squadron should carry no more than 12 guns, each squadron being organised into 3 troops

of 4 guns each. There was no finality in these views, which were essentially those of the traditional Brit. C. school. They favoured a C. div. exclusively composed of that arm, machine-gun units and other auxiliaries being under the control of the div.; while armoured-car units and motor machine-guns should not be included, but only attached as occasion might require. The extensive use of aerial reconnaissance in the Second World War largely discounted the view of the limitations of the air arm in that sphere noted above. C. played no part in the operations on the W. front in the Second World War, but it rendered considerable service on the E. front. Thus C. were combined with light mobile units in the operations of Marshal Rokossovsky against the Ger. Ninth Army in the summer offensive of 1944, and again in his operations to outflank Minsk and Bobruisk in the same offensive. Russian C. were often used in great enveloping manoeuvres to cut off the retreat of Ger. forces in the Caucasus and other regions of the S. Russian front. For the hist. of individual C. regiments see DRAGOON; DRAGOON GUARDS; HUSSARS; LANCERS; LIFE GUARDS; YEOMANRY. See also Maj. M. W. Nicholson (U.S. Army), *Modern Cavalry*, 1922.

Cavan, Frederick Rudolph Lambart, 10th Earl of (1865-1946), soldier. He served in the S. African War 1899-1902 and was mentioned in dispatches. Commanded 1st Battalion Grenadier Guards 1908-12. Had retired before the First World War, but returned to active service, and commanded the Brigade of Guards, and later the Guards Div. and the 14th Army Corps. He was sent to Italy to take command of the Brit. troops in the operations on the Piave (1918). After the war, he was general officer commanding in chief, Aldershot, 1920-2, and chief of the Imperial General Staff, 1922-6; head of the War Office section of the Brit. delegation to the Washington Conference, 1921. Promoted general in 1921; field marshal 1932.

Cavan: 1. Co. of the Rep. of Ireland. Cavan is the co. tn: other tns in the co. are Cootehill, Belturbet, Kingscourt, Bailieborough, Ballyjamesduff, and Virginia. The Erne and the Woodford are the chief rvs., and the chief lakes are the labyrinthine Lough Oughter, and the beautiful Loughs Ramor, Sheelin, and Brackley. The Shannon, the longest riv. in the Brit. Is., rises in co. Cavan on the S. slopes of Culeagh mt (2188 ft). Agriculture is the chief industry; potatoes and oats are the chief crops, and flax is also cultivated. Pop. 79,000 (90 per cent of the pop. is Catholic).

2. Mkt tn on a trib. of the R. Annalee in the above co. The offices of the Dist. and Circuit Court and the Co. Council are in the Courthouse, and the offices of the Urb. Dist. Council are in the tn hall. By far the most conspicuous building in the tn is the splendid modern Romanesque Catholic cathedral (1912). Pop. 3500.

Cavatina, It. term applied in music to a simple melody, having no second nor a *da capo* part. It is also sometimes used

of any kind of light and smooth air, and frequently of those occurring in a grand scena. C. also denotes a piece of instrumental music, as for example in what is popularly known as Raff's C., the piece by which that composer is chiefly remembered.

Cave, Edward (1691-1754), printer, combined both at Norwich and London the functions of journalist and printer. In 1731 he founded, and for some years he ed., the *Gentleman's Magazine*, in which parl. debates were for the first time reported at some length. C. d. with his hand 'gently pressing' Samuel Johnson's. The latter had become his parl. reporter in 1740, and afterwards his friend.

Cave, George, 1st Earl (1856-1928), lawyer, b. London, second son of Thomas Cave, M.P. Educ. at Merchant Taylors' School, and at St John's College, Oxford. Called to the Bar 1880; took silk 1904, and enjoyed for many years a considerable Chancery practice. M.P., Kingston div. of Surrey, 1906-22. Solicitor-general in Coalition Gov. and knighted 1915. In 1916 he became home secretary; in 1919 a lord of appeal in ordinary. Lord chancellor in Bonar Law's ministry, 1922; he retained that office in Baldwin's till 1924. See Sir C. Mallet, *Lord Cave: a Memoir*, 1931.

Cave, William (1637-1713), divine, took his M.A. degree at St John's College, Cambridge, in 1660. He was vicar of Islington 1662-91; rector of All-Hallows the Great, Thames Street, 1679-89; vicar of Isleworth 1690. The 12 books he wrote on early church hist. were once standard works.

Cave Animals, term which is applied equally to animals whose remains have been found in a fossil state in caves and to living creatures which have adapted themselves to an existence in the dark and quiet shelter discovered by their ancestors. They are often distinguished from their kindred by the specific term *spelaeus* (Gk *spelaiōn*, a cave), e.g. the fossil hyaena and tiger are known as *Hyaena spelaeus* and *Felis spelaeus* respectively, while the living blind-fish is called *Amblyopsis spelaeus*. Their frequent lack of vision has also been obtained for many of them, as for deep-sea and underground dwellers, the prefix *Typhlo-* (Gk *typhlos*, blind), e.g. *Typhlichthys*, a genus of blind fishes. The chief characteristics of animals of this type are their reduced or absent eyes and consequent well-developed sense-organs, such as antennae and feelers, lack of colour, and their predaceous carnivorous habits occasioned by lack of vegetable matter in the darkened home. Among the gastropod molluscs sev. species of snails have been found in Austrian caves which have developed blindness as the result of their mode of life. Blind cave-dwellers are represented also in the Crustacea and Arachnida by sev. species, notably by *Cambarus stygius* and *Antrobia mammothia* respectively. In the orthopterous insects a genus of small cockroaches of a peculiar nature has been discovered in caves of the Philippine Is.; the females are devoid of sight and of all

power of flight. The Carabidae and Silphidae are well-known families of coleopterous insects which include sev. cave-dwellers, usually sightless, e.g. in the carabid genus *Anophthalmus* found in Europe and America, and the Amer. genus of Silphidae, *Adelops*. Rising higher in the animal world we come to the phylum Pisces, and here there are numerous fishes which shun the light and prefer a cavern for a home. The *Amblyopsis*, which occurs in the Mammoth Cave of Kentucky, is a colourless fish, about 5 in. in length, in which the eyes and optic nerve are imperfect; in the same family, i.e. Amblyopsidae, are found the *Chologaster*, which has normal sight, and *Typhlichthys*, a blind and colourless fish whose home is near the Mississippi. A blind salamander, *Typhlotriton spelaeus*, inhabits the Rock House Cave in Missouri, and other caverniculous amphibians are the *Typhlomolge rathburni* and *Proteus anguinus*, the olm, the latter being a native of Carniola. Its eyes are completely hidden, and when exposed to the light the colourless creature turns black. If such C. A. have lost their sight as a result of living for many generations in the dark they seem to provide evidence in favour of Lamarck's theory of inheritance of acquired characters. It is, however, possible to adopt the opposite view that the ancestors of these animals become blind as the result of a mutation (sport), and that they could then survive in dark places only, where functional eyes would in any case be useless.

Cave Art. The high importance of C. A. has become widely recognised in recent years largely through the work of the Abbé Breuil in S. France, N. Spain, and N. and S. Africa. This, the earliest known art of man, belongs to sev. of the cultures which go to make the Upper Palaeolithic stage of the Old Stone Age. The radio-carbon dates obtained suggest, with considerable reservations, an age of 20,000 years. The paintings and engravings are found on the roofs and walls of deep caves where no natural light penetrated; indications of torches, and cup-shaped lamps which provided artificial light have been seen. This art depicts animals in fresh and vigorous line which is often enriched with red and yellow ochre, red haematite, manganese and graphite, and sometimes emphasised by very finely powdered colour blown on through a pipe. The animals represented—bison, mammoth, horse, ox, red deer, and reindeer—are those known from datable deposits of their bones to be the food of Upper Palaeolithic man. The human form is depicted rarely, and then only as a sort of caricature or as a figure wearing a mask. These figures are apparently intended to represent hunters; their arrows point at the vital parts of the animals which are quite often shown to be in young. The art has an obvious magic purpose: to ensure fertility in the animals hunted as well as success in the hunt. The most famous cave is that at Lascaux (q.v.) near Montignac, which was discovered in 1940 by 4 boys. Another

well-known cave is Font de Gaume, Dordogne, where there is a remarkable series of bison in polychrome decoration. From the fact that one drawing sometimes overlies another, it is thought that the actual act of drawing and not the drawing itself was the essence of the magic. In the Trois Frères cave in the N. part of the central Pyrenees is a magnificent series of engravings made on the white surface of black rock; a yellow clay-like skin, due perhaps to weathering, is used to produce a cameo effect. A figure called 'The Sorcerer' in this cave has a human body with the head of a deer; it seems to represent the hunting spirit or god. In Spain there are sev. fine examples of C. A. in the prov. of Santander. The famous cave at Altamira, in which was found in 1879 the first known example of C. A. of this sort, has a series of polychrome paintings, particularly of bison, which are the finest of their kinds. No C. A. is known in Britain. See A. H. Brodrick, *Prehistoric Painting*, London, 1948; F. Windels, *Lascaux Cave Paintings*, London, 1949; H. Brouil, *Quatre cents siècles d'art pariétal*, 1952, with an Eng. trans. by Mary E. Boyle, 1952; G. Grigson, *The Painted Caves*, 1957.

Caveat, formal notice or caution given by a party interested, to a court judge, or public officer, against the performance of certain judicial or ministerial acts. In a more restricted sense a C. denotes (1) a caution entered in the Probate, Divorce, and Admiralty Div. to stop the granting of probates of wills or letters of administration; (2) a notice given to the bishop by a party who disputes a particular right of presentation to prevent the institution of a clerk to a benefice; and (3) a notice lodged at the patent office to prevent the registration of any invention under the patent laws.

Caveat Emptor (Lat. 'let the buyer be on his guard'), legal maxim which in the law relating to a contract for the sale of goods means that a purchaser must take all reasonable precautions in buying from another, for as regards the quality of a thing sold in the general circumstances of the sale he will not be allowed afterwards to repudiate the sale because he has not obtained all he wants. The Sale of Goods Act, 1893, has destroyed the maxim of some of its force by implying in every contract of sale conditions that the goods sold shall correspond to their description, that they shall be reasonably fit for the purpose for which the buyer wanted them, provided he made that purpose known to the seller, that the bulk shall correspond to the sample, and that the seller has a right to sell the goods; with the result that on the breach of any such condition the buyer can rescind the contract.

Cavedone, Jacopo (1577-1660), It. painter, b. Sassuolo, near Modena; studied under the Caracci and Guido, and was much influenced by Titian, whose works he studied at Venice. Most of his work was done for churches in Bologna, and is in both oil and fresco. His best work is 'The Virgin and Child in Glory,' 1614 (Academy of Bologna).

Cavell, Edith Louisa (1865-1915), nurse and patriot, b. Swardston, Norfolk, eldest daughter of the Rev. Frederick C. She was educ. at home, in Somerset, and in Brussels, and entered the London Hospital as a probationer in 1895. In 1906 she went to Brussels to assist in establishing a training school for nurses, and in 1907 was appointed first matron of Dr Depage's clinic, the Berkendael medical institute. On the outbreak of war in Aug. 1914 Dr Depage left to organise military hospitals, and Miss C. was left in charge of the institute, which became a Red Cross hospital for both Gers. and their enemies. On 5 Aug. 1915, Miss C. was arrested, charged with harbouring refugees and helping 130 of them to escape, and on 7 Oct. she was one of 36 brought to trial before a court-martial. Her Belgian defence counsel was not allowed to see her beforehand, nor to inspect documents, and the prosecution was helped by her own statement that she had received letters of thanks from the repatriated. She was condemned to death by shooting, the sentence being carried out at 2 a.m. on 12 Oct. despite the efforts of neutral diplomats to get the sentence commuted. On 15 May 1919 her body was buried at Norwich Cathedral. A memorial to her was erected in St Martin's Place, near Trafalgar Square, London, in 1920; her last words, 'Patriotism is not enough; I must have no hatred or bitterness towards anyone,' were added to the pedestal in 1924. See S. Kuschen (Miss C.'s defending counsel), *Devant les Conseils de Guerre allemands*, 1919; and A. Got, *The Case of Miss Cavell*, 1920.

Cavendish, surname of the ducal house of Devonshire (q.v.).

Cavendish, Lord Frederick Charles (1836-82), politician, second son of the 7th Duke of Devonshire, b. Eastbourne, and educ. at Trinity College, Cambridge. He was private secretary to Lord Granville, 1859; elected M.P. for Barrow-in-Furness, 1865; was Gladstone's private secretary, 1872; financial secretary to the Treasury, 1880. In 1882 he was chosen by Gladstone to succeed W. E. Forster as chief secretary to the lord-lieutenant of Ireland. On 6 May C. and the permanent under-secretary, Thomas Henry Burke (q.v.), were murdered in Phoenix Park by a gang of assassins, belonging to the secret society of Invincibles, in front of the viceregal lodge. James Carey, a member of the Dublin corporation, turned informer, 20 persons were arraigned, and 5 were executed and others sentenced to penal servitude. The assassins did not know who Lord Frederick was, but they meant to murder Burke. The murder had far-reaching political consequences for Ireland. Piggott's forged letter of C. S. Parnell condoned this murder.

Cavendish, George (1500-62), historical writer, the eldest son of Thomas C., a clerk in the Exchequer. He became gentleman-usher to Cardinal Wolsey (q.v.), and served him faithfully to the end. After Wolsey's death he wrote his patron's biography, which was circulated

in MS., but not pub. in full until 1815. It is a valuable authentic record of the period.

Cavendish, Henry (1731-1810), natural philosopher, b. Nice, educ. at Cambridge. He was extremely shy and lived the life of a recluse. A millionaire and the possessor of a unique library, C. devoted his whole life to chemical and physical research, and found time also to work at mathematics and to read papers before the Royal Society. Not only did he discover the extreme lightness of hydrogen—which led at once to balloon experimenting, etc.—but before 1783 he had ascertained the constituents of water and atmospheric air, and had conducted his famous experiments on the density of the earth. Sir Humphry Davy spoke enthusiastically of the extreme accuracy of his work. See G. Wilson, *H. Cavendish*, 1851.

Cavendish, Thomas (1560-92), circumnavigator, commanded a ship in Sir Richard Grenville's expedition to Virginia (1585), and in the following year fitted out 3 small ships from Plymouth, in which he sailed round the world (1586-8) by way of the Magellan Straits, the E. Archipelago, and the Cape. During this voyage he discovered Port Desire, Patagonia, burnt 3 Sp. cities, and captured Sp. treasure. He d. at sea off Ascension, broken-hearted because his second expedition was not so successful as the first.

Cavendish, Sir William (c. 1505-57), Eng. courtier, founder of the family of C., b. Cavendish. He was the second son of Thomas C. of Cavendish, clerk of the pipe, and brother of George C. (q.v.). C. was treasurer of the royal chamber under Henry VIII, Edward VI, and Mary I, and was one of the commissioners appointed by Henry VIII to suppress the monasteries. He was 3 times married, his third wife being the Derbyshire heiress, Bess of Hardwick. With her money he planned the sumptuous mansion at Chatsworth, which his wife completed. See Kennet's, *Memoirs of the Cavendish Family*, 1737; J. Grove's *Lives of all the Earls and Dukes of Devonshire*, 1764.

Cavendish, William, 1st Duke of Newcastle (1592-1676), Royalist, educ. at St John's College, Cambridge. Charles I made him tutor to his son Charles in 1638. C. had previously entertained his sovereign at Welbeck, when Ben Jonson, whom he patronised, composed the masque. When the Civil War broke out C. sacrificed his own income to the Royalist cause. He won Yorks for the Royalists by the victory of Adwalton Moor (1643). In the same year he captured Hull, but in the following, after the rout of Marston Moor, went abroad, where he lived in great poverty until the Restoration when he returned to England. Charles II created him Duke of Newcastle in 1665. C. wrote a number of dramatic works and plays. His second wife, Margaret (c. 1625-73), whom he married in 1645, and who had been one of Henrietta Maria's maids of honour, wrote a life of her

husband, 1667, which was extravagantly praised by Charles Lamb; and sev. poems. **Cavendish-Bentinck**, see BENTINCK.

Caversham, Baron, see KNOLLYS, FRANCIS, 1ST VISCOUNT.

Caversham, part of the co. bor. of Reading since 1911. See READING.

Caves, or **Caverns** (Lat. *cavus*, hollow), hollow places formed in the earth or in rock. Most natural C. larger than mere slits or hollows below overhanging ledges have been produced by the action of water in one of 2 ways. The attack of the sea on the coast may form sea C.; the passage of underground water through soluble rocks such as limestones, chalk, or rock salt leads to the solution of rock to give an interconnecting network of subterranean passages and caverns. C. also form below glaciers where melt water carves subglacial waterways, and occasionally C. develop in volcanic areas where the central part of a lava flow has drained away leaving a lava tunnel formed by the rapidly cooled outer skin of the flow (see GLACIERS and LAVA).

Sea C. result from the attack of waves. The beating of waves and the pounding of shingle and boulders thrown up by the waves wear down the rocks unevenly. Where the rock is soft or cut by a plane of weakness such as a joint, fault, or bedding plane, erosion is more rapid. Once a small hollow has been formed a new factor becomes effective, as the air trapped in the hollow is compressed by the rising wave and allowed to expand when the wave retreats. The wedge-like action of the compressed air splits the rock and leads to the formation of a sea cave. The mouths of sea C. lie between tide marks. Old sea C. formed when the sea stood higher than at the present time may be seen on many coasts at the foot of abandoned sea-cliffs (see RAISED BEACHES). The shape of sea C. is usually controlled by planes of weakness in the rock. Blow-holes result when a cave opens out to the surface; air and water are ejected at suitable states of the tide, particularly when the sea is stormy. The force with which a plume of spray is thrown out of such holes illustrates the effectiveness with which air is compressed in the underlying cave by the advancing sea. The partial collapse of blow-holes produces the steeply inclined natural shafts known in the Channel Is. as *creux*. The collapse of the roofs of long sea C. gives rise to the narrow inlets called *göms* in Shetland. The largest C. known are those formed by the chemical rather than the mechanical action of water. These are the C. developed by the attack of underground water charged with carbonic acid derived either from the air or from decaying organic matter. Such water acts upon rocks, in particular upon the carbonates such as limestone or chalk, forming soluble salts which are carried away in solution, leaving cavities behind. Large subterranean galleries, caverns, and channels have been formed in various dists. by underground streams and rivers, particularly where calcareous rock is present. Whenever such a river, for some natural cause, has abandoned

its subterranean water-course, the channel it has occupied gradually dries up, and tortuous underground passages remain, linking together the C. previously made by the water. The holes through which the rivs. have descended on their downward course below the earth are known as sink-holes. The direction of the caverns and channels can frequently be ascertained above ground by examination of these entrance-holes. Fine specimens of such sink-holes are found in Kentucky and Florida. In limestone dists. calcareous deposits are left on the walls of subterranean C. This is due to a double

finest specimens of such C. are to be found in Austria, whilst in England most beautiful specimens can be seen at Cheddar. One of the largest and most famous C. in the world is Mammoth Cave in Kentucky, U.S.A., situated some 85 m. SW. of Louisville. It consists of a perfect maze of great chambers, grottoes, and domes linked by numerous passages and galleries. The extent is over 4 m., and it was evidently formed ages ago by the action of water in the prevailing limestone formation. The main cave is over 40 ft wide by 300 ft in length and about 125 ft high. One of the domes

INTERIOR OF A CAVE, SHOWING STALACTITES AND STALAGMITES

chemical process. First, the carbonic acid acts upon the calcium carbonate (or limestone), forming the soluble bicarbonate. When this solution is left standing on the walls of the cave the reverse process takes place, and glistening crystals of calcium carbonate remain. If water, laden with calcium bicarbonate, comes trickling through the roof of the cave, in the course of ages similar deposits are formed in the shape of icicles. These deposits slowly grow in size as the water drips from them, and where the solution falls on the floor of the cave dome-shaped mounds appear. The incrustations hanging from the roof are known as stalactites, and those on the floor stalagmites. Sometimes the stalactites and the stalagmites may become united, when it appears that the roof of the cave is supported by pillars. Sometimes these formations are of a pure dazzling white, but more often are coloured by some foreign matter in the water. When the cave is lit up artificially, the effect is extremely beautiful. Some of the

attains a height of 300 ft, and there are sev. others only slightly less in height. The presence of bones of humans, anthropoid apes, and of other animals together with artifacts preserved in C. demonstrates that these were inhabited and provides valuable evidence of life in past ages, of the evolution of man and of the way he lived. The preservation of such material and of cave paintings is often extraordinarily fine in consequence of the deposit of translucent calcium carbonate upon them. See also ARCHAEOLOGY and CAVE ANIMALS. Consult Sir W. B. Dawkins, *Cave Hunting: Researches on the Evidence of Caves respecting the Early Inhabitants of Europe*, 1874; Hovey, *Celebrated American Caverns*, 1882; A. Caves of a Thousand Buddhas (Ch'ien-fu-tung), most famous repository of early Chinese painting, situated in the cliffs of a riv. valley, on the edge of a sandy desert, 25 m. from the small tn of Tun-huang, in NW. Kansu, 710 m. from Lanchow. They are really Buddhist shrines, over 400 in number, hollowed out of gravel rock. They vary greatly in size, the largest containing images of Buddha more than 100 ft high, the smallest being little more than niches in the wall. Although the earliest date from the middle of the 4th cent. AD, the majority belong to the T'ang (618-936) and Sung (960-1276) dynasties. The C. were dug out and painted by the monks and usually paid for by high officials and wealthy merchants, whose portraits and those of their families are often depicted along the walls. Many of the images have disappeared or been renovated, but the wall paintings, depicting secular and religious scenes, are still in a wonderful state of preservation, far better indeed than those at Ajanta (q.v.). For many cents. the C. were one of the greatest religious centres in all Asia, visited by monks from many countries. But in the 12th cent., probably owing to unsettled political conditions, they were sealed up with stone walls. First reported to the W. world in 1892 by an Englishman, Capt. Bower, the first serious work on them was done by Sir Aurel Stein (q.v.), who found in the long-buried library a treasure-house of early Buddhist and Asiatic literature, which has since yielded thousands of vols., many of the most important of which are now in the Brit. Museum. The C. are now converted into the Tun-huang Art Institute, and can be easily reached by the Lanchow-Sinkiang railway.

Cavetto, a hollow or concave moulding used in classical architecture.

Cavia, see CAYV.

Caviare, roe of the sturgeon prepared for eating. It is a favourite *hors-d'œuvre* or savoury. The variety known in Russia as *ikra*, which is loosely granulated and almost fluid, is the best. A coarser kind called *pajusnavai* is a common article of food in E. Europe. Hamlet's remark that 'His play . . . was caviare to the general' proves that it was a known delicacy in Shakespeare's day.

Cavitation, see SCREW-PROPELLER.

Cavite, cap. of the prov. of Cavite, Luzon, Philippine Is. Situated on Manila Bay, 10 m. from the city of Manila, it is a fortified seaport and until the Second World War was a naval station of the U.S.A. Since 1947 the U.S. has used the base only to a limited extent. It is an old tn containing narrow streets and buildings of stone with upper storeys of wood; it possesses 5 churches and a high school. It is the chief naval base of the Philippine Is., and during the 19th cent. was the scene of political troubles. An Amer. squadron under Commodore George Dewey wrested it from Spain in May 1898. Pop. of the prov. 262,550; tn

35,052. The chief products of the prov. are sugar, rice, and coco-nuts and other fruits. In the Second World War C. was captured by the Japanese on 3 Jan. 1942. Recaptured by Amer. forces on 13 Feb. 1945. See further under PACIFIC CAMPAIGNS, or FAR EASTERN FRONT, in SECOND WORLD WAR.

Cavity Resonator. Any hollow electrical conductor possesses distributed inductance and capacitance and can therefore act as an oscillatory circuit of definite resonance frequency. C. R.s are used as resonant circuits at very high frequencies corresponding to wave-lengths of the order of 10 cm. The resonant wave-length is proportional to the size of the C. R. and the wave-length can be altered by coupling with a reactance. The C. R. is simple in design, and has a high Q-factor. The shape may be spherical, cylindrical, or prismatic.

Cavour, Camillo Benso, Count (1810-1861), It. statesman, b. Turin, a younger son of an old aristocratic family of Piedmont. He was educ. at the Military Academy at Turin till 1826, when he obtained a commission in the engineers. During his leisure he studied Eng. politics, and developed his strong liberal views which caused him to be regarded with suspicion in official circles. In 1831 he resigned his commission and devoted himself to social problems, practical agriculture, and foreign travel. In 1847 he started at Turin a weekly newspaper, *Il Risorgimento*, for the purpose of spreading the ideas of constitutional reform. In Jan. 1848, the revolution in Sicily broke out, and C.'s speech on the constitutional questions had great influence, not only on the people, but also on the Piedmontese king, Charles Albert, who was induced to grant a constitution. After the Piedmontese defeats against Austria in the war 1848-9, C. threw himself still more ardently into his ideal of freedom from Austria and a united It. kingdom, realising, now, that the unification of Italy would require powerful foreign help; for Piedmont could never defeat Austria single-handed. His difficulties were immense, for he had, in addition to all the external force of Austria and the supporters of the dynasties in Tuscany, Naples, etc., to combat the traditional and separatist policies of Mazzini and the republicans and the danger of an anti-papal and anti-clerical movement, which he judged would destroy his own schemes of employing foreign help to unify his country. In 1850 he became minister of agriculture and commerce, and in 1851 of finance, but he resigned on a difference with the Prime Minister, d'Azeglio. He then travelled in France and England to discover the trend of foreign opinion in regard to the It. problem. In 1852 he returned and was appointed Prime Minister, a post which he filled, with short intervals, till his death. He now began his masterly scheme of foreign policy, which was to make a united Italy possible. He shrewdly placed Sardinia and Piedmont among the major powers by sending a well-disciplined force to the Crimea.

while Austria remained neutral. He secured the active friendship of France, and the benevolent neutrality of England, and in 1858 formed an alliance with Napoleon III, followed (1859) by a victorious joint campaign against Austria (Magenta and Solferino). The agreement of Villafranca, brought about by the sudden withdrawal of Napoleon, left Venetia in the hands of Austria, and bitterly disappointed C., who resigned, but later returned to office. He had ceded Nice, Garibaldi's bp., and Savoy to France in return for the alliance, for which he was violently upbraided by Garibaldi and his supporters. But the adhesion of the central states of Italy to Piedmont soon followed, and the defeat of the Neapolitan kingdom in Sicily and Naples by Garibaldi. Save for the question of Rome and the papal temporal power and Venetia, C.'s policy had succeeded entirely, and at his death, Victor Emmanuel II was king of practically all Italy. The regeneration of Italy had been his ideal, and he had worn himself out prematurely to achieve it. See Countess E. Martinengo Cesaresco, *Cavour*, 1898, and A. J. Whyte, *Early Life and Letters of Cavour*, 1816-48, 1925, and *Political Life and Letters of Cavour*, 1930. **Cavour**, lt. tn, in Piedmont (q.v.), 24 m. SW. of Turin (q.v.). It has an anct. castle, and has marble and slate quarries. Pop. 7000.

Caviat, see DUBROVNIK.

Cavy, or **Cavia**, family of rodents found in S. and Central America, to which the capybara or carpincho belongs. The C.s have rough hair, well-developed ears, no tail, reduced toes, 4 on the fore feet and 3 on the hind feet. The guinea-pig, *C. cobaya*, known to us as a domestic pet, is probably descended from *C. cutleri*, the restless C., a species with greyish fur. The Patagonian C. is a large animal of the same family Caviidae, but its two species form the genus *Dolichotis*; it resembles somewhat a long-legged hare, and has the same number of toes as *Cavia*. See also GUINEA-PIG.

Cawdor, par. of Nairn, Scotland, 3½ m. SW. of Nairn. In the fine old medieval castle the murder of King Duncan is popularly supposed to have taken place, but it actually occurred sev. cents. before the castle was built. Pop. 800.

Cawley, William (1602-66), Eng. regicide. He founded St Bartholomew's Hospital, Chichester, 1626. C. was an active member of the Long Parliament and was one of Charles I's judges. He was excepted from pardon, 1660, and fled to Belgium, and then to Switzerland, his property being granted to James, Duke of York.

Cawnpore, see KANPUR.

Caxamarca, see CAJAMARCA.

Caxias, Luis Alves de Lima e Silva, Duke of (1803-80). Brazilian marshal and statesman. He brought peace to SW. Brazil at the beginning of the Empire, and won the decisive battle of Humaita in the Paraguayan War.

Caxias, tn of Maranhão, Brazil, formerly known as Aldeias Atlas, on R. Itapecuru, 180 m. SE. of Maranhão, with

which it has riv. connection. It has sugar refineries, cotton mills, and ships' babacá nuts. Pop. 7000.

Caxias do Sul, lt. colony in Rio Grande do Sul, Brazil, 60 m. NW. of Porto Alegre, with vineyards and cattle. Pop. 32,200.

Caxton, William (1422-91), first Eng. printer, b. Kent. In 1438 he was apprenticed to a rich silk mercer, and the latter dying in 1441, young C. was dispatched to Bruges to finish his term. Here he set up business for himself, and in 1465 and 1469 he was employed, as governor of the company of Merchant Adventurers, in negotiating commercial treaties with the Dukes of Burgundy. The second time his mission was quite successful, and about 1471 he entered the household of the Duchess Margaret, sister of Edward IV, and wife of Charles the Bold of Burgundy, as commercial adviser. There is some doubt as to where C. actually learnt the art of printing. Many—among them Wynkyn de Worde, his disciple—say it was at Cologne, between 1471 and 1474, in company with Colard Mansion, who was his partner at Bruges, where he printed his first book in 1474 or 1475. This was a trans. of a Fr. romance entitled *The Recuyell of the Histories of Troye*. In 1476 his second printed work (completed in 1474) appeared, *The Game and Playe of Chess*, another trans. At Michelmas 1476 C. was installed at Westminster, and an indulgence, dated 13 Dec. 1476, is the earliest extant specimen of C.'s work. Lord Rivers's version of *The Dictes or Sayings of the Philosophers*, 1477, was the first book printed by C. in England. Thenceforward C. pub. some 80 books, many of them his own trans. of famous Fr. legends and cycles of romance. His *Myrrour of the World*, 1481, is the first vol. he issued with woodcut illustrations, whilst as many as 70 woodcuts were inserted in his ed. of the *Golden Legend*—his own compilation from a Fr. work of the 13th cent., containing lives of the saints. But by his fellow countrymen he will be remembered above all for his services in fixing the Eng. language, which was in a changing, somewhat chaotic condition, and in bringing the literary masterpieces within the reach of those who could read. Twice he printed Chaucer's *Canterbury Tales*, and he brought out also Gower's *Confessio Amantis*, 1483, and Malory's *Morte d'Arthur*.

Cayambe: 1. Extinct volcano of the Andes, in Ecuador, practically on the equator, 19,014 ft high.

2. Tn of Pichincha prov., Ecuador, at the foot of C. volcano, an agric. market. Pop. 7400.

Cayenne, old name for Fr. Guiana (q.v.).

Cayenne, city, Atlantic port, and the cap. of Fr. Guiana, at the mouth of the Cayenne R. on the NW. coast of the is. of that name. The harbour is shallow and ships of over 15-ft draught must anchor outside it. There is an international airport. The staple exports are gold, timber, rum, cocoa, hides, and spices. The penal settlement was

abolished in 1946. Malaria was virtually wiped out and full preventive control instituted in the early 1950's. Pop. 11,000.

Cayenne Pepper, see CAPSICUM.

Cayes, Les, or Aux Cayes, main seaport, cap. of Sud dept. on SW. coast of Haiti, 98 m. SW. of Port-au-Prince. It is an episcopal see and exports sugar, coffee, bananas, cotton, and logwood. Pop. 11,350.

Cayey, tn. of E. central Puerto Rico, W. Indies, in the Central Cordillera 25 m. S. of San Juan. It is a summer resort, and the centre of a sugar, coffee, and tobacco dist. Pop. 18,429.

Cayley, Arthur (1821-95), mathematician, b. Richmond, Surrey. He was educ. at King's College, London, and Trinity College, Cambridge. Senior wrangler of his year, 1842, he was also winner of the Smith prize. He practised as a barrister for 14 years, and returned to Cambridge as Sadlerian prof. of pure mathematics. He produced a number of memoirs of outstanding importance, dealing with quantics, the theory of invariants, analytical geometry, matrices, and elliptic functions, which, collected and pub. by the Cambridge Univ. Press, form a monument to his fame as one of the greatest of mathematicians. He possessed honorary degrees of almost every foreign univ., and was a fellow of the Royal Society. He d. at Cambridge, and his portrait and bust are in Trinity College.

Cayley, Sir George (1773-1857), Eng. inventor, now accepted as the true father of the modern aeroplane. He was the first to formulate the root problems of heavier-than-air flight, and the first to conduct basic scientific research from which the whole development of the aeroplane derives. His model glider of 1804 was the first proper historical aeroplane, and later he constructed and flew the first man-carrying glider (c. 1850). He pub. his researches on aviation and aerostation at various times and thus ensured that those who followed should build on the right foundations. He was also an able inventor in other fields, but his aeronautical work was outstanding. See AEROPLANE.

Caylus, Marie Marguerite Le Valois de Villette de Murcay, Comtesse de (1673-1729), Fr. noblewoman, b. Poitou, the granddaughter of Théodore Agrippa d'Aubigné. She was taken to Paris and educ. at court by her aunt, Mme de Maintenon, and in 1688 married the Comte de C., who d. in 1704. She won a great contemporary reputation as a beauty and wit, and left a book which was edited as *Souvenirs* by Voltaire in 1770.

Cayman, see CAIMAN.

Cayman Islands, 3 low-lying is. of the W. Indies, which were colonised by the Brit. from Jamaica, 140 m. to the NW., of which they still form a dependency. Columbus, who discovered them, named them *Tortugas* after the turtles which abound in the is., and which are even to-day the chief export, together with tortoise-shell and shark skins. The first account of the is. is the report of

the third voyage of Columbus on his return from Porto Bello to Hispaniola in 1593. Therein it is stated that the is. were covered with turtles, which swarmed also on the coasts in such multitudes as to look like ridges of rock. There is also an early description of Grand Cayman by Capt. Wm Jackson, who visited the is. in 1643 in an abortive attempt on Jamaica. He says: 'The island is much frequented by English, Dutch, and French ships, that come purposely to salt up ye flesh of these Tortoises.' In 1655, when Jamaica was taken, the C. I. became a regular source of food supply for the soldiers and fleets of England cruising the Caribbean. Coco-nuts are grown on Little Cayman and Cayman Brae. The is. are rich in timber, and their inhab. are clever shipwrights. Georgetown is the chief tn. of Grand Cayman. The gov. is administered by a commissioner, assisted by a legislative assembly comprising justices of the peace and elected vestrymen; enactments require the assent of the Governor of Jamaica. The total pop. of the group is some 8000. No survey of the is. has yet been made, and the area of the group is variously estimated at 92 to 140 sq. m.

Cayor, dist. of Senegal, Fr. Equatorial Africa, until 1883 part of the kingdom of Djolof. It is now under the direct control of France, and is traversed by the railway from Dakar to St Louis. Pop. about 100,000.

Cayos, see TURES AND CAICOS.

Cays (pronounced 'keys'), name given to the is. off the coast of Brit. Honduras. The prin. are Turneffe (a corruption of Terra Nova), St George's Cay, Eng. Cay, and Ambergris Cay. They are much resorted to for bathing and fishing, and there are sev. 'week-end' residences in St George's Cay. This latter was the H.Q. of the log-cutters, or bay-men as they were called. It was here that the bay-men and the Brit. sloop *Merlin* defeated a force of 2000 men under Gen. O'Neill, the Governor of Yucatan, in a battle on 10 Sept. 1798, the anniversary of which is still annually celebrated in the colony.

Caytoniales, fossil plants of Jurassic age found at Cayton Bay, Yorks. They were early flowering plants or sub-Angiosperms, but were still closely allied to the Pteridosperms.

Cayuga: 1. Co. of New York state, U.S.A., bounded on N. by Lake Ontario, and on W. by Lake C. It has deposits of salt, gypsum, and limestone. Area 722 sq. m.; pop. 70,135.

2. Lake of New York state, U.S.A., lying partly in Tompkins co., and forming the boundary between C. and Seneca cos. Longest (38 m.; average width, 4 m.) of the Finger Lakes. At the S. end lies Ithaca.

Cazalla de la Sierra, Sp. tn in the prov. of Sevilla, with Rom. and Moorish remains. Aniseed liqueur and cork are manuf. Pop. 5000.

Cazin, Jean Charles (1840-1901), Fr. painter, b. Samer, Pns-de-Calais, the son of F. J. C., a famous doctor; he studied in France and England, where he came into contact with the Pre-Raphaelites. In

1889 he was made an officer of the Legion of Honour. Though his earliest works are on religious subjects, he excelled in landscapes into which figures were introduced. Among his best pictures are 'The Flight into Egypt,' 1877, 'Hagar and Ishmael,' 1880, 'Souvenir de fête,' 1881, and 'Journée faite,' 1888.

Cazique, see CACIQUE.

Cazorla, Sp. tn in the prov. of Jaén, with an anct. castle, and a trade in grain and oil. Pop. 7000.

Cea, see CEAS.

Ceada, see CHAD, ST.

Cean-Bermudez, Juan Augustin (1749-1829), Sp. writer, b. Gijón in the Asturias. He studied architecture and drawing, but not apparently with any great success, and, having a small pension from the gov., he was enabled to devote himself entirely to his literary pursuits as the historian of Sp. art. His first pub. was the *Diccionario Histórico de los mas ilustres Profesores de las Bellas Artes en España* (6 vols. 8vo), 1800; and his others are *Descripción Artística de la Catedral de Sevilla*, 1804, *Descripción del Hospital del Sangre*, 1804, *Carta sobre el Estilo*, etc., de la *Escuela Sevillana*, 1806, *Diálogo sobre el Arte de Pintar*, 1819, and lastly the *Noticias de los Arquitectos y Arquitectura en España* (4 vols., 4to), 1829, a work founded upon materials collected by Eugenio Llaguno. He also pub. a memoir of his friend Jovellanos.

Ceanothus, genus of Rhamnaceae, of which the species, natives of America, are cultivated as ornamental shrubs. *C. Americanus*, red root or New Jersey tea, *C. azureus*, *C. x burseroides*, *C. dentatus*, and *C. rigidus* are esteemed for their beauty when in flower, being blue in colour.

Ceará, N. state of Brazil, bounded N. and E. by the Atlantic, Rio Grande do Norte, and Paraíba, S. by Pernambuco, and W. by Piauí; lying partly on the great Brazilian plateau, its formation is that of terraces cut up by water-courses and high hills (3000 ft); the climate is very hot and it is subject to severe and destructive droughts. On the higher ground cattle are raised and some horses. The chief products (grown by irrigation in the interior and along the coast) are cotton, sugar, and coffee; carnaúba and oiticica are exported. The cap. is Fortaleza (q.v.). Area 59,168 sq. m.; pop. 2,735,700.

Cebadilla, **Sebadilla**, and **Sabadilla**, various Sp.-Mexican names applied to liliaceous plants containing veratrine. *Schoenocaulon officinale* is one of these plants and the alkaloid is derived from its dried fruits; *Helonias officinale* is another species, a native of N. America; *Veratrum album*, often known as white hellebore root, and *V. sabadilla* are gathered for the veratrine-yielding rhizomes. These hellebore alkaloids, of unknown constitution, but of considerable physiological activity, have not found much use in medicine. The alkaloid *serpine* forms crystalline salts. *Protoveratrine* is very poisonous and causes violent sneezing. The other alkaloids, *proto-*

veratridine and *veratroidine*, are of little importance. See also VERATRINE and VERATRUM.

Cebes, a disciple of Socrates and one of the speakers in Plato's *Phaedo*. He has been credited with the authorship of a work entitled *Pinax* or *Tabula* which was popular in the Middle Ages and trans. into many languages, including Arabic. It professes to be an interpretation of an allegorical picture in a temple. Like *Pilgrim's Progress*, it represents the snares and temptations of this life, and concludes that the true end of learning is to mould character. Modern scholars, however, while agreeing that the work is inspired by Platonic theories, attribute it rather to C. of Cyzicus (late 2nd cent. AD) or to an otherwise unknown author of the 1st cent. There is a trans. by R. T. Clark, 1909.

Cebidae, large family of Primates which is divided into 4 sub-families, represented by the howling monkeys, sakis, tectates, and Capuchin monkeys. They inhabit trees of the Neotropical region and sev. fossil forms have been discovered.

Cebu, is. of Philippines; area 1702 sq. m. It is intersected by fine mt. ranges. The chief products are sugar, copra, tobacco, and hemp. There is a flourishing export trade, and salt, pottery, and making of sacks are some of the most prosperous industries. Excellent mangoes abound, and good sponges are found off the coast. Coal and oil are found here. The is. continued, under the U.S.A., the prosperity it enjoyed under Sp. rule. The first Sp. settlement was in 1565. Pop. 947,309. The cap. tn, C., is situated on the E. coast, N. of the centre. It is a port of entry and a municipality; the port is well protected from storms. The streets are wide and well laid out, and good roads traverse the surrounding country. C. is an episcopal see, and the bishop's palace is famous for its internal decoration. The Augustinian church possesses the miraculous image of the Santo Niño. The leper hospital was removed in 1906 to the is. of Culion. The cathedral, finished in the 18th cent., contains a cross said to have been erected by Magellan, the great explorer, who was killed in the neighbouring is. of Mactan. Jap. forces landed on C. is. on 11 April 1942, but the Americans recaptured it in 1945. Pop. (tn) 167,503.

Cebus, genus of monkeys typical of the family Cebidae, which belongs to S. America. The species have a well-developed thumb, a hairy prehensile tail, and 36 teeth. They include the Capuchin monkeys (q.v.), and were at one time common in Britain as the companions of hurdy-gurdy players.

Ceccano, It. tn, in Lazio (q.v.), on the Sacco, 5 m. S. of Frosinone (q.v.). It was severely damaged during the Second World War. Pop. 12,000.

Cecchi, Antonio (1849-96), b. Pesaro in Italy. He was a great traveller and explorer, and took part in the Marquis Antinori's expedition to Abyssinia (1876), being responsible for their route from Zeila to Shoa. Two years later he went

on an expedition to explore the Galla country, taking with him Chiarini, but they were captured and imprisoned. C. was set free in 1880, his companion having succumbed during the confinement. He was next sent on a mission to Mussowah by the It. Gov. and succeeded in concluding a treaty of commerce with the Sultan of Zanzibar (1885), at the same time pursuing his explorations along the coast. He wrote sev. books of travel.

Cech, Svatopluk (1846-1908), b. Ostředec, in Bohemia, one of the best-known Czech poets. His poems, inspired by national enthusiasm, have appeared in collections, the first in 1874. The most notable are *Vaclav z Michalovic, Lesetinský Kovář* (The Smith of Lesetin), and *Bísně otroka* (The Songs of a Slave). His best-known novels (notable for their satirical wit) are *Provdický, Arabeský a Humoresky*, 1878-80, and *The Candidate for Immortality*, 1884.

Cechy, see BOHEMIA.

Cecidomyia, typical genus of the family of dipterous insects known as Cecidomyiidae, the species of which are characterised by being minute and fragile, with longish antennae furnished with whorls of hair. The larvae are small maggots which live on vegetable or animal substance, and frequently produce galls on plants. *C. destructor*, the Hessian fly of N. America, is well known as a destroyer of wheat; *C. tritici*, the wheat-fly, has a larva which feeds on the pollen of wheat and the ear consequently produces no grain; *C. salicina* is common in France on willows.

Cecil, Lord Edward Christian David (1902-), critic and biographer, a son of the 4th Marquis of Salisbury. Educ. at Oxford, in 1948 he became Goldsmith's prof. of Eng. literature there, and in 1949 was made a Companion of Honour. His works include *The Stricken Deer* (a life of Cowper), 1929, studies of Sir Walter Scott, 1933, and Jane Austen, 1935, and 3 vols. of criticism, *Early Victorian Novelists*, 1934, *Poets and Story Tellers*, 1949, and *The Fine Art of Reading and Other Literary Studies*, 1957. He has also written biographical studies of Melbourne, *The Young Melbourne*, 1954 (the early years), and *Lord M.*, 1954 (the later years).

Cecil, Henry, see EXETER, PERRAGE OF.

Cecil, Lord Hugh Richard Heathcote, see QUICKSWOOD, 1st BARON.

Cecil, James Edward Hubert Gascoyne- and Robert Arthur James Gascoyne-, see SALISBURY, 4th and 5th MARQUESSES OF.

Cecil, John, sometimes called **Snowden** (1558-1626), priest and political agent, b. Worcester; educ. at Oxford, Rheims, and Rome, where he became secretary to Cardinal Allen. He later went to Spain, and was employed by Father Parsons in various missions between Spain and England. He was captured, and subsequently acted as a spy for Burghley and Sir Robert Cecil. He took a prominent part in the controversies between the secular Catholics and the Jesuits.

Cecil, Robert, Earl of Salisbury (c. 1563-1612), Eng. statesman, succeeded his father, Lord Burghley, as secretary of

state (1596). C. was always delicate, and was known as the 'crook-backed earl.' He was one of the commissioners who tried Essex for leaving Ireland without permission (1600). He became James I's chief adviser; though hard-working and a skilful administrator, he was not of his father's calibre and left little impression on the constitutional hist. of the time. James rewarded C., who had helped him to the crown, by the gift of an earldom, but wanting C.'s estate at Theobalds for himself, obliged him to take Hatfield in exchange. C. was the builder of Hatfield House.

Cecil, Thomas, see EXETER, PERRAGE OF.

Cecil, William, see BURLEIGH, 1st BARON.

Cecil of Chelwood, Edgar Algernon Robert, 1st Viscount (1864-), statesman, third son of the 3rd Marquess of Salisbury. Educ. at Eton, and at Oxford (Univ. College), where he was a prominent speaker at the Union. Called to the Bar in 1887, became Q.C. in 1899. He was Conservative M.P. for Marylebone, 1906, but resigned his candidature, 1910, on account of his opposition to Tariff Reform. He stood for Blackburn as a Unionist Free Trader, but was defeated. In 1911 (by-election) he was elected for the Hitchin div. of Herts. He held that seat until raised to the peerage. He was an early supporter of the women's suffrage movement.

He came into the Coalition Gov., formed during the First World War, in May 1915; being first of all under-secretary for foreign affairs, till 1916; minister of blockade till 1918; assistant secretary of state for foreign affairs, 1918. In 1919 he was in Paris as chairman of the Supreme Economic Council, and assisted in drafting the Covenant of the League of Nations (q.v.). In 1920 he attended the first Assembly of the League at Geneva, as representative of the Union of S. Africa. He became Lord Privy Seal in the Conservative Gov. of 1923, and was raised to the peerage in the same year. In the second Baldwin administration, formed Nov. 1924, he was chancellor of the Duchy of Lancaster; and he frequently represented Sir Austen Chamberlain on the Council of the League. He was prin. Brit. representative on the Disarmament Commission at Geneva in 1926-7; and in 1927 he resigned from the gov. to devote himself to the strengthening of the League. Awarded the Nobel peace prize for 1937. Pubs.: *A Great Experiment: an Autobiography*, 1941; *A Real Peace*, 1941; *All the Way* (autobiography), 1948.

Cecilia, St. (2nd-3rd cent.), Rom. virgin and martyr, whose name occurs in the Canon of the Mass. Her relics, with those of Sts Valerian and Tiburtius, now rest beneath the high altar of Santa Caecilia in Trastevere at Rome. She is the patron of music and musicians, and has been made famous in Eng. literature by Chaucer's *Second Nonne's Tale* as well as by Dryden's celebrated *Ode*. Her feast is on 22 Nov.

Cecropia, genus of tropical Amer. trees, family Moraceae. The wood is very light, and ignites readily by friction; the fruit resembles a raspberry and has an agreeable flavour; the bark is fibrous. *C. peltata*, the trumpet-tree or snake-wood, is a native of W. Indies and S. America, and the stems are made into trumpets by the Indians. It is noted as an example of myrmecophily in which ants live in the hollow stems, obtain food from the tree, and guard it against the ravages of leaf-cutting ants.

Cecrops, legendary first King of Attica. He is supposed to have divided the country into 12 communities, to have instituted the laws of property and marriage, and to have abolished the sacrifice of blood. C. was the legendary giver of the olive-tree to Attica (see ATHENA). His tomb was in the Erechtheum.

Cedar, or **Cedrus**, genus of Coniferae which contains 3 species: *C. Libani*, C. of Lebanon, *C. atlantica*, the silver or Mt Atlas C. of Algeria, and *C. deodara*, the deodar fountain-tree of India. These species, which are probably only varieties of a former plant, agree in having a fragrant, durable, light red wood which is used in building and cabinet-making. They are evergreen shrubs with needle-shaped persistent leaves, have wide-spreading branches, thick trunks, and the seeds take 2 or 3 years to ripen. They are cultivated in Britain on account of their handsome appearance, and in India they are thought to be sacred, and are planted near temples. The resin which exudes from the trunks was formerly used in embalming, and an oil was prepared from it. The name of C. is given to about 50 other trees, especially to sev. of the genera *Cedrela*, *Chamaecyparis*, *Cupressus*, *Juniperus*, and *Thuja*. The bastard C. of Jamaica is *Guazuma tomentosa*, and the white-wood C. is *Tecoma leucocylon*. See FORESTRY; TIMBER; TREE.

Cedar-bird, or *Ampelis carolinensis*, passeriform bird common to N. America, and is closely related to the waxwing. It is a songless bird, gregarious in habit, swift of flight, and has a voracious appetite, feeding on berries, fruits, and insects. It is known also as the Amer. or Carolina waxwing.

Cedar Creek, riv. of N. Virginia, rising in Shenandoah co., and flowing NE. to enter the Shenandoah R. 3 m. E. of Strasburg. Near it the Confederates, under Early, were defeated by the Federals, under Sheridan, on 19 Oct. 1864.

Cedar Falls, city in Iowa, U.S.A., on the Cedar R., 93 m. W. of Dubuque. It manufs. farm equipment, pumps, automobile seat covers, and blankets, and is the seat of Iowa State Teachers' College. Pop. 14,300.

Cedar Gum, resin obtained from *Callitris arborea* used in medicine and in making varnish. It has a fragrant odour, and in appearance is yellow and transparent.

Cedar Mountains, see CEDERBERG.

Cedar Oil, which is an essential oil frequently used in mounting sections, is

obtained from *Juniperus virginiana*. This tree, although known as the N. Amer. red-cedar or pencil-cedar, is not true cedar.

Cedar Rapids, city, cap. of Linn co., Iowa, U.S.A., on Cedar R., 63 m. SW. of Dubuque. It manufs. cereal and other food products, portable rock-crushing equipment, milling and dairy machinery, furnaces, steel office furniture, etc. It has an art association with gallery and is the seat of Coe College. Pop. 72,300.

Cedar Resin, name given to the exudation of cedar-trees and allied species of Pinaceae. It was at one time employed in embalming.

Cederberg, or **Cedar Mountains**, mt range in Clanwilliam co., Cape Prov., S. Africa, so called from the profusion with which it is covered by the native cedar (*Widdringtonia juniperoides*). Highest peak, Sneeuwkop, 6300 ft.

Cedrela, genus of tropical Meliaceae, many of the species of which yield a compact, scented, and beautifully veined timber. *C. toona*, the bastard cedar, toon, or cedar-wood of S. India, has a bark which is a powerful astringent. *C. australis* is the Australian red cedar, and *C. odorata*, the W. Indian cedar, is made into cigar-boxes.

Cedret, or **Coerulignone**, volatile solid occurring in the form of dark blue needles when in the crystalline condition. It was discovered by Reichenbach, who obtained it from coal-tar products, and its chemical constitution is represented by the formula $C_{16}H_{10}O_8$. It is prepared in the pure condition from the distillation products of beechwood tar.

Cedron (*Simaba cedron*), small tree of the order Simarubaceae, indigenous to Columbia. Has a fruit like a plum, containing a seed like a large almond. It is a febrifuge and an antidote to snake-bite.

Cedrus, see CEDAR.

Cefalò, tn and bathing resort in Sicily (q.v.), on the N. coast, 37 m. ESE. of Palermo (q.v.). It stands by a high cliff, and has a fine Norman cathedral (partly 12th cent.). Traces remain of the ant. Gk city of *Cephalopedium*. There are rich marble quarries near. Sardine fishing is an important industry. Pop. 11,800.

Cegled (formerly *Czegled*), tn of Hungary, in Pest co., 45 m. SE. of Budapest (q.v.). It is a railway, agric., and market-gardening centre, with distilleries and flour and brick industries. Pop. 39,000.

Ceglie Messapico, It. tn in Apulia (q.v.), 23 m. W. of Brindisi (q.v.). Pop. (com.) 18,000.

Cehegin (anct *Legisa*), Sp. tn in the prov. of Murcia. It manufs. paper, and has a trade in cereals, wine, hemp, honey, and esparto. There are rich quarries of black marble near by. Pop. 15,800.

Ceiling, the upper interior covering of a room, hall, church, or other building. The derivation has been much disputed. Lat. *cellare*, to carve; *clare*, to hide, have been suggested, but the most probable source is Fr. *ciel*: Lat. *caelum*, sky. The term C. should not be confused with roof, the C. being 'the undercovering of a roof or floor concealing the timbers' (Murray,

New English Dictionary); thus such magnificent timber work as may be seen in Westminster Hall or Middle Temple Hall or the stone vaulting of cathedrals, etc., should not be treated as C.s. In the 14th cent. the construction of C.s proper developed, so that what was merely the underside of the floor above became an ornamental feature of the room below. Fr. and It. C.s of the 16th cent. were moulded in plaster, gilded, and painted.

lating a number of Russian national songs into the 'kindred Bohemian.' Deprived of his editorship of the leading newspaper of Prague, and of his professorship at the univ. because of his criticism of the severity of Emperor Nicholas in quelling the Polish insurrections, he accepted a professorship at Breslau in 1842, and in 1849 returned to Prague to die, his calamities having embittered and warped his nature. His *Kruže stolistá* (hundred-

National Building Record

PLASTERWORK CEILING AT TOTNES, DEVON

In 1520 Raphael executed for the Vatican a reproduction of a C. from the Golden House of Nero, and classical mouldings have been a favourite source of decorative design among architects, notably to the brothers Adam at the close of the 18th cent. The wooden C. of St Albans Cathedral is one of the earliest examples of the class in England. Among other fine examples are the It. C. at Holyrood, and those at Haddon Hall; Sizergh Hall, Westmorland; the Red Lodge, Bristol; houses in Fore St. Totnes, etc.

Čelakovsky, František Ladislav (1799-1852), Czech poet and philologist, early became a passionate enthusiast for Slavonic language and literature. His *Slavanské národní písní*, 1812-27, was a collection of Slavonic national songs, and he wrote a book on *The Philosophy of the Slavonic Nation in Proverbs*, besides trans-

lated a number of Russian national songs.

Celandine, name from Gk *khelidon*, 'the swallow,' applied to sev. plants. *Baccharis frutescens*, the Tree C., a shrub of Mexico, W. Indies; *Chelidonium majus*, the Greater C. or Swallow-wort, a perennial herb of Europe, including Britain, and W. Asia; and *Stylophorum diphyllum*, the C. Poppy, a perennial herb of E. N. America belong to the Papaveraceae; while *Ranunculus ficaria*, the Lesser C., a perennial herb with bright golden yellow, buttercup like flowers, native to Europe and W. Asia, is common in woods, meadows, grassy banks, and stream sides in spring throughout Britain.

Celanese, see RAYON.

Celano, Thomas of (fl. 1250), poet, belonged to the order of Friars Minor. He wrote the words of the long 13th-cent.

hymn or sequence *Dies irae, dies illa* which is interpolated into the *Requiem* or *Mass for the Dead*. The opening of the traditional plainsong setting adapted to the words has been quoted by many composers in works where death is alluded to, including Berlioz, Liszt, Saint-Saëns, and Vaughan Williams. C. wrote biographies of St Francis and St Clara. See also *DIES IRAE*.

Celano, Lake of, see FUCINO, LAKE OF.

LESSER CELANDINE

Celastraceae, family of dicotyledonous plants, containing about 40 genera, in tropical and temperate countries. The species are trees or shrubs, with simple, stipulate, often leathery leaves, and small, usually hermaphrodite flowers. The calyx consists of 4 or 5 free or united sepals, the corolla of 4 or 5 petals, the stamens, 4 or 5 in number, and the carpels, 2 to 5 in number, are inserted on a flattened disk. There are usually 2 ovules in each loculus of the ovary, and the seeds have usually a bright aril; the fruit varies. The chief genera are *Catha*, *Celastrus*, *Elaeodendron*, *Euonymus*, *Pachystima*, *Schaefferia*, and *Tripterygium*.

Celaya, city on the Rio Laja, 29 m. W. of Querétaro, in the state of Guanajuato, Mexico. It was a main centre of the war of independence, 1810. There are famous colonial churches by the architect Francisco de Tresguerras (b. there, 1765). Its elevation is 5764 ft, and its industries include textile and flour milling, tanning, and distilling. Pop. 22,800.

Celbridge, small tn on the R. Liffey, 12 m. W. of Dublin, in the NE. of co. Kildare, Rep. of Ireland, home of Swift's 'Vanessa.' Pop. 800.

Celebes, is. in the Greater Sundas, Indonesia, between the C. Sea (N.) and the Flores Sea (S.). Curiously shaped, it consists of 4 peninsulas running E. and S. and separated by the Gulfs of Tomini, Tolo, and Bone. The mountainous interior rises to 11,286 ft at Mt Rantemario. In the centre are large high-level lakes, Poso and Towuti. Dense forests produce oak, teak, cedar, sandalwood, bamboo, and upas. Agric. products are copra, coffee, sago, and hemp. Mineral

resources include gold, silver, diamonds, coal, sulphur, nickel, and iron. Cattle and ponies are raised in the highlands. Trepang and mother-of-pearl fishing is carried on. The chief tns are Macassar, Manado, and Gorontalo. Pop. about 4,000,000, mainly Malay and semi-civilised Alfuros in the interior. The Portuguese settled C. in the Macassar area, 1625, but were driven out by the Dutch in 1660. Occupied by the Japanese in the Second World War, C. became part of Indonesia in 1950.

Celebes Sea, arm of the Pacific Ocean, surrounded by the Sula Is. and Mindanao on the N., Celebes on the S., and Borneo on the W.

Celcriac, see CELERY.

Celery, or *Apium graveolens*, a European species of Umbelliferae found wild in the marshes of England near the sea. In its wild state the plant is poisonous, but when cultivated the blanched leaf-stalks are valuable as purifiers of the blood, and may be eaten raw, stewed as a vegetable, or made into soup. The form known as celeriac, grown on the Continent, is turnip-rooted, and is used chiefly in made dishes or in sauces. In the cultivation of C. the plants are raised from seeds sown in a light, rich, well-drained soil from the end of Mar. to the beginning of May. When they are a few inches high they are transplanted into another bed until they attain a height of 6 or 7 in., and then placed in a row in a trench and gradually earthed

CELERY

up to blanch the stalks. The soil in this case should be moist, very rich, well fertilised, and well drained, as the goodness of the C. is dependent on its rapid growth.

Céleste, Madame (1815-82), Fr. dancer and actress, b. Paris. As a child she learnt dancing at the opera ballet, and when only 15 was offered an engagement in New York, where she made her first appearance at the Bowery Theatre. She

then came to England and played Fenella in *Masaniello* at Liverpool and in London, 1831. In 1834 she returned to the U.S.A., where she created a great sensation; according to the story President Jackson introduced her to his Cabinet. She returned to London in 1837, gave up dancing, and appeared at Drury Lane. Her best part was Miami in *Green Bushes* by Buckstone. She was manageress of the Adelphi Theatre with B. Webster, and subsequently of the Lyceum. She retired in 1870 and *d.* in Paris.

Celesti, Andrea (1637-1706), painter of the Venetian school, *b.* and *d.* Venice. C.'s works are very attractive, especially in colouring, in which he resembles Paul Veronese. He painted landscape, hist., sacred and profane, and *genre*; cabinet pictures, gallery pictures, and altarpieces. Five of his best pictures are in the gallery of Dresden, one of which is the sack of a city by night, the largest picture in the collection.

Celestial Globe, see GLOBES.

'Celestina, La.' Sp. novel, pub. anonymously in 1499 at Burgos, under the title *Comedia de Calisto y Melibea*, but generally called *La Celestina* from its prin. character. It was written in dialogue form, divided into 16 acts (5 more were added later). It is highly probable that the author was a certain Jew, Fernando de Rojas. Although certain resemblances may be traced between the characters and those in the work of Juan Ruiz, an earlier writer (q.v.), *La Celestina* owes its success not to its simple plot, but to its intense tragic power and magnificent characterisation, especially of *La Celestina*. The work may be called the first European novel. It was soon trans. into French, Italian, Latin, and English by J. Mabbe in 1631.

Celestine, name of 5 popes. C. I (422-432) had a peaceful rule. He was the first to take an active interest in the churches of Britain and Ireland. C. II (1143-4) removed the interdict which his predecessor had put upon King Louis VII of France. C. III (1191-8) was elected at the age of 85. He crowned Henry VI Emperor of Germany, but failed to appease his hostility to the Holy See. The matrimonial irregularities of Philip Augustus of France and Alfonso IX of Leon involved him in disputes with those monarchs. Pope C. IV *d.* before consecration (1241). The fifth and last pope of the name resigned the chair of St Peter after 5 months (1294), and for this great refusal figures in Dante's *Inferno*. He was canonised in 1313. See also CELESTINES.

Celestine, or Celestite, mineral consisting of strontium sulphate, SrSO_4 . It occurs as large, well-developed, orthorhombic crystals and as fibrous, amorphous masses; it frequently has a light blue colour, whence the name C. The crystals are isomorphous with barytes, but are not so abundant; they possess a hardness of 3 and a sp. gr. of 3.9. Both forms are found in Triassic rocks; near Bristol the strontium forming part of the mineral has been taken up by plants; in Glos. the

mineral is put to industrial uses. Other localities are Sicily (a colourless variety), Hungary, Jena (fibrous), Strontian in Lake Erie, and Frankstown, Pennsylvania (fibrous). It is also a constituent of some mineral waters. Celestite is used in the manuf. of other compounds of strontium, such as the hydrate, which is employed in the refining of beet sugar, and the nitrate, which produces the 'red fire' used in theatres and pyrotechnic displays.

Celestines, religious order founded about 1258 by Peter di Morrone, afterwards Pope Celestine V. Though the C. are counted a branch of the Benedictines, their form of gov. was much more akin to that of such mendicant orders as the Franciscans. Peter tried with ill success to persuade both the Benedictine monks of Monte Cassino and the Franciscan spirituals to coalesce with his brotherhood. At one time there were many Celestine monasteries in Italy, France, and the Netherlands, but the order is now practically extinct.

Celeus, King of Eleusis in Attica, where he entertained Demeter in search of her daughter Persephone. The goddess, in return, wished to make his son Demophoon immortal by placing him in a fire; but the child's mother, Metanira, coming upon the scene, cried out. Demophoon perished in the flames. C. is described as the first priest of Demeter at Eleusis.

Celibacy now generally implies complete abstinence from marriage (Lat. *caelebs*, unmarried), but formerly widows and widowers were also considered celibate. From the point of view of the State, widespread habits of permanent C., or of delay in marriage to late in life, must be disastrous, and C. has been frequently discouraged by legislation. In AD 9 (*Lex Julia et Papia Poppaea*) Augustus limited celibates in their rights of inheritance, and preference was given to candidates for office according to the number of their children. Taxation of bachelors has at times been enforced, and still more often proposed. It is, however, the enforcement of C. upon the clergy, or upon the adherents of particular religions, or upon special classes of those adherents, that makes C. of particular historic interest. To trace that hist. throughout the ages would be to write the hist. of asceticism; it must suffice to call attention to the self-castrated priests of Cybele, the *Galli*, to the Rom. vestal virgins, and to the C. of the anct Buddhist monasteries, and then to confine this article to the C. of the secular clergy in the Christian Church. The C. of the monastic orders is a matter of vow on entering the order. Heb. religion made the priesthood hereditary from father to son, and the C. of the Essenes sect may have been a foreign idea derived from Hellenism and the E. mystics. St Paul asserts that a missionary can work more freely without the burden of a wife and children, but reserves for the apostles the right to take a wife with them in their journeys. It has been freely admitted since the Renaissance by Catholic

scholars that C. was no rule of the apostolic church. Clerical C. can be traced first as a custom rather than as a discipline. The first clear rules are of the 4th cent., when bishops and priests were not allowed to marry, but might retain their wives if married before ordination. This is still the rule in the Orthodox Church of the E., where the unmarried, however, have all to be monks and provide all the bishops. The lesser orders, deacons, etc., might marry once only, and the wife must not be a widow or have been a concubine. Gradually, as the clergy became administrators of rich endowments, the feeling grew that church revenues must be kept for the church, not be used to support the families of priests, and more stringent rules were put in force. The local Synod of Elvira, AD 305, was the first to ban the marriage of the higher clergy; at the council of Nicaea, 325, a law to enforce C. on all the clergy was rejected. Paphnutius, a bishop of Egypt, warned the council against imposing so heavy a yoke, and defended the sanctity of marriage. The decretal of Pope Siricius, 385, imposed C. on bishops, priests, and deacons, and ordered the separation from their wives of those already married. Leo I (461) and Gregory the Great (604) extended the rule to subdeacons. The enforcement of C. was constantly resisted, and frequently disobeyed. Marriage of priests was still recognised sporadically, and the practice of having *subintroductae*, or uncanonical 'wives', was often tolerated. Gregory VII (Hildebrand), 1073, took such strong measures that he is often regarded as the author of the rule. Marriages of priests were declared null and void, the wives were treated as concubines, and heavy punishments inflicted on them: no priest who broke the rule could celebrate mass, and the laity were warned against going to such priests. The rule was not submitted to without a long struggle. In 1450 John de la Bere, Bishop of St David's, refused to enforce it among his clergy, as he derived 400 marks yearly from their women. Similarly in England: the Council of Winchester, 1076, and the far stricter Synod of Westminster under St Anselm, unsuccessfully legislated for clerical C., and in 1107 Paschal II in a letter to St Anselm dispensed the rule. In 1129 a Synod of London left it to Henry I to enforce, and he increased his revenues by tolerating clerical wives on payment of a fine. Repeated legislation shows that irregular, i.e. uncanonical, clerical marriage persisted and was common in England up to the time of the Reformation (cf. Henry VIII's proclamation against it in 1521). It was a subject of violent dispute at the Reformation, and became a marked difference between the Rom. and the Reformed Churches. At the revolution in France, by the constitution of 1791, all restrictions on the marriage of priests were abolished, but few took advantage of it.

Celje (Rom. *Claudia Celea*; It. *Cilli*), tn in Slovenia, Yugoslavia, on the Savinja.

It has remains of anct walls and towers, and is a centre for agric. produce. Pop. 22,000.

Cell, in biology, the living unit of which, according to the generalisation first propounded by Schleiden and Schwann (1838) all living forms are composed. The similarity of plan of this unit extends throughout all but the lowest forms of life, and may be extended by accepted definition to include bacteria and perhaps even spirochaetes, etc., but not the controversial viruses. The plant C. consists of a microscopic mass of protoplasm, usually enclosed within a wall of a carbohydrate called cellulose. The animal C. usually possesses no mechanically restricting wall, though its surface has very special properties and structure; it is often capable of considerable changes in shape. The study of cells is *cytology*.

Some animals and plants consist of one C. only: the Protozoa among animals, and the bacteria. All higher forms are multicellular, though even where repeated reproduction by budding has occurred, they can almost unexceptionably be traced back to a single C.—the fertilised egg. The living C. unit is capable of metabolism (q.v.), of growth, and, at least in its early life, of multiplication by div. (see *Differentiation* below). There is thus a complete continuity in life, for every C. owes its existence to a previous C., and thus theoretically all C.s could be traced back to a primordial C. But it is inconceivable that such a complex structure as a C. should come into existence *ab initio*, and possible that, in the series of chemical equilibria of complex compounds which may have existed before life with a cellular organisation, many C.s would have come into existence, as a process of encapsulating portions of a medium with self-reproducing properties. For further hypotheses on the origin of life see *BIOLOGY*.

Structure. To say that all C.s consist of protoplasm—a term first applied by von Mohl (1846) to plant C.s, and subsequently to animal C.s also—implies little beyond a recognition that the common ground base of living material is an unbelievably complex association of organic compounds, containing the elements carbon, hydrogen, oxygen, nitrogen, phosphorus, sulphur, calcium, iron, sodium, magnesium, potassium, and chlorine, in reasonable quantities, together with traces of a great many others. Microscopic study reveals structures within the cell of varying size and shape, down to particles which cannot be resolved, even under the highest magnifications. The electron microscope indicates that the smaller particles are often individual molecules of appreciable size; the suspension of micro-particles in an aqueous medium is a physico-chemical condition known as a colloid (q.v.). Despite much recent work, it may well be that differences in opinion on the nature of protoplasm may largely be explained by the different appearances presented by colloids under the various techniques of observation; colloidal materials like this are extremely sensitive to changes in

temp., acidity, and foreign chemical compounds, which not only goes far to explain the sensitivity of living materials to such environmental constituents, but also points to the extreme dangers of interpreting the structure of living C.s from the appearance of dead ones, even taking into account the method of killing.

The protoplasm of most C.s is grossly divided into an outer, clearer region—the *cytoplasm*—and an inner, smaller, and more dense body—the *nucleus*. Appreciations of the physico-chemical properties of these regions by simple techniques, to measure things like acidity, viscosity, etc., are no real guide to the actual conditions under which the multitude of chemical reactions of life occur. It is considered that these generally take place at the surface of the many large and small inclusions in the protoplasm where conditions locally are very different. The cytoplasm usually contains food and waste particles (often called *metaplasm*), but there are other, more permanent and typical bodies. Chief among these are the *mitochondria* and the *Golgi apparatus*, both of which are regarded as essential to the C.'s secretory and metabolic activities. More temporarily there may also be 'spaces' called *vacuoles*, which are typical of growing C.s, but may also contain secretions, prior to discharge, or, especially in single-celled animals, contractile vacuoles, which serve to pump out excess water and excretory products.

The C. surface is of particular interest, since through it all materials for anabolism (q.v.) and much of the waste products of living activity must eventually pass. This is also true of all secretions, food products, etc., whose eventual destination is in other C.s, but which specialised C.s produce or modify. While to a large extent the substances transmitted by the surface of plant C.s are simpler, all C.s appear to have the special property of selective absorption, i.e. of transporting into the C. particular components of their surrounding medium, regardless of their relative concentrations outside and inside. Energy is expended in this process of *active transport*, which comprises one of the most fundamental problems in biological research.

The nucleus has a definite membrane, and its fluid contents are somewhat different to those of the cytoplasm. There are large numbers of granules of *chromatin*, so called because of its great capacity for absorbing certain stains. This material is often apparently irregularly scattered on a fine network—the *reticulum*—or forming small accumulations—the *karyosomes*. There are also often larger masses of chromatin, called *nucleoli*. The amounts of chromatin vary with the activity, particularly the secretory activity, of the individual C. The nucleus also contains the *chromosomes* (q.v.) on which are arranged the *genes* (q.v.) or individual characters of inheritance. Until very recently chromosomes had only been observable during actual C. divs., but they are now known to retain their individuality at all

other times, even if their shape changes somewhat. Chromosomes and chromatin are thought to be largely composed of *nucleic acids*, which are very complex organic compounds of characteristic type, and which belong to a class of substances that are most essential to life.

The nucleus is essential to the life, activity, and eventual survival of the C. It is intimately associated with heredity, growth, and C. div., and seems little modified in comparison with the diversity of form presented by the cytoplasm of C.s modified for special functions. C.s deprived of their nuclei may live at most for a few days, except for the red blood C.s (corpuscles) of mammals which are unique, even amongst the vertebrates, in being without nuclei when mature; perhaps consequently they live for a few weeks only, and are constantly replaced. In animal C.s, and in some plant C.s, a small granule, the *centrosome*, plays an important role in the div. of the C. It may lie either in a clear region near the nucleus, or actually inside it.

Differentiation. An animal or plant which consists of one C. carries out all the typical life processes—growth, digestion, excretion, reproduction, and often movement—within that one C.; it may even show more complex behaviour in capturing food particles, or swim by means of minute lashing filaments called *cilia* or *flagella*. This type of organisation is called *acellular*, or *non-cellular*, in contrast to the organisms of many C.s which are called *multicellular*. Except in the lowest multicellular forms, different parts of the organism are *specialised* for particular functions; there is a div. of labour amongst the C.s, and likewise a very delicately balanced system of co-ordination between them to achieve the overall functioning of the organism. The fertilised egg C. and the C.s derived from it by repeated div., present a generalised form even though their eventual tasks may be completely determined. But during embryology they *differentiate* into the many types of C., typical of their special roles, some developing contractile fibres and becoming muscle, elongating into nerve fibres, secretory gland C.s, and so on. The relation of these specialised forms to their function is included in *histology* (q.v.). For a description of particular cells see *MUSCLE* and *NERVE*.

Organisation of C.s into tissues produces a large number of characteristic C. types. It is thought that differentiation and specialisation involve also a loss of plasticity, in that the possibilities of regenerating lost portions of the organism decrease as the div. of labour increases; in the final instance only a limited ability to heal wounds is retained, and it is the least differentiated cells which take part in the process. Yet *de-differentiation* is possible, at least in lower forms; e.g. a small portion cut from a *Hydra*, and consisting of comparatively few C.s, which have differentiated, will de-differentiate to 'generalised' C.s, before reorganising themselves into a complete animal and differentiating again.

Growth. Following a period of increase in size, C.s multiply by direct div., or *amitosis* in which they constrict medially and ultimately separate, all their inclusions being reduplicated; they also do so by the more complex *mitosis* or indirect div. Here the centrosome divides, the 2 portions moving to opposite sides of the nucleus, whence they act as centres of attraction for the chromosomes, which divide, become more clearly visible, arrange themselves on a spindle of fine fibres between the centrosomes, and then move apart so that each new C. contains a complete set of chromosomes. Particular interest has been focused on chromosome div. in C.s, especially the div. which produces the germ C.s, because of the special role they play in heredity; for further details see GENETICS and HEREDITY. The relation of C. structure to heredity has given rise to the composite subject *cyto-genetics*. For bibliography see CYTOLOGY.

Cell, Voltaic, apparatus for generating electric current by chemical action. A simple form of C. may be arranged by partially immersing a plate of zinc and a plate of copper in dilute sulphuric acid. Little chemical action is at first apparent, but if the plates are connected by a strip of metal, a brisk action is set up, the hydrogen comes off at the copper plate, and a current flows through the connecting strip. In the liquid the current flows from zinc to copper, in the wire—the external circuit—from copper to zinc. The chemical action is the solution of zinc in the acid, forming zinc sulphate. Owing to the consequent weakening of the acid, the adherence of a hydrogen film on the copper, and its reaction with the zinc sulphate, which results in a deposit of zinc on the copper plate (polarisation), the current soon ceases. Various types of C. have been evolved to obviate or diminish the polarisation effect. In all these C.s the zinc rod or plate is the negative terminal for the external circuit. Any C. has internal resistance, and when current flows, this is equivalent to a counter e.m.f., $e = rI$, where r is the internal resistance.

Daniell's cell. A glass vessel contains a solution of copper sulphate, kept saturated by crystals placed on an annular shelf below the surface of the solution. A perforated copper cylinder stands in the solution, and within this a thin porous cylinder of unglazed earthenware; this contains dilute sulphuric acid, in which is placed a cylinder of zinc. The hydrogen produced by the action of the acid on the zinc combines with the copper sulphate; the sulphate used up is made good by the crystals. A Daniell's C. has an e.m.f. of about 1.08 V., and remains constant for some hours.

Grove's cell. This differs from a Daniell's C. in containing nitric acid instead of copper sulphate, and platinum instead of copper. It consists of a flat rectangular vessel, partly filled with sulphuric acid, a U-shaped zinc plate, a porous pot containing strong nitric acid and a thin platinum foil. The disengaged

hydrogen decomposes the nitric acid, giving off nitrous fumes. A Grove's C. has an e.m.f. of about 1.96 V.

Bunsen's cell. This resembles Grove's C., the platinum foil being replaced by a rod of gas-carbon. The C. consists of a glass vessel containing dilute sulphuric acid; within is a cylinder of amalgamated zinc; within that a porous vessel containing nitric acid and a rod of carbon. The e.m.f. is 1.91 V.

Bichromate cell. This consists of a zinc plate which slides up and down between 2 carbon plates dipping into a mixture of potassium bichromate and sulphuric acid, or chromic acid and sulphuric acid. This solution rapidly acts on the zinc, so that the zinc plate is clamped above the surface of the liquid when the C. is not in use. The e.m.f. is about 2 V., but falls off after a while; for short experiments where a moderately high power is required these C.s are useful.

Leclanché cell. This consists of a glass vessel about one-third full of a strong solution of sal-ammoniac. The negative pole is a rod of zinc placed in this liquid; the positive pole is a rod of carbon placed in a porous pot which is tightly packed with manganese dioxide mixed with carbon. The porous pot is sealed with pitch, only the top of the carbon rod projecting. The C. quickly becomes polarised, but with rest recovers of itself.

Dry cells are usually C.s of the Leclanché type, in which the liquid sal-ammoniac is replaced by a paste or jelly consisting of sal-ammoniac and some absorbent material. They are very convenient and portable, and are well adapted for electric pocket lamps.

Latimer Clark's cell. One form consists of 2 glass tubes joining to form a common trunk; the bottom ends are closed with a platinum wire sealed in each, and the common neck is closed with a ground-glass stopper carrying a thermometer. In one branch is mercury covered by a paste formed by mixing mercurous sulphate, mercury, and zinc sulphate, and in the other is an amalgam of zinc and mercury. Crystals of zinc sulphate are placed in both bulbs, and the whole vessel is filled with zinc sulphate solution. The C. is not economical, but it is remarkably constant in e.m.f., and was used as a standard C. before the Weston C. was developed.

Weston cell. Similar to the Clark C., but the zinc sulphate is replaced by cadmium sulphate and the zinc rod by an amalgam of cadmium. The present internationally accepted value for the e.m.f. is 1.01864 absolute practical volts at 20° C. This is for a C. constructed according to a strict specification. It was first introduced in 1892.

A C. of the above types gives a small current at a fairly steady voltage of 1–2 V. for a short time, sufficient to light a miniature lamp or work an electric bell system. Sev. C.s may be connected in series (the negative pole of one to the positive of the next, etc., Fig. 1), or parallel (all the positives together, all the negatives together, Fig. 2), for increasing

voltage or current respectively, or in mixed series-parallel batteries, for increasing both. Suppose the number of C.s grouped together in either system be n . The total e.m.f. in the series grouping is nE , the total battery resistance nr and

$$I = \frac{nE}{R+nr} = \frac{E}{\frac{R}{n}+r}$$

where R is resistance in rest of circuit.

In the parallel grouping the total battery resistance is r/n , and the e.m.f. is

that of a single C. Thus $I = \frac{E}{R+\frac{r}{n}}$.

FIG. 1

FIG. 2

See also ACCUMULATOR; ELECTROLYSIS, *Theory of voltaic cell.*

Cella, in Rom. architecture, the sanctuary or central portion of a temple, excluding the portico.

Cellaria, genus of polyzoans in the group Flustrina, which is typified by the genus *Flustra*. In appearance it resembles a seaweed, and it is common on Brit. coasts.

Cellarius, Christopher (1638-1707) (whose real surname was Keller), Ger. classical scholar, was a student at the univs. of Jena and Giessen. He had taught in 4 gymnasia, including that of Weimar, before he became prof. of hist. at the univ. of Halle in 1693. His many text-books, as, for example, his *Latin Grammar*, *Antibarbarus Latinus*, 1677, and *Latin Orthography*, 1700, did much to raise the fallen prestige of classical studies. Other of his manuals were among the first authorities on the Samaritan language.

Celle, Ger. tn in the *Land* of Lower Saxony (q.v.), on the Aller, 22 m. N.E. of Hanover (q.v.). It dates from 1292, and from the 14th cent. until 1705 was the residence of the dukes of Lüneburg-C., a branch of the House of Brunswick (q.v.). The former ducal palace, which contains a notable museum, is a Late Gothic and baroque building. There is an unct. church, which contains the tombs of Sophia Dorothea, the divorced wife of George I of England, and of Caroline Matilda, wife of Christian VII of Denmark. The tn has a famous stud (founded 1735), and manufs. dyes, foodstuffs, furniture, leather goods, soap, buttons,

and drilling machinery. The notorious concentration camp of Belsen (q.v.) was near by. Pop. 60,000.

Cellier, Alfred (1844-91), organist, conductor, and composer. With Sullivan he was a chorister at the Chapel Royal. He held various posts as church organist and theatre conductor and made his name with a number of operettas. Of his earlier works *The Sullian of Mocha* was the most successful, but he achieved his greatest success in 1886 with *Dorothy*, the libretto of which was written by C. B. Stephenson. He owed a good deal to his friendship with Sir Arthur Sullivan, but his writing is remarkable for its delicacy and pleasing melody. He composed settings of Gray's *Elegy* (for orchestra and chorus). *The Mountebanks*, libretto by W. S. Gilbert, was produced after his death, in 1892.

Cellini, Benvenuto (1500-71), It. artist, fortunately wrote his own life. It reads like the most extravagant of adventure tales. B. in Florence, he was expelled from his native city after being apprenticed to a goldsmith because of his implication in some civil broil. After living in Bologna, where he became an excellent flautist, he eventually arrived in Rome. Here he became a court musician to Pope Clement VII, made silver vessels of every description, and finally in 1527, according to his own account, actually killed with his own hand the Constable de Bourbon, who was attacking Rome, and later mortally wounded the Prince of Orange. A little while after he had been pardoned for slaying his brother's murderer, he killed by accident a rival goldsmith. But Paul III set him free in 1534, as he wanted some dies in the mint engraved. Later, being falsely accused of embezzling pontifical jewels, he was thrown into an oubliette of St. Angelo, escaped but was recaptured. The intercession of Cardinal d'Este alone saved him from death. His sojourn at the court of Francis I was cut short by his murderous attack on the plaintiff in a lawsuit. Finally C. returned to Florence, where he executed his famous bronze 'Perseus with the Head of Medusa' (in the Loggia dei Lanzi, Florence), under the patronage of Cosmo de' Medici. The merits of this masterpiece are such as to make it one 'of the most typical and unforgettable monuments of the It. Renaissance.' Of his many other works of art there have survived the famous silver salt-cellar of Francis I (now at Vienna), a medallion of his patron, Clement VII, and some gold medals. As an artist he has perhaps been overrated, and his designs are often weak, though his technical ability was beyond doubt. But his versatile genius, which made him at once a goldsmith, sculptor, and engraver, led him also to write as well as treatises on his crafts the work on which to-day his fame largely rests, his unique and diverting autobiography. J. A. Symonds, who trans. it into English, says that from its pages 'the Genius of the Renaissance, incarnate in a single personality, leans forth and speaks to us.' Here the author narrates with a frankness

that disarms the moralist the whole story of his amours, his passionate devotion to arts, his shameless self-worship, and self-assertion running into almost incredible extravagances, the devout complacency with which he could contemplate a well achieved homicide, and his alleged supernatural visions and angelic protection during adversity. See trans by F Nugent, 1771, 1812, T Roscoe 1822, 1904, J A Symonds, 1888, A Macdonell (Everyman's Library), 1903, R H Cust, 1910 also life by R H Cust, 1912

Cellular, or Areolar, Tissue, loose connective tissue consisting of fibres running

relatively unimpeded, and C therefore must be regarded as a potentially serious condition. C. commonly arises from an incompletely localised septic focus such as a septic wound, a boil, or infected sting or bite. Or may also arise from an infection of an internal organ. *Pelvic C* is caused by spread from an infection of one or other of the pelvic organs. Complete rest, heat, appropriate chemotherapy and draining of pus when present is the treatment of C.

Celluloid, Xylonite, or Pyroxylin Plastic, artificial colloid prepared from a mixture of nitrocellulose with camphor. It was

SALT CELLAR OF FRANCIS I BY OFFLINI

in all directions and forming meshes called areolas. There are 2 kinds of fibres white fibres which are soluble in boiling water to form a solution of gelatin, and yellow elastic fibres insoluble in hot water. In the spaces of this tissue are found lamellar cells flattened cells usually attached to bundles of white fibres plasma cells not flattened, granular cells packed with deeply staining granules and leucocytes which have left the blood capillaries. It is the commonest connective tissue in the body being found in the skin and also covering all the internal organs.

Cellulitis, diffuse inflammation of the interstitial tissue. When near the surface of the body, C presents the classical signs of inflammation—redness, tenderness, and swelling. Nearly always infective in origin, C, as its definition implies is not confined within the limiting boundaries of any one organ or defined group of tissues. Its spread through the loosely packed cells of the interstitial tissues is

first prepared in 1856 by Parks and Spill in England but the improvements in the manu introduced by Hyatt, of Newark, New Jersey, revolutionised the industry and made it predominantly American. The name Xylonite is given it by the leading Brit manufacturers, Brit Xylonite Co. The nitro-cellulose is first made from substances composed essentially of cellulose, such as rags or, more particularly, tissue paper. Shreds or strips of the latter are steeped in a combined bath of sulphuric and nitric acids of such composition as not to produce the explosive gun cotton. Nitro-cellulose is thus produced, and great pains are taken to extract the excess of acid, the presence of which produces deterioration in the final product. This is done by thorough washings, and the water is either pressed out by hydraulic pressure or replaced by alcohol. Drying by heating would be too dangerous owing to the risk of explosion. The next process is to break up the cakes of nitro-cellulose

and add to it camphor dissolved in ethyl alcohol in the proportion of 2 of nitro-cellulose or pyroxylin to 1 of camphor, and mix the whole thoroughly up in a kneader. In some cases flake camphor is added to the pyroxylin and the mixture in boxes sprinkled with alcohol until it settles down into a dough. At the same time colouring substances and a fixing compound are added, and the whole is made homogeneous. It is then rolled and worked in heated rollers and pressed by hydraulic pressure machines, and a cake produced of the material containing a quantity of the liquid solvent, which must be removed by keeping the substance in a heated room for prolonged periods. When all is removed shrinking has occurred, and the substance is ready for working in various processes. C. is buff in colour, but may be bleached by means of bleaching powder or other bleaching agent, and can also be made transparent in various colours. It is coloured by mineral colours, while coal-tar dyes are employed for colouring the transparent varieties. In the latter there is more need of a stabiliser or fixing compound than in the other varieties, since the generation of acid is more liable to cause deterioration. A substance is required that reacts with this acid to give products of reaction that will be harmless to the material, and it is found that compounds of urea serve this purpose very well. C. brought in contact with a flame burns more rapidly than paper, camphor distils off, and a good deal of free carbon is evolved. There is always a slight odour of camphor about it, except in the very best produced, especially when it is scratched. Non-inflammable C. has not yet been developed with sufficient success to become a commercial product. It is non-explosive at ordinary working temps. and is plastic at 75° C. Its hardness and elasticity at ordinary temps., together with its invulnerability, have led to its wide application in articles of daily use. Thus, for knife handles, piano keys, combs, and mirror backs its use is general, and its ease in working up has led to the imitation of such natural products as ivory, horn, and bone. Imitation marble is made by pressing together plates of differently coloured material, while imitation tortoise-shell can be and is much produced by pressure and heat on yellow plates between yellow coloured with brown. In recent years C. has been largely displaced by such modern plastics as bakelite, nylon, perspex, etc.

Cellulose, organic substance secreted by the protoplasm to form the primary cell-wall of plants, though not essentially present in all successive layers of the cell-wall after thickening has taken place. It is a carbohydrate, with a polymeric molecular structure, formula $(C_6H_{10}O_5)_n$; its characteristic reaction is that it turns blue when treated with sulphuric acid and iodine. Although noted for its insolubility, C. is dissolved by an ammoniacal solution of copper oxide without change, and by various bases such as tetra-ethyl-ammonium hydroxide, and by alkali

carbondsulphides, the basis of the viscose rayon process. Soaked in strong nitric and sulphuric acid, gun-cotton is obtained from C. Boiling with dilute hydrochloric or sulphuric acid for a long period converts C. into glucose. It is used in the manuf. of paper, collodion, rayon, plastics, and explosives, being obtained from wood pulp, cotton, and other plant resources. It enters into human diet in vegetable matter, but is not so easily digested by humans as by ruminating animals.

Cellulose Acetate is a substance formed by treating purified cellulose, in the form of cotton or bleached cotton linters, with acetic anhydride in the presence of sulphuric acid. It is a pale yellowish, transparent, non-inflammable mass and can be prepared in 3 chief forms:

soluble in alcohol, insoluble in water;

insoluble in water;

insoluble in water, alcohol, and ether. The first manufacturing process for C. A. was patented in 1894 by C. F. Cross. Miles in 1905 improved the quality of the product by introducing the process known as ripening, while the research work of the brothers Dreyfus during and since the First World War has resulted in the development of the acetate-silk industry. (See ARTIFICIAL SILK.) The C. A. as prepared on the commercial scale is a mixture of sev. acetate compounds. It is precipitated with water in the form of flocks, washed free from acid, dried, and dissolved in acetone. The resulting clear viscous solution is filtered and delivered to spinning machines. Amongst its uses are aeroplane dope, non-inflammable films, lacquers, and non-shatterable glass.

Celosia, tropical and temperate genus of Amaranthaceae, cultivated in England on account of the curious inflorescence, which is crested and flattened, and gives the plants the popular name of cockscomb. This appearance is due to the monstrous condition of the floral axis which has now become a common characteristic of the plants through cultivation. *C. cristata*, the common cockscomb, and its varieties, natives of tropical Asia, vary in height from 6 in. to 2 ft, and the colours from red to white.

Celsia, genus of Scrophulariaceae, known to Asia, Africa, and the Mediterranean. The flowers are 4-stamened and in racemes. *C. orientalis*, an annual, and *C. cretica*, a biennial, are hardy; *C. arcturus*, a shrubby perennial, makes a good pot plant.

Celsius, Anders (1701-44). Swedish astronomer, b. Upsala. He was prof. of astronomy in the univ. in his native town from 1730 to 1744. In 1733 while in Nuremberg he pub. original observations of the aurora borealis. He invented the centigrade thermometer (q.v.) in 1742 and marked the boiling-point of water 0° and the freezing-point 100°. A colleague, Martin Stromer, 8 years later inverted

the scale. For the centigrade degrees see METROLOGY.

Celsius, Magnus (1021-79), Swedish astronomer, b. Alfta, Helsingland. He was a prof. of mathematics and astronomy at Upsala, where he discovered the Helsing runes (q.v.) and deciphered them. He d. at Upsala.

Celsius, Olaus (1670-1756), son of Magnus C., b. Upsala. He held the post of prof. of theology and oriental languages at the Upsala Univ., and was also a provost of the cathedral. He was a great botanist, and author of *Hierobotanicon*, a work on the plants mentioned in the Bible. He was the patron and instructor of Linnaeus (q.v.).

Celsius, Olof, the Younger (1716-94), Swedish historian and poet, b. Upsala. He became prof. of hist. at Upsala Univ. in 1747. Later he entered the Church and in 1777 was made Bishop of Lund. He was one of the original members of the Swedish Academy. He wrote, among other works, a hist. of Gustavus I (1746-1753), and a hist. of Eric XIV (1774), and was famous for his brilliant style and keen criticism.

Celsus (c. AD 178), one of the earliest opponents of Christianity, lived during the reigns of the Antonines, and is believed to have been a friend of Lucian. He was the author of *The True Account* (*Alēthēs logos*) about nine-tenths of which has been preserved for us in fragments by Origen, who undertook to refute C.'s arguments, and did so in his work, *Contra Celsum* (AD 248). The heathen's attitude is not that of a philosopher, but rather that of the man of the world whose religion is mere agnosticism, and who has brilliance without depth. He upbraids the Christians for their absurd credulity, their party schisms, their exorcism of demons, and for the disreputable character of their proselytes, who are rogues, poisoners, thieves and idlers, women and slaves. See L. Rongier, *Celse*, 1925.

Celsus, Aulus Aurelius Cornelius (25 BC-AD 50), Lat. writer on medicine and surgery. He wrote sev. works, of which only one remains entire, his treatise *De Medicina* in 8 books. Books i and ii deal principally with diet and principles of therapeutics and pathology; iii and iv with internal diseases; v and vi with external diseases and pharmaceutical preparations; and vii and viii with diseases calling for surgical treatment. His method in dealing with disease is apparently to allow nature to take its own course, though he also advises a free use of the knife on occasions. His treatise on surgery points to the fact that many of the most delicate and serious operations were performed in his time. The *De Medicina* was one of the first medical books to be printed (1478) and has since been pub. in over 100 eds.

Celsus, P. Juventius, Rom. jurist, son of a jurist, Juventius C. (c. 67-c. 135, or about the year when Hadrian d.). Was accomplice in a conspiracy against Domitian along with Nerva and others, but contrived to exculpate himself and his companions. Subsequently he was

highly favoured by Nerva and Trajan. He was praetor at some time and twice consul; the date of the first is not recorded, though the second is said to have been AD 129. He was a friend of Hadrian. Only fragments of his legal commentaries are extant. Among these are a digest of 39 books, 7 of which are a commentary on the *Lex Julia et Papia Poppaea* (prohibiting the marriage of senators and freedwomen and all freeborn with actresses or women of openly bad character) an attempt (with other *leges* of a similar kind) to restore virtue to private life by a system of rewards and penalties. In these fragments there are sev. passages which betoken great self-confidence and dogmatism: for where most jurists prefix their opinions with a *videtur* (or as we should say, 'it is submitted that, etc.') C. stated his opinions unreservedly. But that he was an eminent jurist is shown by the fact that he is so often quoted by many of the most famous jurists of a later time—Pomponius, Ulpian, Paulus, and Maelianus.

Celt (from Low Lat. *celtis*, a chisel) has been used by both Eng. and Fr. archaeologists to designate the stone and bronze axe-heads used by the primitive peoples of Europe. The normal length of a stone C. is 7 in., but it varies from 1 to 20 in.; a bronze C. may be 10 in. long, but is usually 5 to 6. The better bronze C.s often had a socket or hollow for the handle. C.s served also as chisels, adzes, etc., and were superstitiously regarded as 'thunderbolts,' or as implements endowed with strange curative powers. See CELTS.

Celtiberi, powerful race of ant. Spain, said to have sprung from the intermarriage of the Iberians, who probably reached Spain during Neolithic times, and Celtic invaders from Gaul. They inhabited an inland dist. (approximately the present SW. of Aragon and N. and E. of Castile). Celtiberia, however, was often used to include country right to the Guadalquivir's sources. Subdued by Hannibal, they served as Carthaginian mercenaries against Rome, later becoming Rom. mercenaries. T. Sempronius Gracchus subdued their country, 179 BC, but they were always rebelling. Finally, Scipio Africanus conquered them by the destruction of Numantia (133). They joined Sertorius later, but after his death (72) became quite Romanised.

Celtic Languages. In historical times the C. L. were the most W. linguistic group of the Indo-European (q.v.) linguistic family. The earliest direct sources regarding these languages come from classical authors and inscriptions belonging to the first cents. of the Christian era, while the earliest glosses and short literary texts belong to the 8th cent. AD. Thus they are far more recent than the linguistic remains of the Hittite, the Indo-Iranian, the Gk. and Lat. languages, and even more recent than early Gothic and Armenian texts, but older than Slavonic and Baltic.

However, indirect sources, such as names of persons and places, help us to reconstruct the early hist. of the Celts.

Until the 6th cent. BC they inhabited the main part of W. Germany and N. Gaul; but in the course of time they were in possession of the Brit. Isles, the whole of Gaul, a great portion of Spain, N. Italy, the Balkan Peninsula, and part of Asia Minor. But their direct linguistic influence was minimal. In time the Celtic ter. became vastly reduced, and from the 11th cent. onwards C. L. were spoken only in some portions of the Brit. Isles and NW. Gaul.

In its linguistic relationship with the other Indo-European branches the Celtic group occupies a mediate position between the Italic and the Germanic languages.

C. L. may be subdivided into (1) Continental Celtic, or Gaulish, represented by sev. inscriptions, such as the Graufesenque Graftite, the Coligny Calendar, and the Vienna Glossary; (2) Goidelic, including Irish, Scottish, Gaelic, and Cornish; and (3) Brythonic or Cymric, including Welsh, Breton, and Cornish. It is often asserted that the C. L. left no trace in modern English, having disappeared with the reputed extermination of the Celts. The best authorities concur in seeing abundant traces. The very idiom 'I am speaking' is Celtic, and is impossible of an exact rendering in any continental tongue; the employment of the auxiliary 'do' as an intensive is another common illustration of a distinctive Celtic idiom, and corresponds to the Gaelic *dean*. Whether or not Celtic is doomed to disappear as a spoken language, nothing can destroy its imperishable influence on literature. So great an authority as Matthew Arnold declared that rhyme, the most striking characteristic of our modern poetry as distinguished from that of the ancients, is a direct legacy of the Celts, and in this opinion he is confirmed by Zeuss, the most distinguished of Ger. Celtic scholars. Celtic was the common language of the greater part of the Brit. Is. before the Rom. invasion. It has been observed that even at the Norman Conquest the great majority of the Eng. people were Celts, and that the stereotyped belief in the virtual extermination of the Britons, resting as it does on the sole authority of Gildas, as echoed by Bede, is not wholly correct. If this objection is accepted, many philological difficulties disappear, and it is probable that the etymologist Mackay is justified in assuming an unlimited blending of Celt and Saxon reflecting itself in the language, literature, and national character of the English. Certain features of Celtic are found in the colloquial speech of the Eng. people of to-day, and also underlie the Fr. and Sp. and some It. dialects. The 'Low Latin' of the Middle Ages, so beloved of law books, is often a compound of Celtic words with Lat. terminations. Even the word *Angle* in the race appellation A.-S. is by some scholars regarded as a corruption of *An Gael*, or 'the Gael.' These and similar indications are the best possible refutation of Dr Johnson's assumption that Celtic was the rude speech of a barbarous people, who had few thoughts to express, and that, such as it was, it

was never a written language. See also IRISH LANGUAGE AND LITERATURE and SCOTTISH GAELIC LANGUAGE AND LITERATURE. See W. Stokes, *Urkeittischer Sprachschatz*, 1894; A. Holder, *Altkeittischer Sprachschatz* (3 vols.), 1896-1911; H. Pederson, *Vergleichende Grammatik der keittischen Sprachen* (2 vols.), 1903-13; G. Dottin, *La Langue gauloise*, 1920; L. Weigert, 'Die Sprache der Festlandskelten,' *Berichte der röm.-germ. Kommission*, 1931; H. Lewis and H. Pederson, *A Concise Comparative Celtic Grammar*, 1937.

Celtic Ornament, which grew out of the Iron Age decoration in the Brit. Isles, may, for historical purposes, be divided into 2 periods: the pre-Christian, extending from 250 BC to AD 600, and that which followed the introduction of Christianity, and attained its highest excellence in the 11th or 12th cent. In the earlier stage the metal most commonly used was bronze, and the chief fields of decoration were shields, scabbards, bracelets, harness mountings, and horse trappings. Repousse work (q.v.) of low and high relief, done on thin plates which were afterwards riveted into position, has been found throughout the Brit. Is. in the beds of rivers and lakes, in earth houses, crannogs, and grave mounds, where also other products of Celtic art are constantly being found. Sometimes the repousse design is enriched by champleve, enameled of yellow, blue, green, and red, or by patches of coloured vitreous pastes. This is the case with a unique oval bronze shield, rescued from the Thames, on which there are 27 settings of red enamel. During these early cents. the Celtic artists depended on divergent spirals and elliptical curves for their designs, engraved lines or dots like a diaper filling up the pattern, which thus showed up against the plain groundwork. Many fresh elements of ornament, such as fretwork, with involved patterns, diagonal frets, and oblique lines, interlaced work, and diapers of I- and Z-shaped designs, were added as further embellishments when paganism gave way before the new religion. And, further, there were new bells, croziers, shrines, churches, and above all the MSS. of the gospels and psalters as fresh openings and encouragement for the Celtic artist. Some Byzantine influence may be traced, but artists had evidently much recourse to the earlier patterns of Celtic metalwork. The Book of Kells in Trinity College, Dublin, and the Lindisfarne Gospels in the Brit. Museum, with their beautifully illuminated pages, their elaborated patterns of an almost inexhaustible variety, offer the finest illustration of the art of this period. But the enamelled metalwork which still flourished is nobly represented by the Ardagh Chalice; and the Tara and Rogart Brooches and the Cross of Cong are fine examples of filigree and chasing work in gold and silver.

Celtis, Konrad (1459-1508), Ger. humanist, b. Würzburg; studied under Rudolph Agricola at Heidelberg, where he founded a literary society. In 1486

he pub. *Ars Versificandi et carminum*, which led to his appointment as first poet laureate of Germany. In 1497 he accepted the chair of poetry and eloquence at the Collegium Poetarum et Mathematicorum, Vienna. C. discovered in the convent library of St Emmeran at Regensburg the writings of Hrosvitha of Gandersheim, which he pub. in 1501. His works also include *Amores*, 1502, and *Oldae*, 1513, ed. by F. Pindtor, 1934 and 1937 respectively.

Celts, generic name of an anct people, the predominant element in central and W. Europe before the rise of Rom. power and the influx of Ger. tribes. Great confusion has resulted from inaccurate use of the words Celt and Celtic. The dark-complexioned people of France, Great Britain, and Ireland have been called Black C., while the tongues of the races of W. Scotland and Ireland are commonly termed Celtic. More properly they are Gaelic. Anct writers never used the word of dark peoples. The Celtic characteristics were great stature, fair hair, and blue or grey eyes. All fair-haired peoples N. of the Alps were called *Celtor*. Physically there were 2 main groups closely allied: Scandinavians (Teutons in modern writers), and peoples of France, Switzerland, and Italy (Celtic or Alpine race), standing midway between the Teutonic and the Mediterranean race (dark). C. appear to have settled in Gaul between 1200 and 700 bc. Some had dwelt in the Alps and the Danube valley from the Stone Age. Others passed into Italy in the Bronze Age. In the 6th cent. bc they spread into Spain, and from intermarriage with the native Iberians in the N.-central parts were called Celtiberi (q.v.). About the 4th cent. bc a great wave of C. invaded Italy, occupying Rome after the battle of the Allia, 390 (Livy, v. 34). Bought off, they retired to Sena Gallica. The Bituriges (a name still surviving in Berri) were the chief tribe. Others were the Arveni, Senones, Ambarri, and Aedui. These Gauls are often also called Cimbri. The most dreaded tribes came from the Baltic and the N. Ocean; hence the peoples now called Teutons were named C. The height of their power was about 400 bc. In the 3rd cent. they had spread as far as Greece and Asia Minor. Their raids were the terror of antiquity, but Caesar and Augustus reduced them to inactivity. Under the latter Galatia, where numbers of C. had settled, became a prov. They founded no lasting state alone and preferred a pastoral to an agric. life. Their strength made them formidable foes, but they lacked discipline. Cato described them as 'devoted mainly to warfare and witty conversation.' In the Brit. Isles they remained independent for cents. These is. C., who were but colonists, were far less civilised than the continental C. During the 400 years after Caesar's expedition to Britain they became closely allied with their Rom. conquerors. They wore a sleeved blouse and trousers, fitting close to the ankle, with a tartan plaid across

the shoulder fastened by a brooch, much like the costume of highlanders in Queen Anne's time. They often had gold or bead ornaments, and enamel on their armour. The C. of Gaul and Belgium wore plated armour or chain-mail coats. They could work various metals (copper and iron), and discovered bronze. Among their weapons were swords, daggers, bows, pikes, slings, and javelins. They used 2-wheeled chariots in war with a bronze scythe projecting on either side, and were exceptionally good seamen. They had Druids, or priests, who performed magical ceremonies, which survived in the forms of the 'ordeal,' augury, exorcism, etc. The clan system was deep-rooted. They had musical, poetical, and literary tastes, and were distinguished for dramatic talent. The group of languages which are commonly known as Celtic belong to the Indo-European family. They now comprise Welsh, Breton, Irish and Scottish Gaelic, and Manx. Cornish has died out. See also MYTHOLOGY and RACE. See J. Beddoe, *Celtic Races of Britain*, 1885; W. F. Skene, *Celtic Scotland*, 1886-1890; A. H. Keane, *Man, Past and Present*, 1899; J. Rhys, *Celtic Folklore*, 1901; D. Mathew, *Celtic Peoples and Renaissance Europe*, 1933; H. Hubert, *The Greatness and Decline of the Celts*, 1934; V. C. Child, *Prehistoric Communities of the British Isles*, 1940; J. A. MacCulloch, *The Celtic and Scandinavian Religions*, 1949.

Celyphus, genus of dipterous insects which resemble little beetles rather than 2-winged flies, on account of the enlarged scutellum which hides the reduced abdomen. *C. abjectus* inhabits Java. *C. scutellatus* the E. Indies.

Cement, material used for binding surfaces together or for uniting particles in one mass. The chief kind used for building purposes is *Portland C.*, which consists of various aluminates and silicates of calcium, formed by heating chalk or limestone with clay. It was invented by Joseph Aspdin, of Leeds, in 1824, and was first developed on the lower reaches of the Thames and Medway, where mud was plentiful; this locality still produces most of the C. made in Britain. The process of manuf. has 3 stages: (1) the preparation of the raw materials; (2) calcining the clinker; (3) crushing and grinding to give the finished product. Two alternative processes, the wet and the dry, are in use. In the wet process, the materials are mixed in a wash mill, which consists of a basin of brick or masonry with a masonry pier in the middle. On the latter is fixed a vertical revolving shaft to which horizontal arms are attached. From these hang harrows or vertical iron bars which dip into the materials mixed with water and rotate with the shaft. This thoroughly mixes up the sludge and breaks up any of the lumpy parts. The product is known as slip or slurry and passes out of the mill through a grating of such div. as to let pass any particles under a certain fineness. Stones accumulate at the bottom of the mill basin and can be easily removed, while any hard lumps of chalk must be ground by rollers. In the dry

process, the materials are crushed and dried before mixing. After either of these processes the material is ready for calcining, generally in a rotary kiln. This consists of a long cast-iron tube, lined with firebrick and slightly inclined to the horizontal. The slurry or dry powder enters at the upper end and the fuel, usually coal dust, at the lower end, borne by the draught. The kiln rotates slowly, and the calcined clinker emerges at the lower end. The final process, the grinding of the clinker, is performed in 2 stages, coarse grinding and fine; the resulting

such as breakwaters, piers, sea-walls, etc. The nodules consist of about 20 per cent of silica and 15 per cent of alumina. They are calcined to drive off the carbon dioxide and ground fine.

Keene's C. and *Parian C.* are types of plaster (q.v.) based on gypsum. Another class is the magnesium oxychloride or *Sorel's C.s.*, formed by the reaction between magnesium chloride, water, and prepared magnesia. Mixed with fillers such as wood-flour, cork, sand, asbestos, ground limestone, etc., they are much used for flooring. See also ADHESIVE. See

Cement Marketing Board

A GROUP OF SLURRY MIXERS

powder is so fine that about 9/10ths of it will pass through a 170-mesh sieve (i.e. one with 28,900 holes to the sq. in.). Tests and quality requirements to be satisfied by various classes of Portland C. are laid down in Standard Specifications.

High-alumina C. may sometimes be used where Portland C. would be unsuitable, as when concrete is required to gain strength very rapidly after being placed, or when concrete foundations have to be laid in certain chemically aggressive soils. *Roman* or *Parker's C.* was unknown to the Romans, being invented in 1796. It was much used before the invention of the cheaper and stronger Portland C. It is prepared from the nodules known as septaria which are found in shale, especially in the Isle of Sheppey and its neighbourhood. It is similar to hydraulic lime, being quick in setting, and owing to the fact that it sets rapidly under water was used extensively in hydraulic works,

F. M. Lea, *The Chemistry of Cement and Concrete*, 1956.

Cementstones, name given geologically to argillaceous limestone, particularly suited to the manuf. of cement. C.s. occur in the Tertiary London Clay, but are best developed, in the Brit. Isles, in the Lower Carboniferous rocks of N. England and of Scotland as the C. Group, a subdiv. of the Calciferous Sandstone Series (q.v.). This group, deposited in inland lakes or arms of the sea, formed between fresh-water deposits of the Old Red Sandstone and younger marine Carboniferous sediments. It makes an excellent building stone, much used in Edinburgh.

Cemetery (from the Gk *koinotérion*, a sleeping-place), piece of ground which is specially set apart for the burial of the dead. The name was originally given to the underground burial-places of the Romans. The Greeks always made their

C.s. outside the cities, and the Romans placed their tombs generally by the side of the public roads. In the early ages, the Christians used to hold their religious ceremonies in the C.s, and it is believed that this fact brought about the practice of always consecrating the ground that was to be used for the dead. In modern times it has become the rule for each sect or denomination to have its own burial-ground, and each C. is consecrated according to the formula peculiar to the sect to which it belongs. Sometimes one C. is allotted to various denominations for the convenience of everyone living in that dist. See also BURIAL ACTS and BURIAL CUSTOMS.

Cenchreæ: 1. (Now Kenkri) was a city on the E. side of the isthmus of Corinth in the Peloponnesus. It was from this port that St Paul embarked when he left Corinth for Jerusalem.

2. Also the name of an anct Gk settlement in the Troad, probably situated some distance N. of Eneke in the plain of Baitramich (NW. promontory of Asia Minor).

Cenci, Beatrice (1577-99). It. girl whose fame rests on the tragic and sordid character of her family hist. She was the child of Francesco C., a wealthy, passionate man, who proved a dissolute liver and a harsh father. She was involved in a plot to murder Francesco, who was assassinated whilst he slept, and after torture and confession was beheaded with her mother in 1599. Shelley's magnificent tragedy, *The Cenci*, is historically inaccurate, but has nevertheless made Beatrice one of the most heroic and tragical of women. Modern research has revealed her in a somewhat different light.

Cenis, Mont (It. Monte Cenisio), Alpine peak (11,792 ft) and pass (6893 ft) between France (Savoie) and Italy (Piedmont). The famous Mont C. tunnel (opened in 1871) is not really under the pass itself, but lies below the Col de Fréjus, some 15 m. W.; it is 7 m. long. The railway runs from Chambéry to Susa (qq.v.), via Modane and Bardonecchia. The carriage road, built by Napoleon between 1802 and 1810, goes from Lanslebourg to Susa. The Little Mont C. (7166 ft), to the SW., connects the main pass with the Étahe valley on the Fr. side. The Mont C. pass is said by some to have been used by Hannibal (q.v.).

Cenisio, Monte, see CENIS, MONT.

Cennini, Cennino, It. painter of the late 14th to early 15th cent., b. Colle di Valdelsa, worked with Agnolo Gaddi at Florence. He is of importance as the author of a famous treatise on painting, his *Trattato della Pittura* (Eng. trans. ed. by Mrs Herringham, 1899), which details the methods and precepts of the school of Giotto and gives an early account of the oil-painting technique.

Cenomani, offshoot of the Auleri, a people who inhabited Gallia Celtica, an anct div. corresponding to the modern Maine in the dept of Sarthe. This people helped Vercingetorix in the rising against Cæsar in 52 bc, and constituted under Augustus a *civitas stipendiaria* of Gallia Lugdunensis. They were allies of Rome

in the Gallic war (225 bc) and in the second Punic war, but they helped the Gauls in their revolt under Hamilcar (not the father of Hannibal) and only finally submitted to Rome following their defeat by Gaius Cornelius (197 bc).

Cenomanian, name applied to lower part of the Upper Cretaceous, notable for a widespread transgression of the seas over what had been land. The Lower Chalk of Britain was laid down in C. times.

Cenotaph (Gk *kenos*, void; *taphos*, a tomb), monument or memorial stone to the memory of a person whose body lies

D. McLeish

THE CENOTAPH, WHITEHALL, LONDON

elsewhere. C.s are very common for drowned persons. An added significance attaches to the word since the First World War. In England, the *C. par excellence* is that which stands in Whitehall, London, near the end of Downing Street. The architect was Sir Edwin Lutyens, who drew up the plans overnight and submitted them to the gov. the next morning. The design is of striking simplicity, and has an air of dignity seldom found in such memorials. The original C. was a temporary structure made of wood, erected hastily for the peace procession on 19 July 1919. In 1920 it was decided that the temporary structure should be demolished and a permanent one erected on the same site. This gave rise to much criticism in the press; it was considered that the site was unsuitable owing to the busy traffic at this spot, and that the monument should be placed on one of the grass plots in Parliament Square near the Houses of Parliament. The original view, however, prevailed, and no traffic

problem has arisen. As the memorial is to all who d. or were killed in the First World War and who lie buried in every theatre of war, irrespective of creed, denomination, or belief, a purely Christian inscription was out of place. It was therefore decided to inscribe on it the words 'TO OUR GLORIOUS DEAD.' It was intended that the flags upon it should be of stone, the colours being impregnated by a new process. This, however, was not carried out, and 3 bunting flags fly on 2 faces of the memorial. It is still the general practice of all male civilians to uncover their heads in passing the C. out of respect for the dead who gave their lives in the two world wars. On the Sunday nearest the anniversary of the signing of the Armistice (11 Nov.) a mass memorial service is held at the C. in which the royal family, the gov., and representatives of all important bodies, etc., participate. The service was, however, omitted during the war years 1939-1945. A new inscription to commemorate the dead of the Second World War was unveiled by King George VI on 11 Nov. 1946.

Censer (Lat. *incendere*, to kindle), vessel for the burning of incense. Also called a thurible.

Censor (Lat. *censere*, to assess, estimate): 1. Originally the name of 2 Rom. officials, first appointed in 443 bc. Till 351 only patricians were C.s; the plebeian Marcus Rutilius was elected in that year (Livy, vii. 22). In 339 Lex Publilia enacted that one must be a plebeian. In 131 both were plebeian for the first time. C.s were elected on the same day in Comitia Centuriata, with a consul presiding. The term of office, at first 5 years, was later limited to 18 months. This magistracy was considered the highest dignity in the state, except dictatorship. The chief duties were three: (a) the original taking of the census, or register of citizens and their property (held in the Campus Martius); (b) the *regimen morum* (regulation of morals), most dreaded of all their powers, this superintendence gradually spreading to private as well as public life; (c) administration of the state finances, including regulation of *tributum* (property tax) and of *vectigalia*, which were usually leased out to speculators (*publicani*, 'farmers' of the taxes). Only his colleague's *intercessio* (veto) could overrule a C.'s decisions. They could degrade men from or promote them to the rank of senator or knight at choice, until Sulla's legislation, 81 bc. They might class citizens with *aerarii* with no vote. They introduced various sumptuary laws. In 338 they drew up the list of senators (*lectio senatus*). In 265 a law forbade re-election to censorship. Their dreaded stigma, *nota censoria*, might be affixed to any name on their lists, but the successors of 1 pair of C.s could remove it. Augustus exercised censorial powers himself as consul (8 bc and ad 14). Claudius, Vespasian, and Domitian revived the office. Trajan and later emperors acted as C.s without actually assuming office.

2. Name now extended to one who

controls or censures the action of others; to critics of literary or artistic work, and judges appointed by a gov. to examine plays or songs before their publication. It is also the title of the official head of non-collegiate students at Oxford and Cambridge. The C.s of the Royal College of Physicians grant licences.

3. See PSYCHOANALYSIS.

Censorinus (3rd cent. ad), Rom. grammarian, author of a lost work *De Accentiis*. He also wrote *De Die Natali* (ad 238), which is dedicated to his patron Q. Caerellius. This work is extant. It deals with a variety of subjects ranging from the natural hist. of man to astronomy, chronology, and mathematics. See the critical ed. of O. Jahn (1845).

Censorship, see INDEX LIBRORUM PROHIBITORUM; LITERARY CENSORSHIP; PRESS, FREEDOM OF THE.

Censorship, Film, Britain. In 1912 the British Board of Film Censors was set up by the film industry itself. All films except newsreels are viewed and passed out or cut under U, A, and X gradings. 'U' films may be seen by general audiences; 'A' films may be seen by children under 16 only accompanied by an adult; and 'X' films may not be seen at all by anyone under 16. A small number of films are banned. In 1921 the Middx Co. Council inserted a clause in its licence that no film might be shown in its area without a certificate from the Board of Film Censors. Soon after, all the local authorities in the country accepted this condition, reserving the right, however, to pass a film banned by the board or to ban a film passed by the board.

France. Fr. censorship operates under the Ministry of Information through a commission made up of representatives of various gov. depts. Visas are issued by the ministry; the commission always advises at script stage. Subtitles or dubbing scripts for exported versions also require visas. Classification is twofold—adults 16 and over and general audiences.

Italy. Censorship in Italy is official and is a function of the Ministry of Tourism, Entertainment, and Sport, on whose behalf a censorship committee issues visas. No film may be shown without a visa. Classification is twofold—adults 16 and over, and adults and children. The censorship does not read scripts or give advice during production. In addition to the official censorship there is of course widely influential Church control and many cinemas undertake to recognise Church pronouncements on films.

United States of America. Control of films in the public interest depends almost entirely on voluntary acceptance by the industry of the production code which is operated by the Motion Picture Association of America. When a film is approved it receives a M.P.A.A. seal, and the number appears on the credits. There is no law against the showing of films without a seal, but wide public showing is difficult without it.

Censorship of the Drama, power that originally sprang from the royal prerogative. The C. of the D. has existed

ever since the rise of the Eng. drama in the period of the Renaissance. In the time of Henry VII court entertainments were supervised by a master of the revels, and from that date to the middle of the 17th cent., when all theatres were suppressed by law, playwrights were subject to the control of either the master of the revels or the court of Star Chamber. According to writers on the constitutional hist. of England, it is not certain at what date the lord chamberlain first began to exercise a direct control over plays, but as early as 1628 he either personally or through his subordinate, the master of the revels, licensed and exercised a general control over dramatists. From being an emanation of the royal prerogative his powers ultimately, in 1737, became statutory. The object of the Act of 1737 was mainly political, a fact which was sufficiently indicated by the preamble to the Act, which recited that its purpose was to restrain the political and personal satire which was then prevalent on the stage, which the gov. of the day found embarrassing, and which the censorship as it then existed was found ineffective to curb. On the passing of this Act the lord chamberlain appointed a licenser or examiner of plays, with a salary of £400 a year, and that office has continued in spite of criticism down to the present time. The Act of 1737 conferred an unfettered power of veto on the lord chamberlain, and it was only when the Theatres Act, 1843, was passed that the legislature gave any indication of the principle on which the veto was to be exercised. Under the Theatres Act the lord chamberlain has (1) power to prohibit the performance of unlicensed stage plays anywhere; (2) power to license theatres in certain places; (3) a practically arbitrary right to ban any stage play which in his opinion is contrary to 'good manners, decorum, and the preservation of the public peace,' words which the joint committee of 1909 characterised as vague, and 'the only existing statutory authorisation' of this particular aspect of the lord chamberlain's powers. Under this Act every new play and every addition to an old play must be sent to the lord chamberlain by the theatre manager who proposes to produce it at least 7 days before it is intended to be performed, accompanied by a fee for perusal of not more than 2 guineas. Plays written before the Act are exempt from the lord chamberlain's veto. The lord chamberlain has local jurisdiction to licence all theatres in the cities of London and Westminster, in Finsbury, Marylebone, the Tower Hamlets, and also in Windsor and other places where there is a royal residence. The co. councils license places to be used in their cos., and the univ. authorities of Oxford and Cambridge have a veto as to the performance of plays within their respective jurisdictions.

The C. of the D. was hardly likely to go unchallenged in the progress of time. But until comparatively recent years opposition to it was of no very open or sustained character, and 3 joint com-

mittees pronounced in favour of its continued existence.

The year 1908 and succeeding years saw a remarkable manifestation of hostility to the C. of the D. on the part of a number of distinguished persons in the literary world, the exciting cause of which was the refusal by the lord chamberlain, on the advice of his examiner of plays, to license 3 plays—*Waste*, a skit on *An Englishman's Home*, and *Monna Vanna*. As a result of widespread criticism of his action in the press, a joint committee of both Houses was appointed in 1908 to inquire into the working of the C. of the D. A considerable number of well-known writers, actors, and theatre managers gave evidence before the committee. Generally speaking, the dramatists and other writers were against, and the actors and managers in favour of, the continued existence of the C. of the D. A remarkable feature in the evidence was the admission by the examiner of plays that in advising the lord chamberlain on the various plays submitted to him he proceeded on no principles that could be defined, but based himself on custom, and followed the precedents of the office: his practice was to refuse a licence where plays were avowedly adapted from the Scriptures, contained political allusions likely to jeopardise friendly relations with a foreign state, or had an immoral tendency. Since his assumption of office in 1895 the examiner said that some 7000 plays had been submitted to him, of which 43 were refused licences, though 14 of these were subsequently reconsidered and the licences issued; the majority of his refusals were on grounds of immorality. The figures given by the examiner, however, in no way represented the true measure of his activity, for in countless instances plays were only licensed after modifications to meet objections. The absence of principle or certainty in the quasi-judicial functions of the reader was exemplified by the refusal to license Shaw's *Mrs Warren's Profession*, d'Annunzio's *La Città Morta*, and *The Breaking Point*, while at the same time passing *Die Walküre* and *The Christian*, and other plays which, though dissimilar in treatment and action, yet contained parallel incidents. The gravamen of the dramatists' grievance was that the suppression of a play before production was an excessive use of executive power, and cast a stigma on the profession of the dramatist; and that it was an anomaly to place the drama under restrictions other than those imposed by the ordinary law of libel and blasphemy. The actors, on the other hand, feared that if the C. of the D. were replaced by magisterial and police control an element of uncertainty would be introduced into their calling, and place in constant doubt the employment of numbers of persons who were not directly concerned with the ethics of the dramatic art. The committee recommended: (1) that the lord chamberlain should remain the licenser of plays, with the duty of licensing any

play, submitted to him, unless he considered it indecent; offensively personal; calculated to do violence to the sentiment of religious reverence, to impair relations with any foreign power, to cause a breach of the peace, or to conduce to crime or vice; or as representing in an invidious manner some living person, or some person recently dead; (ii) that it should be entirely optional to submit a play for licence, and legal to perform an unlicensed play. Where any unlicensed play contravened the stated bounds the matter should be left to the director of public prosecutions. In spite of repeated questions in the House, and a petition to the king signed by 60 dramatists and a number of musicians, artists, novelists, and representatives of repertory theatres and dramatic societies, nothing was done to give legislative effect to the proposals of the joint committee. An account of the sittings of this committee together with a sane criticism of the present system of the C. of the D. is contained in the introduction to Bernard Shaw's *The Shewing-up of Blanco Posnet*, 1909. One weakness of the C. of the D. is that pornography when sugared with farce and fun is more likely to be granted a licence than a play of serious intent. It is notorious that variety shows invariably escape the censor, and moreover the examiner of plays, who considers only the text of a play, has no control over its production. However, *Young Woodley* by John Van Druten, 1929, was refused a licence which was afterwards granted when a private performance had been witnessed. Three notable plays recently banned in Britain are Arthur Miller's *A View from the Bridge*, Ibsen's *Tragedy of the Tenth*, and Tennessee Williams's *Cal on a Hot Tin Roof*. The ban however, has been evaded by the formation of a theatre club, with a membership fee of 5s. a year. Paradoxically, as the result of the notoriety achieved by a banned play, it is probable that these plays have attracted a wider public than they would normally have done. It is also curious that radio and television drama, with its far wider public, is exempt from the lord chamberlain's authority. In the U.S.A. the Wales Act was inaugurated in New York State in 1927, and by its terms a theatre which has seen the performance of a play subsequently banned in the police courts may be padlocked for a whole year, to the heavy loss of its possibly innocent owner. In Boston theatres are licensed for a season, but licences may be suspended by order of the mayor, the police commissioner, and the chief justice. The work done in England by the lord chamberlain's dept is in America carried out by the secretaries of watch and ward societies. Of the 2 the lord chamberlain's office is the more susceptible to public opinion.

See V. C. Gildersleeve, *Government Regulation of the Elizabethan Drama*, 1908; F. Fowell and F. Palmer, *Censorship in England*, 1913; and M. L. Ernst and W. Seagle, *To the Pure*, 1929.

Census, enumeration of the inhab. of a state taken by order of its legislature. In ant Rome C. meant an authentic declaration made usually every 5 years by every Rom. citizen before 2 magistrates called censors of his own name and age, and of the name and age of his wife, together with a statement of the number of his children and slaves. The Rom. C. differed from a modern C. in respect of both its purpose and scope, its object being mainly fiscal; but it was also designed to ascertain the number of men capable of bearing arms. Taxation depended on the results of the Rom. C. Livy states that it also showed the amount of a man's debts and the names of his creditors. Rom. citizens were divided according to the valuation of their property at the C. into 6 classes, each class containing a number of centuries or hundreds. As the richer classes contained far more centuries than the poorer, it is obvious that the influence of wealth was greatly preponderant in the Comitia Centuriata, the legislative assembly of ant Rome. From the codes of Theodosius and Justinian, it appears that the scope of the Rom. C. became widened under the empire. It had become a complete register of the pop. and wealth of all the centuries included within the limits of the Caesars' dominions. Full as it was, however, it was in no sense a statistical record like a modern C., and was apparently in no way conceived to further the social progress of the people at large. The first actual enumeration of the people of England and Scotland was made in 1801. The topics of inquiry were the number of persons, the number of inhabited and uninhabited houses, and the number of families in each par. It attempted a classification of the employment of individuals under the very general divs. of agriculture, trade, manufs., and handicraft. The inquiry under this last head entirely failed, owing to the confusion engendered by the classification into families. The next C. was in 1811, and since 1801 the C. has been taken every 10 years, excepting 1941. In the C.s of 1811 and 1821 the official form of inquiry was modified so as to obtain a more accurate return of the occupation of the people. The heads of inquiry in 1841 were more numerous and minute, with the result that more accurate information was obtained. In reference to occupation, the enumerators were directed to ascertain the employment of every person, distinguishing sex, instead of merely, as hitherto, the employment of families and males over 20. Furthermore, the exact age of every person was ascertained, instead of quinquennial and decennial periods being taken, and the place of birth was also a subject of inquiry. The C. of 1851 was much facilitated by the system of registration of births, marriages, and deaths, which came into operation in 1837. Prior to that time the unchecked par. registers were the only available sources of information. The C. of 1851 showed a marked advance on its predecessors in regard to what may be termed social statistics. For the first time the

number of blind, deaf, and dumb persons was recorded. It also made inquiry into the eccles. and educational condition of the country by ascertaining the amount of church accommodation at the command of each denomination, and obtaining a return of the numbers of all the congregations on a particular day. This C. brought into prominence the sudden and startling decrease in the pop. of Ireland. In 1861 the C. exhibited for the first time the number of aliens and naturalised Brit. subjects in the U.K. The pop. of Ireland continued to show a decrease. The first C. of Ireland was taken in 1813, but it was not till 1821 that it was in any true sense an accurate or complete record. In 1871 the C. was extended to cover the Brit. Empire (apart from indigenous non-white races in the colonies), and since that year the mode of taking the C. has in no essentials been improved upon. The accuracy of this C. was ensured by the div. of the country into enumeration dists., with a clear indication of the various confusing local governmental or municipal sub-divs. of the kingdom. One striking feature of the C. of 1871 was that the names of persons were required, and to facilitate inquiry a separate schedule or form was sent out to each householder. Special schedules were issued for Welsh people, persons in public institutions, on board ship, and homeless or houseless persons. In regard to the last mentioned the co-operation of the metropolitan and co. police was enlisted. The comparative rate of mortality in various occupations was also inquired into by classifying the living in the different occupations or professions with regard to age. Subsequent C.s have still further widened the field of inquiry and elicited a mass of valuable information in the way of social and vital statistics; in 1901, for example, investigation was made into the evils of overcrowding by inquiries as to the number of persons occupying any particular room or part of a house. The following additions were made to the inquiries in 1911: (a) the duration of existing marriages; (b) the number of children born to such marriages; (c) the industries or services with which workers were connected, as distinct from the occupations in which they were personally engaged; (d) in the case of persons born outside England and Wales, whether they were residents or visitors in this country; (e) the number of rooms in all dwellings, instead of, as heretofore, in dwellings of less than five rooms only. In contrast to the prejudice, especially in certain eccles. quarters and among the ignorant, excited by the earlier C.s, it was noteworthy some years ago that the registrar general expected fuller and more accurate returns than ever on account of the interest evinced by the public in the C., an interest which he attributed to the aid rendered by the press; to the co-operation of the parl. committee of the Trades Union Congress; and to the efforts of elementary school-teachers who gave special C. lessons to children under their charge.

The total pop. in England and Wales was 8,892,536 in 1801; 10,164,256 in 1811; 12,000,236 in 1821; 13,896,797 in 1831; 15,914,148 in 1841; 17,927,609 in 1851; 20,066,224 in 1861; 22,712,266 in 1871; 25,974,439 in 1881; 29,002,525 in 1891; 32,527,843 in 1901; 36,070,492 in 1911; 37,886,699 in 1921; 39,952,377 in 1931; 43,757,888 in 1951. The pop. of Great Britain and Ireland a month before the beginning of the First World War was officially estimated at 46,089,249. There were over 1,000,000 more females than males in England and Wales in 1911, and, by 1921, the excess, aggravated by the losses of men in the war (about 1,000,000), was 1,736,221, and in 1931, 1,706,357. It is significant that the loss of pop. owing to emigration, which was 164,000 in 1871-81, 601,000 in 1881-91, 69,000 in 1891-1901, rose again to 501,000 in 1901-11, for it seems estab. that the number of emigrants is greatest during times of prosperity. In 1913 the total number of Brit. and N. Irish emigrants was 416,278, in 1926, 284,009, in 1930, 327,992, and in 1931, 213,057. Since then, owing to quota restrictions in the U.S.A. and Canada and elsewhere, the number has declined. Moreover, in the decade immediately following the First World War there was a steady flow of migrants to the dominions overseas, which was enhanced by schemes of state-aided migration; but during the world economic depression, 1930-3, emigration declined to its lowest point, and in 1933 less than 30,000 Brit. emigrants went to places out of Europe, while immigrants of Brit. nationality coming into Great Britain in 1932 and 1933 numbered 75,000 and 60,000 respectively.

The C. of 1911 showed a slight net gain by excess of births over deaths, a result due, however, to a relatively greater reduction in the death-rate than increase in the birth-rate. In 1924 the excess of births over deaths was 256,698; in 1933, when the trough in the birth-rate was reached, the excess was only 83,948. In the years between 1934 and 1937 the excess varied between 100,000 and 121,000; in 1938, 142,208; in 1939, 114,577; in 1940 a mere 8,583; in 1941, 43,911; and in 1942, 171,366. With the high post-war birth-rate the excess was, in 1946, 328,629; in 1947, 363,411; and in 1948, 305,408. In 1954 the excess appeared to have become stabilised at 171,755.

Cent and Centime (from Lat. *centum*, a hundred), names of coins. The cent varies in value according to the country. Thus in the U.S.A. and Canada it is a bronze coin, the hundredth part of a dollar, worth more than an Eng. penny at the 1955 rate of exchange, whilst in Holland the cent is also of bronze, and is the hundredth part of a guilder (2s.). The centime originated in France, being a hundredth part of the franc, and before the revaluation of the franc in the 1920's was equivalent to a tenth part of the Eng. penny. It was adopted in Belgium and Switzerland, and also in Italy, Greece, and Spain under different names, but to-day

it is only in circulation in Switzerland. In Spain the peseta has been divided into 100 centimos. See METROLOGY.

Cental, see METROLOGY.

Centaurea, Old World genus of Compositae of about 400 species. *C. cyanus*, the cornflower or bluebottle, grows in Britain and is cultivated for its pretty many-coloured flowers; *C. moschata*, the Sweet Sultan, and *C. montana* are garden flowers. *C. scabiosa*, the Greater Knapweed; *C. nigra*, Lesser Knapweed, or Hardheads; *C. aspera*, Rough Star Thistle; and *C. calcitrapa*, Star Thistle, occur in Britain.

(CENTAUREA CYANUS: CORNFLOWER)

Centaurium (synonym *Erythraea*); family Gentianaceae; family of about 30 species, chiefly annuals, cosmopolitan, except for tropical Africa. See also CENTURY.

Centaur. According to Homer they were simply wild beasts. Later they were represented in their now more familiar guise of half man and half horse. Two legends describe them variously as the offspring of Ixion (q.v.) and a cloud, and of Ixion's son Centaurus and Nephele ('cloud'). Driven from their home on Mt Pelion in Thessaly after a celebrated fight with the Lapithae (q.v.), they inhabited the region of Pindus on the borders of Epirus. See CHIRON and HERCULES.

Centaurus, the Centaur, *S. constellatio*, of which only a small portion can be seen in the Brit. Isles. It lies S. of Hydra and N. of Crux and was supposed to represent the centaur Chiron. Part of this constellation, which was mentioned by Aratus, lies in the Milky Way, and has sev. points of interest, not the least being that it contains Alpha Centauri, our second nearest neighbour in the stellar universe, the faint star Proxima Centauri being slightly nearer. Alpha Centauri is of the first magnitude (0.2), and the fourth brightest star. It has a very considerable proper motion, being as much as 368 in. a cent., and is $4\frac{1}{2}$ light-years distant from

the earth. Alpha Centauri is a binary star, each revolving around the common centre of gravity in 79 years, and there is reason to believe from perturbations observed that there is also a third invisible companion. The 2 luminous stars have a probable mean distance of 2,232,000,000 m. from each other. One of them has an identical spectrum with the sun, and is thought to be of the same mass and luminosity. Its companion is about the same size, but considerably less bright. Alpha and Beta Centauri are known as the S. Pointers because they serve as a guide in finding the S. Cross, which can be used for finding the S. Pole.

Centaur, name applied to *Centaurium minus*, the common C., an ann. herb with pink flowers, and *C. portense*, the Perennial C., both natives of Britain. The Amer. C. consists of the genus *Sabbatia*, and *S. angularis* has rose-pink flowers. The composite *Centaurea* (q.v.) is also often known as C. in popular language.

Centenary (Lat. *centenarius*, to do with a hundred), celebration of an event which happened 100 years ago, especially of the births and deaths of famous men.

Centetes, typical of the family Centetidae, a small, insectivorous mammal found in Madagascar. The single species, *C. caudatus*, the tenrec, is sometimes known as the tailless hedgehog, and is distantly connected with the hedgehog within the same order. In length it is from 12 to 16 in., its teeth are 43 in number, the young have spiny hairs, and the female brings forth from 12 to 20 little ones at a birth.

Centigrade, see METROLOGY; TEMPERATURE; THERMOMETER.

Centigrade Thermometer, see THERMOMETER AND THERMOMETRY.

Centimetre, see METROLOGY.

Centipede, or Chilopoda, order of Arthropoda in the class Myriapoda, in some respects resembling insects. The number of legs varies greatly, some species having only 15 pairs, while others have as many as 173 pairs, and the term C. is consequently misleading. The galley-worms, as they are sometimes called, have flat bodies consisting of numerous segments, all but the last two bearing a pair of legs, and the first body-segment bearing a pair of poison claws, while the head has 3 pairs of jaws and long antennae. The species are carnivorous, killing their prey with their poison-claws, which in some tropical representatives are able to inflict dangerous wounds upon man. They are creatures of night, light seeming to have little effect on them, as some are utterly devoid of sight and only one family has compound eyes. They lurk beneath stones or in houses, and at night attack small animals. The genera *Lithobius*, *Scolopendra*, and *Geophilus* are known to Britain; *L. forficatus* is our most common species; *S. gigas* is a large tropical C., which attains a length of 12 in.; and *G. electricus* glows in the dark.

Centlivre, *Susannah* (c. 1667-1723), actress and dramatist, b. probably in Ireland, her maiden name being Freeman. As her third husband she married in 1706

Joseph C., chef to Queen Anne. She wrote about a score of plays, which are well constructed and amusing, among the best being *The Perjured Husband*, 1700, *The Gamester*, 1705, *Love at a Venture*, 1706, *The Busybody*, 1709, and *A Bold Stroke for a Wife*, 1718.

Cento, It. tn. in Emilia-Romagna (q.v.), on the Reno, 19 m. SW. of Ferrara (q.v.). It has an anct castle and sev. other fine old buildings. Francesco Barbieri (see GUERCINO) was b. here. Pop. 4500.

Cento (Gk *kentrōn*; Lat. *cento*, patch-work), composition put together out of passages borrowed from other writings. The manuf. of such artificial works was a favourite literary exercise of the Romans in the early cents. AD, as later of the medieval monks. Virgil's *Aeneid* was especially subjected to this treatment. Thus on it were based both Ausonius's rapid survey of biblical hist. (4th cent. AD) and Capitulus's attack on the immorality and luxury of monasteries (1535). The Empress Eudoxia succeeded in stringing together a life of Christ from the Homeric poems.

Centorbe, see CENTURPE.

CENTIFEDE

Central America, geographical div. extending from the isthmus of Tehuantepec to the isthmus of Panama. Mt ranges traverse this portion of America from end to end. The Sierra Madre is the prin. range, which runs across Guatemala, and the highest point reaches close on 10,000 ft. These mts extend S. into Nicaragua. The large volcanoes of Mexico and C. A. are situated on the Pacific side, and form a cordillera. These rise to great heights, as in Acatenango in Guatemala (12,800 ft) and Irazú (11,500 ft) situated in Costa Rica. The amount of deposit from the volcanoes is very great, and covers a wide area. In some places this deposit has entirely blocked up the original structure of the country. Eruptions began in the Cretaceous period, and continue at the present time. The

rocks are composed of lava and ashes, mostly andesitic and basaltic. Owing to the greatest elevation being on the Pacific side, the rivs. are shorter than on the Atlantic side. The prin. riv. is the Usumacinta, on the E. side, which is more than 600 m. long from its mouth to the Rio de la Pasión. The average temp. on the low coast lands is from 80° to 73° F., and in those lands lying from 2000 to 5000 ft above sea level the temp. is 73° to 63° F. Above this altitude frosts occur. The rainfall is exceptionally heavy on the Atlantic side, as much as 180 in. falling in the year in Alta Verapaz, Guatemala, while El Salvador has only 54 in. A more striking contrast exists between Greytown, with a rainfall of 244 in., and Rivas with 69 in. The flora ranges from Alpine to tropical. With regard to the forests, they are inferior in size to those found in the lats. in the E. hemisphere, but they are far more beautiful and luxuriant. In the volcanic regions the soil is extremely fertile, and yields in consequence splendid crops of rice, coffee, cocoa, and maize. The fruits grown are bananas, yams, pineapples, guavas, and citrons, while arrowroot, beans, and tomatoes are largely cultivated. The woods found there are mahogany, cedar, logwood, and Brazil wood; cocoa palms and mangroves also grow in this country. Of fibrous plants which grow in the region winter's bark, sarsaparilla, vanilla, and indiarubber may be mentioned. Numerous beautiful orchids and flowers are peculiar to this country. With regard to the animals, these are as varied as the plants, but owing to the region being comparatively small, there are very few species that can claim to be peculiar to C. A. Pumas, jaguars, tapirs, monkeys, alligators, venomous snakes, vultures, and birds of brilliant plumage are found in large numbers. There are as many as 260 species of birds, many of which are found only in this part of the world. Bats are so numerous that in some parts they have amounted to a plague, and whole vils. have been left deserted owing to the overwhelming swarms of these creatures. Insects are also present in large numbers, and are of the troublesome kind. The natives once consisted of the Maya Indians of the N., and there were smaller tribes in other parts of the country. At present the pure-bred Indian is mostly found in Guatemala and Yucatan, and only to a much smaller extent in other states. The greater part of the pop. is made up of half-breeds, but in Costa Rica Sp. people predominate. Scattered over the country may be found many very interesting remains, the prin. being the ruins of Palenque in Tabasco, Uxmal in Yucatan, Santa Lucia in Guatemala, and Copán in Honduras. C. A. is divided into reps. named as follows: Guatemala, Honduras, Salvador, Nicaragua, Costa Rica, and Panama (qq.v.). Brit. Honduras (q.v.) is a crown colony belonging to Great Britain. The provs. of Chiapas, Tabasco, and Yucatan all form part of the Mexican rep. See T. A. Joyce, *Central America*

and *West Indian Archaeology*, 1916; T. Gann, *Discoveries and Adventures in Central America*, 1928; H. G. Miller, *The Isthmian Highway*, 1929; W. W. Von Hagen, *Maya Explorer*, 1947; S. de Madariaga, *The Rise of the Spanish American Empire*, 1947, and *The Fall of the Spanish American Empire*, 1948; W. Beebe, *Book of Bays*, 1948; W. C. Gordon, *Economy of Latin America*, 1950.

Central Asia (Soviet) is nearly all comprised in the former prov. of W. Turkestan. There is some confusion over the precise delimitations of the great extent of country comprised under the old name of Russian or W. Turkestan—a ter. covering 1,534,000 sq. m., and supporting a pop. of over 16,000,000. Politically Soviet C. A. comprises Uzbekistan (q.v.), on the frontier of Afghanistan, in the foothills of the Tien Shan and Pamir Mts; Turkmenia (q.v.), situated on the frontiers of Persia and Afghanistan, stretching from the Caspian Sea to the Amu-Darya R.; Tajikistan (q.v.), which lies on the frontier of Afghanistan and W. China; and Kirgizia, also bordering W. China, Kazakhstan (q.v.), on the frontier of Sinkiang and stretching from the lower reaches of the Volga to the Altai, and from the mts of the Tien Shan to the Trans-Siberian railway, is a separate area according to Soviet classification, but is often regarded as C. A. by the W. Up to the revolution of 1917, Russian C. A. was divided politically into the khanate of Khiva, the governor-generalship of Turkestan, and the emirate of Bukhara; but after the revolution the Soviet Gov. abolished the governor-generalship of Turkestan (1920) and set up a Soviet rep. in its place. Following a redistribution in 1924 of all these ters., the new autonomous reps. of Uzbekistan, Turkmenia, and Tajikistan were estab., advancing in 1929 to the status of Union reps. The name Kirgiz Autonomous Oblast was first given to the present Kirgizia in 1925 and Kirgizia became a S.S.R. in 1936. The Uzbek S.S.R. now includes the Kara-Kalpak Autonomous S.S.R. On the N. Soviet C. A. is bounded by Siberia, on the W. by the Caspian Sea, on the S. by Persia, Afghanistan, and India, and on the E. by Sinkiang and Mongolia. There is a very sharp physical div. between the mountainous country to the E. and the deserts and steppes to the W. and N. The highlands are part of the orographical flange which skirts the NW. border of the great tableland of C. A., and runs in a direction SW. to NE. The great border chains of the S. Tien Shan consist of the Alai Tau, Trans-III. Kunghel Alai Tau, Kokshal Tau, and Trans-Alai, etc., whilst many ranges, including the Chigiz Tau, Kandy Tau, Ferghana, Nura Tau Mts, etc., shoot off from these border chains in various directions. In both systems the heights of individual peaks vary from 10,000 to 20,000 ft. and Mt Stalin attains an altitude of 24,590 ft. In this region, to the E. of the Academy range, is the Fedchenko glacier, 50 m. in length, and (excepting the Arctic) the largest in the world; whilst perpetual snow covers many

summits. Deep depressions such as the 'Dzungar Gates', Issyk-kul, etc., between the ridges spreading out westward have from time immemorial served as passes to the W. from the great central plateau. But the mean elevation of the passes is over 10,000 ft. The highlands are girdled by a belt of plains, known as the Balkash plains, whose average elevation is some 1250 ft, which in their turn are surrounded by the Aral-Caspian Depression—a great stretch of lowland occupying two-thirds of the whole prov., the altitude of which is rarely greater than 400 ft, sinking sometimes to below sea level. The Kara Tau Mts separating the Syr-Darya and Chu R.s are considered the line of demarcation. The higher girdle of plateau land, which is well drained by the Balkash, Ala-kul, III, and other rivs, which flow into Lake Balkash, supports the countless herds and flocks of the Kirgiz. The Akkum steppe, with its wide expanse of shifting sands, encircles Lake Karakul. The lower and outer belt of plains belonging to the Turanian basin is watered by the Amu and Syr, which alone succeed in bridging the desert as far as the Aral Sea. The Murghab and Tedzhen dry up in the heart of the Kara Kum desert, whilst the Zeravshan gets no further than the gardens of Bukhara. In those plains the dividing line between oasis and desert is very clearly defined. Continuous fertile soil is found only at the base of the mts. The physical features of the country are perpetually changing. Hot desert winds are continually parching the numerous lakes; the sea of Aral, or the 'Blue Sea,' now fills only a fraction of its former basin; prosperous regions, where ancient civilisations flourished in Bukhara, Bactria, and Samarkand, have been swept away through the desiccation of riv. channels which were once their main arteries. The climate is continental, its salient feature being the scarcity of rain. Thus though precipitation is plentiful on the highlands, it is reduced to 11 in. at Tashkent, and is almost zero over the Transcaspiian steppes. The ann. variations in temp. are very considerable. Thus, whilst in Jan. the thermometer falls usually below freezing-point, and has been known to register 10° F., a temp. of 100° F. in the shade and more is not uncommon in the summertime. Reflection from an arid soil aggravates the discomfort caused by the heat. The fauna include the Himalayan bear, marmot, badger, lynx, tiger, jackal, fox, wolf, antelope, zebu, hedgehog, etc.

Wild horses and camels are found, whilst the splendid *Ovis poli* abounds on the Pamir tableland. There are some 400 different species of birds, whilst the variety of insect fauna is almost countless. Arboreal vegetation is rare. Poplars, ash, juniper, maples, and pines occur, whilst apple and apricot orchards flourish on the lower mt slopes.

In the 4 reps. vast deserts have forced the pop. to the oases and irrigated lands. The largest area of cultivation is around Tashkent in the sheltered Ferghana valley; cotton and sugar-beet are the chief

crops. Other fertile areas lie by Samarkand, and in the extreme S. near Tedzhon, Merv, and Stalinabad. Here, as on all the oases, cotton is the chief crop, and that, increasingly, of the Egyptian variety. Irrigation in the Vakhsh valley in Tajikistan has rendered 100,000 ac. of land capable of producing cotton crops. There is also some orchard cultivation, and a considerable co-operative silk industry. Mechanisation and the collective and state farm form of agriculture have been introduced. Merino and Astrakhan sheep are bred in Uzbekistan and Kirgizia; in the latter horse-breeding is also an important occupation. Industry is keyed to products of the central Asiatic countries. Local cotton and silk production has built a large textile industry; vegetable oil is manuf. from cotton seed; and textile and agric. machinery is made at Tashkent. There are large chemical plants at Kara Bogaz on the Caspian Sea and in the middle of the Kara Kum desert, which provide fertilisers. Coal is mined in Kirgizia and Uzbekistan, and there are oil wells at Nebit Dag on the Caspian, near Bukhara, and in the Fergana valley. Of the cities, Tashkent is the largest of C. A. with a pop. of 615,000; Samarkand (165,000) was once Tamerlane's cap.; Ashkhabad (120,000), cap. of Turkmenia, is the terminus of the Asiatic railway. Bukhara (60,000) is an ant. city, noted for its handicrafts; Frunze (155,000) is the cap. of Kirgizia, and Stalinabad (150,000) of Tajikistan. These and other cities possess many mosques, old buildings, mud walls, and relics of the ant. feudal states close to the 20th-cent. factories and flats. The descendants of the old Iranian dwellers in the S. reps. of C. A. are the Tajiks who now form about 14 per cent. of the pop. The later invaders of the land, the Uzbeks, Turkmens, and Kirgiz, have remained; one-half of the whole pop. are of Uzbek stock. Pop.: Turkmenia, 1,170,000; Uzbekistan, 6,360,000; Tajikistan, 1,460,000; and Kirgizia, 1,600,000. See A. E. Voeklov, *Le Turkestan russe*, 1914; E. Mannin, *South to Samarkand*, 1936; E. K. Mallart, *Turkestan Solo*, 1938; E. S. Bates, *Soviet Asia*, 1942; J. S. Gregory and D. W. Shave, *The U.S.S.R.: a Geographical Survey*, 1944.

Central Asian Society, Royal, founded in 1901 to provide up-to-date information on current affairs, problems, etc., of Central Asia and the Middle E. Lectures twice monthly cover recent events and trends. Papers and reports of lectures are pub. in the quarterly jour. of the society.

Central Australia, now part of the N. Ter., which under the provisions of the Northern Australia Act of 1926 was divided into 2 areas, N. Australia and C. A., which were separated by the twentieth parallel of S. lat. C. A. was administered by a governor resident assisted by an Advisory Council. This Act was repealed in 1931 when the whole of the ter. was reconstituted as an administrative entity, with Darwin as the seat of the

administration. See also ALICE SPRINGS and NORTHERN TERRITORY.

Central Criminal Court, Old Bailey (q.v.), London, estab. in 1834 for the trial of treasons, murders, and other felonies and misdemeanours committed within the city of London and co. of Middlesex, and in certain specified parts of the cos. of Essex, Kent, and Surrey. Generally speaking the jurisdiction of the C. C. C. is similar to that of the criminal side of the assizes, and its judges or commissioners, like the assize or circuit judges, sit by virtue of commissions of oyer and terminer and jail delivery. The judges of the C. C. C. comprise the lord chancellor, who, however, never sits there, the judges of the high court, the recorder and common serjeant of London, together with the lord mayor and aldermen of the city of London, and such other persons as the Crown may appoint. In practice the recorder and common serjeant sit on the first 2 days of each session, after which one or more high court judges comes down to try the more serious cases. The court is held at least 12 times a year, and more often if necessity arises. The dates of the sessions are fixed annually at a conference of the judges. The C. C. C., like the assize justices, has the power to try all offences committed on the high seas or within the jurisdiction of the Admiralty. The Admiralty jurisdiction extends over the territorial waters of the Brit. dominions, i.e. to a distance of 3 m. from low-water mark; but in the case of crimes committed on Brit. ships its jurisdiction extends not only over the high seas but also up foreign rivers. 'as far as great ships go.' The C. C. C. also tries cases sent to it by queen's bench div. It has, too, a transferred jurisdiction in cases removed to it from the various sessions of the peace within its dist.

Central Electricity Authority. Following on the passing of the Electricity Re-organisation Act, 1954, the Brit. Electricity Authority (q.v.) became the C. E. A., having 11 generation divs., responsible for generation of electricity and bulk supply to the 12 area electricity boards in England and Wales, and also for exercising a general control over the policy of these boards. The C. E. A. is appointed by and responsible to the Minister of Fuel and Power, and the electricity which it supplies is bought by the area boards for distribution and sale to consumers in their respective areas. In each board's ter. there is a consultative council representing the interests of local authorities and consumers. The supply system of the C. E. A. is based on 274 generating stations, with plant of a total capacity of 22,000,000 kw., producing over 63,000,000,000 units a year.

Central Electricity Board, see BRITISH ELECTRICITY AUTHORITY.

Central Falls, manufacturing city in Providence co., Rhode Is., U.S.A., on Blackstone R. and New York, New Haven, and Hartford railway, 6 m. N. of Providence. It manufs. textiles, glassware; paper, leather, and wood products; plastics, toys, chemicals, and machinery; there

is also a boat-building industry. Pop. 23,550.

Central Force, force which tends to produce acceleration towards a centre or focus (see CENTRIPETAL FORCE).

The conception of C. F. has a special importance in the history of astronomical research (see ASTRONOMY; GRAVITATION; KEPLER).

Central Provinces and Berar, see MADHYA PRADESH.

Centralisation, system of concentrating administrative functions in the hands of the prin. depts of the State. In political science it is the exact opposite of *laissez-faire* (q.v.). The irreducible minimum of the functions of the State, which, according to Herbert Spencer, comprises the duty of keeping order within the ter. of the State, and of defending its borders from external aggression, has in more recent times become so expanded that much that was formerly left to the discretion of local governing bodies has been transferred to State depts. With the remarkable increase in municipal trading in England, the introduction of so much legislation on the lines of social reform, and the great activity in matters appertaining to public health, the functions of such depts as the Home Office, the Board of Trade, and the Ministry of Health have necessarily become even more comprehensive. C. secures uniformity in institutions, and what may appear to be encroachments by the State may amount to an enlightened conception of the obligation to preserve internal order. Yet the growth of C. has brought dangers to democratic gov., local initiative, and personal liberty. See CLASSICAL ECONOMISTS.

Centranthus, see KENTRANTHUS.

Centrarchidae, or **Sunfishes**, family of perch-like fishes which inhabit fresh water of N. America. The species, of which about 30 are known, are compressed and somewhat oval in body and have a spot on the operculum. Most of them build nests, all are voracious, and many are valued as food. The genus *Micropterus*, which comprises the black bass, is found in Europe.

Centre, point which is equidistant from all points on the bounding lines or surfaces of a figure. Such a fixed point can only exist in a circle or a sphere, and the equal lines which may be drawn from the C. to the boundary are called radii. Irregular figures and solids, however, have a fixed point which is called a centroid (q.v.), or C. of mass, generally known as the C. of gravity. This point is such that the moment of the whole figure in any plane is the same as if the whole mass were collected at that point. If a figure is so regular that circles may be described within and without touching different points at regular intervals, the C. of such circles is often referred to as the C. of the figure.

Centre, Canal du, canal in the dept of Saône-et-Loire, France, joining the Saône and Loire. The canal is 75 m. long, stretching from Châlon-sur-Saône to Digoin, and serves the industrial region

of Le Creusot and Montceau-les-Mines. It was constructed in 1781.

Centre-board, nautical device used to prevent a boat making too much lee-way by offering greater oblique resistance to the current. The device is used in small speed-boats, yachts, and other racing skiffs. The board consists of a movable keel which swings on a pivot, and is lowered at pleasure through a slot in the bottom of the boat. Vessels with wall sides can acquire keel depth by means of a lee-board.

Centre of Gravity, or **Centre of Mass**, fixed point in a body through which the resultant of the gravity forces acting on all the molecules of the body may be said to act. From the earliest times it had been vaguely recognised that an attraction existed between all material particles, but it was Newton who estab. the fact that the tendency of bodies to fall to the surface of the earth was part of the law of universal attraction. Owing to the great mass of the earth, it is extremely difficult to demonstrate on the earth's surface the existence of any gravitational force other than that in which the mass of the earth is an overwhelming factor. Every particle, therefore, tends to fall in a direction which we call *vertical*, that is, towards the earth's C. of G. The vertical line at any point of the globe may be determined by the use of the plumb-line, which consists of a weight attached to the end of a string. A force acts upon every particle composing a body in a vertical direction; the directions of all the forces on all the particles will, therefore, be parallel, and a point can be found through which the same effect can be produced by a force equal to the sum of all the individual forces. This point is called the C. of G. In the case of a sphere or circle, the C. of G. is the geometrical centre, in a cylinder it is the middle point of the axis, in a triangle it is situated on the line which joins the vertex (q.v.) to the middle point of the opposite side and at a distance from the vertex equal to two-thirds of that line; in each of these cases it must be supposed that the material is equally dense throughout. To determine the C. of G. of a body experimentally, it should be suspended from one point and allowed to hang freely; the C. of G. must then be in the vertical line passing through the point of suspension, otherwise the body would rotate by reason of a greater force acting on one side. By choosing another point of suspension a second vertical line may be estab. in which the C. of G. is situated, and the point of intersection of these 2 lines will give the required centre. As the action of gravity can be reduced to a single vertical force acting at a single point, equilibrium (q.v.) depends on the relative positions of this point and the points at which a body is supported. If the body is supported at one point only, that point requires to be in the same vertical line as the C. of G. to establish equilibrium. If the body is supported on or from a number of points, the vertical line from the C. of G. requires to fall

within the figure traced out by joining those points by straight lines. The broader the base, therefore, the more *stable* is the equilibrium, for the body may be tilted to a greater extent without bringing the line of gravity outside the base; so that the body when released simply resumes its former position. A body is said to be in *unstable* equilibrium when the slightest disturbance of position results in its toppling over, such as a stick balanced on the finger; in this case the vertical line through the C. of G. does not pass through the point of support if the stick is moved. If a body is moved to an adjacent position and still remains in equilibrium it is said to be *neutral* equilibrium—a sphere on a plane is an example; however it is moved, the C. of G. is always vertically above the point of support. See CENTROID.

Centre of Gyration, that point in a rotating body at which the total mass of the body may be supposed to be concentrated. Gyration is rotation about a fixed line, called the axis of gyration, and the inertia of the body acts as a resistance to any change in the angular velocity of the body with regard to the axis of gyration. The resistance depends upon the distribution of the mass, and it is possible to conceive of the whole mass being located at a single point so that the resistance is unaltered.

Centre of Mass, see CENTRE OF GRAVITY.

Centre of Oscillation, that point in a suspended body at which the whole mass of the body may be looked upon as concentrated in order that the time of oscillation for small displacements may be the same. An ideal simple pendulum consists of a heavy particle suspended by a weightless rigid thread from a fixed point, about which it oscillates. Such a pendulum does not exist in practice, and it is usually convenient to use a rigid rod terminated by a heavy mass. The different points in this system will strive to complete their oscillations in different times, owing to their varying distances from the point of suspension. They must, however, all oscillate together; and it follows that the motion of particles near the point of suspension will be retarded, while that of the more distant particles will be accelerated. Between these points it will be possible to fix upon a point where the motion is neither accelerated nor retarded, and the distance of this C. of O. from the point of suspension is the length of the pendulum. It has been found that the point of suspension and the C. of O. are mutually convertible, so that the C. of O. may be found experimentally as that point at which the pendulum must be suspended in order to produce the same time of oscillation as when the pendulum was suspended at its first point of suspension.

Centre of Percussion. If a body capable of rotating about a fixed axis receives a blow that starts it rotating round that axis *but without causing any impulsive pressure on it*, the point in which the plane containing the fixed axis and the centre of inertia of the body is met by

the direction of the blow, is called the C. of P. of the body. The 2 points, the C. of P. and the centre of rotation, are mutually convertible, and in fact stand in the same relation, as the centre of oscillation and the point of suspension of the body, considered as a pendulum. A cricket bat swung to meet a ball at its C. of P. does not communicate any shock to the hand, regarded as the axis, by reason of the impact, but a shock is felt if the obstacle is met at a greater or smaller distance.

Centre of Pressure, that point in a surface pressed by a fluid at which the whole pressure exerted by the fluid may be counteracted by a single force equal to the impressed force. If a plane surface is immersed horizontally, the C. of P. corresponds with the centre of gravity, but not if it is immersed in any other direction. If a rectangle be immersed vertically with one side in the surface, the C. of P. is at a distance of two-thirds of the vertical side below the surface. The term is used with reference to plane surfaces only, since it is not always possible to represent the pressure on a curved surface by a single force. The resultant pressure on a plane area immersed in a fluid is equal to the product of the area and the pressure at the centroid. See HYDROSTATICS.

Centrifugal Force, see CENTRIPETAL FORCE.

Centring, or Centering. When arches are being made it is necessary to support them in order that they shall not come to pieces before the mortar is set and equilibrium obtained. This is done by making a framework of wood called a centre of the required curve along its upper edge, upon which the brick or stone can rest and be built up. In the case of arches of small rise, such as those above a window, the centre can be shaped from a single board or 2 boards, which are held in position by means of supports nailed into the jambs of the opening. This can only be done if the soffit is of small thickness: for larger ones a semicircular frame is made with strips crossing the top. For larger arches with a big rise a complicated structure of wooden pieces must be built up to the required shape and of such a form that stresses in the members are of safe values when the load is applied. The removal of the centre is done gradually so as to let the arch take up its proper form (see ARCH). In reinforced concrete construction, similar support is required for floors, beams, columns, etc., during erection, until the concrete has set hard. This is generally made of adjustable metal tubing, and is called 'farmwork.'

Centripetal Force is the force that must be applied to a body to cause it to move with uniform speed in a circular path. According to Newton's first law a body will continue to move with a constant velocity in a straight line unless acted upon by external forces. If we wish the body to take up a circular path, a force must be applied perpendicular to the direction of motion and equal in magnitude to the product of the mass into the square of the velocity divided by the

radius of the circle, $F = mv^2/r$. The direction of the force is towards the centre of the circle and is known as a C. F. The motion of the body when the force is removed will be along the tangent to the circle at the point where the body leaves it. By analogy to the conditions for equilibrium in statics it is usually, but strictly speaking incorrectly, assumed that a body moving in a circle is held in 'equilibrium' by 2 equal and opposite forces. One is clearly the C. F. acting towards the centre of the circle and the other is known as the centrifugal force. It is usually said to act on the body away from the centre, but is in fact simply the tendency of any body to travel in a straight line. The centrifugal force on a body is proportional to its mass, ($F = \frac{mv^2}{r}$)

so that dense bodies will tend to move to the outer radius of a cylindrical vessel rotating about its axis, and lighter substances are displaced towards the axis. In the design of flywheels, and all rapidly rotating wheels, the centrifugal force is an important consideration. With heavy rims moving at high velocities the force becomes enormous, and if the tensile strength of the metal does not exceed the tension caused by the force, the wheel may fly to pieces with dangerous consequences. Centrifugal force lies behind the action of various machines, e.g. 'spin driers' (see DRYING MACHINES), milk separators (see DAIRY), and speed regulators (see STEAM, Governor).

Centriscus, the shrimp-fish, a genus of the teleost order Solenichthyes, which includes the pipe-fishes and sea-horses. The body is encased in a thin, bony armour with a knife-like lower edge. C. is found in the Indian and Pacific oceans.

Centroid, the point in a geometrical figure having co-ordinates which are the mean values of the co-ordinates of all the points of the figure. The C. corresponds to the centre of gravity (q.v.) of a material body of similar form and uniform density.

As an example of how the C. is found, consider the case of a circular arc of uniform thickness and line density. In the figure ADB is the arc of radius r , D its mid-point, O the centre of the circle, and P is any point on the arc such that $POD = \theta$. The C. clearly lies on the line OD. Let it be at C so that $OC = \bar{x}$.

Then the sum of the moments of all the small elements of the arc of length $r.d\theta$ about the line through C. parallel to the y -axis must be zero, i.e. the arc would balance on a knife-edge placed under C. If the x -co-ordinate of P is x , the moment of the small element is $r.d\theta \cdot (x - \bar{x})$, and we have $\int_{-a}^a r.d\theta \cdot (x - \bar{x}) = 0$, where the sum is taken from A to B, i.e. from $\theta = a$ to $-\alpha$, where $\alpha = DOA$. Therefore,

$$\int_{-a}^a r.x.d\theta - \int_{-a}^a r.x.d\theta = 0$$

and since $x = r.\cos \theta$,

$$r.\bar{x}.(a + \alpha) - \int_{-a}^a r^2 \cos \theta.d\theta = 0$$

or $2r.\bar{x}.\alpha = r^2[\sin \alpha - \sin(-\alpha)]$

therefore $\bar{x} = r.\sin \alpha / a$.

Thus the position of C. is determined. For a semicircle, $\alpha = \pi/2$, $\sin \alpha = 1$ and therefore $\bar{x} = 2r/\pi$. For a circle $\alpha = 2\pi$, $\sin \alpha = 0$ and therefore $\bar{x} = 0$, i.e. the C. is at the centre, as may be expected. Other figures can be treated in a similar manner.

Centrolophus, genus of oceanic fishes of the family Stromateidae and order Perciformi. *C. niger*, the black fish, has occasionally been found on Brit. coasts.

Centronotus, or **Pholis**, genus of spiny-rayed fishes of the Blenniidae, or blenny family. The species are littoral, and *C. gunellus*, the butter-fish, is British.

Centropomus, genus of perch-like fish of the family Centropomidae. *C. undecimalis*, the sea-pike, which tenants the mouths of great rvs. of S. America, weighs about 25 lb., and is used largely for food.

Centropristis, genus of spiny-rayed fish, of which sev. species appear on the coasts and in the rvs of America. *C. nigricans*, the black perch or black bass, is abundant in N. Amer. rvs., and is much esteemed for the table.

Centumviri, court of civil jurisdiction in ant Rome, the number of which varied from 105 to 180. Sometimes the court sat as a whole body under the presidency of a praetor, but on occasions it sat in sections (*consilia*). Their jurisdiction extended in the first place to matters of status and quiritian ownership, but was later confined mostly to questions of succession. The special sign of quiritian ownership was the spear, which was always erected in front of their court.

Centunculus, genus of 3 ann. species of Primulaceae which flourishes in temperate and sub-tropical countries. In Britain it has one native species, *C. minimus*, the bastard pimpernel, or chaff-weed, a small plant with pink flowers.

Centurion, see ROMAN ARMY.

Centuripe (formerly **Centorbe**; ant **Centuripae**), tn in Sicily (q.v.), on a hill 26 m. ENE. of Enna (q.v.). In ant times it was one of the most important tns of the Siculi (see SICILY, History; and see CICERO, Verr. (2nd oration), iii, iv, and v, *passim*, and Plin. iii, c. 8). In 1333 the

tn was sacked by the Emperor Frederick II (q.v.). It suffered some damage during the Second World War. There are sulphur mines and marble quarries in the vicinity. Pop. 11,000.

Cenydd (Kenneth, Fr. Kinède), St. 6th cent. Celt, said to have been born a cripple and fed on doe's milk out of a bell. He was trained in monasticism by Sts Illtyd and Cadoc, and St David put him over his foundation in Gower, where later he founded his own monastery at Llangennith. He was married, and one of his sons was St Ffili (whence the place-names Kerrill, Caerphilly, Rhosilly). He followed his father (St Gildas Badonicus), with his family, c. 544, to Brittany, where he is venerated (e.g. at Ploumélain and Plaintel). See S. Baring-Gould and J. Fisher, *Lives of the British Saints*, 1908.

Coori, O.E. word used to denote a 'churl' or freeman who held the position above a serf, but below the noble or thegn. The economic position of the C. was precarious; occasionally he could rise to the rank of thegn, but more often through stress of circumstances he became identified with the serf, and the latter process had become the general rule by the time of the Norman Conquest.

Ceos, now called *Cea*, or *Zea*, an is. of the Cyclades group in the Aegean Sea. It is 10½ m. long by 6 m. wide and has an area of about 40 sq. m. It has a moister climate and is more fertile than most of the Gk is. Spring water is plentiful. There are forests of Valonia oak from which tanning bark is obtained. Grain and fruit are grown. C. is the hp. of the poet Simonides. Pop. 3700.

Cephaelis, now sometimes included in the genus *Uragoga*, belongs to the family Rubiaceae and flourishes in S. America. C. (or *U.*) *ipecaeuana*, which grows in damp, shaded parts of Brazilian forests, is a herb from the roots of which the drug ipecaeuana is obtained.

Cephalæmatoma, term used in medicine to denote a tumour or swelling due to the extravasation of blood beneath the pericranium. It is only observed in new-born infants, and is produced by pressure during labour, which causes a tearing of the periosteal tissues. There is no need in most cases to do anything with a swelling of this kind, as absorption generally occurs and the C. disappears.

Cephalanthera, genus of N. Orchidaceae, of which 3 species (helleborines) are British. C. *damasonium*, C. *rubra*, and C. *longifolia* are all leafy plants with rhizomes, a rudimentary rootlet, and an unspurred labellum.

Cephalanthus, genus of Rubiaceae common to Asia, Africa, and America. C. *occidentalis*, the button-wood, is a shrub which grows to a height of 6 to 15 ft. and has a light spongy wood. The root contains an agreeable bitter used as a remedy for coughs.

Cephalaspids, members of the order Osteostraci of the jawless ostracodermas (q.v.). They are abundant in rocks of late Silurian and Lower Devonian age. They have fish-like bodies, with dorsal fins and a heterocercal tail. The large

head is covered with a bony shield bearing electric fields, and the flat ventral surface and dorsal eyes suggest a bottom-dwelling mode of life. There are paired pectoral fins, and the scales of the body are arranged in vertical rows. There are 10 pairs of gill cavities, and an ossified cranial skeleton is present. The anatomy of the soft parts such as brain, nerves, and blood vessels is known in considerable detail.

Cephalocarida, a subclass of Crustacea. *Hutchinsoniella macracantha*, the only representative of this group, was discovered in Long Island Sound in 1954. This is a small (about one-tenth of an inch long) elongated crustacean with a horseshoe-shaped head and 19 succeeding segments of which the first 8 bear biramous limbs. Segments 11 to 18 lack appendages. The head is produced backward as a short carapace. *Hutchinsoniella* is regarded as an extremely primitive crustacean.

Cephalochordata, class of protochordate animals called lancelets. They are slender, transparent, fish-shaped creatures with a stiffening rod or notochord running along the back from one end of the animal to the other. See also **AMPHIOXUS**.

Cephalodiscus, curious animal about the classification of which there has been some disputation among zoologists. It was first discovered in 1876, when the members of the *Challenger* expedition were dredging in the Strait of Magellan, but later it was found in sev. other seas. It was originally believed to be related to the Polyzoa, but is now classed with *Balanoglossus*, and *Rhabdopleura* and has been placed among the protochordate animals. The C. is colonial, and lives with other individuals in a branching, weed-like investment which may measure as much as 9 in. by 6. The body, like that of *Balanoglossus*, is divided into a proboscis, collar, and trunk; 2 gill-slits may be present and a notochord may be represented by a diverticulum of the alimentary canal. All these animals comprise the Hemichordata, allied to the Cephalochordata (q.v.).

Cephaloedum, see **CEFALU**.

Cephalonia, or **Kephalonia**, place mentioned in the *Odyssey* under the name of Samos (Same). It is the name given to the largest of the 7 Ionian Isles lying to the W. of Greece and opposite the entrance to the Gulf of Patras. It is 31 m. long, up to 22 m. across and has an area of 277 sq. m. The coastline is very broken, and the surface is mountainous. The highest point is Elato, or Monte Negro (anc. Gk *Ainos*; Lat. *Aenos*) (5315 ft.). The vine and currant are grown extensively, and wheat, oil, and fruit are the chief exports. The chief tn Argostoli. Pop. 47,300.

Cephalopoda (Gk *kephale*, head; *pous*, 'foot'), to which belong the octopods, cuttlefishes, and squids, are the most highly specialised molluscs, and are characterised by the well-marked head, round which are arranged symmetrically arms bearing suckers or tentacles,

formed from the foot, as is the funnel through which water is squirted. The mantle-cavity contains 4 ctenidia (gills) in the Tetrabranchiata, 2 in the Dibranchiata, and in both orders the median anus, ink-sac, paired kidneys, and genital duct open into it. The eyes are very large, those of one species measuring 15 in. across; the mouth has a parrot-like beak and on the tongue there is a rasping ribbon; the sense of touch is highly specialised in the arms. The cephalopods are all marine, voracious animals which feed on animal matter, especially on Crustacea; they can swim in a horizontal position or creep by means of their arms,

CEPHALOPODA: COMMON OCTOPUS

and they project themselves backward swiftly by a contraction of the mantle. The ink-sac is a gland which opens into the rectum, and contains a dark brown fluid in which is sepia; when alarmed the creature can expel this fluid and darken the surrounding water so as to cover its disappearance by a kind of 'smoke screen.' Among the C. the sexes are always distinct, a characteristic not common among molluscs, and the female is usually larger than the male. The eggs are large and are attached in masses, called sea-grapes, to bodies in the sea, and immediately on hatching they present the appearance of a diminutive adult. The C. are divided into 2 orders, the Tetrabranchiata and Dibranchiata, according to the number of their gills. In the former order there are 4, and the species are characterised by having no ink-sac, a well-developed external shell, a funnel composed of 2 unfused lobes, 4 kidneys and auricles, and numerous arms without suckers. *Nautilus* is the single living genus of this order, but sev. are found fossil, the commonest being *Ammonites*. The Dibranchiata have 2 gills, and the species are usually furnished with an ink-sac; there is no external shell, the lobes of the funnel are fused, the kidneys and auricles are 2 in number, and there are either 8 or 10 sucker-bearing arms. When

there are 8 arms and 2 tentacular arms these molluscs are known as Decapoda, and have an internal shell, e.g. fossil *Belemnites*, or the living *Sepia*, the cuttle-fish (of which the internal shell, or cuttle-fish 'bone' is sometimes suspended in parrot cages); when there are only 8 arms, the creatures are Octopoda and have no shell, e.g. *Octopus*, the poulpe or octopus, and *Argonauta*, the paper-nautilus. The reproduction of C. is remarkable in that one of the arms of the male becomes charged with sperm and is used as a copulatory organ; in some species (e.g. the Argonaut) this arm is much modified ('hectocotylised') and is left behind in the body of the female, where it was described by Cuvier as a parasite. Some deep-sea species of C. are enormous in size, being amongst the largest of known animals. *Architeuthis*, the giant squid, attains a length of 50 ft or more.

Cephalotaceae, dicotyledonous family of a single genus consisting of one species, *Cephalotus follicularis*. This plant, popularly known as New Holland pitcher plant, grows in the marshes of W. Australia, and is very closely related to plants of the order Saxifragaceae; it has a pitcher which closely resembles that of *Nepenthes* in structure and in the function of insect-catching. The flowers are hermaphrodite, apetalous, perigynous, with 6 perianth leaves, stamens in 2 whorls of 6, a gynaeceum, consisting of 6 free apocarpous carpels each with a single basal ovule. The fruit is a one-seeded follicle. The family differs from the Saxifragaceae only in the free, apocarpous carpels and basal ovules. The upper leaves of the plant are flat and green, while the lower leaves are those which bear the pitchers and have lids.

Cepheid Variables, see VARIABLE STARS. Cepheus, King of Ethiopia, son of Belus, husband of Cassiopeia and father of Andromeda, was changed into a constellation after his death. (See Ovid, *Met.* iv. 669, and v. 12.)

Cepheus, in astronomy, a constellation of the N. hemisphere, surrounded by Cassiopeia, Ursa Major, Draco, and Cygnus. The prin. star, Alderamin, is one of the third magnitude, while Delta Cephei is an interesting variable which has given its name to many other similar stars—the Cepheid variables—and is also a double star.

Cephus (**Cephisus**) (Gk *kēphisos*): 1. One of the largest rive. of Attica, rising in Mt Parnes and flowing S. through the olive grove W. of Athens into the Bay of Phaleron (near Eleusis), E. of Piræus. 2. A riv. flowing through Phocis and Boeotia towards the bed of the unct. Lake Copais (Topolias). Now called Mavronero, it empties into the channel of Euboea. Its waters are drawn off in drainage canals.

Cephren, see KHAFFRA.

Cephus, genus of hymenopterous insects of the family Cephidae (stem sawflies), which have no waist and live on plants. The females lay their eggs in stems or twigs and the white larvae eat their way through and thus frequently are very

destructive. *C. inteyr* is an Amer. species which feeds on willow, and *C. pygmaeus* a European species which lives on corn.

Cepola, typical genus of perch-like fishes of the Cepolidae, or bandfish family. The species are all marine and inhabit European seas; *C. rubescens*, the red bandfish or red snakefish, is a Brit. species which grows to an average length of 12 in.

Ceram, or **Serang**, is. of S. Moluccas, Indonesia; situated between the C. Sea (N.) and the Banda Sea (S.), divided by the isthmus of Taruno into Great and Little C. Very little is known of the interior of the is.; a chain of mts crosses it, the chief height being Binaya (10,000 ft). The land is fertile, and sago is largely grown. The exports are timber, iron, dried fish, edible nests, and birds of paradise. Area about 6600 sq. m.; pop. 100,000.

Ceram Laut, or **Serang Laut**, Islands, Indonesia, group of small is. of the S. Molucca group, situated SE. of Ceram (q.v.).

Cerambycidae, or **Longicorns**, family of coleopterous insects which have elongated bodies, long antennae with their insertion much embraced by the eyes, 5 segmented tarsi and no rostrum. The species live on trees and herbaceous plants, and the larvae are soft, whitish grubs, usually without legs. More than 12,000 species are known, and many of them greatly damage trees, e.g. *Saperda populnea*, which attacks the aspen, and *Elaphidion villosum*, the oak.

Ceramics (Gk *keramos*, earthenware), general term for all the products of the technical process of making objects by baking clay, whether classed as pottery (see DELFTWARE; EARTHENWARE; FAIENCE; HISPANO-MOORESCUE WARE; MAJOLICA; SLIPWARE; STONEWARE) or as porcelain or chinaware (q.v.).

Ceramium, genus of marine algae belonging to the family Ceramiales. It consists of delicate red, filamentous seaweeds, with the tips of the filaments incurved and a cortical band at the nodes. *C. rubrum* is a common species.

Ceramus, genus of the hymenopterous family Masaridae, is related to the true wasps of the family Vespidae. The forewings of the species are flat, their antennae clubbed, and their homes are usually underground cells.

Cerapus, genus of amphipodous crustaceans, is shrimp-like in general figure, but the first pair of limbs are small, and the second constitute strong pincers; the antennae are strongly developed. *C. tubularis* lives in a small cylindrical tube and exposes only the anterior part of its body. The species occur in abundance in N. America.

Cerargyrite, otherwise called **Chlorargyrite**, or **Horn-silver**, mineral found in S. America and Australia. It is a form of silver chloride, containing 75 per cent silver and 25 per cent chlorine. It is remarkable for malleability and ductility, and is blackened by light.

Cerasin, solid, tasteless, insoluble body obtained from cherry-tree gum. The

soluble part of the arabin (constituting the chief part of gum-arabic) is dissolved out by digesting with water, and C. remains. When C. is heated with nitric acid it yields mucic and oxalic acids.

Cerastes, genus of vipers found in W. Asia and N. Africa. The males, and sometimes the females, have a horn-like process over the eyes, and this feature is responsible for the name of the species *C. cornutus*, the horned viper. The other species, *C. vipera*, has no horns and is said to have been the asp of Cleopatra.

Cerastium, genus of Caryophyllaceae. *C. arvense*, *C. vulgatum*, *C. glomeratum*, are the Mouse-ear Chickweeds native to Britain. *C. biebersteinii*, *C. latifolium*, and *C. tomentosum*, Snow-in-Summer, from S. Europe, are grown in gardens for their silvery foliage.

Cerasus, colony of Sinope on the S. shore of the Black Sea. It gave its name to the cherry, a fruit which grew abundantly in that region.

Cerasus, name which Tournefort gave to a genus now included in *Prunus*, which belongs to the Rosaceae. See *PRUNUS*.

Ceratina, genus of solitary bees which belongs to the group Scopulpedinae of the family Apidae, or Anthophila. Unlike most bees, the *Ceratina* has very little hair on its body, and like the carpenter-bee of the same group it bores in wood for its home. *C. caerulea* is not uncommon in Britain.

Ceratodus (Gk *keras*, horn; *odous*, tooth), name given to a genus of lung-fishes only one of which is still in existence; many species, however, have been found fossil. The body is long, compressed, covered with large thin scales, and there is a pair of tooth plates in the lower jaws biting against a pair in the roof of the mouth. The swimbladder is lung-like and is used for breathing atmospheric air. They are found in the Trias and less seldom in the Jurassic, and living examples occur in the mud-fish of Queensland river, *Eptceratodus forsteri* is commonly called the barramunda (q.v.).

Ceratonia *Siliqua*, sole species of its genus in the Leguminosae, and is known by the name of carob-tree. It is found wild in the countries skirting the Mediterranean, especially in the Levant, and is almost the only tree of Malta. The pods, called algarroba, or St John's bread, contain a sweet nutritious pulp and are used for consumption by human beings and domestic animals. C. S. is said to be the tree which yielded the honey eaten by St John the Baptist, and the seeds are supposed to have been the original of the carat weight.

Ceratophyllaceae, family of a single genus of dicotyledonous, submerged aquatic plants, *Ceratophyllum*, of 4 species. Leaves are whorled, cut, and sessile on round stems; flowers axillary, minute, and monoecious; stamens 12 to 16; carpel single; the fruit an achene.

Ceratophyllum, sole genus of Ceratophyllaceae (q.v.) is represented in Britain by *C. demersum* and *C. submersum*, the hornworts. They are found submerged in ponds and ditches as rootless plants

with much-divided leaves, the old leaves being horny and giving them their popular name.

Cerbera, genus of Apocynaceae, flourishes in S. India, Ceylon, and Madagascar. *C. tanghin*, Ordeal Tree, has a fruit from which the tanghin poison is procured; it was formerly used in trials of persons convicted of crime, their guilt being estab. if it took effect, their innocence if they survived.

Cerberus, mythical dog who guarded the entrance to Hades. Some anc. writers represent him as having 50 or 100 heads; but later poets allow him only 3 heads and give him a mane and tail of serpents. The twelfth labour of Hercules consisted in dragging C. to the upper world.

Cerberus, genus of Colubridae, belongs to the sub-family Homalopsinae, and consists of viviparous, aquatic snakes common to the rivs. and estuaries of the E. Indies from Bengal to N. Australia. *C. rhynchops* has large ventral scales, and none of the species is fatal to man.

Cercamon (fl. 1100), famous Provençal troubadour, b. Gascony. A *tenso* and 3 of his amorous lyrics survive, but the *pastorelas*, of which mention is made by his old biographer, is lost. Marcabrun, a poet of great originality of thought and style and whose historical poems date from 1135 to 1149, was a pupil of C. See F. Diez, *Die Poesie der Troubadours*, 1827; *Leben u. Werke der Troubadours*, 1929 (later eds. by Bartsch, 1883 and 1882 respectively); P. Rajna, 'Cercamon' in *Romania* vi. 115.

Cercaria, scientific name applied to many young Trematodes in the genus *Distomum*, or liver-fluke. They bear considerable resemblance to the adult form, but possess a long, motile tail, frequently have eyes, and the generative organs are only rudimentary. When the eggs of a *Distomum* hatch, the larvae search for a host, e.g. water-snail, and when the C. stage is reached in the host's body they wriggle out of it, swim to another host or foreign body, lose their tails, and encyst. In this form they may be eaten by a vertebrate, e.g. sheep, when they become mature and the larvae once more continue the cycle.

Cercis, genus of leguminous plants, flourishes in Europe, Asia, and America. *C. silquastrum*, the Judas-tree, so called from the tradition that the false disciple hanged himself upon one, flowers in the open air in Britain. In colour they are a bright pale red, and in the spring they burst out before a leaf appears.

Cercopithecidae, one of the 2 families of Catarrhine Apes, is to be found only in the Old World. The dentition is the same as that of the Simiidae, the inter-nasal septum is narrow, the tail is never prehensile, cheek pouches may or may not be present, and ischial callosities are to be seen. The members of this family include the guernons (*Cercopithecus*), mangabeys (*Cercocebus*), baboons (*Papio*), the macaques (*Macaca*), and the mandrill (*Mandrillus*).

Cercopithecus, or Guernons, genus of Old World monkeys, which have long

tails, ischial callosities, cheek pouches, and are often brightly coloured, e.g. *C. callitrichus*, the green monkey. *C. diana*, the Diana monkey, has a white beard.

Ceroyon, son of Poseidon, or Hephaestus, and King of Eleusis. A cruel tyrant, he killed his daughter, Alope, and all strangers whom he overcame in wrestling. He was conquered and slain by Theseus.

Cerdagne (Sp. *Cerdaña*), W. part of the prov. of Roussillon (q.v.) in France during the 14th and 15th cents. The name is now applied to the land on the N. and S. of the Pyrenees, partly in Spain (Catalonia) and partly in France (dept. of the Pyrénées-Orientales). From its broad valley the R. Tév flows to France, and the R. Segre to Spain.

Cerdaña, see CERDAGNE.

Cerdic (fl. c. 495-534), traditionally first king of the W. Saxons. He is said to have landed in England at a place called by the chroniclers *Cerdices ora*, probably in Hants, in 495. He defeated the Britons on many occasions. In 519, with his son Cynric, he founded the kingdom of the W. Saxons. C. was regarded as the founder of the W. Saxon dynasty; but his origins are obscure. Some scholars have suggested that his name is of Celtic origin. In 530 he conquered the Isle of Wight.

Cerdus, Juan Luis de (1560-1643), Sp. author and theologian, b. and educ. at Toledo, where he spent the greater part of his life. He entered the Society of Jesus and was made prof. of theology and belles-lettres. He is principally famous for his able commentaries on Virgil's *Bucolics* and *Georgics* in 1608 and on the *Aeneid* in 1612. He also edited the works of Tertullian in 1624.

Cereals, **Cereal Grasses**, or **Cerealia** form a group of graminaceous plants which are cultivated for their edible seeds; the name is derived from Ceres, the corn-goddess of classical mythology. Botanically speaking the term has no definite limits, for the species of some genera are often cultivated for their grain, while their near allies are of no importance as food. The plants have been grown from the earliest times, and frequently the wild form from which they have sprung is unknown, as in the wheat and barley. The C. which are best known to the human race are wheat or *Triticum*, barley or *Hordeum*, rye or *Secale*, oats or *Avena*, Indian corn (maize) or *Zea*, millet or *Panicum* (also *Sorghum*, *Setaria*, *Pennisetum*), and rice or *Oryza*.

Cereatae, see ARTEO.

Cerebelliaca, see CHARNELL.

Cerebral Softening, see BRAIN.

Cerebration, **Unconscious**. It is supposed that all conscious mental processes are accompanied by molecular changes in the cerebrum (see BRAIN, *Functions of the Brain*). Sir W. Hamilton and Dr Carpenter suggested that these changes in the brain may go on without accompanying conscious action. As an example of this, we may take the ordinary experience of suddenly recalling a name or an incident while in the midst of some entirely different line of thought, after having been unable to recall it while

thinking definitely of it. According to Dr Carpenter, the cerebrum, after being put in action by the consciousness, goes on working automatically. This may perhaps be regarded as the physiological interpretation of the psychological statement that some mental processes are unconscious. See Sir W. Hamilton, *Lectures on Metaphysics and Logic* (vol. 1), 1859-60, 1874, and W. B. Carpenter, *Principles of Mental Physiology*, 1874.

Cerebro-spinal Fever, see MENINGITIS.

Cerebro-spinal Fluid lies between the coverings of the brain and spinal cord. The outer covering is termed the dura mater, while the inner one, which follows the contours of the brain, is termed the pia mater. Between these two there is a third, the arachnoid, formed of loose connecting tissue. The C. F. is contained partly between the dura mater and the arachnoid, but mainly between the pia mater and the arachnoid. It is formed by the choroid plexuses of the cerebral ventricles (see BRAIN). It passes over all the brain and spinal cord, and acts as mechanism for the exchange of gases and for conveying nourishment to the nervous system. It also acts as a fluid buffer against sudden movements of the brain and spinal cord within their bony casings. It further maintains an equal pressure on the skull, being variable in quantity. It is clear, practically colourless, liquid, being very similar to lymph.

Cerebrum, see BRAIN.

Ceremonies, Master of the, title reminiscent of the 'Governor of the Feast' of the N.T. In the present day it is usually applied to a person who assumes control of affairs at any eccles. or social function.

Cerenkov Counter, device for the detection of very fast charged atomic particles. Cerenkov discovered in 1934 that very fast electrons caused the emission of visible radiation in a transparent medium provided that the velocity of the electrons in a vacuum was greater than the velocity of light in the medium. The flashes of light are of quite different origin from those in scintillation counters (q.v.) and are detected by a photomultiplier (q.v.) and hence counted by a suitable electronic device. See GEIGER-MUELLER COUNTER.

Cereopsis, genus of anseriform birds of the family Anatidae, is one of the least natatorial of its kind. *C. novae hollandiae*, the New Holland or Cape Barren goose, is a handsome bird of grey-brown plumage.

Ceres, Rom. name for Demeter (q.v.).

Ceres, dist. and tn in Cape Prov., S. Africa, near the Hex R. valley and 79 m. from Cape Town by road. It has a good water supply and is a health resort. Pop. of dist.: Whites, 2017; Coloureds, 2790; Bantu, 580.

Ceres, name given to the first discovered of the asteroida (q.v.). It was first seen by Piazzi at Palermo, Sicily, on 1 Jan. 1801, and observed by him till 13 Feb. There was some danger of its being lost again, owing to its proximity to the sun. The difficulty was overcome by the invention of a new method of planetary orbit computation by Gauss. C. is not visible

to the naked eye, being of the seventh or eighth magnitude.

Céret, Fr. tn, cap. of an arron., in the dept of Pyrénées-Orientales, on the Tech. It has talc and cork industries, and manufs. espadrilles. Pop. 5100.

Ceret, see JEREZ DE LA FRONTERA.

Cereus (from Lat. *cera*, wax or torch; the old name for the genus was *Torch Thistle*), family Cactaceae; a genus of cacti, usually with erect, ribbed, branching stems, with spiny areoles, funnel-shaped, long flowers, large fleshy fruits, and now of a few species, including *C. peruvianus*, the Rock Cactus, *C. jamacaru*, and *C. repandus*, all natives of S. America.

Ceria, genus of dipterous insects, belongs to the Syrphidae, or hover-fly family. The body is elongated and somewhat ovate in form, black and yellow in colour, the general appearance is wasp-like. *C. conopoides* is a species rarely found in Britain.

Cerignola, It tn, in Apulia (q.v.). 22 m. S.E. of Foggia (q.v.). Near here, in 1503, Gonzalvo di Cordova (q.v.) defeated the French under the Duc de Nemours. The tn has a cathedral, and there are linen manufs., and a trade in agric. produce, olives, and wine. Pop. 51,200.

Cerigo, officially known by its anct name, *Cythera*, Gk is. lying between the most S. point of the Peloponnese and Crete, but considered as one of the Ionian Is. Area about 100 sq. m. The cap., at the S. end, is called Cythera and its harbour Capsali. Most of the is. is a plateau. Fruit, honey, and cheese are exported and grain is grown. In antiquity the Phoenicians colonised C. where they fished for *murex*, from which purple dye was obtained. They introduced the cult of Aphrodite to whom C. became sacred. Pop. 8000.

Cerinthus (c. AD 100), early Christian heretic. Early accounts seem to agree that the prov. of Asia was the scene of his work, and Hippolytus states that he had his training in Egypt. The teaching of C. was that the world had been made by angels, and the only part of the N.T. he accepted was extracted from St Matthew's gospel.

Cerithium, gastropod mollusc, is to be found in marine, but more often in brackish, water. Like others of the family Cerithiidae, it has a long, many-whorled turreted shell, a short branchial siphon, and a horny operculum. It occurs fossilised in great abundance.

Cerium, one of the 'rare earth' metals, chemical symbol Ce. Atomic weight, 140; sp. gr., 7.0; melting-point, 645°. It resembles iron in appearance. It is malleable and ductile and a poor conductor of electricity. Burns in air, and in the form of wire its flame is brighter than that of magnesium. The metal is prepared by the electrolysis of its fused chlorides, with the addition of a small percentage of sodium or potassium chloride with iron cathode and graphite anode. Sev. mixtures are used for making lighters. C. occurs in a number of rare minerals, one of the commonest being monazite sand; and thorium and

other rare metals contain up to 30 per cent of the oxide; much rarer, but containing some 60 per cent of the oxide, is cerite. See RARE EARTHS.

Cernauti, see CHERNOVTSY.

Cerne Glant, see WHITE HORSES AND HILL FIGURES.

Cernobbio, It. resort, in Lombardy (q.v.), on the SW. shore of Lake Como (q.v.). Near it is the magnificent 18th-cent. Villa d'Este. Pop. (tn) 2000; (com.) 6500.

Cernuschi (Cernuschi), Enrico (1821-96), It. economist, b. Milan; fought as a Republican (1848-9), and in 1850 settled as a banker in Paris. In 1871, having incurred the hostility of the Communards, he left France and travelled in Egypt, China, Japan, England, and America. He was an advocate of bimetalism, and his works, mainly on money questions, include *Mécanique de l'échange*, 1865, *Illusion des sociétés coopératives*, 1866, *Silver Vindicated*, 1876, and *Le Bimétallisme à quinze et demi*, 1881.

Ceroxylon, genus containing 5 Amer. palms, is remarkable chiefly for *C. andicola*, the wax palm of the Andes. The plant grows to a height of about 180 ft among the most rugged precipices of the wild region it inhabits, avoiding tropical plains; its leaves are 18 to 20 ft long, and the trunk is covered with a thick incrustation of wax which is made into excellent candles.

Cerreto Sannita, It. tn, in Campania (q.v.), 16 m. NW. of Benevento (q.v.). It has a fine cathedral. There was some damage during the Second World War. Pop. 6000.

Cerro de Pasco, mining tn and cap. of Pasco dept and prov., 120 m. from Callao, in the highlands of Peru. It has copper and silver mines which are extraordinarily rich, and there are large smelting works; gold, lead, and zinc are also found, and there is an output of 400 tons of coal a day from the Goyllarisquisga canyon, claimed to be the highest coal mine in the world. One of the world's largest vanadium mines is near by at Minasragra.

Cerro Gordo, pass between the mts in E. Mexico on the road from Mexico City to Vera Cruz and about 40 m. from the latter. The Americans under Gen. Scott defeated the Mexicans under Santa Anna here in 1847.

Cerro Largo, dept in NE. of Uruguay, bordered by the Rio Negro on the NW. and Brazil on the E. Large herds of cattle and sheep are pastured on the grass-covered downs. Melo is the cap. Area 5764 sq. m.; pop. 97,260.

Certaldo, It. tn, in Tuscany (q.v.), in the Elsa valley, 16 m. SW. of Florence (q.v.). It is the place where Boccaccio (q.v.) lived and d. His house and other buildings in the tn were damaged during the Second World War. There is a trade in wine, oil, and agric. produce. Pop. (com.) 12,000.

Certhia, genus of passeriform birds, consists of sev. species with moderately long curved bills, short wings, and stiff tail-feathers, which have large feet and strong claws well adapted for climbing

about trees and rocks. The food consists of insects and their larvae. *C. familiaris*, the tree-creeper, is an active little creature common in England, with a monotonous and often repeated note.

Certhiidae, family of passeriform birds known popularly as creepers and found in all parts of the world except S. America, Madagascar, New Zealand, and the Pacific Islands. The species have a long, slightly curved beak and there is a sharp claw on the hind toe; many utter shrill cries, e.g. *Tichodroma muraria*, the wall-creeper, but others are songsters, e.g. *Certhia familiaris*, tree or common creeper.

Certhiidae, genus of the Alaudidae, or lark family, of which the members dwell in arid plains and deserts. The plumage is dull-coloured, and the beak long and curved.

Certificate, in law, may comprise either (1) documents officially prepared by a court for the purpose of notifying another court, or anyone whom it may thereafter concern, of anything directed or ordered in the certifying court; or (2) signed and written statements by various persons admissible as evidence of the facts certified therein. Instances of the first kind are a bankrupt's C. of discharge, a C. of conviction or acquittal on a criminal charge tried before a court of record, a C. of dismissal on a charge before a court of summary jurisdiction, and a judge's C. of costs. Instances of the second class are a public analyst's C., a C. of the registration of a Brit. ship, an alien's C. of naturalisation, an architect's C. as to the due performance of a building contract, a C. of shares in a joint-stock company constituting the document of title to the shares, and a C. of deposit given by a banker for the purpose of certifying that the person named therein has placed a certain sum on deposit account.

Certification, in Scots law, means the express or implied notice to the defender (defendant in Eng. law) that unless he complies with the order in a summons, or shows a reason why he is not bound to do so, certain penalties will be inflicted by the judge. The defender may by custom obtain a special C. against the pursuer (plaintiff) if the latter fails to prosecute an action after having commenced it.

Certiorari, order issuing from one of the superior courts, directing the judges or officers of an inferior court to transmit or cause to be certified (*certiorari facias*) records or other proceedings. The object of the removal is either that the judgment of the inferior tribunal may be reviewed by the superior court, or that the decision and the proceedings leading to it may take place before the higher tribunal. The Crown office rules provide that indictments and proceedings from inferior courts in criminal matters may not be removed by order of C. unless it is clear that a fair trial cannot be had in the inferior court, or that some question of law of unusual difficulty may arise, or that a view of the premises or a special jury in respect of which the indictment is preferred may be required for a satisfactory

trial. The Central Criminal Court (q.v.) has a transferred jurisdiction by order of C. from the various sessional courts within its jurisdiction. An order of C. is demandable as of right by the Crown, but a private prosecutor must apply for leave to obtain such an order.

Certosa di Pavia, celebrated Carthusian monastery in Italy, 5 m. N. of Pavia (q.v.). It was founded in 1396 by Gian Galeazzo Visconti (see VISCONTI), and was dissolved in 1866. The buildings were made a national monument in 1891. The façade of the church, which is very richly decorated, is considered one of the finest pieces of Renaissance work in Italy. The church contains the tombs of Lodovico il Moro (see SFORZA) and his wife, and there are other masterpieces of sculpture, painting, and wood-carving, as well as beautiful stained-glass windows and inlay work. It was near the monastery that Francis I (q.v.) of France was taken prisoner in 1525.

Cerumen, commonly known as ear-wax, is yellow waxy matter, and is secreted by certain glands which lie in the passage leading from the outer ear to the tympanum or drum. Its purpose is to catch particles of dust and other substances, and so prevent them from damaging the drum, and it further serves to lubricate the passage. Sometimes C. is formed in excess, blocking the passage, and it then causes deafness. Oiling and syringing have in these cases to be resorted to so as to remove the wax which has become hard.

Ceruse, see WHITE LEAD.

Cervantes Saavedra, Miguel de (1547-1616). Sp. playwright, poet, and novelist, b. Alcalá de Henares, the son of an apothecary surgeon with 7 children. From 1566 onwards the family lived in Madrid. In 1569 C. contributed some poems to a memoir of Isabel de Valois, the wife of Philip II. In 1569 also we have indisputable evidence that C. was in Rome. In 1570 he became a soldier in the regular service, and in 1571 he took part in the great sea battle of Lepanto, where he lost the use of his left hand. In 1575 he received leave to return to Spain, but his ship was seized by Barbary pirates, and C. and his brother, together with many other Spaniards, were taken to Algiers and there sold as slaves. C. became the slave of a man called Dali Maini and, since he was supposed to be a man of considerable importance, was somewhat closely guarded. Finally, after much difficulty, he was released and returned to Spain in Oct. 1580. During the years immediately following he seems to have visited Algiers and Portugal, and may possibly have been in the Azores. From 1583 to 1587 he produced many plays for the stage, very few of which remain in existence at the present time. In 1585 he produced *La Galatea*, and in the Dec. of the same year he married. He found, however, that he could not earn sufficient with his pen, although he had been exceedingly busy writing numerous dramatic plays, and so in 1587 we find him engaged in gathering stores

for the Invincible Armada. Between this date and the end of the cent. his fortune sank lower and lower. The work which he was doing was uncongenial, the pay was often in arrears. He was at least twice imprisoned during this period, and by 1600 his condition was that of extreme poverty. In 1604, however, permission was granted C. to publish *Don Quijote de la Mancha*, the book which had grown out of C.'s lifelong experience of failure and frustration. His work may have been read in MS. previous to this date, but it was first definitely pub. at the beginning of 1605. *Don Quijote* sprang into universal popularity almost at once.

CERVANTES

After an engraving by D. F. Selma.

The breadth of the humanity of the book and its general philosophy did not at first strike the public mind; but its essentially natural character, its broad survey of the types of the time, its masterly dialogue, and its comedy appealed at once, and the book became a huge success. Eds. of it were pirated; it was printed at Madrid, at Lisbon, at Valencia. Within 6 months of its pub., *Don Quijote* and *Sancho Panza* were regarded as proverbial types of character. His main object, as C. himself said, was to ridicule the romances of chivalry; the greater worldwide view of the book came only slowly and was not appreciated, because it was not seen by the greater number of his contemporaries. Even after the pub. of his great book, C. would seem to have remained poor. In 1609 he became a member of one of the Franciscan orders, and in 1613 he pub. and sold his *Novelas Exemplares*, a book which would itself entitle him to rank as one of the greatest of Sp. writers. It consisted of 12 short stories written in his own inimitable style. Between this date and 1614 he pub. some plays and some interludes. The plays are acknowledged by

himself not to be good, but in most cases the prose is good. In 1814 also appeared his most famous poem, the *Viage del Parnaso*. In 1814 was pub. a second part to *Don Quixote*, this time, however, from the pen of one Avellaneda (see FERNÁNDEZ DE AVELLANEDA), who in his preface taunted C. with his poverty and ill fortune and openly acknowledged that whilst he knew that he (the author) would not stand any chance from a literary point of view in competition with C., he was determined to be the first in the market. The second part from the pen of C. was pub. in 1815, and was received with as much acclamation as had been the first. His last work, *Los Trabajos de Persiles y Sigismunda*, the author did not live to see pub. *Don Quixote* had been trans. into more than 50 different languages, of which the English by Shelton was the first. It was destined to become one of the most popular books of all languages. Its influence on the Eng. novel was enormous. Fielding's *History of the Adventures of Joseph Andrews*, 1742, was written 'in imitation of the manner of Cervantes.' The best complete ed. of C. is by R. Scheyll and A. Bonilla (19 vols), 1914-41. Complete works (trans.) edited by J. Fitzmaurice-Kelly, 1901-6. Trans. of *Don Quixote* by T. Shelton, 1612, 1620; P. A. Motteux, 1712; C. Jervas, 1742; T. Smollett, 1755; J. Ormsby, 1885. Lives by J. Fitzmaurice-Kelly, 1892 (revised ed., 1913), and A. F. Calvert, 1905. See also Américo Castro, *El pensamiento de Cervantes*, 1925; S. de Madariaga, *Don Quixote*, 1935; W. J. Entwistle, *Cervantes*, 1940; L. B. Walton, *Cervantes*, 1948; and introduction to *Don Quixote* in Everyman's Library.

Cervera y Topete, Pascual (1839-1909), Sp. admiral and commander-in-chief during the Sp.-Amer. war of 1898. He was b. at Jerez in the prov. of Cadiz. When the war broke out, he sailed for Cuba with secret orders to defend Sp. interests. He reached Santiago on 19 May, and was there blockaded by Adm. Sampson, commanding the Amer. fleet. The latter tried to block the harbour by sinking the *Merrimac*, but failed to do so, and on 3 July the Sp. fleet endeavoured to escape. This was done in response to public opinion, but against C.'s judgment. The result was that the Americans captured or sank every Sp. ship, killed a third of their crews, and C. was made a prisoner. When the war ended he returned to Spain, where he was tried by court-martial, but honourably acquitted.

Cerveteri (formerly *Cervetri*), It. vill., in Lazio (q.v.), 20 m. WNW. of Rome (q.v.). It is built at the site of the Etruscan (see ETRURIA) city of *Caere*; the old city remained prosperous down to the 13th cent. There is a famous Etruscan necropolis here, some of the tombs in which are cut out of the solid rock. Pop. 2000.

Cervetri, see CERVETERI.

Cervia, It. tn. in Emilia-Romagna (q.v.), on the Adriatic, 14 m. SE. of Ravenna (q.v.). With Ravenna it gives its name to an archbishopric. It is a

modern bathing resort with a fine beach. Its N. part is called 'Milano Marittima.' Pop. 12,000.

Cervidae, deer family, of the artiodactyl div. *Pecora*. Extinct genera are found fossil. The members of the family are distinguished by their antlers, features possessed by no other ruminants, which are present in all male deer but *Moschus* and *Hydropotes*, and in the females also of *Kangifer*, the reindeer. In the genus *Elaphodus* the antlers are devoid of any branching, but in *Cervus* there are sev. branches and there may be as many as 48 points. A gall-bladder is present only in *Moschus*, the Asian musk-deer, and in the family Bovidae (q.v.) only one genus lacks this organ: all deer have two orifices to the lachrymal duct, and only one genus of antelope has this feature; and in sev. minor points the C. may be shown to differ from the Bovidae. The 60 or so species of deer are spread over Europe, Asia, America, and part of Africa, and are totally lacking in Australia.

Cervin, Mont, see MATTERHORN.

Cervole, Arnaud de, see ARNAUD DE CERVOLE.

Cervus, see DEER.

Cesalpino, see CAESALPINUS, ANDREAS.

Cesarevich, title of the heir to the throne in imperial Russia.

Cesari, Giuseppe (1568-1640), called Il Cavaliere d'Arpino, b. Rome, where he became a successful and wealthy painter. He was the rival of the Carracci and Caravaggio (q.v.) to whose 'naturalism' his own conventionally idealistic style was opposed. He painted a series of frescoes depicting Rom. hist. for the Capitol.

Cesarini, Giuliano (1389-1444), also known as Cardinal Giuliano, It. diplomatist. He studied law at Padua, and won the favour and patronage of Pope Martin V, who created him a cardinal in 1426. In 1430 he was sent to Germany as papal legate to preach a crusade against John Huss and his followers. He was present at the Battle of Tans in 1431. He became president of the Council of Basel in 1431, but as his propositions were not agreeable to the council he resigned in 1438. He was also a leading member of the Council of Ferrara. The King of Poland, Ladislaus III, had conquered the Turks and made a treaty with them, when C. approached him as papal legate and persuaded him to go back on his word. The result was disaster. In 1444 they fought the Turks at Varna, and both C. and the king were killed. See CONCILIA, CHURCH.

Cesarotti, Melchiorre (1730-1808), It. writer, b. Padua, of noble but poor family. He became a prof. of Greek and Hebrew at the univ. in his native tn in 1768, and held that position all his life. When Italy was invaded by the French, he wrote in defence of their cause, and Napoleon I made him a knight of the Iron Crown, and gave him a pension. By way of expressing his gratitude he wrote an epic poem in praise of Napoleon called *Pronea*. His most important original work was *Saggio sulla Filosofia delle*

Lingue, 1785, advocating a free development of language as opposed to the teaching of the Della Cruscan Academy at Florence. He also wrote a book called *Filosofia del Gusto*. His great work of trans. was Macpherson's *Ossian*, first pub. in 1763. This exercised a great influence in Italy and elsewhere. His introductory preface was trans. into English and edited with notes by J. McArthur in 1806. He also attempted a prose trans. of the *Iliad*, which he followed with a long verse paraphrase running into 10 vols., entitled *La Morte d'Elttore*. In 1772 he trans. some of Voltaire's plays and Gray's *Elegy*.

Cesena (anc. *Caesena*), lt. tn, in Emilia-Romagna (q.v.), on the Savio, 12 m. S.E. of Forlì (q.v.). Murat (q.v.) defeated the Austrians here in 1815. The tn, to the hist. of which Dante alludes in his *Inferno*, lies in a valley, overlooked by a fortress. It has a cathedral (partly 14th cent.) and a famous library, the *Biblioteca Malatestiana* (see MALATESTA), containing valuable MSS. and incunabula. There is a race-track, and the dist. produces hemp, silk, wine, and sulphur. Two popes, Pius VI and Pius VII (qq.v.), were b. here. Pop. (tn) 23,500; (com.) 67,700.

Cesenatico, lt. tn, in Emilia-Romagna (q.v.), on the Adriatic, 18 m. E. of Forlì (q.v.). It was bombarded by Brit. ships in 1800. It is a fishing port and a popular bathing resort. Pop. 13,500.

Cesia, see WENDEN.

Ceská Lípa (Ger. *Böhmisch-Leipa*), Czechoslovak tn, in the region of Liberec (q.v.), with chemical and foodstuff manufs. Pop. 12,000.

Ceská Trébová (Ger. *Böhmisch-Trübau*), Czechoslovak tn, in the region of Pardubice (q.v.). It has engineering and textile industries. Pop. 11,700.

České Budějovice: 1. Region (*kraj*) in SW. Czechoslovakia, bordering on Austria and Bavaria, part of the former prov. of Bohemia (q.v.). It is watered by the Vltava (q.v.). Area 3460 sq. m.; pop. 494,000.

2. (Ger. *Budweis*) Czechoslovak tn, cap. of the region of C. B., on the Vltava. It was founded in 1265, is the seat of a bishop, and has a fine cathedral (partly 13th cent.) and other noteworthy buildings. It is an important commercial and industrial tn, is in an anthracite-producing area, and manufs. chemical, metal goods, machinery, and pencils. Pop. 38,200.

Československá Republika, see CZECHOSLOVAKIA.

Český Brod (Ger. *Böhmisch-Brod*), Czechoslovak tn, in the region of Prague (q.v.). The Hussites (q.v.) suffered a defeat near here in 1434. Pop. 5800.

Český Krumlov (Ger. *Krumau*), Czechoslovak tn in the region of České Budějovice (q.v.), on an is. in the Vltava. It has an anc. castle and important saw-mills. Pop. 11,800.

Český Les, see BOHEMIA, FOREST OF.

Český Těšín, see TĚŠÍN.

Cesola, Luigi Palma di, Count (1832-1904), explorer, b. Rivarolo, near Turin. He fought in the war with Austria, 1848, and in the Crimean War, and in the Civil War

in America he had a command with the N. army. In 1865 he was made Amer. consul at Cyprus, and while in that position he began his excavations at Dali, Curium, and Larnaca. The Museum of Art in New York bought nearly all his collection, and he was appointed its director in 1878. He brought out a book entitled *Cyprus: its Ancient Cities, Tombs, and Temples*, 1877.

Cessio Bonorum, in Scots law, a system which enabled any person who was in prison for civil debt, or against whom such a writ of imprisonment had been issued, to present a petition setting forth his inability to meet his liabilities and his willingness to convey the whole of his property to a trustee for the benefit of his creditors. C. B., like the old insolvency system in England, was characterised by this important difference from mercantile bankruptcy, that the person who obtained the privilege was not discharged from his debts, but only from proceedings against his person. After the Debtors Act, 1880, which virtually abolished imprisonment for debt, the term C. B. was applied to sequestration (in Eng. law, 'adjudication') in minor bankruptcies. C. B. was abolished by the Bankruptcy (Scotland) Act, 1913.

Cession (Lat. *cedere*, to yield), name given in international law to the formal transfer of ter. from one state to another. This may be the result of a gift, an exchange, or a sale, but is more usually due to the fortune of war, most C.s having been exacted as the price of peace between warring nations. The consent of the people of the ceded ter. is not essential, but deference is often paid to their wishes, except by modern totalitarian states. Their civil and political rights should be and generally have been determined by the treaty under which the C. is made. Apart from special stipulations, the citizens transfer their allegiance from one sovereignty to the other, obtaining their share in the rights of the new state, though, in recent instances of 'cession,' as, e.g., in the case of Czechoslovakia and Poland, the Ger. and Russian Govs. first set up puppet govs. and then accorded the inhab. only such rights as were convenient to Ger. and Russian interests respectively. But according to international jurists, the position is that old laws continue valid until altered by the new sovereign. Titles to property and personal relations remain unchanged. If the citizens should suffer loss of property by the C., the ceding state is not bound to indemnify them. Usually a clause in the C. treaty deals with the question of debts. As the object of C. is sovereignty over the ceded ter., all such individuals domiciled therein as are subjects of the ceding state become *ipso facto* by the C. subjects of the acquiring state. The hardship involved in the fact that in all cases of C. the inhab. of the ter. who remain lose their old citizenship and are handed over to a new sovereign, whether they like it or not, revived after the First World War a movement in favour of the claim that no

C. should be valid until the inhab. had by plebiscite given their consent to the C. Moreover sev. treaties of C. concluded during the 19th cent. stipulated that the C. should only be valid provided the inhab. consented to it through a plebiscite. But it seemed doubtful whether the law of nations would ever make it a condition of every C. that it must be ratified in such a way. By the treaties of peace after the First World War the method of a plebiscite was adopted in a number of cases. In any case the hardship of the inhab. being handed over to a new sovereign against their will can be lessened by a stipulation in the treaty of C. binding the acquiring state to give the inhab. of the ceded ter. the option of retaining their old citizenship on making an express declaration. But it must be emphasised that, failing a stipulation expressly forbidding it, the acquiring state may expel those inhab. who have made use of the option and retained their old citizenship, since otherwise the whole pop. of the ceded ter. might actually consist of aliens and endanger the safety of the acquiring state. In many cases an option of neutrality was accorded in the treaties of peace following the First World War to the inhab. of ters. ceded under them. The terms of the option varied in each particular case; but the general principle applied was that persons habitually resident in ceded ter. acquired *ipso facto* the nationality of the state to which the ter. had been transferred, and lost the nationality of the ceding state. Nevertheless such persons, if over 18 years of age, might opt for their old nationality, and if they exercised that option their choice covered a wife and any children under 18 years of age. They must, however, in that case remove themselves to the ter. of their old state (L. F. L. Oppenheim, *International Law*). See T. J. Lawrence, *Principles of International Law*, 1910; W. E. Hall (ed. Higgins), *Treatise on International Law*, 1917; J. L. Brierly, *The Law of Nations*, 1928.

Cessnock, coal-mining tn. of New S. Wales, Australia, 130 m. N. of Sydney by rail. Pop. 14,630.

Cesti, Pietro Antonio (1623-69), It. composer, b. Arezzo, where he was a boy chorister at the cathedral. In 1637 he became a Minorite friar. He studied under Carissimi in Rome, lived at Volterra in 1645-8, and later seems to have served alternately the papal chapel in Rome and that of the Archduke Ferdinand at Innsbruck. His last years, 1665-9, were spent in Vienna, where he produced 5 operas, but he d. at Florence. His work includes church music and sacred cantatas, but it was as an opera composer that he became most famous, his 15 operas being produced at Venice, Lucca, Innsbruck, Florence, and Vienna, and of course, given elsewhere. *Il pomo d'oro* (Vienna, 1667) is the most elaborately spectacular baroque opera known to musical hist.

Cestoda, or Cestoid Worms, form an order of Platyhelminthes, or flat worms, and from their elongated shape are known

as tapeworms. They are all parasitic and only one genus reaches the adult stage outside the alimentary canal of vertebrates. The tapeworm consists of a head, or *scolex*, which attaches itself to the lining of the canal by suckers or hooks, and most of the species then show a long chain of segments, or *proglottides*, each of which, when separated from the others, lives as an independent animal. A few species, however, have no external segmentation, and do not break off in this way. In no species are there sense organs, vascular system, mouth, or alimentary canal, food being absorbed by the body from the host, but there are a nervous and a well-developed excretory system. The life hist. is curious. The detached proglottides pass out of the host, and the eggs are scattered. These are swallowed by a new host in its food or drinking-water and the embryos eventually bore into the blood-vessels and are carried to the various organs. Thereupon they change into a *cystic* or *bladder-worm*, and develop a scolex, and if the animal in which they live is eaten by another the scolex passes into this final host, enters the alimentary canal, and matures. Among the vertebrates attacked by the C. are man, dog, sheep, ox, horse, hare, rabbit, squirrel, fox, pig, rat, mouse, frog, and sev. birds. *Diphyllobothrium latum* (*Bothriocephalus latus*), the largest species preying on man, may attain a length of 30 ft; *Coenurus cerebralis* destroys many sheep, causing the disease of staggers; and various members of the genus *Taenia* may infest human beings. *T. saginata* is the beef tapeworm, still common in many countries; *T. solium*, the pork tapeworm, is not so common. The bladder-worm stage of *T. echinococcus* sets up hydatid cysts in various internal organs; this species becomes adult in dogs and consequently it occurs chiefly in people, e.g. Eskimoes, closely associated with these animals. Cooking destroys the cysts present in infested meat and pork, and proper cooking therefore is the chief means of preventing the parasite from being passed on to human beings. Cooks and those who handle raw meat frequently—as in sausage-making—must take particular care to avoid transferring particles of raw meat to their mouths.

Cestus: 1. Thong of leather which the Gk and Rom. boxers wore on their hands. They were not used, as are modern boxing-gloves, to soften the blow, but to make it harder, as those thongs were often weighted with iron or lead. See BOXING.

2. Magic belt of Aphrodite (Venus) which made any who saw her fall in love with her.

Cestus Veneris, or Venus's Girdle, species of Ctenophora found in the Mediterranean and Atlantic. The body of this coelenterate is much compressed, and becomes ribbon-like in shape; it often exceeds 1 yd in length. *C. pectenalis* resembles it in appearance, but has a patch of orange at each end of its body.

Cetacea, large order of mammals, consisting of whales, dolphins, and porpoises,

but the form and purely aquatic habit of its members led them to be classed erroneously with fishes. They have a tapering tail expanded into horizontal flukes which aid the creatures in their powerful locomotion; there are no posterior limbs, and the anterior limbs are converted into paddles which are unprovided with external digits. They are unlike fish in nearly all important characteristics, such as that they possess warm blood and breathe air; in connection with this feature it may here be mentioned that in spouting whales do not blow sea-water,

found in rivs. of Asia and S. America. On land they are helpless, and after being for a short time out of their native element they die, probably crushed by their own weight. In diet all cetaceans are carnivorous, their chief food being cuttle-fish, squid, crustaceans, and true fishes; some even devour seals and smaller whales; the whalebone whales feed on the minute animals of the surface waters (plankton). In disposition they seem gentle and docile. The minimum size of one of these animals is about 3 ft. and the maximum is the enormous length of

CESTODA (TAPEWORMS)

In man. HD, head; N, neck; PR, proglottides.

Free-living. Free proglottis and egg-cases; UT, uterus; GA, genital aperture. Embryo within the egg case.

In pig. II, hexacanth embryo; P-SC, proscœlex; M, muscle of pig; SC, scolex; BL, bladder.

and any water that can be seen is the condensed vapour of their breath. Among the C. a hairy covering is always absent, but it is represented usually by a very few bristly hairs about the mouth cavity counted; the warmth of which they would be deprived by the absence of the covering is amply replaced by a thick layer of blubber under the skin. The head of the animals is always very large, the nostrils are seen as a single or double blowhole placed generally far back on the skull, the bones are spongy and full of oil, teeth are present or absent, there is no collar-bone, the eyes are tiny when compared with the bulk of their owner, and there is no external ear. The females usually bring forth 1 at a birth; their 2 mammae are inguinal in position and are adapted to the function of feeding the young in the water; the mother proves most devoted to her offspring. Whales are very widely distributed throughout the seas of the world, and a few are to be

100 ft. Fossil C. have been found in the Eocene, Miocene, and Pliocene (sub-order Archaeoceti). The 2 suborders of living C. are the Mystacoceti or whalebone whales and the Odontoceti or toothed whales. In the former div. are to be found the species known as right whales, rorquals, the grey whale, the blue whale, and the hump-back whale; in the latter occur the sperm whales, bottlenose, dolphins, porpoises, the narwhal, white whale or beluga, the killer, and the pilot whale. See separate articles for products and species. See also WHALE.

Cetacea Alba, see BELGOROD-DNESTROVSKY.

Cetagus, name of a Rom. patrician family of the gens Cornelia.

Marcus Cornelius Cetagus (d. 196 BC) was censor in 209 and consul in 204 BC. He was renowned as an orator, and Horace refers to him as an authority on the use of Lat. words.

Gaius Cornelius Cetagus was one of

Catiline's fellow conspirators in 63 B.C. He stayed in Rome intending to murder a number of leading senators, but Cicero (q.v.) arrested him and had him put to death.

Cetin ($C_{25}H_{42}O_2$), fatty crystalline substance, insoluble in water, but soluble in alcohol and ether. It melts at $49^\circ C$. and volatilises at $360^\circ C$. It is the chief constituent of spermaceti, a wax found in the body of the sperm whale and other cetacea. C. is employed as an emollient, and for the manuf. of candles, etc.

Cetinje (Cetynje), tn in Montenegro, Yugoslavia, built on a plateau surrounded by mountains. It was founded in 1485 as a refuge from the Turks, and was for more than 400 years the cap. of the principality of Montenegro (q.v.). The first book in a Slavonic language is said to have been written in the monastery here. The 2 palaces (one ant. one 20th-cent.) of the former rulers, remain, and there is a 15th-cent. church. Pop. 11,100.

Cetonia, genus of coleopterous insects of the family Scarabaeidae, inhabits warm lands. *C. aurata*, the rose-chaffer, is a beautiful bright green beetle. Both larva and imago feed on vegetable substances, but *C. floricola* is said to live in ants' nests in the larval state and to eat the young.

Cetraria Islandica, or Iceland Moss, fruticose or shrub-like lichen procured mostly from Norway and Iceland, but also a native of the higher mts of N. Britain. When dry it is almost odourless and the taste is bitter and unpleasant, but when the bitter principle is removed it becomes a wholesome and palatable food. It must first be boiled in water, upon which it becomes a mucilaginous fluid; unless steeped it is offensively bitter, and its purgative properties have given it the name of *Lichen catharticus*.

Cetie, see SETE.

Cetus, The Sea Monster, constellation situated S. of Pisces and Aries. It was supposed to represent the sea monster about to devour Andromeda. Although it covers a large expanse of sky, no star in it is of a brighter magnitude than the third. Omicron Ceti—generally known as Mira Ceti—is a long-period variable. In about 332 days it increases in brightness from below the ninth magnitude (when it is visible with a 3-in. telescope) to about the second magnitude, and then declines. Its period varies from 320 to 370 days, and its maximum and minimum luminosity is not invariable. It is historically interesting as being the first recorded variable, its fluctuations being noticed in the first instance by David Fabricius in 1596. No satisfactory explanation has yet been given of its remarkable variations.

Cetyl Alcohol, see ETHAL.

Cetywayo, phonetically spelt Ketshwyo (c. 1836-84), son of the Zulu King Panda, whom he deposed in 1856. He defeated his brother Umbulazie, and then his right to the throne was acknowledged by Natal on the conditions that he dispersed his troops and gave up his barbarous mode of governing. It was owing to

the Transvaal being annexed in 1877 that Britain had to enforce these measures, and in 1879 C. was made a prisoner by Maj. Marter and lodged in Cape Town. He was brought to England in 1882, but through pressure of public opinion he was restored as the king of the Zulus in 1883. However, very soon after he returned to his native land he was attacked by one of his old enemies named Usibepu, and had to seek an asylum in the native reserve on Brit. ter. C. d. at Eshowe.

Ceulen, L. van, see KEULEN.

Ceuta, fort and seaport which, until Morocco became a sovereign state, belonged to Spain, situated on the E. of the Moroccan peninsula which juts out N. towards Gibraltar. It is supposed to be the ant. tn in Abyla, one of the mythical Pillars of Hercules. It consists of an old tn right on the tongue of the peninsula, and a new tn running up the hills at the back. It is a bishop's see, and has a fine 15th-cent. cathedral. C. was once a very busy tn and did a great trade under both Rom. and Arab rule. It was conquered by King John I of Portugal in 1415, but passed into the hands of Spain in 1580. Pop. (1945) 60,353.

Ceutorhynchus, genus of coleopterous insects of the family Curculionidae, is a small weevil with many species, which frequents various plants.

Cevadine, alkaloidal substance found in hellebore and saladilla. It occurs in white crystals, soluble in water, alcohol, and ether. In medicine it has been used to expel worms, but it is very poisonous.

Cévennes (from Celtic root, cf. Welsh *cefn*, ridge), important mt range in SE. France, extending (in its widest application) from Canal du Midi (N. of Carcassonne) to the S. of the Côte d'Or. This range is some 330 m. long, forms the SE. border of the central plateau, and the watershed between the Rhône and Garonne. Sometimes the name is confined to the S. ranges only, ending at the gorge of the Chassezac, N. of Montagne de Lozère. In its narrowest significance it means only those mts E. of the plateaux of the Causse, beginning with Lozère plateau and ending with those round Aigoual at the head of the Gard valley. The large group is divided into 2 divs.: N., with Monts du Charolais, Beaujolais, Lyonnais, Vivarais (Mt Mézène), and S. with Montagnes Noires, C. proper, Garrigues, Monts de l'Épinouse and Lozère (Lozère, Pic de Finiels, Mt Aigoual). The Loire, Allier, Tarn, Aveyron, Gard, and other rivers, rise in the C. In the NE. a railway from Nîmes crosses the range by Alais to the valley of Allier and Clermont. The central mass lies in the depths of Ardèche, Lozère, Haute-Loire. The rocks are chiefly metamorphic and granitic, volcanic in parts. The revolt of the Camisards (q.v.) occurred here. See R. L. Stevenson, *Travels with a Donkey in the Cévennes*, 1879; Porcher, *Le Pays de Camisards*, 1894; Ribard, *L'Histoire cévenole d'après des documents*, 1898; A. Chamson, *A Mountain Boyhood*, 1947; J. Salcis, *A House in the Cévennes*, 1949.

Ceylon (Sanskrit *Sinhala*), is. in the Indian Ocean, crown colony of Great Britain until 1948, when it became a self-governing dominion. It is separated from India by the Gulf of Manaar and Palk Strait, but virtually joined to the mainland by the submerged coral reefs and sandbanks known as Adam's Bridge, and by Rameswaram Is. It lies between $5^{\circ} 55'$ and $9^{\circ} 50'$ N. lat., and $79^{\circ} 40'$ and $80^{\circ} 53'$ E. long. Length from Dondra Head to Palmyra Point about 266 m., width varies from 32 to 140 m. Area over 25,000 sq. m. The is. is mountainous in the S., expanding into a wide plain

The soil is mostly fertile, and vegetation very luxuriant. The time of greatest heat is between the 2 monsoons, from Feb. to May. The 3 main agric. crops, upon which the economy of the is. largely depends, are tea, rubber, and coco-nuts. For home consumption rice (paddy) is widely grown, and special efforts are being made to increase production. Tea, of which the is. is one of the largest producers in the world, accounted in 1954 for 65 per cent of the export income.

Of its mineral resources, plumbago (graphite) is of most commercial value; precious stones, notably rubies and

E.N.A.

TEA PLANTATION DISTRICT IN CEYLON: ON THE LEFT, ADAM'S PEAK

towards the N., still partly impenetrable jungle. The loftiest peak is Piduru Talagala, over 8000 ft.; the best known is Adam's Peak, over 7000 ft. There are 9 provs. for administrative purposes provided over by gov. agents. The longest riv. is Mahaveli Ganga, 208 m., flowing into the sea by Trincomalee Bay. The SW. is well watered, but NE. and SE. require irrigation, and remains of vast reservoir basins for this purpose are found in the N.

The climate is tropical, but the heat is tempered by the surrounding sea. Nuwara Eliya, the chief hill station, 6200 ft. has a mean temp. of 58° , Colombo one of 80° . Among C.'s chief tns are Colombo (its cap. and chief seaport), Jaffna, Kandy, Kalutara, Peradeniya, and Point de Galle. In the N. are the famous ruins of Anuradhapura. There are sev. short railway lines, the longest being between Colombo and Kandy. The total railway mileage is 898 (811 being 5 ft 6 in. gauge, the rest 2 ft 6 in.).

sapphires, are found in considerable quantities. Recently various earth minerals and china clay have been identified. Most tropical wild animals are to be found, and special measures have been taken to protect elephants. There are countless kinds of ferns and flowers, innumerable species of birds, and many reptiles, including crocodiles. C.'s chief imports are rice, textiles, wheat flour, and fuel. The leading exports in order of total value are tea, rubber, and coco-nut products. The value of the exports to the U.K. (1956) was 498.3 million rupees, and of imports from the U.K. 344.6 million.

History. The Portuguese reached C. in 1505, and estab. commercial settlements. They were driven away by the Dutch, 1656. In 1785 C. passed into Brit. possession, being first annexed to Madras; 6 years later the is. was ceded to Britain under the treaty of Amiens (25 Mar. 1802), and C. was then formed into a separate crown colony, the Kandyan kings finally disappearing voluntarily, 1815. The is.

of C. was known to the Greeks and Romans under the name of Taprobane (copper lead) and in later times Serendib, Sirindul, and Zeylan were used to designate it by writers of the W. and E. worlds. Sinhalese kings ruled from 543 BC to AD 1815.

Historical records are scanty, but it is known that there were constant irruptions from S. India. It is also known that at the friendly intervention of the Emperor Asoka of India, Buddhism was introduced in the 3rd cent BC and has

municipal or urb. councils exceed 50,000. Great attention is being paid to the extension of educational facilities, Sinhalese, Tamil, and English all being used as the medium of instruction. There are (1954) 3581 gov. schools with 845,000 pupils and 2181 assisted schools with 687,000 pupils. Teachers in training have been more than doubled in 7 years. The Univ. of Ceylon (1948) caters for 2400 students, and 277 adult classes and centres have been estab.

Constitutional developments. The germs of a representative system of gov. in C.

Department of Information, Colombo

RUWANVELISAYA, ANURADHAPURA

The most venerated dagaba in Ceylon.

remained the prevailing faith in C. ever since. Anuradhapura was sacked about AD 1000 by Tamils from S. India, but between AD 1050 and AD 1150 the Sinhalese kings re-established their authority with their centre at Polonnaruwa.

Population, etc. The pop. in 1953 was 8,000,000; of these some 5,500,000 are Sinhalese and 900,000 are Ceylon Tamils. There are 460,000 Moors, i.e. Muslims. There are nearly 1,000,000 Indians, not regarded as Ceylonese, most of them Tamil labourers from S. India, working on tea and other estates. Sinhalese, a language derived from Sanskrit and with close affiliations to 'Pali,' is the official language. Tamil, a Dravidian language, is spoken in the N. Colombo is increasingly the greatest urb. centre, with a pop. of 420,000. Only 5 other

have existed since 1829, but for many years officials in the Legislative Council outnumbered the non-officials. By a reform of 1910 the official majority was reduced to one, but the majority of the non-officials were not elected but nominated. Between 1920 and 1924 further changes were introduced, providing a non-official majority in the Legislative Council and non-official representation on the Executive Council. This system, however, which still reserved all real power to the Executive Council and in the last resort to the governor, served in the main to encourage complete irresponsibility in the Legislative Council, which was in fact constitutionally irresponsible. In 1927, therefore, the Donoughmore Commission was appointed to recommend constitutional revision,

and their report was submitted in June 1928, about 7 months after they had first arrived in C. They focused their attention upon the divorce of power from responsibility. The Legislative Council, having power over finance but no power to initiate expenditure, had become a permanent opposition devoted to obstruction. The theory of the old constitution that the gov. should be a partnership had broken down, or, at all events, had become a mockery of the party system, because the gov. could not claim to represent any one racial group in the council, whereas the unofficial block, externally united only in attacking the gov., were divided upon every other positive matter. The Donoughmore Commission made political re-education the main requirement of the situation, and proposed universal suffrage. They proposed the estab. for the gov. of C. of a system which had hitherto worked satisfactorily in the sphere of local gov. They recommended the estab. of a State Council which would give both responsibility and power to its members. It was to possess legislative powers as a general body. It was also to exercise its powers. The depts of gov. were to be divided into 10 groups. Three of them were to be in charge of officers of state (the chief secretary, the financial secretary, and the attorney-general—late legal secretary), who were to be members of the State Council but without the right to vote. The remaining 7 groups were to be controlled by the elected members of the State Council, who were to be divided into 7 executive committees of home affairs; agriculture and lands; local administration; health; labour, industry, and commerce; education; and communications and works. These committees were to elect their chairmen, and these chairmen, together with the officers of state, were to form the board of ministers. The State Council was to consist of 65 territorially elected members, in addition to the 12 nominated members. Officials, of course, had no place in such a council, where there was no question of commanding a majority. The Legislative Council, whose representation was based on communal lines, naturally opposed the abolition of communal representation. The Sinhalese supported the commissioners as its abolition coincided with their interests. The Tamils objected to the estab. of electorates based on numbers which would prejudice their influence; the Muslims and burghers, however, supported communal representation as it was their one safeguard against political extinction. The other features in the Donoughmore report which were strongly opposed were the system of executive committees and the wide powers given to the governor. The executive committee system was condemned 'either as unworkable or as derogatory to the status and proper functions of a minister... or as an impediment to further constitutional evolution towards the desired goal.' The secretary of state agreed to the proposal of the Legislative Council to have a State Council of 50 territorially

elected members and 8 nominated members, of whom 4 were to be Europeans. The proposals of the secretary of state were finally accepted in the council by the unofficial members by 19 votes to 17. The Donoughmore constitution was estab. by Sir Graeme Thomson in 1931, but requests for changes were made from 1932. The secretary of state refused to consider any radical alteration of the constitution before it was given a fair trial. In 1937 Sir Andrew Caldecott was asked by the secretary of state to examine the position and submit recommendations. He proposed the estab. of a cabinet system of gov. by the exclusion of the

E.N.A.

THE OLD DUTCH GATE AT GALLE

officers of state and the appointment of 2 other ministers to be entrusted with their work. These proposals led to no general agreement and the Colonial Office felt that the whole position should, in view of the approach of war, be postponed for fuller consideration.

After the war a new commission under the chairmanship of Lord Soulbury visited C., and recommended a form of constitution akin to the Brit. constitution. They thought that the existing system of universal suffrage should be retained and recommended the setting up of a Senate of 30 members and a House of Representatives of 95 elected members plus 6 members nominated by the governor-general. Instead of the 'board of ministers' there would be a Cabinet responsible to the legislature. The governor-general would be empowered to legislate on external affairs and defence. Currency Bills and any Bill likely to involve 'oppression or serious injustice' for any racial or religious community would be

treated as 'reserved' Bills. The Brit. Gov. (Oct. 1945) accepted the Soulbury committee's report, having come to the conclusion that a constitution on the general lines proposed by the commission conformed in broad outline, save as regards the second chamber, with the constitutional scheme put forward by the C. ministers themselves (see Cmd. 6890, 1945: Statement of Policy on Constitutional Reform). The recommendations were not greatly to the liking of minority communities in C., while the Sinhalese

Department of Information, Ceylon
THE TEMPLE OF THE TOOTH, KANDY

majority considered that the time had come for complete self-gov. on the lines offered to India and Burma. The new constitution was, however, accepted after the Brit. Gov. had issued a White Paper affirming self-gov. as their policy. It had been in existence only a year (June 1947) when the Brit. Gov. announced their decision to make C. a dominion.

C. became a self-governing dominion of the Brit. Commonwealth on 4 Feb. 1948, with the putting into force of the Independence Act, which was passed by the Brit. Parliament in Dec. 1947. The first session of the new Parliament of C. was opened on 10 Feb. 1948 by the Duke of Gloucester under special commission from the king. The Order in Council giving effect to the Independence Act replaced the governor by a governor-general appointed on the advice of the Prime

Minister of C. and representing the king. The Gov. of the U.K. is now represented by a high commissioner as in the case of the other dominions. Agreements, concluded in Nov. 1947 between the U.K. Gov. and the Gov. of C. as a prelude to this constitutional development, make provision for defence and external affairs, and the protection and/or compensation of officials appointed by the secretary of state.

The C. Gov. have announced their intention to become a rep. within the Commonwealth, as is the case with India and Pakistan, but have fixed no date for putting this into effect.

Geiger, *Litteratur und Sprache der Singhalesen*, 1901. See also *Annual Report on the Social and Economic Progress of the Peoples of Ceylon* (H.M.S.O.).

Cézanne, Paul (1839-1906), Fr. painter, and the outstanding figure of the post-Impressionist epoch, b. Aix-en-Provence, son of a banker. At first destined for a banking career, in 1862 he forsook his father's business house to study art in Paris. His early canvases were sombre, and romantic in their violence. He was one of the group (which included his boyhood friend Zola) that formed in defence

of Manet, and mainly through the influence of Pissarro he came eventually into the Impressionist circle, exhibiting with them. Impressionism taught him the value of pure colour and of the close study of nature. Little interested in Parisian life, he returned to Aix where the greater part of his life was spent; and after the death of his father he had income enough to disregard the sale of pictures. He set himself the task, as he said, 'to make of Impressionism something solid and enduring like the art of the Old Masters.' His early rather forced style of painting gave way to a method of absolute sincerity. Every brush stroke placed upon the canvas had its part to play in defining the structure of

Druet

CÉZANNE'S 'WOMAN WITH ROSARY'

an object, and it was in his use of colour to express form rather than atmosphere in the Impressionist sense that he initiated a new phase of art. At Aix he painted landscape, portraits, and still-life, but he treated all these branches of painting as still-life. His famous remark after a hundred portrait sittings that he was 'not displeased with the shirt front' sufficiently conveys his lack of interest in anything but the special problems of his art. In later life he painted water-colours that were extraordinarily fresh and brilliant in colour. Derided in his lifetime, he strongly influenced a later generation and his insistence on geometrical structure had its result, not long after death, in the Cubist movement. His 'Montagne Sainte-Victoire' (Courtauld Collection) at the National Gallery is one of his best landscapes, and in 1954 the National Gallery purchased his 'Woman with Rosary.' See E. Bernard, *Souvenirs sur Paul Cézanne*, 1924; A. Vollard, *Paul Cézanne, his Life and Art* (Eng. trans.), 1924; E. Fauré, *Paul Cézanne*, 1926;

Roger Fry, *Cézanne*, 1927; J. Meier-Graefe, *Cézanne*, 1927; J. Gasquet, *Cézanne: what he said to me*, 1931; G. Mack, *Paul Cézanne*, 1935; F. Jourdain, *Cézanne*, 1950.

Chadavayev, Pётr Yakovlevich (1793-1856), Russian thinker. In his 'Philosophic Letter' (1836) he maintained that Russia had no past, no present, and no future save in a reunion with the great body of European civilisation and with the Rom. Catholic Church, and he thus stimulated the great div. in Russian thought between the Westernisers and the Slavophiles. The gov. declared him insane.

Chabas, François Joseph (1817-82), Fr. Egyptologist, b. near Briançon, a wine-merchant by profession, who devoted his leisure to study. C. pub. many valuable treatises in his day.

Chabeuil, Fr. tn in the dept of Drôme, 7 m. SE. of Valence (q.v.). It is supposed to be the ant city of Cerebelliaca. There is a silk trade. Pop. 2700.

Chablais, dist. in France, formerly in the Duchy of Savoy (q.v.), now in the dept of Haute-Savoie. It borders on Lake Geneva. Its prin. tn is Thonon.

Chablis, Fr. tn in the dept of Yonne, on the Serein. It is the centre of a famous vineyard producing the great White Burgundy wine. C. Pop. 1700.

Chabot, Charles (1815-82), lithographer and calligraphic expert, b. Battersen. His skill as a calligraphist was much in demand at the law courts; he gave evidence in the celebrated Roupell and Tichborne cases. He identified Sir Philip Francis as being the author of the *Letters of Junius*.

Chabot, François (1759-94), Fr. revolutionary. He was a Capuchin monk who subsequently became a fanatical atheist. In 1790 he became a member of the Constituent Assembly, and gained great influence as an extreme democrat, instigating many of the worst excesses committed by the party, and being noted for his blasphemy and immorality. He was finally guillotined by order of Robespierre.

Chabot, Philippe de (1480-1543), Fr. soldier and Count of Charny and Buzançois. In 1524 he saved Marseilles from the Imperialists, and in 1525 was made a prisoner at Pavía. He was made Governor of Burgundy and admiral of France in 1526, after which he conquered the greater part of Piedmont.

Chabrias, Athenian general. In 390 bc he took part in the Thracian expedition of Thrasybulus. In 388, on his way to Cyprus to help Evagoras against the Persians, he defeated the Spartans at Aegina. In 378 C. commanded against the Spartans and drove Agesilaus from Boeotia, inventing the famous manoeuvre of receiving a charge on the left knee, with shields resting on the ground and spears levelled at the foe. In 376 he won the naval victory at Naxos; 373, went with Iphicrates to Corcyra; 369, fought against the Thebans in Peloponnesus, repulsing Epaminondas before Corinth; 367-36, was accused of treason over the Theban capture of Oropus, but was

acquitted. In the Social war (357) he joined Charas in command of the Athenian fleet, and was killed as trierarch at the siege of Chios. See H. W. Parke, *Greek Mercenary Soldiers*, 1933.

Chabrier, Emmanuel (1841-94), Fr. musical composer, b. Ambert, Puy-de-Dôme. In 1877 he wrote *L'Étoile* (an operetta) and in 1883 *Dix Pièces pittoresques* for the piano. He was chorus master at the Château d'Eau theatre in 1884-5, where he played at concerts. While there he assisted Lamoureux (q.v.) to produce 2 acts of *Tristan und Isolde*. He also brought out *La Sulamite* in 1885, and also selections from his opera *Gwendoline*, which was done as a whole in Brussels in 1886. His orchestral rhapsody, *España*, was a triumph, but the Paris Opera, while accepting his comic opera *Le Roi malgré lui*, rejected his *Gwendoline* as 'Wagnerian.' For his harmonic and orchestral experiments he may be regarded as a forerunner of Debussy and Ravel (q.q.v.). When he d. he left his opera *Briséis* unfinished.

Chabron, Marie Etienne Emmanuel Bertrand de (1806-89), Fr. general and politician, b. Retournac, Haute-Loire. He served with distinction in the Crimean War, the It. war, in which he fought at the battle of Palestro, and the Franco-Ger. War of 1870-1, being made a general of div. by Gambetta for the relief of Blois. At the close of the war he was elected deputy for Haute-Loire, and later became a senator.

Chachapoyas, or **San Juan de la Frontera**, city, cap. of Amazonas dept, Peru, situated 80 m. N.E. of Cajamarca. The city dates back to pre-Inca times; to-day it is an important trading centre. Pop. 5500.

Chacma, *Papio porcarius*, largest species of baboon (q.v.), belonging to the family Cercopithecidae (q.v.) and closely allied to the mandrill. It is a native of S. Africa, and in habit it is gregarious. Although largely vegetarian in diet, it is omnivorous at times and is particularly fond of insects.

Chaco, prov. in the C. Austral, Argentine Rep., which is part of the Gran C. (q.v.). Timber-felling is the chief industry, but cattle-grazing and agriculture, lead founding, and tanning are also carried on. The cap. is Resistencia, which is also the governing centre, and is 400 m. N. of Buenos Aires. Area 38,041 sq. m.; pop. 430,600.

Chaco War, between Bolivia and Paraguay. The dispute on the boundaries of the Gran Chaco was of more than 50 years' standing. The first military incidents in the war occurred early in 1927, and by the middle of 1933 hostilities had developed into extensive trench warfare, with aeroplanes and armoured cars. In 1933 the League of Nations Council, on the suggestion of the belligerents, invited Argentina, Chile, and Peru to intervene, it being their opinion that this offered a better chance of solution than mediation by a League commission. But the S. Amer. countries refused the invitation, and hostilities dragged on until Oct. 1935, when a truce was negotiated. After 2½

more years, by which time the resources of both countries, both human and material, were almost exhausted, a peace treaty was drafted in July 1938, under which they agreed to accept the decision of neutral arbitrators on the question of the Gran Chaco boundary. Ratified soon afterwards, the treaty gives Bolivia free commercial transit across the Chaco, and free commercial entry to Puerto Casado on the Paraguay R. Paraguay retained the ter. she had conquered.

Chaconne (Fr.), dance, probably of Sp. origin. Its movements were slow and stately. The music was generally a number of variations on a ground bass of 8 bars; and it differed from the Passacaglia (q.v.) in keeping the theme in the lowest part throughout. Purcell, Bach, Handel, and others of their time wrote C. music, of which the C. of Bach (the last movement of the D. minor Suite or '2nd Partita') for solo violin is the most famous. Lully usually ended his operas with a C., and Gluck still used it to some extent.

Chad, Tohad, or Tsad, Lake, or rather 2 large but shallow lakes, surrounded by swamps, situated between Bornu, Bagirmi, Kanem, and Wadal in W. Africa. The lake is studded with is., and the depth is from 8 to 15 ft. It has an estimated area of 7000 sq. m. but the area varies according to the season. Lake Chad gets most of its water from the Shari, but it also gets the waters of the Waube or Yo (otherwise the Komadugu Yobe). In the 19th cent. it was much larger than at present. There are many fish to be found there, and it is also frequented by wild fowl, hippopotami, and alligators. The convention of 1898 gave France the right to the E. shore. There are 2 groups of is., the Kuri archipelago in the S. and the Buduma in the N. They are inhabited by the Buduma and Kuri tribes.

Chad, or Ceadda, St (d. 673), b. Northumbria, a follower of St Aidan. He was Bishop of Mercia, with his see at Lichfield. His feast is on 2 March.

Chad, name given to the young of a fish—the common sea bream—by the fishermen of Devon and Cornwall.

Chad Colony, in the Fr. Congo, a ter. with an area of 461,200 sq. m. and a pop. of 2,238,600 natives and about 3359 Europeans. It was formerly a dependency of the Ubangi-Shari colony, but by decree, on 17 Mar. 1920, it was made a separate colony. Great numbers of cattle, sheep, camels, horses, and asses are raised in the colony. Copper, zinc, gold, lead, manganese, corundum, tantalum, and diamonds are found. Ivory is an important export. The French owe the conquest of this region to the activities of Savorgnan de Brazza, who in 1855 led an expedition through Ubangi to Sangha; to Lt. Gentil, who founded Fort Archambault; to Commandant Lamy, from whom it is named the cap., Fort Lamy; and above all to Lt. Binger, from whom it is named Bingerville. It is noteworthy that the colony of Chad was the first Fr. overseas ter. openly to support de Gaulle (q.v.) in the Second World War.

Chadderton, par. and tn of Lancs, England, N.E. of Manchester. Has important cotton, engineering, and chemical manufs. Pop. 31,500.

Chaderton, Laurence (c. 1536-1640), theologian, b. Lancs; studied theology at Cambridge, in opposition to his father, who wished him to enter the law. In 1584 was chosen by Sir Walter Mildmay as master of the newly refounded Emmanuel College. He assisted in the A.V. of the Bible.

Chaderton, William (c. 1540-1608), Eng. divine. After holding sev. important positions at Cambridge, he became Bishop of Chester in 1579, being also appointed a commissioner for the discovery and conviction of Rom. Catholic recusants. In 1595 he was appointed Bishop of Lincoln, where his efforts were still directed towards conformity.

Chads, Sir Henry Ducl (c. 1788-1868), naval commander, son of a naval captain. In 1810 he took part in the operations off Mauritius, being one of the party that seized the *Ile de la Passe* (see W. James, *Naval History*, 1860). First lieutenant of the *Java* under Capt. Lambert when captured by U.S. frigate *Constitution*, 1812. Tried by court-martial for loss of this ship, 1813, but honourably acquitted. He commanded the *Alligator* throughout the first Burmese war, 1826. In 1845-1854 captain of gunnery ship *Excellent* at Portsmouth. Admiral, 1863. His son (1819-1906) was also an admiral. See W. R. O'Byrne, *Naval Biographical Dictionary*, 1849; Montagu Hurrows, *Memoir of Admiral Sir H. D. Chads*, 1869; T. Roosevelt, *Naval War of 1812*, 1882.

Chadwell St Mary, par. of Essex, England, including Tilbury (q.v.), on the Thames, containing the E. and W. India deep-water docks. Pop. 12,000.

Chadwick, Sir Edwin (1800-90), social reformer and statistician, b. Manchester. He came to London, studying at the Inner Temple; called to the Bar, 1830. He early studied social, sanitary, and political science, and devoted his life to reforms and prevention of pauperism and disease. In 1828 his article 'On Life Assurance' in the *Westminster Review* appeared; 1829, a paper 'On Preventive Police' in the *London Review*. These won him the notice and friendship of Jeremy Bentham (q.v.). In 1834-47 he was secretary to the Poor Law Commission. From evidence collected for this commission, C. wrote *Report on the Sanitary Condition of the Labouring Population of Great Britain*, 1842. An earlier report of 1833 laid the foundations of later systems of gov. inspection. A public health Act was passed in 1848, and a general Board of Health appointed. C. was a member from 1848 to 1854. He was one of the founders of the Social Science Association, 1878. K.C.B., 1889. The society called Friends in Council (including Rowland Hill, John Stuart Mill, and others) was formed by C. to discuss political economy questions (c. 1844). C. advocated competitive examinations for gov. offices. See Sir B. W. Richardson, *The Health of Nations: a*

Review of the Works of Chadwick, 1887; S. E. Finer, *Life and Times of Sir Edwin Chadwick*, 1952; R. A. Lewis, *Edwin Chadwick and the Public Health Movement*, 1952.

Chadwick, Sir James (1891-), b. Manchester, physicist, master of Gonville and Caius College, Cambridge, since 1948. He worked under Rutherford at Cambridge and took a prominent part in the researches that led to the modern ideas of atomic structure. In 1932 he demonstrated that what had appeared to be a penetrating radiation, produced by bombarding certain light atoms with α -particles, was in fact a stream of particles, of mass similar to that of the hydrogen atom nucleus, but without electric charge. This discovery of the neutron (q.v.) was of immense importance for the understanding of atomic structure, since it soon became apparent that neutrons formed part of the central core or nucleus of all atoms except hydrogen. C. also shared in the discovery of the disintegration of the deuteron by β -rays, and of the creation of a pair of electrons (one positively and the other negatively charged) by γ -rays. He was elected F.R.S. in 1927, and in 1932 he received the Hughes Medal of the Royal Society; in 1935 he received the Nobel prize for physics and was prof. of physics at Liverpool until 1948. At the outbreak of the Second World War he began to study the chain reactions arising during the fission of uranium nuclei, and played a prominent part in the researches that led to the production of the atomic bomb (q.v.). With Rutherford and Ellis he pub. *Radiations from Radioactive Substances*, 1930, revised 1951.

Chaenomeles, family Rosaceae, a genus of 4 deciduous shrubs of N. Asia, closely akin to *Cydonia* (q.v.). *C. speciosa*, formerly *C. japonica* or *Pyrus japonica*, is the Jap. Quince, grown for its scarlet flowers early in the year, and has sev. varieties. *C. japonica* (synonym *C. maulei*) is Maul's Quince, giving fruit excellent for jelly. *C. x superba* is a hybrid of the 2 above species. *C. sinensis* and *C. cathayensis* are Chinese species.

Chaerea, Caius Cassius, Rom. tribune of the praetorian cohorts under Caligula. He formed a conspiracy and assassinated that emperor, AD 41. Shortly afterwards he was executed by Claudius. See Tacitus, *Annales*.

Chæronæa (Chæronesia), tn in Boeotia, memorable for the defeat of the Athenians, Boeotians, and other Gk forces by Philip of Macedon in 338 BC, and for Sulla's victory over Mithridates in 86 BC. C. was also the bp. of Plutarch. There are extensive remains, including the marble lion which was erected over the sepulchre of the Boeotians who fell in 338.

Chaerophyllum, genus of Umbelliferae, flourishes in N. lands of temperate climate. *C. temulum*, a biennial, is the Rough Chervil, with rough, purple-spotted stems; *C. aureum* is a perennial, introduced to Britain from S. and central Europe. See CHERVIL.

Chaetodon, genus of spiny-rayed fishes of the family Chaetodontidae (butterfly

fishes). The body is laterally compressed and elevated, the snout is fairly long, the mouth is furnished with closely set rows of long, slender, bristle-like teeth, and there is one dorsal fin. The species are often remarkable for their beauty of colour, the commonest tints being black, yellow, and brilliant metallic blues and greens. Their food consists of small animals and green algae. The numerous species frequent coral reefs.

E.N.A.

THE LION OF CHAERONEA

Chaetognatha, small group of transparent, elongated, worm-like animals with the body divided into head, trunk, and tail. The head has a pair of light-sensitive organs and carries 2 groups of chitinous teeth and jaws. The trunk and tail bear lateral fins. The 'arrow worms' or 'glass worms,' as this group is commonly called, consist of about 30 species, nearly all of which are pelagic.

Chaetopoda, class of Annelida, or segmented worms, in which the setae, or bristles, are very noticeable. The chaetopods are divided into 2 orders, the Polychaeta and the Oligochaeta, according as the setae are borne on special processes called parapodia, or spring directly from the body. In the first order all the species are marine, with extremely few exceptions, and in most of them the sexes are distinct, while the second order is composed of hermaphrodite creatures which generally inhabit fresh water or live underground. Among the former may be mentioned the genera *Arenicola*,

the lob-worm; *Aphrodite*, the sea-mouse; and *Chaetopterus*; among the latter occur all the earthworms, e.g. *Lumbricus* and *Megascolides*.

Chaetopterus, genus of polychaet worm which is noted for its green phosphorescent glow. It is a curiously shaped worm which inhabits a long tube.

Chaffer, name applied popularly to beetles of the family Scarabaeidae, which consists of about 13,000 species. The males have horns, and many of the perfect beetles and larvae are destructive to vegetable life. The term is usually compounded with another, e.g. cock-chaffer, barkchaffer, rosechaffer.

Chaffinch, or *Fringilla coelebs*, pretty, active little bird of the family Fringillidae, and is related to the sparrow, canary, and buntings. The cock-bird is a favourite songster, and from his note the Germans call him *finch*, from which we derive the word finch; his specific name is obtained from the habit of the sexes of living apart in winter, the females migrating and leaving the celibate males behind.

Chagall, Marc (c. 1887-), Russian painter, b. Vitebsk. Studied painting under Bakst in St Petersburg and (1910-14) in Paris. Worked in Russia during the First World War but returned to Paris, 1922, and migrated to the U.S.A. in 1941. Famous in the School of Paris of the Cubist period, he brought a novel element of fantasy (not to be confused with the later Surrealism). His scenes of Russian folk life are well known. His water-colours illustrating La Fontaine's Fables, etchings for various illustrated works, and theatre designs are other aspects of his work. See studies by T. Daubler, 1922; A. Salmon, 1928; L. Yenturi, 1945; and autobiography, 1931.

Chagga, Basuto tribe living on the S. slopes of Mt Kilimanjaro, in Tanganyika. After the First World War they took over many of the former Ger. coffee farms and founded their own coffee co-operative, which is still flourishing. They are one of the most progressive peoples of this ter.

Chagny, Fr. tn in the dept of Saône-et-Loire, on the Canal du Centre. It has a trade in wines, and has pottery and cooperage industries. Pop. 4700.

Chagos Archipelago, scattered group of coral reefs and islets in the Indian Ocean, S. of the Laccadive and Maldivo groups. They lie in circular form round the Chagos bank, in 5° 30' to 6° 30' N. and 71° 30' to 72° 30' E., separated from the Maldivo Is. by a deep channel 300 m. wide. Area about 150 sq. m. A dependency of the Brit. colony of Mauritius. The most important cluster is the Oil Is., with Grand C., or Diego Garcia (q.v.), in the SE. This is. has a good harbour, is a coaling-station, and exports much coconut oil. It is on the route of Australian and Red Sea steamers. Other is. are Danger, Egmont, Eagle, and Three Brothers Is. Various other is. S. and E. of the bank have disappeared. Pop. 5200.

Chagres River, in Panama, Canal Zone. Rising in San Blas Mts, about 30 m. from

Panama, it flows SE. through Lake Madden to the Panama Canal; it forms part of the canal from Gamboa to the W. of Gatú, and flows NW. into the Caribbean Sea. Navigation, except where it is canalised, is hindered by its falls and extreme swiftness. The Panama railway follows a part of its course.

Chaguaramas, inlet on NW. peninsula of Trinidad (q.v.), Brit. W. Indies, a bay on which is situated a U.S. naval base, 8 m. NW. of Port of Spain. The cap. of the new Caribbean Federation (q.v.) is to be on Trinidad, and it was strongly recommended that C. should be the chosen site.

Chahar, formerly a prov. of Inner Mongolia, China; now part of the Inner Mongolia Autonomous Region.

Chailié-Long, Charles (1842-1917), African explorer of Fr. parentage, b. Baltimore, graduated at Washington Academy, 1860; studied law at Columbia, becoming barrister, 1880; served in the Confederate army, 1862-5; went to Egypt and was made lieutenant-colonel by the khedive, 1870. In 1874 he became chief of Gordon's staff, and went on a mission to King M'tesa of Uganda. Obligated owing to plots to return to Gordon at Gondokoro, he managed to explore Lake Victoria and the country round, the course of the Somerset Nile, and Makaraka and Nyam-Nyam countries. He was decorated with many medals and honours for services as explorer and soldier. Among his works are *Les Combattants français*, *Les Sources du Nil*, *L'Égypte et ses provinces perdues*, *Central Africa: Naked Truths of Naked People*, 1876, *The Three Prophets*, 1886, and *My Life in Four Continents*, 1912.

Chailloteaceae, obscure family of Dicotyledons flourishing in the tropics. The inflorescence is cymose, the flowers are hermaphrodite or unisexual, the calyx, corolla, and androecium are in parts of 5, the gynaecium consists of 2 or 3 united carpels, and the fruits is a drupe.

Chaillot, dist. in Paris, on the r.b. of the Seine, opposite the Eiffel Tower, formerly a vil. dating back to the 7th cent. In a mansion here (on the site of the present palace) built by Catherine de' Medici, Henrietta Maria (q.v.), queen of Charles I of England, founded a famous convent. On the same site, Napoleon ordered to be built the 'most vast and extraordinary palace' in the world, but it was uncompleted at his fall. The site is now occupied by the Palais de C., a huge building reconstructed for the international exhibition of 1937 out of the Palais du Trocadéro, built for the exhibition of 1878.

Chaillu, Paul du, see DU CHAILLU.

Chain, Ernst Boris (1906-), biochemist, b. Berlin and educ. at the univ. there. He graduated 1930 and emigrated to England in 1933. C. carried out research at Cambridge (1933-5) and Oxford, in which latter he was univ. demonstrator and lecturer in chemical pathology, 1935-50. At Oxford he was associated with Sir H. W. Florey (q.v.) in the development and clinical application of penicillin; for this work he shared the Nobel prize for medicine in 1945. Since 1950 he has been prof. of biochemistry and scientific

director of the International Centre for Chemical Microbiology, Istituto Superiore di Sanità, Rome.

Chain, Chain Cables (Lat. *catena*), series of links of metal, or other material, so connected as to form a flexible band. C.s are of very ancient origin, but the number of different uses to which they can be put has been largely increased in modern times. Some of the oldest uses are as ornament (collar, bracelet, cf. modern watch C.), as a symbol of office (cf. modern knight, mayor), and as fetters for prisoners or slaves, hence any kind of shackle or bond, or figuratively a restraining force. Cordage was used for many purposes now served by C.s. They are employed to confine, bind, fasten, or connect together various objects, to lift weights, to transmit a mechanical power. These last are known as pitch C.s. In some C.s the links are composed of a single piece of metal (oval-link hoisting C.), in others the links are made up of sev. separate pieces (bicycle C.). These pieces are connected by bolts, rivets, or stud-screws, and are so formed as to engage with the teeth of a sprocket wheel.

C.s differ very considerably in structure according to the shape of the links (stud C.s, open-link C.s, twisted-link C.s), the mode of uniting them, and the purpose for which they are intended. They are sometimes loosely divided into hand-made and machine-made C. Ornamental C.s may have a large variety of links, but those for useful purposes are mainly of 2 types: (1) stud C.s, in which a transverse stud or brace is inserted in each link to keep the sides from collapsing under strain; (2) open-link C.s with no stud. The first are much stronger, increasing the load a C. can bear by about 50 per cent. Small C.s are often made by machinery, but larger ones are usually made by a smith and entirely hand-wrought. Crane C.s and ships' cables, etc., are generally hand-made from rolled bar-iron. The weld is commonly at the end of the link, but for large cables presses may be used to bend the link, or power hammers for welding, the weld sometimes being at the side. Weldless C.s are machine-made ones, manuf. from cruciform steel bars pressed while hot into links with no join (Strathern's process). They are mostly made in small sizes for cow-ties, dog C.s, or fence C.s. Strong C.s can withstand a breaking strain of many tons. C. cables have to undergo severe tests before passed by the Brit. Admiralty for use on board ship. C.s for railways, cranes, dredges, etc., have similar tests. Size is defined by the diameter of the bar from which the links are made. A 2-in. stud C. cable must withstand test load of 72 tons. For full 'test requirements' see Kent, *Mechanical Engineer's Pocket Book*. As a nautical term C. means the contrivance to extend the basis of the lower shrouds of a mast, consisting of dead-eyes, C.-plates, and C.-wale ('channel').

Chain, or Gunter's Chain, measuring-line in land surveying, of 100 links, connected by oval rings, with a brass handle

each end of the C. The total length, to the outside of the handles, is either 66 ft (Gunter's C.) or 100 ft. At every 10 ft or link a brass tag is fixed. Ten square (Gunter's) chains = 1 acre.

Chain-mail, see ARMOUR and MAIL ARMOUR.

Chain-plates, in shipbuilding, strong plates or bands of iron fastened to the ship's side under the chainwale, to which are attached the dead-eyes or (more recently) rigging-screws, to which the standing rigging and shrouds are fastened. In architecture a series of connected plates built into walls to give greater strength.

Chain Reaction, see ATOMIC BOMB and THERMO-NUCLEAR REACTION.

Chain-shot, obsolete form of projectile, invented by Adm. de Witt in 1666, consisting of 2 balls connected by a chain or bar, and used to destroy the rigging of enemy ships.

Chained Books. The custom of chaining books to stands or reading-desks was very common in various parts of Europe in the 15th and 16th cents. A library fitted with reading-desks made with an iron rod along the top to which the books were fastened by a chain was founded at Zutphen, 1561, and is still to be seen. Later, as the number of books increased, upright book-shelves were set up (very much as in modern libraries) and the books so arranged in them as to show the fore-edges on which the titles were written. Sloping desks were placed in front of the shelves, and chains were fastened to the books long enough to allow of their being placed and consulted on the corresponding desks. All Saints' Church, Hereford, still has a library of this kind dating from 1715. Hereford Cathedral library is an earlier example of the same system. In the reigns of the Tudor kings Henry VIII and Edward VI, orders were given for Bibles and copies of the Paraphrases of Erasmus to be chained in the par. churches. These books, together with Foxe's *Book of Martyrs* and works of Jewell (*d.* 1571), may still be found in old churches with their chains attached to them. The practice was discontinued early in the 18th cent. It was doubtless first introduced because the scarcity of books made them very valuable. See W. Blades, *Books in Chains, and other Bibliographical Papers*, 1892, and J. W. Clark, *The Care of Books*, 1901.

Chair, see FURNITURE.

Chairman, presiding officer at the meeting of any assembly, association, or company, whether convened for public purposes or for the transaction of the private business of the members. When a meeting is assembled the first thing to be done is for the chair to be taken. Some person present may have a statutory right to preside, and in the case of many public meetings the name of the C. is previously announced in the notice convening the meeting. In the absence of the foregoing, or where the C. selected by the convenors of the meeting is challenged, the meeting should put the call to the chair to vote. The president

or C. of the House of Commons is elected at the beginning of every new Parliament, and is called the Speaker. The prin. function of a C. is the maintenance of order, and on taking the chair a C. is consequently invested with authority to control and regulate the proceedings of the meeting. Generally speaking the duties of a C. are to decide points of order, put motions to the vote, call upon speakers to address the meeting, regulate the discussions, call upon the stewards or managers (if any) or the members themselves to eject interrupters without unnecessary violence, sign and secure the proper framing of the minutes, and adjourn the meeting. The Speaker of the House of Commons gives rulings as to procedure, names members guilty of disorder, reprimands members and other persons, if necessary, and signs warrants of committal for contempt. Speakers at a meeting must always address the chair. Unless previously selected to speak, when he will be called upon to do so by the C., a member desiring to speak must rise at the end of another member's speech. If 2 or more rise simultaneously, the one that 'catches the C.'s eye' should be called upon; but the C. may call upon whom he will. The office of C. may not be an easy one to fill. The ideal qualities in a C. are urbanity, the most unimpeachable impartiality, and a clear perception of the fundamental rules of debate. In calling speakers to order his function is to keep a discussion within legitimate or relevant bounds. In the case of meetings of public bodies it is obvious that public time can only be saved by confining speeches to the questions on the agenda. The C. is the sole judge as to whether any speech, resolution, or amendment is in order. When any resolution or amendment is proposed and seconded the C. is bound to put the resolution or amendment to the vote. Where the voting is equal the C. may have a second or casting vote. See W. M. Citrine, *ABC of Chairmanship*, 1933.

Chairman of Committees, officer who takes the chair in the House of Commons when the House is in Committees. He holds office during the whole Parliament. He does not sit in the Speaker's chair, but at the table in the place normally used by the Clerk. To the C. of C. belongs the duty of superintending all matters relating to private Bills. The salary of the C. of C. is £2500 a year. When the Speaker of the House is absent the C. of C. takes his place. There is also a deputy chairman. The corresponding officer in the upper House is called the Lord C. of C. See HOUSE OF COMMONS.

Chaise (Fr. *chaise*, chair), light, wheeled vehicle. C. is sometimes loosely used for any kind of pleasure carriage, but it is usually a 2-wheeled carriage for 2 people, with a calash top and the body hung on straps, drawn by 1 horse (cf. *hansom*). The post-chaise of the 18th and 19th cents. was a closed, 4-wheeled vehicle, with 2 or 4 horses.

Chaitanya, Indian mystic (fl. c. 1486-1570). Founder of the Vaishnava sect

of Bengal. Regarded by his adherents as Krishna incarnate.

Chalaza, in botany the base of the nucellus of the ovule, a mass of parenchymatous tissue from which the integuments arise.

Chalcedon, properly **Calchedon** (mod. **Kadiköi**), anct Gk city of Bithynia on the Bosphorus, opposite Byzantium, S. of Scutari. It was a Megarian colony, founded 685 BC. For long it vacillated between Athenian and Lacedaemonian interests. **Attalus III** of Pergamum bequeathed it to the Romans, 133 BC. Partly destroyed by **Mithridates**, it was recovered under the empire. C. was frequently ravaged by barbarian hordes, such as the Goths (AD 256) and Persians under **Chosroes** (AD 616-26). In AD 451 the fourth general council was held here. C. was destroyed by the Turks after 1075.

Chalcedony, or **Calcedony**, precious stone of the commoner sort, deriving its name from Chalcedon, a city of Bithynia in Asia Minor. The unct mineral, however, appears to have been a green stone, whereas modern C. is a milky-white or yellowish stone consisting of silica. It differs from quartz in not being definitely crystalline, but occurs in concretionary, mammillary, or stalactitic forms with a fibrous structure. Its hardness is 6.5 and sp. gr. 2.6. It occurs in cavities in volcanic rocks, where it has been deposited out of solution in water, as in the basalt of N. Ireland, Iceland, the Faroe Isles, etc. It is widely distributed, excellent specimens being found in Uruguay, Brazil, and the Lake Superior dist. Occasionally specimens are found with a drop of water in the interior, and these are much prized as ornaments. C. has been worked by jewellers from early times, and variegated forms are differentiated as agate, onyx, jasper, bloodstone, carnelian, etc.

Chalcedonyx is a specially marked variety of chalcedony, a mineral composed of quartz of a milk-white colour caused by the presence of opal. It usually has greyish markings, which give it, when polished, an ornamental value; it is used for making brooches and vases.

Chalchicomula, see **SERDÁN**.

Chalchihuitl (**Chalchihuite**), Mexican name for a kind of green, fine-grained stone, quarried near Santa Fé, much prized by the anct Mexicans. Probably it was a green variety of turquoise, or else a kind of jade. It was valued above gold, used for carved sculpture and polished, or made into beads and ornaments. Figures were found in tombs, and the brooch fastening Montezuma's robe was of C.

Chaloides, name of a genus of lizards in the family **Scincidae**. The species are pleurodont lizards with bony plates on the head and body, a scaly and feebly nicked tongue, elongated and sometimes serpentine-form body, the limbs wanting or little developed, and the lower eyelid has a transparent disk. They inhabit SW. Asia and the Mediterranean. **Ch. ocellatus** attains a length of about 10 in.

Chalcis (**Negropont**), anct seaport of Greece, cap. of Euboea, on the Euripus at

its narrowest part and 17 m. from Thebes, 35 m. from Athens, to which it was subject in 5th and 4th cents. BC. In early times it was a flourishing seat of commerce and manufs. (metal-work, purple, pottery), and a great colonising centre. The 3-pronged peninsula of Chalcidice, projecting from Macedonia into the Aegean Sea and divided into Pallene, Sithonia, and Acte (with Mt Athos), took its name from colonists in the 8th cent. BC from C., and its tns, Olynthus and Potidaea, were famous in Gk hist. Cumae and Naxos were also colonised from there. In the 7th cent. it defeated Eretria in the Lelantine war, becoming chief city of Euboea. Both Antiochus III (192 BC) and Mithridates VI (88 BC) used C. as a base for invading Greece. Aristotle d. here. C. was important in the Middle Ages; called Egripo by the Greeks, Negroponte by the Italians. It has medieval walls and towers, buildings of Venetian construction, and mosques mostly converted into Christian churches. In 1894 an earthquake did much damage. Since 1904 a railway connects C. with Athens and Piraeus. Pop. about 11,000.

Chalcis, typical genus of the curious suborder of hymenopterous insects, **Chalcidoidea**. The family contains numerous species of tiny parasites which prey on the larvae of galls, on caterpillars, on bees and beetles, but also on many destructive insects and they are thus of considerable value to man. *C. flavescens* is a species which is native to tropical America, and certain hymenopterous insects of the allied genera *Blastophaga* and *Sychophaga* assist in caprification or the fertilisation of the cultivated fig.

Chalcocondylas (or **Chalcocondyles**), **Demetrius** (1424-1511), Gk grammarian, b. Athens; brother of **Laonicus**. On Lorenzo dei Medici's invitation he went to Florence, where his pupils included **Grocyn**, **Linacre**, and **Latimer** (1480-92). He was also prof. of Greek at Perugia, Rome, and Milan. The first printed ed. of **Homer** (1488) was ed. by C.; his Gk grammar, *Erôtēmata*, appeared about 1493. C. also ed. **Isocrates** (1493) and **Suidas** (1499). See **J. A. Symonds**, *Renaissance in Italy*, 1875-86, 1920.

Chalcoondylas (or **Chalcondyles**), **Laonicus** (c. 1432-c. 1490), Gk historian, educ. by **Plethon** (q.v.) at the court of the **Palaeologi** at **Mistra**. He wrote a hist. covering the years 1298-1463, the plan of which is modelled upon that of **Herodotus**, though the style and language are clearly an approximation to those of **Thucydides**. There is a critical ed., *Historiarum demonstrationes*, by **E. Daskó** (2 vols., 1922-7); but no Eng. trans. of this masterly work exists.

Chaldaea, **Chaldaeans**, general description in O.T. and late Assyrian texts for the whole of Babylonia and its inhab. C. strictly applies to the land between the head of the Persian Gulf (marshland), the desert of Arabia, and the R. **Euphrates**. The prin. city, **Bit-Yakin**, was the base from which **Merodach-Baladan** (q.v.) conquered **Babylon** (703-702 BC) and defied **Sargon II** and **Sennacherib** (qq.v.) of

Assyria. A strong Chaldaean dynasty, ruling an independent Babylonia, was founded by Nabopolassar in 605 bc and displaced by Cyrus in 539 bc. Throughout this period C. became synonymous with Babylonia and its Semitic language, which was closely allied with Aramaic which language superseded it. Through a misunderstanding Aramaic has, until recently, sometimes been called 'Chaldee.' Chaldaean also designates the learned classes (astronomers, etc.) of Babylon as in Daniel, Herodotus, Diodorus, and Strabo. Xenophon's 'Chaldaeans' (*Anab.* vii) were the Haldaeans or Urartians of Armenia. See D. J. Wiseman, *Chronicles of Chaldaean Kings* (826-556 bc), 1956. See also BARYLONIA and UR.

buried in the Friends' cemetery near by. Milton lived here during the plague (1665-1666), and finished *Paradise Lost* and began *Paradise Regained*. His cottage is shown daily except on Tuesdays. Pop. 4460.

Chalford, eccles. dist. and vil. of Glos., England, 4 m. from Stroud, picturesque hillside vil., accessible only through a maze of winding and narrow lanes. Pop. 3000.

Chalgrove (A.-S. *cealc-graef*, chalk-pit), par. and vil. of Oxon., England, about 11 m. from Oxford. In 1643 the Parliamentarians were crushed here by the Royalists under Prince Rupert, Hampden being mortally wounded. The chancel of the par. church, which dates from the

SWISS CHALETs AT ZUM-SEE, NEAR ZERMATT

Topical

Chalder, old Scottish dry measure of 16 bolls or 64 firloths of corn (96 bushels). For lime or coal it varied from 32 to 64 imperial bushels. Still used in computing the stipends of Scottish ministers (cf. Chaldron).

Chaldron, see METROLOGY.

Chalet (dimin. of O.F. *chastel*; Mod. Fr. *château*), originally a wooden hut or cabin in the Swiss mts, where cattle are lodged in summer, and cheese is made. Extended to a Swiss peasant's small cottage, a herdsman's hut, or a wooden house. Applied now to any picturesque villa built in imitation of that style.

Chaleurs Bay (Baie des Chaleurs), sheltered inlet of the Gulf of St Lawrence, Canada, between Gaspé Peninsula and New Brunswick. Quebec is on the N., New Brunswick on the S. The bay is about 90 m. from E. to W., maximum breadth 25 m. There are good mackerel fisheries. Shippegan and Miscou Is. are near the entrance. Discovered by Cartier in 1535, it was named from the intense heat of the summer season.

Chalfont St Giles, par. of Bucks, England, 4½ m. NE. of Beaconsfield. Penn is

12th cent., contains some interesting frescoes, covered during the Civil war, but brought to light again about a hundred years ago.

Challapin, Feodor Ivanovich, see SHALIAPIN.

Chalibaus, see CHALYBAEUS.

Chalice (Lat. *calix*), drinking-cup, goblet, or bowl, but especially the cup used at Mass and in the Anglican Communion service. Formerly it was made of any material (the 'Luck of Edenhill' preserved in the family of Musgrave, near Penrith, is of glass), but must now be of gold, silver, or silver-gilt, with the inside gilded, and consecrated by a bishop. It should be handled only by those in holy orders.

Chalina, genus of Porifera, received its name from the naturalist Grant. The sponge is represented in Britain by *C. oculata*, the mermaid's glove.

Chalk, soft, white variety of limestone. As found in the S. and E. of England, it is white or yellowish-white in colour and easily broken, though it varies considerably in compactness. Flints of various sizes are found embedded in the C.,

The Worshipful Company of Goldsmiths

CHALICE

16th-century silver-gilt chalice and paten from St Ethelburga's Church, Bishopsgate, London.

usually in fairly definite layers; otherwise it consists of calcium carbonate, with some admixture of silica, alumina, and magnesia. C. consists largely of the hard parts of organisms known as coccoliths, forms of which inhabit warm seas at the present day; calcium carbonate secreted by these animals was deposited on the sea bed as they died. From this calcareous ooze, C. has consolidated. Rocks resembling C. were formed during the Tertiary Period and are exposed in the Near E.; despite these and other occurrences, it remains true that the great period in which C. was laid down was the Cretaceous (named after the Latin for lime). The Cretaceous C. was laid down in warm seas which occupied much of what is now N. France, S. Britain, and Germany. C. also occurs in Ireland and Denmark. In Britain the C. outcrops in a broad belt running SW. from the Yorks Wolds; in this belt it gives rise to a characteristic landscape with rounded hills, often covered with downs of short herbage which can tolerate the chalky soil; near Salisbury Plain the outcrop widens and from here 2 arms stretch eastwards forming the N. and S. Downs. The sea cliffs of C. are a striking feature of the Channel coast. The C. is used for building purposes when found hard enough, and the flints are used for building and road-making. When subjected to a bright heat, C. loses its carbon dioxide, and calcium oxide, or quicklime, is formed. When mixed with water the hydrate, or slaked lime, is produced, and this, mixed with 3 times its bulk of sand, forms the mortar used to cement bricks together. Lime is also much used as a fertiliser and

is particularly valuable in acid soils. C. burnt with certain proportions of clay provides different forms of cement, which harden with more or less rapidity according to the proportions of their constituents. When the C. is triturated with water, and the fine particles allowed to fall in a fairly homogeneous mass, the resulting product is whitening, used as a pigment and a polishing medium. An artificial C. is prepared by adding sodium carbonate to a solution of calcium chloride, when a fine precipitate forms. This product, known as precipitated C., is used in medicine as an antacid and astringent, and serves as a tooth-powder and as a pigment. Substances somewhat similar in consistency to the carbonate are known as C.s. *Black C.* is a soft schist containing carbon; *red C.* consists of iron ore and clay; *French C.* is a variety of steatite, or soapstone.

Chalking the Door, mode of giving tenants notice of removal (especially among the poorer classes) formerly common in Scotland. The chalk mark was made by a burgh officer in the presence of witnesses on 'the most patent door,' on the proprietor's verbal order. This was done 40 days 'before Whit Sunday,' or the date on which the tenants were expected to leave. When this had been done, and a declaration of 'chalking' written out and signed by the officer and 2 witnesses, he might demand the election of the tenants 6 days after the expiry of the 40 days.

Chalkley, Thomas (1675-1741), Quaker. After a varied and adventurous youth, he began preaching at Quaker meetings, and in 1697-8 visited the Puritan American colonies. In 1700 he returned to America; in 1701 made a preaching tour to the Barbados, and between then and 1710 visited Ireland, Scotland, England, Holland, and Germany. The rest of his life was mainly spent in preaching and organisation in America, where he had great influence. His *Journal* and works appeared in 1751 and 1790.

Challemeil-Lacour, Paul Armand (1827-1896), Fr. writer and statesman, b. Avranches, became prof. of philosophy at Pau and Limoges. In 1868 he estab. the *Revue Politique*, with Brissot and Gambetta, who made him prefect of Lyons, 1871; deputy, 1872; senator, 1876; ambas. to Switzerland, 1879; to England, 1880-1882. In 1883, under Ferry, he was minister of foreign affairs, in 1890 becoming vice-president, and in 1893 president of the Senate. Member of the Fr. Academy, 1893. He wrote a large number of philosophical works.

Challenge, see **JURY**.

'Challenger' Expedition, scientific exploring expedition sent out by the Brit. Gov. (1872-6) for experiments in deep-sea soundings and the investigation of the conditions of life in the Atlantic, Pacific, and Antarctic Oceans. The cruise of H.M.S. *Challenger*, the first steam vessel to cross the Antarctic Circle, followed that of the *Lightning* in 1868, and of the *Porcupine*, 1869-70. Capt. G. S. Nares was naval commander of the vessel, the

scientific staff being under Prof. Wyville Thomson. Every kind of scientific appliance was supplied for sounding the depths, mapping the basins, and determining the physical and biological conditions of the oceans. H.M.S. *Challenger* reached Santa Cruz in Feb. 1873. Investigations were made at 362 stations. Among numerous places on the route were Madeira, Canaries, W. Indies, Nova Scotia, Cape Verde, Fernando Noronha, Cape of Good Hope, Melbourne, Hong Kong, Japan, Valparaiso, Magellan Straits, Portsmouth, and various subantarctic is. The deepest sounding was between Admiralty Is. and Japan, 4575 fathoms. See *Official Reports on the Scientific Results of the Voyage of H.M.S. 'Challenger'*, ed. by Wyville Thomson and John Murray, 50 vols. (Zoology, Botany, Deep-sea Deposits, Physics, and Chem., etc.), 1880-95. The narrative occupies 2 vols. (1882-5). Consult also H. N. Moseley, *Notes by a Naturalist on the 'Challenger'*, 1872-76, 1879; W. J. J. Spry, *Cruise of H.M.S. 'Challenger'*, 1876; and works of W. Thomson, J. Murray, Lord George G. Campbell, and J. J. Wild.

Challis, James (1803-82), astronomer and physicist, b. Braintree, educ. at Trinity College, Cambridge. Senior wrangler, first Smith prizeman, 1825; ordained, 1830. In 1836 Plumian prof. of astronomy and experimental philosophy, and till 1861 director of the observatory of Cambridge Univ. His labours were largely directed to determining the positions of the sun, moon, and planets, so as to increase tabular accuracy. Among his valuable improvements were the collimating eye-piece (1850), the transit-reducer, and the meteoroscope. His works include *Astronomical Observations*, 1828-46, 1829-50; 1846-51, 1854-6; and *An Essay on the Mathematical Principles of Physics*, 1873.

Challoner, Richard (1691-1781), Eng. Rom. Catholic priest, educ. at the Eng. college at Douai, 1704; prof. of philosophy there, 1713-20; vice-president and prof. of divinity, 1720-30. C. returned to London, becoming coadjutor to Petre, 1741, succeeding him in 1758 as vicar apostolic of the London dist. He was appointed titular Bishop of Debra in Libya, 1741. During the Gordon riots he took refuge in Highbury. His pub. works include *Church History, Grounds of the Old Religion, The Garden of the Soul*, 1740, *The Rheims New Testament and the Douay Bible, with Annotations*, 1749-50. His version of the Douay Bible is substantially that since used by Eng.-speaking Catholics. C. also trans. *The Imitation of Christ*, 1706. See *Barnard's Life*, 1784, also E. H. Burton, *Life and Times of Bishop Challoner*, 1909.

Chalmers, Alexander (1759-1834), biographer and editor, b. Aberdeen. He studied medicine, but turned to journalism, ed. newspapers in London, contributed to periodicals, and wrote prefaces for new eds. of Eng. classics. His *Glossary to Shakespeare* appeared in 1797. His *British Essayists*, in 45 vols., 1817, is still useful. His fame rests chiefly on his

General Biographical Dictionary in 32 vols., 1812-17.

Chalmers, George Paul (1833-78), painter, b. Montrose; in early life a surgeon's errand-boy, then apprenticed to a ship-chandler. He studied art in Edinburgh, Orchardson, Graham, Pettie, and others being among his fellow students. His landscapes were considered his best work, including 'The End of the Harvest', 1873, 'Running Water', 1875, and 'The Legend' (Edinburgh National Art Gallery). See *Art Journal*, April 1873, and *Memoir*, 1879.

Chalmers, James (1841-1901), missionary, served in Glasgow City Mission, passed through Cheshunt College, and was appointed by the London Missionary Society (1866) to work in Raratonga Is. in the S. Pacific. He worked there for 10 years, training native evangelists, and was called Tamate by the natives. Then he was transferred to New Guinea. Besides zealous missionary work, C. and Lawes (his colleague) opened up the land, and helped in establishing the Brit. protectorate. C. and Tomkins (another missionary) were murdered by cannibals at Gauribari Is. See R. L. Stevenson, *Letters*, II. 212, 220, and *J. Chalmers: Autobiography and Letters*, ed. by R. Lovett, 1902.

Chalmers, Thomas (1780-1847), theologian and economist, one of the most eminent figures and influential preachers of the 19th cent. His powers of oratory were so great that Jeffrey ranked him with Demosthenes, Cicero, Burke, and Sheridan. Educ. at St Andrews Univ., he began preaching at 19. From 1803 to 1815 he was minister of Kilmany, Fife. He then gave much time to studying mathematics, political economy, and natural philosophy; but after reading Wilberforce's *View of Practical Religion*, and writing at his request the article on Christianity for Brewster's *Edinburgh Encyclopaedia*, 1810, his religious enthusiasm awoke, and he became an enthusiastic pastor. In 1815-20, as minister of Tron par., Glasgow, he tried to remedy the ignorance and vice of his par., making experiments in parochial organisation which anticipated modern methods as seen in charity organisations and in settlement work (see N. Masterman, *Chalmers on Charity*, 1900). C. divided the par. into 25 dists., and estab. 2 week-day and numerous Sunday schools. His *Astronomical Discourses* appeared in 1817, and were very popular. His visit to London was enthusiastically received. His *Christian and Civic Economy of Large Towns* appeared from 1821 to 1826. These energetic labours told on his health. In 1823 he became prof. of moral philosophy at St Andrews; 1828, of theology at Edinburgh. In 1827 appeared the *Use and Abuse of Literary and Ecclesiastical Endowments*; in 1834 his *Bridgewater treatise, Adaptation of External Nature to the Moral and Intellectual Constitution of Man*, which won him great distinctions from Edinburgh, France, and England (D.C.L., Oxford). In 1829 C. spoke in favour of Catholic emancipation. He

was elected moderator of the General Assembly of the Scottish Church, and convener of the church-extension committee (1834). Cases of conflict between the church and civil authority arose in Auchtermarder, Dunkeld, and Marnoch. In 1843, owing to these internal troubles, 470 clergymen, headed by C., left the church and founded the Free Church, claiming for it spiritual independence. C. was made principal of the Free Church College. He devoted much time to the attempt to abolish pauperism round about Edinburgh. His last work was *Institutes of Theology*. His works were collected by W. Hanna, 1836-40, and posthumously 1847-9. See R. Buchanan, *The Ten Years' Conflict*, 1849; W. Hanna, *Memoirs*, 1849-52; Taylor Innes, *Law of Creeds in Scotland*, 1867; Mrs T. C. Olliphant, *Thomas Chalmers*, 1896; W. G. Blackie, *Life*, 1897.

Châlons-sur-Saône (anc. Cabillonum), Fr. tn, cap. of an arron., in the dept of Saône-et-Loire, on the Saône and the Canal du Centre. It has extensive water-borne trade with the Atlantic and the Mediterranean. It is a wine market, has iron and copper foundries, engineering and ship-building works, brewing, and sugar, glass, and chemical manufs. Pop. 32,700.

Chaloner, Sir Thomas (c. 1521-65), diplomat and writer, b. London and educ. at Oxford. He was sent by Henry VIII as ambas. to Charles V, whom he accompanied in his disastrous expedition against Algiers, 1541. Later C. was recalled to England as chief clerk of the Privy Council; he was knighted in 1547. Elizabeth I employed him as ambas. to the Emperor Ferdinand I, 1558, to Philip II at Courtray, and as minister at the Sp. court, 1561. Among his literary works is a trans. of Erasmus's *Praise of Folly*, 1549.

Chaloner, Sir Thomas (c. 1561-1615), naturalist, son of the statesman, father of Edward, James, and Thomas the regicide. In 1603 he was appointed director of the education and household of Prince Henry. He opened the first Eng. alum-mine at Belman Bank, Guisborough, about 1600.

Châlons-sur-Loire, tn in the dept of Maine-et-Loire, France, 12 m. SW. of Angers. The chief trade is in wines, grain, and limestone. There are mineral springs in the neighbourhood. C.-sur-L. possesses the ruins of a 12th-cent. chateau. Pop. 3800.

Châlons-sur-Marne, Fr. tn, cap. of the dept of Marne, on the r. b. of the Marne. It was known to the Romans as Catalaunum. From the 10th cent. to the 14th cent. it was governed by its bishops. It suffered at the hands of the English in the Hundred Years War. In 1589 Henry IV (q.v.) transferred the parlement of Paris here when the tn sided with him. Taken by the Germans in 1870, when MacMahon (q.v.) withdrew from the famous camp of C.-sur-M., formed by Napoleon III in 1856 (see FRANCO-GERMAN WAR), and was again in Ger. hands for a short period in the First World War. The tn, including the 13th-cent. cathedral, was severely damaged in the Second World

War. There are many old houses, and a 12th-cent. church, Notre-Dame-en-Vaux, and the tn is the seat of a bishop. C.-sur-M. is an important railway junction, and a centre of the wine trade of Champagne. It also has leather, oil, and textile manufs. It was formerly noted for its worsted cloth called 'shalloon' (called 'chalons' by Chaucer). Pop. 31,000. See also CATALAUNIAN FIELDS.

Châlus (Castrum Lucil), Fr. tn in the dept of Haute-Vienne, on the Tardoire. It has a ruined castle on a hill, besieging which Richard I, Cœur-de-Lion (q.v.), was mortally wounded. Pop. 2100.

Chalybaeus (Chalybæus), Heinrich Moritz (1796-1862); Ger. philosophical writer. From 1839 until 1852 he was prof. of philosophy at Kiel Univ. where, with the exception of one brief interval, he remained till his death. In 1836 he pub. *Historische Entwicklung der spekulativen Philosophie* (Kant to Hegel). But his chief works are *Entwurf eines Systems der Wissenschaftslehre*, 1846, and *System der spekulativen Ethik* (2 vols.), 1850. His general principle, 'ideal-realism', rejects both the extreme realism of Herbart and what he regards as the one-sided idealism of Hegel, and he tries to find a mean between the two. He defines the 'world ether' as the infinite in time and space and which in his view must be postulated as necessarily coexisting with the Infinite Spirit or God.

Chalybeate Springs are natural mineral springs in which iron predominates, as at Harrogate and Leamington Spa, England. The iron is generally combined with carbonic acid, in the form of protoxide or proto-carbonate, or with sulphuric acid, in the form of sulphate of iron, and the springs, therefore, can be subdivided into carbonated chalybeate and sulphated chalybeate.

Chalybes (Gk *Chalubes*, from *Chalups*, iron), Asiatic people who lived in Pontus, Asia Minor, SE. of Black Sea. Famed as ironworkers, whence our word 'chalybeate.' Also a people mentioned by Xenophon as dwelling in the mts on the borders of Armenia and Mesopotamia.

Chalybite, see SIDERITE.

Cham (Fr. for Ham, son of Noah) (1819-84), pseudonym of the brilliant caricaturist, Amédée Charles Henri, Vicomte de Noé. He studied under Delaroche and Charlet, and won fame for depicting the humorous side of contemporary Parisian life, his first album, *Calembours, bêtises, jeux de mots tirés par les cheveux*, appearing in 1842. In 1843 he first became connected with *Charivari*, and in this and the *Journal des Pèlerinages* his drawings continued to appear till his death. His masterpieces are chiefly social, but he also did political cartoons. Among his skits are *Proudhomana*, *Raigneurs et buveurs d'eau*, *L'Exposition de Londres*. For collections of his comic sketches see *Deux Années comiques*, 1880, *Les Folies parisiennes*, 1883. There are also examples in G. A. Sala's *Paris HerSELF Again in 1878-79*, 1882. See F. Ribeyre, *Cham, sa vie et son œuvre*, 1884.

Chamaecyparis, genus of hardy, evergreen coniferous trees, closely related to and often included under Cupressus; family Pinaceae; sometimes known as Bastard or False Cypress, and chiefly from N. America, Formosa, and Japan. *C. lawsoniana*, Lawson's Cypress, is very variable; *C. nookatensis*, *C. obtusa*, and *C. pisifera* are valued for forestry and ornamental gardening. See CYPRESS.

Chamaeleon, small S. constellation near the S. pole S. of Carina and Musca, announced by Bayer in 1603.

Chamaerops, family Palmaceae, Palm genus of 1 species, *C. humilis*, native to Mediterranean region, and only palm native to Europe. An evergreen shrub, with fan-shaped leaves, it is a popular greenhouse foliage plant, with many varieties; and may be grown outdoors in mild localities in Britain.

Chamba, tn and area in India, formerly an Indian state, now part of Himachal Pradesh. The hill station of Dalhousie lies in C. ter., which contains magnificent forests.

Chambal, riv. in central India, trib. of the Jumna R. (q.v.). It rises in the Vindhya Range (2019 ft) and flows 650 m. in a N.E. direction to its junction with the Jumna, 90 m. S.E. of Agra.

Chamber Music, name for music suitable for performance at home, as distinct from church and theatre music, but now also applicable to concert music performed by small groups of solo instruments. It has been said that C. M. dates no further back than Haydn, but this is quite untrue, since the fantasies for consorts of viols of the age of Elizabeth I. and the 17th-cent. It. *sonata da camera*, usually for 2 violins, bass viol (or cello), and continuo (q.v.), are earlier examples of what is domestic music of the same kind. What Haydn did develop, though not originate, was the string quartet, which is, so to speak, the staple form of C. M.; it was in his hands that it became allied to sonata (q.v.) form, having been at first, like the symphony, hardly distinguishable from the It. operatic overture, which was in fact usually called *sinfonia*. Mozart and Beethoven cultivated the quartet at its finest; what is more, the former showed that C. M. in sonata form could be equally perfect in various other instrumental combinations, with or without piano parts, and the latter, in his last quartets, that this classical form was capable of being departed from or transcended. The purest C. M. in the classical manner in the early 19th cent. was written by Schubert and in its late years by Dvořák, for although the latter was surpassed by Brahms, the Czech composer understood the ideal chamber style better than the Ger. master. Brahms's C. M. is more considerable, but he transfers to its medium a good deal that is actually orchestral in conception, though still suitable because, like most of Brahms's music even in other domains, it is domestic in feeling. Schumann's C. M. is purer, but less important; on the other hand the C. M. medium was stretched either in the direction of ampler sound or in that of

programme music (q.v.) by Smetana in Bohemia, Tchaikovsky in Russia, Grieg in Norway, and Franck in France. It was in France, however, that much was done by the beginning of the 20th cent. to purge C. M. of such elements, especially by Fauré, Debussy, and Ravel, but also by disciples of Franck, such as d'Indy and Chausson. In Russia a true chamber style was cultivated by Glazunov and, more interestingly, Taneyev; in Germany Max Reger did a vast amount of work with a similar aim, but overloaded its essentially classical structures with excessive technical difficulties and tortuous chromatic modulations. It was Hindemith who restored Ger. C. M. to its proper functions by simplifying his texture, though not his idiom, sometimes to the point of calling and actually making his chamber works 'utility music,' designed for moderately skilled players. In modern England C. M., very little cultivated in the home, is written mainly for concert performance and therefore often difficult to play; but it has been finely cultivated by many composers, including Stanford, Frank Bridge, Arnold Bax, John Ireland, Arthur Bliss, Edmund Rubbra, Gerald Finzi, Michael Tippett, Elizabeth Maconchy, and Benjamin Frankel, to name only some who have more or less specialised in C. M., though Elgar, Holst, Vaughan Williams, and others have contributed notably to the species. In Hungary Bartók has achieved what is perhaps the most important development of the string quartet since Beethoven; in Italy Pizzetti has revived true C. M. nobly; in Czechoslovakia the most original contribution has been made by Janáček. Amer. composers are faced with much the same decline in domestic music-making as those of Great Britain, but many have contributed assiduously to the concert repertory.

It remains to be said that although C. M. is mainly instrumental, it does not exclude the human voice. In the 17th and 18th cents. chamber cantatas and duets were fashionable; in modern times settings of poetry often provide single vocal parts consorting with various instrumental combinations.

Chamber of Commerce, an organisation formed to protect the interests of private enterprise in industry and commerce within a particular tn or area. In some countries C.s of C. are gov. controlled and membership is compulsory, whereas in others—such as the U.K.—C.s of C. are independent bodies, relying for their revenue on the voluntary subscriptions paid by their members. Such basic differences make generalisations impossible, but it is true to say that C.s of C. are universally respected, and their advice is frequently sought by govts. The first C. of C. was formed in France, at Marseilles, in 1599, and the first chamber to be formed in the U.K. was in Glasgow in 1783, when it was incorporated under royal charter by George III. To-day nearly every manufacturing centre in the U.K. has its local C. of C., the largest of these being the London C. of C. with a

direct membership of 12,500, and a further 50,000 represented on its council through 46 affiliated associations. The London chamber is the largest in the world.

Membership of a U.K. C. of C. is composed mainly of manufacturers and merchants. It should be remembered, however, that in the U.K. the title 'Chamber of Commerce' is not protected in law, and there are a number of bodies using the title which could more appropriately be styled 'Chambers of Trade,' as their membership is predominantly retail. At a national level the views of C.s of C. in the U.K. are co-ordinated by the Association of British Chambers of Commerce (A.B.C.C.), to which some 98 U.K. chambers and 16 Brit. chambers in foreign countries are affiliated, the majority being incorporated by the Board of Trade under the Companies' Act (to-day only incorporated chambers are accepted for affiliation). Her Majesty's Gov. frequently seeks the views of C.s of C., both from the association on national policy matters and from its constituents on subjects they are particularly qualified to handle. An example of the confidence placed in C.s of C. affiliated to the A.B.C.C. is the fact that only these chambers, together with the London and regional offices of the Federation of Brit. Industries (q.v.), are authorised by the Board of Trade to issue certificates of origin and to certify commercial invoices. So extensive are the activities of U.K. chambers, both locally and nationally, that it is impracticable to give a comprehensive list. Reference should, however, be made to some particular aspects of their work; e.g. some large chambers—London and Manchester—have estab. courts of arbitration; in areas where a particular industry has developed, specialised services are offered, such as the facilities of the textile testing laboratory estab. by the Manchester chamber; the A.B.C.C. is one of the sponsoring bodies for the National Certificate in Commerce; the commercial examinations set by the London chamber are widely recognised and internationally known and accepted; the Birmingham chamber organises the Brit. Industries Fair which is staged in extensive fair space and buildings at Castle Bromwich.

The more important C.s of C. affiliated to the A.B.C.C. assist their members in the following matters: agencies, contract terms, export and import problems, parl. reports, local affairs, market reports, purchase tax, rating policy, taxation matters, tin and country planning, trade inquiries, trade marks and names, and trans. These are but some of the varied services available on request from members.

The object of Brit. C.s of C. in foreign countries is to promote Brit. trade in the country in which they are situated. To qualify for membership of the A.B.C.C. such chambers must confine the privileges of full membership to Brit. subjects, and the officers, members of the council, and the secretary must be British. The

first of these chambers was formed in Paris in 1873. Correspondingly, there are a number of foreign C.s of C. in the U.K. The views of C.s of C. within the Commonwealth are co-ordinated by the Federation of Commonwealth and Brit. Empire C.s of C., which was formed in 1886 and the secretariat for which is in the London C. of C. This body holds triennial congresses, at which questions of general interest to traders in all parts of the Commonwealth are discussed and examined, and policies suggested for the guidance of the govts. of the Commonwealth and dominions. At an international level the International C. of C. (see below) serves a similar purpose on a worldwide scale.

Chamber of Commerce, International, founded in 1920 to promote international trade (H.Q. in Paris). Its objects are to express, and to represent to govts., the considered judgment of international business on current problems of international trade, to improve trading conditions, and to foster private enterprise. It has the highest grade of consultative status with the U.N.O. Membership covers 57 countries of which 36 maintain national committees. Executive authority is vested in its elected council which meets 3 times a year. The International C. of C. Congress meets every 2 years. The address of the Brit. national committee is 15 Kingsway, W.C.2.

Chamber of Shipping of the U.K. Includes most of the ship-owners' associations of the U.K. It communicates with the chief gov. depts on all matters affecting the interests of Brit. merchant shipping. In 1929 the chamber passed resolutions in favour of an international load-line agreement, and a uniform standard for safety of life at sea. Its affairs are managed by an executive council to which each affiliated association elects 1 or more members. Its offices are at 3 Bury Street, London, E.C.3. See *LOAD LINE AND SHIPPING*.

Chamberlain, (Arthur) Neville (1869-1940), statesman, b. Birmingham, younger son of Joseph C., by his second wife, Florence Kenrick. He was educ. at Rugby and at Mason College, Birmingham (later known as Birmingham Univ.). He managed an estate in the Bahamas, 1890-7; returned to be a manufacturer in Birmingham; entered Birmingham City Council, 1911, and became chairman of the town planning committee and an alderman, 1914. During the First World War he was member of the Central Control Board (Liquor Traffic), 1915, and director-general of national service, 1916-1917. C. was lord mayor of Birmingham, 1915-16, and took a leading part in the estab. of the municipal bank, which began as a war-time expedient. In Dec. 1918 he was elected Conservative M.P. for the Ladywood div. of Birmingham; was made a privy councillor and postmaster-general in the Bonar Law ministry, in 1922; paymaster-general, 1923. When Baldwin replaced Bonar Law as Prime Minister, C. entered the Cabinet as minister of health. Only a

few months later he became chancellor of the exchequer. This series of meteoric promotions, remarkable in the case of a man who had not entered public life till he was past 40, was in a measure justified by the general recognition of his notable gifts for parl. debate. In 1924, when the Conservatives returned to power, C. was asked to resume the chancellorship of the exchequer, but he preferred to be minister of health and he made that ministry a leading dept of state. He became chancellor of the exchequer again in the National Gov., 1931, in succession to Snowden, and his first move was to carry

Elliott & Fry

NEVILLE CHAMBERLAIN

protection. In all C. introduced 6 budgets, and his policy was to refuse large state expenditure on public works and to restore confidence by economy, by raising wholesale prices, and by fostering easy credit and low rates of interest. He differed from the old *laissez-faire* school in that he desired large state expenditure on social reform, but only if private enterprise created the requisite wealth. His hope for a great programme of social reform were now, however, dashed by the menace to international security and the need to think of rearmament. It was on his advice that the gov. capitulated to Mussolini on the question of sanctions over the war with Abyssinia. In Feb. 1937 he announced the gov.'s decision to spend £1,500,000 on rearmament. Later that year he succeeded Baldwin as Premier. Early in 1938 he came into conflict with his foreign secretary, Eden, over his decision to negotiate an agreement with Italy and Eden resigned.

This was in fact the real beginning of the 'appeasement policy' with which the memory of C. must ever be associated. Himself comparatively a novice in foreign affairs, he had an instinctive distrust of the Foreign Office experts and was largely his own foreign secretary. He insisted on a rigidly non-interventionist attitude towards Spain; and early in 1939 visited Mussolini. When, in 1938, war with Germany seemed inevitable over the Sudeten issue, C. then took the unprecedented step of going by plane to Berchtesgaden to see Hitler. As he was now 69 and had never flown before, the world saw an element of the heroic in this personal dash for peace. C. acceded to Hitler's damaging demands and carried both the Brit. and Fr. Cabinets with him. At a second meeting with Hitler at Godesberg, Hitler naturally raised his price and even C. shrank from compliance. War seemed imminent but, on the intervention of Mussolini, C. and Hitler were once again brought together—this time at the notorious Munich 4-power meeting (see MUNICH PACT) which in effect threw the Czechs overboard. C. deluded himself by bringing back a worthless signature to a treaty of permanent friendship between Germany and Britain. He announced that he had 'brought back peace with honour' and he believed that it was 'peace for our time'; and he compared his home-coming to that of Beaconsfield from Berlin in 1878. He was acclaimed everywhere, and though disillusionment soon followed with the increasingly bellicose tone of Ger. political utterances, C. continued to point to his various international agreements as vindications of his policy of appeasement. In Feb. 1939 he announced Britain's recognition of the Franco regime in Spain, and repeated his conviction, with obvious sincerity, that Germany had no aggressive intention. On 10 Mar. he gave out a statement that the international outlook was fair; but 5 days later Hitler invaded Czechoslovakia. At this point C. seems to have realised at last that appeasement had failed. He rebuked Hitler for his perfidy, gave a guarantee to Poland and, still later, guarantees to Rumania and Greece. It is true to say that C.'s part in the Munich Pact gave Britain a year in which to make good her defences; but in fact his rearmament programme did not keep pace with that of Germany, and on 1 Sept. 1939 Germany's lead in air strength was much greater than at the time of Munich. It was only in May that C. at last consented to waive his prejudice against the formation of a Ministry of Supply. Himself a quick and business-like administrator, he neither filled ministerial posts with able ministers nor had the power to drive others. Britain declared war on Germany on 3 Sept., after Germany had invaded Poland; and C. announced the fact in a moving and historic broadcast. His gov. was not to survive much longer. The failure of the allied campaign in Norway infuriated the whole country, and in the debate in the Commons of 6-8 May his vote of

confidence was passed by only 281 to 200, a great many gov. supporters abstaining. C. then tried to meet the rising storm by reshuffling his Cabinet, but Labour refused to join any gov. under him and he resigned on 10 May, the day when the Germans invaded the low countries. As lord president of the council in the Churchill Gov. he wholeheartedly supported the new Prime Minister's resolve to continue the war come what might. At the end of July he underwent an operation, but hopes of recovery were not fulfilled. He d. 9 Nov. See D. Keith Shaw, *Prime Minister Neville Chamberlain*, 1939, and K. Felling, *The Life of Neville Chamberlain*, 1946.

Chamberlain, Basil Hall (1850-1935), scholar, b. Southsea, Hants. Held the chair of Japanese and philology at the Univ. of Tokyo. Among his pubs. are *Essay in Aid of a Grammar and Dictionary of the Luchuan Language*, 1874, *The Classical Poetry of the Japanese*, 1880, *A Romanised Japanese Reader*, 1886, *A Simplified Grammar of the Japanese Language*, 1886, *The Language, Mythology, and Geographical Nomenclature of Japan viewed in the Light of Aino Studies*, 1887, *Ainos*, 1888, *A Handbook for Colloquial Japanese*, 1888 (revised ed., 1907), *Things Japanese*, 1890 (6th ed., 1938), *A Handbook for Travellers in Japan*, 1891 (5th ed., 1899), *A Practical Introduction to the Study of Japanese Writing*, 1899 (2nd ed., 1905), Murray's *Japan* (3rd and subsequent eds. in collaboration with W. B. Mason), *Japanese Poetry*, 1911, and *Haikü Siècles de Poésie française*, 1927.

Chamberlain, Houston Stewart (1855-1927), Anglo-Ger. author, b. Southsea, the son of an admiral, and educ. at Cheltenham. He later lectured on philosophy at Vienna Univ. The results of his study of modern thought and civilisation are embodied in his book *Die Grundlagen des neunzehnten Jahrhunderts*, 1899, trans. into English in 1910. In 1896 he pub. a biography of Wagner, whose daughter he married. He became a naturalised German, his admiration of the Ger. way of life being coupled with an intense hatred of anything English. During the First World War he wrote much anti-Brit. propaganda. C. was a strong anti-Semite and probably Hitler derived his Aryan theory and policy partly from C. See A. Rosenberg, *Houston Stewart Chamberlain als Begründer einer deutschen Zukunft*, 1927.

Chamberlain, John (1554-1628), Eng. letter-writer, b. London, and educ. at Trinity College, Cambridge. His own life was uneventful, but he was a friend of such people as Inigo Jones, Lancelot Andrewes, etc., and his nearly 500 extant letters (1587-1626) give a vivid picture of many aspects of Jacobean life. See W. Notestein, *Four Worthies*, 1956. His letters were ed. by N. McClure, 1939.

Chamberlain, Joseph (1836-1914), statesman, b. London, son of a rich Unitarian business man, and educ. at Canonbury and at the Univ. College school (London). On leaving school he spent

a short time in his father's office in tn, and then left for Birmingham, where he joined his cousin, Joseph Nettlefold, in the screw business. His keen business methods and his undoubted ability ensured the progress of the firm. As a result C. was able to retire from business at an early age, a very wealthy man, and take an active interest in public life. He was already recognised as one of the leaders of liberal ideas in Birmingham, and had been instrumental in establishing a Liberal Association in the tn. In 1870 he became a member of the Birmingham school board, and 3 years later the chairman. His politics at this time were usually given the name of republican, not because they actually advocated the principles of republicanism, but because they were so advanced and so radical that they easily outdistanced even the most liberal ideas of the formal Liberal party. In 1873 he became mayor of Birmingham, an office he occupied for the succeeding 3 years, and during his period of office many reforms and much public rebuilding were carried out. C. soon gained a national reputation. In 1876 C. became one of the M.P.s for Birmingham, his colleague being John Bright (q.v.).

He rapidly advanced towards the front ranks of the Liberal party. He showed his organising ability by the manner in which he organised the Liberal Association throughout the country, an organisation for which both he and the Liberal party were recompensed in the general election of 1880, when the Liberals were returned with a clear majority over both the Conservatives and the Nationalists. In the Liberal Gov. of 1880, C. was given the position of the president of the Board of Trade, with Cabinet rank, and Sir Charles Dilke, another leader of the radical section, became under-secretary for foreign affairs. In 1885 he put forward what was called the 'unauthorised programme,' that is, a programme which went far beyond the conception of the Liberal party. He had up to this time supported the Liberal party on questions of foreign policy, and more especially Irish policy. He advocated also free education and small holdings, the famous phrase 'three acres and a cow' exemplifying the latter policy. In 1886 Gladstone's ministry was defeated. At the elections which followed the number of Liberal members was decreased, and it became necessary to depend on the Irish vote for a majority. C. was returned for W. Birmingham, and in Jan. 1886 Salisbury's gov. was defeated. Already it was known that Gladstone was going to introduce a Home Rule Bill, but C. accepted office as president of the Local Gov. Board. In Mar. he resigned, giving as his reason that he was unable to accept the measure which Gladstone had laid before the Cabinet, that he still supported a large extension of local gov. for Ireland, but could not go to the lengths proposed, and in the end C. and his followers voted against Gladstone's Bill. The feeling of the Gladstonian Liberals, not unnaturally, was deep and bitter against C. The

Liberal-Unionists led by C. rapidly became more and more separated from the Gladstonian Liberals, and they adopted a definite policy for themselves. They decided that it was necessary under every consideration to keep Gladstone out of office, and they supported the Tories with that end in view. They did not, however, yet take office with the Tories, and their influence was rather widening in Tory policy. The Tory Gov. passed measures which up to this time had been regarded solely as part of the Liberal programme, and many of them were more progressive than similar measures previously adopted by the Liberals. In the general election of 1892 C. was again returned for his old constituency, but the Liberal-Unionists and Tories were in a minority and Gladstone became Prime Minister. In 1893 C. took the most prominent part in opposing the Home Rule measure introduced by Gladstone; a measure which passed the House of Commons but was rejected by the Lords. In 1895 the Rosebery gov. was defeated, and the gov. which was formed by Salisbury included a number of Liberal-Unionists. This was the first great definite step towards the union of the parties. C. became colonial secretary.

The period 1895-1900 was one of great difficulty, especially in the matter of colonial affairs, and more especially in S. Africa. War broke out in 1899, but in 1900 C. received vindication of his actions as colonial secretary in the result of the election which followed. During this period of office he had also passed the Australian Commonwealth Act (1900). During the years of office C. had advocated the policy called imperialism. He had never subscribed to the narrow limits of the Gladstonian foreign policy, and his tenure of office as minister for the colonies had taken his ideals from the purely national point of view and widened them to the imperial point of view. During the war he was the hero of his party, and by his firm policy and his unswerving support of the war did much to enhance his reputation.

In 1902 Arthur Balfour became Prime Minister, and C. continued to serve under him. The Boer War had convinced him that the economic links of the Brit. Empire must be strengthened, and in 1903 he stated his belief in an imperial preferential tariff. The Conservative party was bitterly divided on the subject, and C., pleading for a free hand, resigned. Ritchie and Hamilton, the stauncher free traders, also resigned at the same time. C. resigned merely to become the pioneer of the movement which he advocated, and not from any sense of hostility towards his 'friend and leader' Balfour. Balfour's attitude on the question was more or less philosophic, and he was claimed by both sections of his party. He, however, made it clear that he was in favour of a measure of tariff reform for purely retaliatory purposes. C. spent the years 1903-6 in travelling throughout the country advocating his system of tariff reform. The withdrawal of C. from the

Cabinet, and the advocacy of these new measures, contributed to the downfall of the gov., which resigned in Dec. 1905. The election which followed was to a very great extent the result of the differences in the party. C. insisted on the adoption of his principles, and the Unionist party was overwhelmed at the elections. Balfour, after the elections, pledged himself to tariff reform, which after that became the prin. plank of the Unionist platform. But C.'s health had broken down, and after 1906, though retaining his parl. seat, he took no further part in politics. See J. L. Garvin, *The Life of Joseph Chamberlain*, 1932.

Chamberlain, Sir (Joseph) Austen (1863-1937), statesman, eldest son of Joseph C., educ. at Rugby and Cambridge. In 1892 he entered Parliament as Liberal-Unionist member for E. Worcs, for which constituency he sat till 1914. From that year he represented Birmingham W., his father's former constituency. During Lord Salisbury's third administration (1895-1900), C. was civil lord of the Admiralty, being promoted as financial secretary to the Treasury on the formation of Salisbury's fourth Gov. (1900-2). As financial secretary he represented the postmaster-general, Lord Londonderry, in the House of Commons. He became postmaster-general in Balfour's first Gov., July 1902. C. was appointed chancellor of the exchequer on the reconstruction of Balfour's Cabinet, 1903-6. In 1913 he was chairman of the royal commission on Indian finance and currency. In the Coalition Gov. formed during the First World War he was secretary of state for India, 1915-17—resigning because the dept over which he presided was culpable in regard to the Mesopotamian campaign. He became a member of the War Cabinet, without office, in 1918. He was chancellor of the exchequer, 1919-21; lord privy seal and leader of the House of Commons, 1921-2. Later, in the Conservative Gov., he was secretary of state for foreign affairs, 1924-1929; and signed the Locarno Treaty, 1925 (he was knighted for his services in this connection), and the Kellogg Pact, 1928. He was lord rector of Glasgow Univ., 1925-8. He received the Nobel peace prize, 1926. C. wrote his autobiography in 1935. See Sir C. Petrie, *The Life and Letters of Sir Austen Chamberlain*, 1939.

Chamberlain, Sir Neville Bowles (1820-1902), field marshal, b. Rio de Janeiro, Brazil. He entered the Indian Army in 1837 and took part in the Afghan war (1839-42) at Ghazni, Kandahar, and Kabul, and was wounded on 6 occasions. He fought at Maharajpur in the Gwalior campaign of 1843 and in the Punjab campaign of 1848, after which he was made commandant of the Punjab military police. In the Indian Mutiny (1857) he distinguished himself at Delhi, where he was severely wounded. He was in command of the Umbeyla campaign (1863), and from 1870 to 1881 was commander-in-chief of the Madras Army. He retired in 1886, and was made a field

marshal in 1900. See life by G. W. Forrest, 1909.

Chamberlain, officer attached to the court of a monarch, appointed by a king, nobleman, or corporation to perform domestic and ceremonial duties. In Great Britain this office dates from very early times. The C. was one of the chief officers of state from the 13th cent.; 1406, Parliament declared that he must be a member of the Council (*see* CABINET) *ex officio*. Hence he had a large share in the responsibilities of gov., and though this is no longer the case he remains an officer of very high standing in the royal household. The Lord C. has control over all officers, servants (except those of the bed-chamber), physicians, musicians, comedians, and tradesmen connected with the royal household. In 1782 he became provider of state robes for the royal family and household and officers of state. Cards of admission to royal functions (levees, drawing-rooms, balls) must be obtained from him. Theatres in tns containing a royal palace have to be licensed by the Lord C.; no new play can be performed without his sanction (*see* CENSORSHIP OF THE DRAMA). A vice-C. as deputy and assistant has existed from the time of Richard II. Other state officials are the Lord Great C. and City C. (of various corporations).

Chamberlain, Lord Great, hereditary office, historically descended from the ancient chamberlain of the Exchequer of the Norman period. The office was formerly of the highest dignity, and was held in grand serjeanty. The L. G. C. is now the sixth great officer of state, and the duties of the office are mainly concerned with coronation ceremonies. To the office also appertain the care of the queen's palace at Westminster, authority over the buildings of the 2 Houses of Parliament during recesses, and the duty of attending on peers at their creation, and bishops when they perform their homage. The office, which became hereditary on the grant by Henry I to the family of De Vere, Earls of Oxford, has been the subject of 2 legal contests within the last 150 years. Towards the end of the 19th cent. it was still held conjointly by the families of Cholmondeley and Willoughby d'Eresby, in right of their mothers, who were sisters and co-heirs of the 4th Duke of Ancaster, but later it was in the joint tenure of the Marquess of Cholmondeley, the Earl of Ancaster, and the Marquess of Lincs. The present holder of the office is the 5th Marquess of Cholmondeley.

Chamberlens, name of family of man-midwives and physicians of Huguenot descent.

William Chamberlen (c. 1540-96) fled from France to England with his family in 1589.

Peter Chamberlen (I) (1560-1631), eldest son of Wm, was physician to James I and his wife. The obstetric forceps used by the Chamberlens and kept a closely guarded secret by them, were probably invented by Peter I.

Peter Chamberlen (II) (1572-1626),

fifth and last child of Wm, fell foul of the Royal College of Physicians for practising medicine without a licence and for not confining himself to midwifery.

Peter Chamberlen (III) (1601-83), son of Peter II, went to Cambridge and Padua, at which latter he was M.D., 1619. He succeeded his uncle, Peter I, as court physician and delivered Charles II in 1630. He attempted to organise the female midwives into a company with himself as their president; for this he was reprimanded by the Royal College (he was a fellow of the college in 1628, but was dismissed from his fellowship in 1649). A very successful obstetrician, he returned to his court appointment on the accession of Charles II.

Hugh Chamberlen (fl. 1665-1700), eldest son of Peter III, succeeded his father at court in 1673. He again used the 'secret instrument' with great success, and attempted to sell it to François Mauriceau, the Fr. obstetrician, for 10,000 livres. He attended Mary, Queen to James II, at the birth of the Old Pretender, and Princess (later Queen) Anne. He advocated a health insurance scheme which was not adopted, and a land bank which failed and caused him to retire hastily to Holland.

The secret instrument was used by the Chamberlens for many years, enabling them to deliver more women more effectively than anyone before them. When Peter III retired he went to live at Woodham Mortimer Hall, near Maldon, Essex. After his death his widow hid a box beneath a trap-door in the attic, and it remained there until 1813, when it was discovered and found to contain the secret—3 sets of obstetric forceps—with other midwifery instruments. These are now in the possession of the Royal Society of Medicine. *See* W. Radcliffe, *The Secret Instrument*, 1947.

Chamberlin, Thomas Chrowder (1843-1928), geologist, b. Mattson, Illinois. In 1869 he was appointed prof. of natural science at the State Normal School of Whitewater, Wisconsin, and was appointed prof. and head of the dept of geology and director of the Walker Museum of the univ. of Chicago. In 1894 C. accompanied the Peary Arctic Relief Expedition as geologist. He was also from 1902 to 1909 investigator of fundamental geological problems in the Carnegie Institution.

His theories on the glacial deposits of the N. states, together with his work on the planetesimal hypothesis with Moulton, won for C. a worldwide reputation. For nearly 40 years he edited the *Journal of Geology*, and his pubs. include *The Geology of Wisconsin*, 1877-1883, *Contribution to the Theory of Glacial Motion*, 1904, *General Treatise on Geology* (with R. D. Salisbury), 1907-9, *The Origin of the Earth*, 1916, and *The Two Solar Families: the Sun's Children*, 1928.

Chambers, Charles Haddon (1860-1921), Australian playwright, b. Stanmore, Sydney. His father was in the Civil Service, which he himself entered at 15; but after 2 years he gave it up and

became a stockrider. At the age of 22 he went to London, and in 1888 won success as a playwright with his comedy *Captain Swift*. Other plays are *The Idler*, 1891, *John-a-Dreams*, 1894, *The Tyranny of Tears*, 1899, his best work, and *Passers-By*, 1911.

Chambers, or Chalmers, David, Lord Ormond (c. 1530-92), judge and historian, educ. at Aberdeen, then studied theology and law in France and Italy. Parson of Suddy, chancellor of Ross, lord of session (1565). A partisan of Mary Queen of Scots, said to have been privy to Darnley's murder, 1567. Attainted by Parliament after the battle of Langside, he fled to Spain and France. Pub. *Abregé des histoires*, reprinted with additions, 1579 (a chronological summary of European hist.). C. returned to Scotland, becoming again lord of session, 1586.

Chambers, Sir Edmund Kirkehever (1860-1954), scholar, b. Berks, son of Rev. Wm C., fellow of Worcester College, Oxford. He was educ. at Marlborough and Oxford. His great works are *The Medieval Stage*, 1903, and *The Elizabethan Stage*, 1923. In these he shows the connection between the political and social hist. of England and the growth and flowering of the drama. The latter book unfolds in minute detail the story of each stage company, and sums up all the knowledge in existence on the subject. Other publications include *Tudor Revels*, 1906; *Shakespeare: a Survey*, 1925; *William Shakespeare*, 1930, which assembles all the known facts of Shakespeare's life; *Arthur of Britain*, 1928, a brief but penetrating discussion of Nennius's sources; *Oxford Book of Sixteenth Century Verse*, 1932; *S. T. Coleridge*, 1935; and *A Sheaf of Studies*, 1942. He was knighted in 1925.

Chambers, Ephraim (1680-1740), encyclopaedist, b. Kendal. As a young man he was apprenticed to a map-maker in London. In 1728 he pub. by subscription his *Cyclopaedia, or an Universal Dictionary of Arts and Sciences* in competition with Harris's *Lexicon Technicum*, 1704. C.'s work reached its fourth ed. a year after his death, and gave rise to the *Encyclopédie* of Diderot and d'Alembert.

Chambers, George (c. 1803-40), marine painter, b. Whitby, Yorks. He was the son of a fisherman, and went to sea as a boy; but his sketches of shipping scenes found a market in Whitby, and he set out for London where he became a scene painter at the Pavillion Theatre. He also worked on the panorama of London at the Colosseum. His work received the attention of Lord Mark Kerr, through whose patronage C. received the appointment of marine painter to William IV and Queen Adelaide. He was a member of the Society of Painters in Water Colours, and exhibited from 1827 to 1840. Two of his pictures of naval battles are at Greenwich, viz. 'The Capture of Portobello' and 'The Bombardment of Algiers in 1836.'

Chambers, Robert (1802-71), author and publisher, b. Peebles and educ. at the local school. In 1818 he started business

as a bookstall keeper in Leith Walk, Edinburgh. With his brother Wm (q.v.) he founded the publishing firm of W. & R. Chambers. In 1825 he pub. *Traditions of Edinburgh*, which won him the friendship of Scott and led to further writings of the same description, *Notes of the Most Remarkable Fires in Edinburgh from 1385 to 1824*, 1824, and *Walks in Edinburgh*, 1825. Robert was at first only a contributor to the *Journal* started by his brother in 1832. Later he became joint editor, and his essays and wisdom in selection of such materials in literature, hist., art, and science as would best suit the popular taste were large factors in the success of the paper. He wrote the *Life and Works of Robert Burns*, 1851, for which he gathered many hitherto unpublished details from the poet's sister, Mrs Begg. Robert C. was an ardent scientist, and visited Scandinavia and Canada for purposes of geological exploration, the results of which are contained in *Tracings of the North of Europe*, 1850, and *Tracings in Iceland and the Farøe Islands*, 1856. In 1844 he pub. anonymously, to avoid bringing an accusation of heterodoxy upon his firm, *Vestiges of the Natural History of Creation*, which anticipated the theories of Darwin's *Origin of Species*. The authorship was acknowledged in Alexander Ireland's preface to the 12th ed., 1884. In 1869 the univ. of St Andrews conferred upon him the degree of Doctor of Laws, and he was elected a member of the Athenaeum Club in London. See W. Chambers, *Memoir of Robert Chambers with Autobiographic Reminiscences of William Chambers*, 1872, 1881, and *Story of a Long and Busy Life*, 1884.

Chambers, Robert William (1865-1933), Amer. novelist, b. Brooklyn, New York. Educ. at Brooklyn Polytechnic, he went on to study art in Paris, and exhibited at the Salon. His first book, *In the Quarter*, was pub. in 1891, and after that he became a prolific writer, publishing some 70 novels, mainly historical romances.

Chambers, Sir William, R.A. (1723-98), architect, b. Stockholm, son of a Scottish merchant. Travelled as a supercargo to China when a youth, made drawings there of buildings, costumes, etc., and decided to become an architect. Then studied architecture in Italy and Paris. Returning to England, 1755, he taught drawing to the Prince of Wales (afterwards George III), and pub. *Designs for Chinese Buildings*, 1757. He was employed to lay out Kew Gardens, and built the pagoda and orangery there. His *Treatise on Civil Architecture*, 1759, became a standard work. In 1761 he was appointed—jointly with R. Adam (q.v.)—one of the 2 official 'Architects of the Works'; and in 1782 became surveyor-general. His masterpiece is Somerset House, 1776-86, much altered in appearance by the subsequent construction of the Embankment and Waterloo Bridge. The small Casino at Marino near Dublin is perhaps the best of a very long list of public and domestic buildings, which included additions to Trinity College, Dublin. He was a co-founder of the Royal

Academy of Arts, and its first treasurer, 1768.

Chambers, William (1800-83), publisher, b. Peebles. In 1813, owing to family misfortunes, he was apprenticed to a book-seller in Edinburgh. Five years later he started business for himself, afterwards adding printing to the book-selling, and was soon joined by his brother Robert. In 1825-30 he wrote the *Book of Scotland*, and collaborated with Robert in a *Gazetteer of Scotland*. In 1832 he issued the first number of *Chambers's Edinburgh Journal*, the pioneer of the cheap popular periodical. This led to the founding of the firm of W. & R. Chambers, and the issue of *Chambers's Encyclopaedia* (10 vols.), first pub. in 1859-68. See also CHAMBERS, ROBERT.

Chambersburg, bor., cap. of Franklin co., Pennsylvania, U.S.A., 50 m. SW. of Harrisburg. The tn has many fine buildings, among which is the Wilson College for girls. The trade of the tn is extensive, and among its chief manufacturing industries are metal and paper products, food, clothing, machinery, and flour; there is also fruit growing. In 1864 a portion of the tn was destroyed by the Confederates. Pop. 17,212.

Chambertin, see BURGUNDY.

Chambéry, Fr. tn, cap. of the dept of Savoie, in a gorge linking the R. Isère to Lake Bourget. It is the seat of an archbishop, and was the anet cap. of the Duchy of Savoie (q.v.). Part of the 15th-cent. château of the dukes of Savoie remains, now incorporated into a modern building. C. is a tourist centre, has good wines (including vermouth), and a silk industry and tanneries. It also manufs. confectionery. J. and X. de Maistre (qq.v.) were b. here. Pop. 30,000.

Chambon-Feugerolles, Le, Fr. tn in the dept of Loire, on the Ondaine. It has steel manufs. Pop. 15,700.

Chambord, **Henri Charles Dieudonné**, Comte de and Duc de Bordeaux (1820-83), posthumous son of the Duc de Berry and grandson of Charles X of France, b. Paris. Charles X abdicated in favour of his grandson (known to his supporters as Henri V of France) in July 1830, but the movement in favour of Louis Philippe forced Charles and his grandson to flee to England. C.'s character was weak and indecisive, and his readiness to comply with the plans of the vacillating nobles who supported his cause dissipated his chances of attaining to the throne, both in 1848 and in 1870. He d. at Frohsdorf, Austria, without an heir, the nearest claimant being the Comte de Paris.

Chambord, famous château of the Renaissance period, situated in the dept of Loir-et-Cher, France, 12 m. E. of Blois (q.v.). The building of the castle was commenced by Francis I in 1519, and was completed by his successors of the Houses of Valois and Bourbon. It is a huge pile, capped by many turrets and gables, and stands in a walled park of 13,000 ac. It has been the residence of the Fr. kings down to Louis XV, and of Marshal Saxe, Diane de Poitiers, Stanislaus Leszczyński, King of Poland, and Marshal Berthier,

who had it conferred upon him by Napoleon in 1809 (qq.v.). After the death of Berthier it passed into the hands of the comte de Chambord, who left it to the house of Bourbon-Parma. Molière gave his first performance of the *Bourgeois Gentilhomme* in the castle in 1670. See A. Arnauld, *La Question de Chambord*, 1887, and H. Debraye, *Touraine and its Châteaux*, 1926.

Chambre Ardente (Fr. 'flaming chamber'), court organised c. 1535 by Francis I of France for the suppression of Protestant heresy. The courts were draped with black and lit, even in the day-time, by torches. The C. A. was abolished in 1682.

Chambre Introuvable (Fr. 'the matchless chamber'), name popularly given to the Chamber of Deputies which was first convened in July 1815, after the second recall of Louis XVIII. This Parliament roused indignation and alarm throughout France for its thorough-going royalist policy. The term has since been ironically applied to any ultra-monarchical assembly.

Chamdo, or Ch'angtu: 1. Name of a Tibetan Autonomous Region, W. of Szechwan, China. It covers an area of 78,000 sq. m. with 23 cos. under its administration. Pop. 200,000, mostly Tibetans. The Szechwan-Tibet motorway traverses this region.

2. Chief tn of the C. Autonomous Region, on long. 97° E., lat. 31° N. It has sev. monasteries frequented by Lamaist pilgrims. With the motorway completed in 1954 it has become a trading centre between Lhasa and Chengtu. Pop. (estimated) 15,000.

CHAMELEON

Chameleon, name of a large and distinct order of lizards in the family Chamaeleontidae which inhabit S. Spain, Asia, and Africa, but especially Madagascar. Many of their characteristics are very peculiar, e.g. the long, prehensile tail used in steadying the animal by being coiled round a branch; the long, sticky, club-shaped tongue which can project about

the length of its body; the eyes covered with a thick granular lid capable of moving independently and squinting; the 5 digits in bundles of twos and threes; the triangular head, flattened body with a toothed crest; and the habit of changing colour which can be performed at will. They are all insectivorous, are rather quarrelsome and inactive, difficult to keep in captivity, and when angry they will distend their capacious lungs and puff out their bodies to a great extent. At night they sleep on a twig, and in winter hibernate after taking in large supplies of food and water. Nearly all are oviparous, and the female lays her 30 to 40 eggs in a hole in the ground. The commonest species is *C. chamaeleon*, which never exceeds 1 ft. in length, and *C. parsoni* is the largest species, sometimes measuring 2 ft. from head to tail.

Chamfort, Nicolas Sébastien Rooh (de) (1741-94), Fr. author and moralist, b. Clermont in Auvergne. His comedies, ballets, and critical writings, as well as his brilliant conversation, attracted a wide circle of admirers of every class. Louis XVI and Marie Antoinette favoured his literary efforts, but he was keenly opposed to the Royalist party during the revolutionary agitation. He became suspect, however, and to escape he was obliged to commit suicide. His works, mainly of apophthegms and anecdotal, were edited by Auguis and pub. in 5 vols., 1824-5. A selection of his works, called *The Civic's Breviary*, is trans. by Hutchinson. See J. Teppe, *Chamfort: sa vie, son œuvre, sa pensée*, 1950.

Chamidae, family of molluscs nearly related to the cockles, belongs to the order Eulamellibranchiata. The members of the family are confined to the warmer seas, and fossils are abundant from the Jurassic. Two of the chief genera are *Chama* and *Diceras*.

Chamier, Frederick (1796-1870), naval historian and novelist, entered the navy at the age of 13, and served in the Walcheren expedition, and on the Mediterranean and W. Indian stations. He devoted his leisure to authorship. His most valuable work was a continuation of W. James's *Naval History of Great Britain*, 1837.

Chaminade, Cécile (1857-1944), Fr. musical composer, b. Paris. She began to compose at the age of 8, and her works became well known in France and England, where she toured widely. Works: *Les Amazones* (dramatic symphony); *Callirhoe* (symphonic ballet); Trios for piano, violin, and cello; sev. vols. of songs and numerous piano pieces. Her style is light but melodious and elegant.

Chamisso, Adalbert von (Louis Charles Adolphe de Chamisso de Boncourt) (1781-1838), Ger. poet and naturalist. He was b. at the château of Boncourt in Champagne, but spent his childhood in Prussia, where his family took refuge during the Fr. Revolution. In 1798 he entered the Prussian Army, but in 1806, when war broke out, his patriotism led him to return to his native country. In

Paris he became the friend of Mme de Staël at Coppet, where he met Schlegel. At this time he began the study of botany, which he afterwards continued at Berlin, being appointed curator of the botanic gardens in 1819. He edited the *Musenalmannach* (1804-6), and became a member of the Berlin Academy in 1835. C.'s fame rests on his romantic ballads, which are by turns fantastic and lurid. *Peter Schlemihls wundersame Geschichte*, 1814, a prose tale, already known to folklore, of the man who sold his shadow to the devil, has been trans. into almost every European tongue. C. also made many verse trans. from poems in other languages, and wrote sev. works on natural hist. His collected works (6 vols.) were pub. by E. Hitzig, 1836-9. See K. Fulda, *Chamisso und seine Zeit*, 1881; E. du Bois-Reymond, *Chamisso als Naturforscher*, 1889; R. Leutznier, *Chamisso: a Sketch of his Life and Works*, 1893.

Chamois, goat-like antelope (*Rupicapra rupicapra*) inhabiting the mts of central and S. Europe (especially the Alps) and of W. Asia. Noted for great speed, agility, and delicate power of scent. The flesh is highly prized as venison, the skin furnishes true chamois-leather (sheepskin is often sold as such). The hunting of C. is a favourite but dangerous pastime in Switzerland and the Tyrol. In the Caucasus, Taurus, and Carpathians over 100 are often seen in a flock. The C. has short horns, and is grey-brown in colour. In the Pyrenees it is known as the lizard.

Chamomile, see CAMOMILE.

Chamonix-Mont-Blanc, Chamonix, or Chamonvi, Fr. vil. in the dept of Haute-Savoie, on the Arve, 40 m. SE. of Geneva. It is in a beautiful, narrow valley, N. of the Mont Blanc range. There are 7 glaciers in its vicinity. It is the usual approach to Mont Blanc (Dr Parcard (q.v.) ascended from here), and is extremely popular with mountaineers and tourists. The altitude is about 3400 ft. Pop. 5900. See BLANC, MONT.

Champa, name of a country which extended southwards from the R. Giang along the coastal region, now occupied by Annam, as far as the delta of the It. Mekong. The Cham people had racial and probably linguistic affinities with the Is. peoples of SE. Asia, and their religion was a form of Hinduism. The hostility of the Vietnamese in the N. and the Khmers in the S. finally destroyed C. From the 11th cent. onwards the Vietnamese people pushed relentlessly southwards, annexing more and more of Cham ter. until, at the end of the 17th cent., C. was no more. Remains of Cham towers and other buildings still survive in Annam, and their sculpture reveals strong Indian and Khmer influences. Small pockets of Chams are still found to-day, chiefly in Cambodia and Cochinchina, where they live in houses raised on piles and continue to speak the Cham language.

Champac, or *Michelia champaca*, is an Asiatic evergreen tree, family Magnoliaceae, which is cultivated in China for its beautiful and scented flowers, handsome appearance, medicinal bark, and useful

timber. It is a sacred tree of the Buddhists and Brahmins.

Champagne, or Champaigne, Philippe de (1602-74), portrait painter of the Fr. school, b. Brussels. He first studied under Fouquieres at Antwerp, but in 1621 went to Paris, where he became the queen's painter. In this capacity he painted decorations in the Luxembourg for Marie de' Medici. He was appointed rector of the Académie de Peinture et de Sculpture, and received frequent commissions from Cardinal Richelieu. In his later years he became associated with the Port Royalists and the Jansenists. He inaugurated an official style of portraiture, typical works being his Cardinal Richelieu in the Louvre, and a triple portrait of Cardinal Richelieu in the National Gallery.

Champagne (Fr. 'flat country,' from Lat. *campus*, a field), dist. and former prov. of France, comprising the depts of Marne, Haute-Marne, Aube, and Ardennes, and part of Seine-et-Marne, Meuse, Aisne, and Yonne. The prov. was about 180 m. long by 150 m. broad. The land is fertile in the W. region, and its vineyards produce the famous champagne wines. The prov. was ruled at one time by the Franks, and later by native princes, the vassals of the Fr. kings. In 1284 it passed to the Fr. crown by the marriage of Philip IV to Joanna of Navarre. In the Middle Ages the fairs of C. were frequented by merchants from all over Europe. See F. Bourquelot, *Études sur les foires de Champagne*, 1865.

Champagne, Campaign in (First World War). The geographical position of C. renders it an obvious battlefield for an attack on France from the E. or NE. During the First World War it was the scene of great endeavours by both sides. Towards the end of Aug. 1914, von Moltke, chief of the Ger. General Staff, ordered Prince Rupprecht to penetrate the Fr. frontier at Nancy. The French hero were under the command of de Castelnau, and after a battle lasting 6 days the Germans were repulsed with heavy loss. Further N., however, the Germans overran C. in their great sweep towards Paris, and Rheims, Châlons-sur-Marne, Épernay, and Château-Thierry all fell to them early in Sept. 1914. By 9 Sept. the Brit. Army, under Sir John French, was recrossing the R. Marne at Château-Thierry and taking the offensive against von Kluck, and with this movement the battle of the Marne commenced. By 14 Oct. the Germans had been forced back from just N. of Verdun—N. of Rheims—and N. of Soissons, and that part of C. S. of that line was not again invaded by the enemy during the war, except on the left, where it was again pierced by the Germans in July 1918. From the middle of Oct. to middle of Nov. 1914, the Germans kept a heavy pressure on the French in the Rheims-Soissons sector, and gained some ground about Moussy. At the beginning of the new year another action took place which resulted in the Germans gaining ground at Crouy. Taking advantage of the disorganisation of the Fr.

supplies occasioned by the sweeping away of all the bridges at Villeneuve and Soissons, the Germans again attacked, and maintained pressure for 2 days, and the French were forced to withdraw to the S. of the Aisne at Soissons. A few days later the French lost more positions on the Chemin-des-Dames (q.v.). After this a period of trench warfare set in, the lines occupied being chiefly dictated by the Ger. desire to maintain a strong line on the Verdun-Rheims sector. Joffre then decided upon a Fr. offensive in C., with a view to clearing the enemy N. of the Aisne. The advance began on 16 Feb., and after nearly a month's hard fighting little progress had been made, and at great sacrifice. Operations were practically suspended for the summer. With the object of breaking through the Ger. line E. of Rheims, an offensive was planned for the autumn. If this were successful it was hoped that it would so threaten the hostile flanks in this region as to compel their withdrawal. No attempt was made to keep the Fr. plan secret, and the Germans fully prepared to meet the offensive. The preliminary bombardment opened on 22 Sept. and was maintained for 3 days continuously. Operations went on fiercely until 29 Sept., but again little impression was made on the Ger. positions. Joffre resigned the post of commander-in-chief in Nov. 1916 and was succeeded by Gen. Nivelle, who had to meet difficulties within and without the army. A change of gov. had brought in ministers unfavourable to the proposed C. offensive. In the end, chiefly owing to support by the Brit. higher command, Nivelle was given a free hand. The offensive in C. commenced on 16 April, and important gains were made in ground and prisoners, etc. Pétain then succeeded Nivelle, with Foch as chief of the general staff. One of the chief Fr. successes in this region during 1917 was their victory over the Germans on the Chemin-des-Dames. During Oct. they had taken Fort Malmaison, and this placed them in a favourable position for attacking the Chemin-des-Dames, of which they made full use, the Germans being compelled to evacuate the position early in Nov. The area to the E. of Rheims was the main scene of the Ger. offensive in May 1918. Here they succeeded in making a great bulge in the Fr. line towards Paris, with Rheims and Soissons at the E. and W. ends, respectively, of the curve. The Chemin-des-Dames fell to the invader very early, and the Aisne was soon crossed, as was also the Vesle further S. Gradually Fr. resistance about Soissons was felt, then the Americans brought the Germans to a halt at Château-Thierry, and within a few days the Ger. offensive had shot its bolt. A further Ger. attack was attempted in the middle of July, but this melted away within 2 days. It was now the turn of the Allies to take the offensive, and the large salient created by the Germans in May was an obvious point of attack.

In this area Gen Mangin was in command of the Fr. Army. After a series of minor operations the general offensive

commenced on 18 July. An enormous number of tanks contributed largely to its success. In Aug. the offensive was resumed and maintained until the Germans were gradually forced back out of C. and eventually out of France.

Champagne Wines. grown in a region legally specified in 1911 within the ancient prov. of Champagne. They are pressed from the black and white *pinot* grape, the great Burgundy grape, the black grape giving depth and body, the white delicacy and perfume; white wines can be made from black grapes if the juice is removed before fermentation from the skins which contain the colouring matter. Grown in a barren, chalky soil such as the vine requires for the making of the finest wines, the grapes are picked over as soon as they are gathered and then pressed as quickly as possible, the juice being run off into a vat where fermentation takes place. The wine is then left to settle for 6 months or more. Vintage wines are supposed to be made entirely from the grapes gathered in some particularly good vintage, but nowadays they generally contain wines of earlier vintages, and very often a non-vintage wine, though cheaper, is quite as good as a vintage wine. Blending is an essential operation in the making of C., for every dist. has its peculiarity and it used to be said that the only C. which could stand on its own merits came from the vineyards of Ay (q.v.). So there is a blending of the wines of various vineyards and one of various years taken from the vast reserves of fine wine. Then, as the wine is bottled, a carefully calculated dose of sugar is added to provide for the secondary fermentation in the bottle which will give the wine its sparkle. The huge piles of bottles are stored in the famous chalk cellars of the region and the wine in them ferments, producing alcohol and carbonic acid gas from the added sugar and throwing a sediment. It is essential that C. should be golden star-bright, and the sediment has to be removed without releasing the gas from the bottle. In the course of a long operation, the sediment is gradually worked down the bottle until it rests on the cork. The bottles are placed in racks and very gradually tilted up by the *remueur*, a skilled craftsman who by a special turn of the wrist displaces the sediment until the bottles are upside down. Then the neck of the bottle is frozen hard and the cork removed with the sediment with a minimum waste of wine. C. is one of the hardest of wines, almost proof against climate and ill usage, and a certain alcoholic degree is necessary for its constitution. At this stage there is an addition of grape spirit, and the brandy most congenial to the wine is that distilled from the wines of Cognac where the finest dist. is as chalky as C. and bears the same name (see BRANDY). Moreover the wine has by this time converted nearly every trace of sugar into alcohol and gas, and must be sweetened by a liqueur formed of the brandy with from a quarter to 5 per cent of sugar to make it *brut* (or nature), *extra sec* (or

extra dry), *sec*, or *demi-sec*; for the French, who to-day drink the bulk of C., like their wine sweet to go with the sweets, and the English like it dry to go with their meals, knowing, perhaps, that only the best wine will pass muster when it is practically unsweetened. Modern methods of vinification have given C. an almost uniform golden colour; pink C.s are made by the addition of a little red wine or colouring matter. A good deal of red and white still C. used to be made and it will no doubt reappear if the demand for the expensive sparkling wine

Pommery & Greno

A STORAGE GALLERY IN CHAMPAGNE
CAVES AT RHEIMS

falls below the supply of the vintage. Old sparkling C.s can be wonderful wines, but they are bound to be rare as their existence depends on first-rate corks and careful storage. See Paotet and Guittonneau, *Vins de Champagne*, 1918; H. Warner Allen, *White Wines and Cognac*, 1952; A. Muir, *How to Choose and Enjoy Wine*, 1953.

Champagnole, Fr. tn in the dept of Jura, on the Ain. It is a popular resort. There are metallurgical and watch-making industries. Pop. 5000.

Champaign, city in Illinois, U.S.A., 125 m. SSW. of Chicago, in a grain-growing and livestock area, with railway shops and an oil refinery. With adjoining Urbana, C. is the prin. seat of the univ. of Illinois. It manufs. gloves, machinery, chemicals, etc. Pop. 39,600.

Champ-de-Mars, park in Paris on the l. b. of the Seine, now about 50 ac. in

extent, originally a field for military parades and reviews. The Eiffel Tower (q.v.) stands in the N.W. corner. It was the site of the celebrated fête de la Fédération on 14 July, 1790, the first anniversary of the fall of the Bastille (q.v.). In 1791 it was the scene of a massacre, and here, in 1804, Napoleon distributed the 'Eagles' (standards) to his army. The international exhibitions of 1867, 1878, 1889, 1900, and 1937 were held here.

Champerico, seaport of Retalhuleu dept., Guatemala, on the Pacific. C. is linked with the Pacific Highway, and is also the terminus of the San Felipe railway. Pop. 1000.

Champerty, or **Champarty** (Lat. *campum partiri*, to divide the land), in criminal law is a species of maintenance or officious intermeddling in a law suit which in no way concerns one. The crime consists in making a bargain with a plaintiff or defendant that, in consideration of the champertor carrying on the action at his own expense, the land or other subject matter of the action shall in the event of success be divided between them. C. is a misdemeanour punishable by fine or imprisonment, or both. It has been held to be a champertous agreement to offer to exercise influence in procuring evidence to support a claim for money upon condition of receiving a portion of the sum recovered. See also CRIMINAL LAW and MAINTENANCE.

Champfleury, Jules Husson (1821-89). Fr. author, b. Laon. His true name was Jules Fleury-Husson or Husson. He joined the Bohemian circle of Baudelaire and Henri Murger, and was an acknowledged leader of the realistic school. His *Bibliographie céramique*, 1882, written after he was appointed director of the Sèvres potteries in 1872, is of some value. Among his novels are *Chien-Caillou*, 1847, which won the praise of Victor Hugo; *Les Souffrances du professeur Delleil*, 1853; *Les Bourgeois de Molinchart*, 1855, a satirical tale of prov. life among the middle classes; *Les Amoureux de Sainte Péline*, 1859; *Le Violon de Falence*, 1862, generally considered his masterpiece. His biographical works include *Honoré de Balzac*, 1852. See M. Clouard, *L'Œuvre de Champfleury*, 1891.

Champigny-sur-Marne, Fr. tn in the dept of Seine, a SSE. suburb of Paris, on the Marne. There were engagements here between the French and the Germans during the siege of Paris in 1870 (see FRANCO-PRUSSIAN WAR). It is a boating resort for Parisians, and has engineering works. Pop. 29,200.

Champion (Late Lat. *campio*, from *campus*, a field or open space), in the judicial combats of the Middle Ages the hired combatant who took the place of women, children, aged persons, or any incapable of fighting their own battles. These C.s were of the lowest class, and were regarded as disreputable persons. Later, in the age of chivalry, the name acquired a higher meaning and was applied to a knight who challenged or defended on behalf of an injured lady or child. The

office of crown C. is peculiar to England. The 'King's C. in full armour and mounted on horseback rode into Westminster Hall at the coronation banquet and challenged to single combat any who should deny the sovereign's right to reign.' The challenge was never accepted, but the picturesque ceremonial was performed up to the coronation of George IV. The office is hereditary and is held by the family of Dymoke.

Championnet, Jean Antoine Etienne (1762-1800), Fr. general, b. Valence in Drôme. He enlisted in the army at a very early age and took part in the siege of Gibraltar. When the revolution broke out he took a prominent part; suppressed the Girondist movement in the Jura (1793) without bloodshed; was brigadier-commander in the Rhine campaign, and by his stubborn resistance at Fleurus (1794) greatly contributed to Jourdan's victory. In 1798 he was appointed commander-in-chief of 'the army of Rome,' defended Rome against the Neapolitans and the Brit. fleet, and finally captured Naples (1798), setting up the Parthenopean rep. there. His intolerance of opposition was the cause of his recall from Italy in disgrace. In the following year he was appointed commander-in-chief of the 'army of the Alps,' but was defeated at Gendia (1799) by the Austrian and Russian troops, and retired to Nice. He d. at Antibes in the following year.

Champlain, Samuel de (1567-1635), Fr. explorer, founder of Quebec and first governor of Fr. Canada, b. Brouage (Saintonge). His youth was spent in the army of Henri IV, and in an expedition to the W. Indies of which he wrote an account in *Bref Discours des Choses plus remarquables que S. Champlain a reconnues aux Indes Occidentales* (first pub. 1870). In 1603 he made his first voyage to Canada. On his third voyage (1608) he founded Quebec, estab. friendly relations with the Indians, and founded a prosperous fur trade. In 1612 he was made lieutenant of Canada. In 1629 Quebec fell into the hands of the British, and C. was taken to England as a prisoner. At the treaty of St Germain (1632), which restored Canada to France, C. returned to Quebec as governor. When C. came to the St Lawrence, furs were already being brought to the riv. from great distances, and C. found himself involved in the intense rivalry for the trade. In his trade and explorations C. had followed a policy of making alliances with Indian tribes, especially with tribes N. of the riv. where the best fur country lay. In 1609, soon after Quebec was founded, C. was already beginning to ally himself with the N. Indians. In that year he made an exploration up the Richelieu R. and into the lake which still bears his name. C. was often hindered in making explorations himself by the cares of the settlement at Quebec; but he sent younger men to live with the Indians and learn their ways and languages. It was through one of these young men, Vignau, that C. was led to make his second important expedition, a voyage, in 1613, up the Ottawa as far

as Allumette Lake. Two years later C. undertook his greatest exploration. This was to the Huron country with Étienne Brûlé, a Quebec youth, in an attack on the Iroquois. C. made the long trip up the Ottawa, across the Mattawa R. to Lake Nipissing and down the Fr. R. to Georgian Bay and thence to a Huron vil. near Lake Simcoe; in the fighting there C. was wounded and his party retired defeated; and in the following year C. went home. Brûlé subsequently carried on the work of exploration. At C.'s death large parts of the great lakes were still unexplored; but C. was the pioneer in the remarkable voyages which first put the great lakes on the map. His men had pointed the way to the Mississippi and found the St. Mary's R. and Mackinaw Strait, which were subsequently to be the cross-roads of the great fur-trading routes of the N. and W. Great as he was as an explorer, C.'s fame rests solidly on his writings. To-day these are printed, with an Eng. trans., in 6 large vols. and by a society which bears his name. They are no doubt his best memorials, a valuable and convincing record of the beginnings of Fr. settlement and exploration, besides being an attractive character-study of the man himself. See *Oeuvres de Champlain* (6 vols.), 1870, and *Voyages* (3 vols.), 1878-82; also life by Dionne, 1891; and in *Makers of Canada Series, Champlain*, by Dionne, 1905.

Champlain, lake in the N.E. of the U.S.A., lying between Vermont and New York. It is long and narrow, its N. end stretching for nearly 6 m. into Canada. It is drained to the N. by the Richelieu into the St. Lawrence, and is connected by a canal with the Hudson. It has an area of about 435 sq. m., being approximately 110 m. long by from $\frac{1}{2}$ to 14 m. broad. To the E. lies the Green Mt. range, to the W. the Adirondacks. The lake was discovered in 1609 by Samuel de C., who gave it his name. It was the scene of many skirmishes during the Fr. and Indian wars, and during the Amer. Revolution. In 1814 the Brit. fleet was defeated by the Americans in the naval war of 1812-15.

Champlain Epoch or Period, name given by Prof. Dana to the period succeeding the Glacial in N. Amer. geology, equivalent to the post-Glacial period of Brit. geologists. The chief traces left by the C. E. are the deposits, including marine shells, round Lake Champlain and elsewhere in N. America, the raised beaches around the great lakes, and old lake basins, now dried up, in their neighbourhood and near the E. coast. The small bitter lakes, the most important of which is the Great Salt Lake of Utah, are the remains of a great system in the W.

Champollion, Jean François, le Jeune (1790-1832), Fr. Egyptologist, b. Figeac, in the dept. of Lot, France. At the age of 16 he read a paper at Grenoble maintaining that Coptic was the ancient language of Egypt. In 1816 he was appointed to the professorship of hist. at the Lyceum of Grenoble, which he was afterwards obliged to vacate on account of his

Bonapartist sympathies. By comparing ancient MSS. and monuments, and inferring that hieroglyphs represented ideas or letters, C. made rapid progress with the decipherment of hieroglyphic writing. He was sent on scientific expeditions to Italy, 1824-6, and to Egypt, 1828-9; appointed prof. of Egyptology in the Collège de France, 1830. See H. Hartleben, *Champollion, sein Leben und sein Werk*, 1905.

Champollion-Figeac, Aimé Louis (1813-1894), Fr. author, b. Grenoble, son of Jacques Joseph C.-F. He was assistant librarian to his father at the Royal Library; also pub. sev. works on Fr. hist., art, and palaeography, and edited a number of memoirs.

Champollion-Figeac, Jacques Joseph (1778-1867), Fr. archaeologist, elder brother of the more famous Jean François Champollion, b. Figeac. He became prof. of Greek at Grenoble, and in 1828 was appointed conservator of MSS. in the Royal Library at Paris. In 1848 he was appointed librarian of the palace at Fontainebleau. He wrote sev. works on historical and philological subjects, and was editor of some of his brother's works.

Chamson, André (1900-), Fr. novelist and essayist, b. Nîmes. He was brought up in the narrow Protestant tradition of his region; and although he studied at the Sorbonne and the Ecole des Chartes, his severe upbringing forms the inspiration of some of his best work. In his first novels, *Roux le bandit*, 1925, *Les hommes de la route*, 1927, *Histoire de Tabusse*, 1928, and *Le crime des justes*, 1930, he describes the life of the peasantry in his native region. Later novels show more interest in social and political problems, such as *La Galère*, 1930. He has also written a series of political essays, including *L'homme contre l'histoire*, 1927, and *La révolution de dix-neuf*, 1930. See A. Rousseaux, *Ames et visages du XX^e siècle*, 1932.

Chamusca, tn of Portugal, in Santarém dist., on the Tagus, 14 m. N.E. of Santarém (q.v.). It has a trade in fruit, wine, and cheese. Pop. 3800.

Chañaral, or Chañaral de las Animas, coastal tn and cap. of C. dept. Atacama prov., Chile, 75 m. NNW. of Copiapó. It acts as an import-export centre for the important Potrerillos copper-mine. Apart from what can be obtained from condensation, drinking-water has to be piped from hundreds of miles away. Pop. 3000.

Chance, see PROBABILITY.

Chance-, or Chaud-medley (Chaud-mellé) (O.F. *chaude mellee*, heated affray), originally meant any casual affray accompanied by violence but without deliberation or preconceived malice. The expression, though seldom used now, means the killing of another in self-defence upon a sudden and unpremeditated encounter. C.-M. is to be distinguished from manslaughter, for the latter is a crime, but the former an excusable act. The general distinction is that, if both parties are actually fighting, he who gives the mortal blow is guilty of manslaughter, but if one of them at first refuses to fight and retreats until, at last,

to avoid his own destruction, he kills his antagonist, that is excusable homicide, or, as it is inaccurately termed, C.-M.

Chancel (Late Lat. *cancellus*, a screen), the E. part of a church, usually separated from the nave by an open-work screen or rail. In some medieval churches the screen is very high, so that the congregation is completely shut off. The choir stalls and the rector's pew are in the C., and the communion table on a raised platform at the far end. The term C. is often used as synonymous with choir;

THE CHANCEL OR CHOIR OF MANCHESTER CATHEDRAL, AS IT APPEARED IN 1884
From a drawing by T. Challis.

the C. is also frequently called the sanctuary or presbytery. According to Eng. law the rector has special rights over the C., is entitled to the chief pew, and is liable for all necessary repairs. Parishioners are allowed beyond the screen for the celebration of holy communion and for marriage services.

Chancellor, Richard (d. 1556), navigator; appointed in 1553 as captain and pilot-general of the *Bonaventure*, in the expedition of Sir Hugh Willoughby to search for a N.E. passage to India. The ships were separated in a storm off the Lofoten Is., and C. reached Vardohuus, the meeting-place that had been agreed upon, and after waiting 7 days in vain for the rest of the company, he went on alone into the White Sea, from whence he travelled to the court at Moscow, being well received there, and concluding a treaty that gave freedom of trade to Eng. ships. On a second voyage he was lost in a shipwreck off the coast of Aberdeen.

Chancellor (Lat. *cancellarius*). Primary meaning of *cancellarius* is one who is stationed at the lattice-work of a window or doorway, to introduce visitors, etc. In another sense, *cancellarius* was a kind of legal scribe, so called from his position at the cancelli of the courts of law. The *cancellarius*, under the later emperors and in the court of Constantinople, was a chief scribe or secretary who was ultimately invested with judicial powers and a general superintendence over the rest of the officers of the emperor. All the modern nations of Europe have or have had C.s, though the powers and duties seem to have varied in each. In England the C. was originally the king's chief secretary, to whom petitions were referred, by whom patents and grants from the Crown were approved and completed, and by whom reports upon such matters were, if necessary, made to the king; hence in Saxon times he was sometimes styled *referendarius*. The name C. is said first to occur in Eng. hist. in the time of Edward the Elder, AD 920. In early times, as the C. was usually an ecclesiastic, head chaplain and father confessor to the king, he became keeper of the king's conscience, examiner of his patents, the officer by whom prerogative writs were prepared, and keeper of the great seal. The last ecclesiastic who exercised the office was John Williams, Archbishop of York, from 1621 to 1625.

The interference of the king, the source of justice, was frequently sought against the decisions of the courts of law; and also in matters which were not cognisable in the ordinary courts, or in which, from the maintenance of protection afforded to his adversary, the petitioner was unable to obtain redress. The Eng. C.'s jurisdiction sprang from this royal discretionary authority (see also CHANCERY and EQUITY). It may be observed that although the Eng. C.'s powers were so closely interwoven with the development of equity he nevertheless possessed at one time a political pre-eminence not only far greater than he enjoys at the present day, but second to none in the state; for on the decline of the office of chief justiciar, the C. succeeded him as the chief minister. The Earl of Suffolk in the reign of Richard II, for example, exercised authority not only over revenue matters, but also over foreign policy. Like the justiciar, however, the office of C. always tended to become a purely legal one. The style of the C. in England is lord high C. of Great Britain. He takes rank above all dukes not of the royal blood, and, next to the Archbishop of Canterbury, is the chief judge in England, and has a seat in the Cabinet. He is appointed by delivery of the great seal, sits on the woolsack, presides at debates in the House of Lords, and goes out with the gov. A Rom. Catholic may not be lord high C. of England. The salary of the lord C. is £10,000 a year, and an ex-lord C. receives a pension of £4000 a year, but on going out of office he usually conducts a great deal of judicial work, presiding in the House of Lords,

sitting as the ultimate court of appeal, and hearing appeals to the Privy Council. In the House of Lords the C. presides as Speaker. He is the guardian of wards in chancery and their property, and has jurisdiction over idiots and lunatics by special delegation from the Crown. He is qualified to sit in the court of appeal, and presides when he sits there, and is the titular head of the chancery div. He appoints the judges of the court of appeal and the high court and the county courts, and may remove county court judges if necessary. He also appoints co. justices of the peace on the recommendation of the lord-lieutenant, bor. magistrates, and commissioners for oaths. At the opening of a new Parliament he signifies the Crown approval of the appointment of the Speaker of the Commons, and reads the queen's speech in the absence of the latter. He has the presentation of various canonries and livings, dispenses a wide patronage in addition to that already noted, exercises a concurrent jurisdiction with the other judges of the superior courts with respect to writs of *habeas corpus* (q.v.), and is, *ex officio*, visitor of all hospitals and colleges founded by the Crown. There was also, before the estab. of the Irish Free State in 1922, a Lord C. of Ireland, whose authority within his own jurisdiction was in most respects the same as that of the lord high C. of Great Britain. His salary was £8000 a year.

In Scotland, as in England, the C. was always a high officer of the Crown and had great authority in the king's councils; and similarly, that authority at length extended beyond its original limits and affected the whole judicial power in the kingdom. But while in England the C. for the most part only carved out for himself a jurisdiction in equity, in Scotland he reached the head of the administration of justice, and sat in a court which dispensed both equity and common law and the course of proceeding in which all the other judicatures were bound to follow. The office of C. of Scotland expired in 1707 when, by the treaty of Union with England, it was provided that there should in future be but one great seal for the U.K. The C. of a bishop is vicar-general to the bishop, and presides over the bishop's consistory court. He must be a barrister of at least 7 years' standing. The C. of the Duchy of Lancaster is an officer who presides in the duchy chamber of Lancaster, adjudicating on equity matters connected with the Crown lands of the duchy. He is one of the titular heads of the Ministry of Agriculture. The C. of a cathedral is one of the 4 chief dignitaries of cathedrals of ancient foundation. The C. of the Exchequer is the prin. finance minister of the Crown. His legal functions are now merely formal, such as presiding at the ceremony of nominating sheriffs. Constitutionally he is the under-treasurer, the office of lord high treasurer being now executed by the Lords Commissioners of the Treasury. His voice, however, may be all-powerful

in connection with the Exchequer, the degree of his political eminence varying with the qualities of the individual who holds the Exchequer seat (*see* EX-CHEQUER, CHANCELLOR OF). The C.s of the univs. of Oxford and Cambridge are the titular heads of the univs., and are elected by the respective corporate bodies of which they are the heads. Their duties are mainly discharged by a vice-C. The C. of the order of the Garter and other orders of knighthood seals and authenticates the formal instruments of the chapter and keeps the register of the order.

Chancellorsville, vil. of Virginia, U.S.A., situated in Spottsylvania co., between Richmond and Washington. It was the scene of one of the greatest battles of the Civil war in 1863, when Gen. 'Stonewall' Jackson received his death wound and Gen. Hooker was defeated.

Chancery (Lat. *cancellarius*, chancellor). Before the fusion of common law (q.v.) and equity (q.v.) by the Judicature Act, 1873, the Court of C. was the name given to the court which had the sole administration of equity. Since 1873, when the Supreme Court of Judicature was estab. to exercise the consolidated jurisdictions of the old courts of C., queen's bench (q.v.), common pleas (q.v.), exchequer (q.v.), and the admiralty (q.v.), probate, divorce, and matrimonial causes courts, the administration of equity became competent to all courts of law, and the C. div. now means that side of the high court of justice to which are assigned the trials of certain special causes. As a fact practically all matters falling within its old jurisdiction are still heard in the C. courts. The prin. matters assigned to the C. div. relate to the estates of deceased persons, partnerships, trusts, partition or sale of real estates, specific performance of contracts for the sale of land or other property, the redemption or foreclosure of mortgages, care of infants' estates, cancellation or rectification of deeds or other written instruments, and the construction of wills. It consists at the present day of 7 puisne judges, with the lord chancellor as titular head.

History. The whole course of the gradual evolution of the court of C. is intimately connected with the development of equitable principles; principles which, borrowed partly from the civil and canon law, and partly from the dictates of natural justice, were designed to redress grievances for which there existed no available remedy at common law. The king as the fountain-head of justice enjoyed the prerogative of dispensing justice personally in his royal council (*curia regis*). Later the judicial side of the royal council became specialised in the *concilium ordinarium* acting as a court of appeal and equity, and the chancellor, as the keeper of the king's conscience and the chief legal officer of the council, presided over it in the king's absence. The old court of C. is generally believed to have been estab. in 1348 by an ordinance which vested in the chancellor plenary authority in 'matters of grace and favour.' But whether after 1348 the so-called

court of C. was or was not merely the royal council, sitting in a place called 'the chancery' to hear petitions of 'grace and favour' in cases which the common law could not reach, the chancellor gradually usurped the judicial functions of the council and sat as a judge alone. The power of the court of C. after it ceased to follow the king in 1348 was developed mainly through the chancellor's delegated authority to invent new writs to meet cases for which the common law judges were unable to give redress either because of some defect of principle in the law itself, or because such remedies as it did provide could not avail against the oppression or local influence of one of the parties. During and after the end of the 14th cent. the judicial power of the court of C. increased enormously in spite of remonstrances from the common law judges and the Commons. At the time of Coke it exercised an *ordinary* or common law (*secundum legem et consuetudinem*) jurisdiction and an *extraordinary* (*secundum aequum et bonum*) jurisdiction, in the former giving auxiliary remedies such as discovery of documents in cases otherwise decided on common law principles, in the latter proceeding entirely on grounds of equity. The characteristic features of its proceedings were the summons by subpoena to *appear and answer* without any *original writ* to the sheriff, by which means it could reach powerful personages who defied the common law courts, and the *injunction*, by the instrumentality of which it removed causes from the common law judges or reversed their decisions, and committed a plaintiff for contempt who persisted in going on in the common law courts against conscience, and in defiance of the order of the C. court.

The constant struggles between the common law judges and the C. court culminated in the historic contest between Coke and Ellesmere in 1616, when the king pronounced in favour of the chancellor. From that time the court of C. became the dominating power in the judiciary, and the rules of equity were made to prevail over those of common law. Down to the middle of the 19th cent., the business of the court of C. was exercised by the lord chancellor, 3 vice-chancellors, and the master of the rolls, each occupying a separate court. There were also various officials who exercised certain parts of the equitable jurisdiction of the court, who derived their authority from special delegation of one of the C. judges. These were principally the masters in ordinary and the accountant-general. Proceedings in the old court of C. were conducted by *Bill and Answer*. The Bill set out the facts as alleged by the plaintiff, prayed for relief, and concluded with a request for a subpoena to compel the appearance of the defendant for examination. The defendant's answer usually contained a demurrer (q.v.) to the Bill, various pleas in reply, and a denial of the truth of the allegations, with his own version of the case. Scientific precision indeed was completely subordinated to conscience,

but the true spirit of equity was in a measure violated by the gradual tendency of the procedure to as complete a technicality as that of the common law. The partial fusion of administration of equitable remedies effected by the Judicature Acts has to a great extent modified the excessive technicality of the C. court, or its modern representative the C. div. It may be noted that in most Brit. colonies there are courts of C. based more or less on the model of the Eng. courts. In Amer. law it also indicates a court of general equity jurisdiction. Separate courts of C. or equity exist in a few of the states; in others the courts of law sit also as courts of equity; in others equitable relief is administered under the forms of the common law; and in yet others the distinction between law and equity has never existed or has been formally abolished. The Federal courts exercise an equity jurisdiction as understood in the Eng. courts about 1889. See also BILL IN EQUITY.

Chanctonbury Ring, hill on the S. Downs, in Sussex, England, near Steyning. Its tree-capped summit (814 ft) is occupied by prehistoric earthworks and a dewpond. The oval rampart which defended it is 500 ft by 400 ft, and its outworks measure nearly 400 ft. Rom. coins and other remains were found in 1909.

Chanda, tn in Madhya Pradesh, India. It is surrounded by the ruins of the anc. city of Bhadravati. It was for long the cap. of the Gond kings, of whom a number of tombs remain.

Chanderi, tn in Madhya Bharat, India, in the former Gwalior state. The old tn is deserted and hidden in thick jungle, having ruins of 10th-cent. temples. The modern tn, 8 m. S., is famous for its silks and gold brocades.

Chandernagore, or properly **Chandarnagar** (city of sandalwood), former Fr. settlement in W. Bengal, India, 20 m. N. of Fort William, Calcutta, on the r. b. of the R. Hughli. It was transferred to India in 1951 following a referendum among the inhab. Founded by the French in 1673, it changed hands between French and British, but was finally restored to the French in 1815.

Chandigarh, new cap. of the Punjab (India), built to the design of Le Corbusier on a site 150 m. N. of Delhi at the base of the Shivalik Hills and named after a temple dedicated to the goddess Chandi. The lay-out follows the principle of self-contained neighbourhood units to take a total pop. of 150,000, with a 5-m. green belt around. Notable buildings are those of the Capitol, university, stadium, town hall, and hospitals.

Chandler, Ellen Louise, see MOULTON.

Chandler, Richard (1738-1810), classical archaeologist, b. Hants. He was educ. at Winchester and at Queen's and Magdalen, Oxford. In 1763 he pub. a detailed description of the Oxford marbles in his *Marmora Oxoniensis*, which was printed at the expense of the univ. In the following year the Society of Dilettanti sent him out with Revett and Pars to study the antiquities of Greece and Asia

Minor. On his return C. pub. his discoveries in *Ionian Antiquities*, 1768-97, *Inscriptiones Antiquae*, 1774, *Travels in Asia Minor*, 1775, and *Travels in Greece*, 1776.

Chandler, Samuel (1693-1766), non-conformist divine, b. Hungerford, Berks, where his father was minister. He was educ. at Gloucester, where he met his lifelong friend, Bishop Butler. He became fellow of the Royal and Antiquarian Societies, and D.D. of Edinburgh and Glasgow. He was minister at Peckham, 1716-26, then preached at the Old Jewry until his death. His writings were numerous, and he was prominent in the deist controversies of the time.

Chandos, Eng. family, claiming descent from a follower of William the Conqueror: *Sir John Chandos* (d. 1428) was the last representative in direct male line.

Sir John Brydges, descendant in the female line, was lieutenant of the Tower under Queen Mary, and was created Baron C. in 1554.

James Brydges, 9th Lord C., was created duke in 1719. The C. residence which he built once at Canons, near Edgware, is now destroyed. The daughter of the 3rd Duke of C. married the Marquess of Buckingham, who became Duke of Buckingham and C., 1822. In 1889 this title became extinct. In 1954, however, Oliver Lyttelton was created Viscount C. (see CHANDOS, OLIVER LYTTELTON, 1st VISCOUNT).

Chandos, Oliver Lyttelton, 1st Viscount (1893-), Brit. statesman and industrialist, educ. at Eton and Trinity College, Cambridge. From 1940 to 1954 he was Conservative M.P. for Aldershot. In the Coalition Gov. during the Second World War he was president of the Board of Trade, 1940-1; minister of state, 1941-2; and minister of production, 1942-5, his work in the last-named office being outstanding. When the Conservatives returned to power in 1951, C. became secretary of state for the colonies. His period of office coincided with the Kenya Mau-Mau crisis, in which C. displayed considerable political ability and understanding, though he was criticised as reactionary by left-wing opponents at home and as over-progressive by right-wing critics in Kenya itself. In 1954 he retired from politics to devote himself to his substantial business interests, and was created Viscount C. Since 1955 he has been chairman of the Advisory Development Council for N. Ireland.

Chandragupta, or Sandrocottus (reigned 316-292 BC), founder of the Maurya empire and first emperor of India. He was son of a king of Magadha, his mother being of humble birth. As a youth he was forced into exile by his kinsfolk, and during this period he gathered round him a great company of warriors, then attacked the Macedonians, and conquered the Punjab. He next attacked Magadha, slew the king, and estab. himself on the throne, and in due time his kingdom extended from the Hindu-Kush to the Bay of Bengal.

Chang, name given to the Tibetan

plateau which breaks up about the meridians of 84°-86° E. Scientific investigations have not been systematically carried out in this region as yet, but it is known that the Himalayan tribes of the Brahmaputra derive their sources from the Tibetan plateau.

Chang Chih-tung (1837-1909), Chinese scholar and statesman, b. in the prov. of Chih-li. From 1889 to 1907 he was viceroy of Hukwang. In character he was a great dreamer and enthusiast, and very impractical. He had great literary powers, and his knowledge of the Chinese classics was unrivalled. He is said to have been one of the most able men in modern times, and his powerful personality and true patriotism won for him a high position in the regard and trust of his fellow countrymen.

Chang Tso-lin (1870-1928), Chinese marshal and leader of one of the Chinese factions. Born of humble parentage and a native of Fengtien prov., Manchuria. Joined the Jap. cause in the Russo-Jap. war, 1904-5; became ruler of Manchuria in 1915. In 1925 he defeated Wu Pei-fu, and set up a gov. in Peking in 1927. In 1928 he withdrew with the intention of going to Mukden, but the train in which he was travelling was bombed by the Japanese near Mukden and his injuries led to his death on 3 June.

Ch'angan, see SI-AN.

Changarnier, Nicolas Anne Théodule (1793-1877), Fr. general, b. Autun. He was for many years governor-general in Algeria, and served in the Sp. war, 1823. He later on obtained a military post in Paris, where he subdued the Communist struggles of 1849. He was arrested in 1851 for opposing Napoleon III, and exiled from France, to which he returned 8 years later, after the settlement of 1859. He joined with Bazaine in the war of 1870, and when the tn. of Metz was captured he was taken prisoner and sent to Germany.

Changchow, Chinese coastal city in the prov. of Fukien, about 28 m. W. of Amoy. It has manufactories of bricks and sugar, and a great silk trade.

Ch'angchow, or Wuchin, city in Kiangsu prov., China, on the Shanghai-Nanking railway, in a fertile dist. near the Grand Canal. Rice and silk are produced, and there is a prosperous textile industry.

Change (derived from Low Lat. *campium*, exchange), meeting-place for merchants. The name has been thought to be an abbreviated form of exchange and is written thus—"change, but this is incorrect.

Changeling, fairy infant substituted for a human one immediately after its birth. In olden days a child that was especially peevish was regarded as a C. Great precautions were taken in the guarding of the mortal infant, and often some charm was left in the cradle. It was supposed the exchange could only take place before the christening, and that afterwards the mortal infant was safe.

Changkakau, see KALGAN.

Changkufeng, hill on the Russo-Manchurian border notable as the scene of

a savage conflict between Soviet forces and the Japanese in 1938. Between the frontier of Jap.-controlled Korea and the Soviet area S. of Vladivostok was a sort of no man's land whose precise limits had never been clearly determined. In June 1938 the Japanese learned that the Russians were planning to estab. a new submarine and air base on Possiet Bay, at the extreme S. limit of Soviet ter. Hence they seized a hill called C, situated in the no man's land about 90 m. from the sea, which gave artillery control over Possiet Bay. The Russian frontier guard expelled the Jap. patrol which had seized C. The Japanese returned in strength and annihilated the Russian frontier guard. The Russians countered in turn, and within 10 days 2 large armies each of 80,000 men, with planes, tanks, and heavy guns, were fighting for possession of the narrow ridge of C. The battle was won by Russian dive-bombers whose pilots had learned the methods of *blitzkrieg* in the Sp. Civil War, and by Russian infantry, which drove the Japanese into the valley below. Although the battle attracted but little attention from the rest of the world, it was an important conflict in its implications. Each antagonist evidently thought that the other was bluffing, but when the fight had developed from a mere frontier skirmish into a savage battle, both sides seem to have realised that the bluff had gone far enough, and an 'amicable' settlement was reached, by which, however, the Japanese, for the first time in Russo-Jap. hist., abandoned a field of battle. They recognised that the ridge of C. was Russian ter. and withdrew discomfited to the valley lying 5 m. to the SW.

This episode gave the Kremlin the assurance that the Red Army in Siberia was neither impotent nor demoralised at a time when the peak of misunderstanding between Soviet Russia and the rest of the world was attained. The following year the Japanese tried again, on the even more vague border-line between Inner Mongolia, which they controlled, and Outer Mongolia, controlled by the Soviet, at a place called Nomanhan. In this struggle the brunt was borne by native levies, although regular Jap. and Russian troops, with planes, tanks, and artillery, were engaged. In a 'war' which lasted 6 weeks, the Japanese were again defeated and again withdrew from the field. The C. affair confirmed Stalin's belief that the Soviet had been strengthened by the notorious army purge of 1936-8. He now knew, despite foreign prejudices, that his long-drawn internal struggle in Russia had been won and his Red Army in the E. could deal with the Japanese. The sequel was the pact of friendship and non-aggression between Russia and Japan in 1941. There was no real friendship on either side, but actually a salient example of 2 countries following a policy dictated solely by their own interests. The pact was scrupulously observed for some years and led to the settlement of such vexed questions as the frontiers between Manchukuo and Korea and the

border between Inner and Outer Mongolia, which had never previously been determined. See W. Duranty, *U.S.S.R.: the Story of Soviet Russia*, 1944.

Changpaishan, Laoling, or Shanalin Mountains, mt. range in the prov. of Kirin, China. It stretches in a N.E. direction between Kirin and Korea, the altitude being 8000 ft. Two rivers have their source in the mts, the Sungari on the N. side and the Yalu on the S.

Ch'angsha, cap. of Hunan prov., China, at the confluence of R.s Hsiang and Liu, on the Canton-Hankow railway. C. is an ant. city dating back to the 5th cent. BC, and it has occupied a strategically important position throughout the ages. Situated in the centre of a dist. rich both in agric. products and minerals, it has a prosperous trade, exporting rice, coal, antimony, etc. It was opened as a treaty port in 1903, but its foreign trade has been much overshadowed by Hankow. The commercial quarters are in the N. and W. of the city, while the S. part is occupied by factories. The Yoloshan in the SW. is one of the sacred peaks of the Hengshan and at its foot was the Yolo Academy founded in the 12th cent., which is now the site of the Hunan Univ. The temple of Chia Yi (201-169 BC) inside the city walls is believed to be his old house. The city was almost completely destroyed by fire started by Chiang Kai-shek's stampeding troops in face of the invading Japanese in 1938; but it withstood 3 subsequent Jap. offensives between 1938 and 1943. The present city was almost completely rebuilt after the war and much industry has been built up since 1953. Pop. 630,000.

Changteh, see ANYANG.

Ch'angteh, Chinese city in the province of Hunan situated on the R. Yuan, which is the chief means of communication from the neighbouring province of Kweichow.

Ch'angtu, see CHAMDO.

Channel, English, see ENGLISH CHANNEL.

Channel Islands (Fr. *Iles Anglo-Normandes*), group of Brit. is. in the Eng. Channel, W. of the Cotentin Peninsula, NW. France. The largest is. are Jersey and Guernsey; the lesser inhabited is. are Alderney and Sark. Herm, Jethou, and Brechou have, from time to time, a few inhab. Outlying rocky islets or reefs include Burhou, the Casquets, the Dirouilles, the Ecréhos, Lihou, the Minquiers, and the Paternosters. Chausey, an extensive rocky reef, with a few inhab., lies SW. of Jersey but belongs to France. Navigation around the coasts is difficult owing to rocks, tides, and currents. The area of the 4 main is. is about 75 sq. m. The total pop. is nearly 103,000, mostly centred in Jersey and Guernsey. The is. formed part of the duchy of Normandy at the time of William the Conqueror's invasion of England in 1066. They were not included in the Eng. continental possessions lost to France in 1204, in the reign of King John, and remained attached to the Brit. Crown, of which they are the oldest possession. The is. remained, however, in the diocese of

Coutances (Normandy) until 1568, when they were brought into the diocese of Winchester. Their strategic importance in the past and their effectiveness as privateering bases brought attacks by the French, the last in 1781, when a landing force under de Rullecourt was routed by the Eng. garrison and the local militia in the battle of Jersey, commemorated in a painting by Coploy, hung at the Tate Gallery, London. Under conditions of modern warfare the is. are untenable against a powerful enemy in occupation of the mainland of France, and shortly

home secretary. The bailiff in each halliwick is also appointed by the Crown and combines the functions of chief magistrate and president of the legislature. Each of the 4 is. has its own legislature and courts. The laws and customs and political institutions vary in each is., but are all based on those of medieval Normandy, though modified in many respects by local legislation. Sark is unique in being still almost entirely feudal. The is. have shown great attachment to their traditional laws and forms of gov., both sustained in the past by the common use of

Photo Precision, St. Albans

MONT ORGUEIL CASTLE, GOREY, JERSEY

after the collapse of France in June 1940, they were declared by the Brit. Gov. to be open tns, and were occupied by Ger. forces. They were heavily garrisoned and fortified by the Germans, but were of little positive value to them during the war. They were peacefully liberated in May 1945. The is. have long enjoyed full self-gov., subject only to the queen-in council, they are not represented in the Parliament at Westminster and are not subject to it. The is. are divided into 2 bailiwicks: one for Jersey and one for Guernsey, Alderney, and Sark. Alderney being governed almost entirely by Guernsey, but Sark retaining a high degree of independence within the bailiwick, with direct appeal to the queen-in council on some matters. Alderney has an elected president. A lieutenant-governor represents the queen in each bailiwick and is the formal channel for communication between the is. and the

the Norman language, still spoken with variants in vocabulary and accent in most of the is. Until recent times French was used exclusively in the legislatures and courts, but English is now in general use. In 1946 a committee of the Privy Council visited Jersey and Guernsey and approved substantial changes, already proposed by the islanders, in the composition of the legislatures in Jersey and Guernsey, and also approved the setting up of an appeal court for both bailiwicks. The reforms in Jersey have now been constitutionally adopted, but in Guernsey they have been rejected. The C.I. enjoy a mild climate, with moderate range and with record sunshine periods during the summer, ann. rainfall varies from 34 in. to 38 in. They have developed an intensive agriculture and a flourishing holiday traffic from England, the latter activity centred mainly in Jersey and Guernsey. The is. attract as residents many *rentiers*

and Eng. folk living in retirement from service overseas. Glasshouse culture has developed extensively in Guernsey, because the is. slopes northwards and is therefore less favoured than Jersey, which slopes southwards, and where outdoor intensive cultivation prevails on small holdings seldom exceeding 20 ac. The is. enjoy long-standing privileges of exporting their crops—potatoes, tomatoes, fruit, and flowers—to the U.K. free from import taxes. Jersey and Guernsey also export considerable quantities of granite. The is. are the homes of the well-known Guernsey and Jersey breeds of cattle. The herds are strictly controlled and are virtually free from tuberculosis. The large proportion of local production exported from Jersey and Guernsey gives rise to large imports from the U.K. of food, coal, motor vehicles, feeding stuffs, fertilisers, packing materials, horticult. requisites, hardware, and general goods. Jersey and Guernsey are served by regular steamer from Southampton and Weymouth and air services from the U.K. Sark and Alderney have regular trade and communications with Guernsey and there is a regular daily air service between Alderney and England. Trade between France and the is. is insignificant and there is a steamer service only from Jersey. Eng. currency of all denominations is used, and the 'big five' Eng. banks are estab. Jersey and Guernsey make token issues of their own copper coinage. During the Ger. occupation (1940-5) they issued their own currency notes and postage stamps. A large part of the administration of the is. is carried out on a voluntary basis, which, with the frugal character of the islanders, accounts for the comparatively low taxation and relatively small public debt in each is. Taxation is, however, tending to rise to meet social legislation of various kinds. The is. have a rich flora and offer much of geological and archaeological interest, Jersey having a remarkable megalithic tomb, La Hougue Bie, and a cave, La Cotte de St Brelade, which has revealed evidence of Neanderthal man. See ALDERNEY; CASQUETS; GUERNSEY; JERSEY; JETHOU; SARK. See T. D. Kendrick, *The Archaeology of the Channel Islands*, 1928; B. de Guerin, *The Norman Isles*, 1948; R. M. Lockley, *The Charm of the Channel Islands*, 1950; W. D. Hooke, *The Channel Islands*, 1953; A. and Mary Wood, *Islands in Danger*, 1955.

Channel Ports. Ger. designs on the C. P. became obvious in the early months of the First World War. Possession of them would have given Germany bases for submarines, besides offering favourable conditions for cutting Brit. communications with France. Hence the Ger. plan was to capture Dunkirk, Calais, and Boulogne and also the Belgian ports, Zeebrugge and Ostend. The menace was increased after the fall of Antwerp on 9 Oct. 1914, when the Germans concentrated 3 armies for a general offensive towards the straits of Dover. Ostend and Zeebrugge were evacuated and the Belgian Army retreated to the Yser. In the last

days of Oct. the 3 Ger. armies delivered a formidable and almost simultaneous attack on the allied front extending from the Yser R., through the Ypres sector and La Bassée, to Arras. This was the inception of the first battle of Ypres, and upon its issue hung the fate of the C. P. At the beginning the sorely tried Belgian Army bore the brunt of the attack, stubbornly resisting Württemberg's troops behind the Yser until such time as the Brit. warships were in position to fire on the Germans, and so compel them to withdraw. Between Nieuport and Ypres, further inland, the advance was thwarted by the desperate expedient of opening the dykes and so flooding the surrounding country. The sole gain to the Germans in this quarter was the capture of Dixmude. Southward, the second Ger. Army, that under the Bavarian crown prince, after sev. days of fierce fighting, succeeded in advancing its positions a few miles, from La Bassée to Neuve-Chapelle; but this proved the limit of its advance to the C. P. The third Ger. Army, under von Bülow, operating still further S., could make no headway against the French in front of Arras. The fiercest fighting in the whole battle was near Ypres, the attacks on the Brit. forces being repeated and long-drawn; but though the Brit. line was driven back some little way, it was never pierced. The historic effort of the Germans to take the C. P. had thus definitely failed. A further effort was made in 1918 in the course of the final Ger. offensive, but the attack was launched from motives of despair. When they were held before Amiens (q.v.), the Germans delivered a great assault against the Brit. line between Arras and the region N. of Ypres, the plan being to separate Plumer's Second Army from Horne's First Army, the attempt to drive a wedge between the French and British having failed. Success would have jeopardised Calais, for an advance in any way comparable to that already made in the Amiens sector would have involved first Hazebrouck and then Ypres. But though the British sustained a terrific battering at Passchendaele Ridge, and lost many important positions, they still dominated the strategic railway lines from and to Amiens, Arras, and Ypres, and the Germans, despite heavy losses, were no nearer the C. P. At the same time, too, they had lost the Belgian ports as effective bases for U-boat operations, owing to the Brit. Navy sinking ships in the harbours of Ostend and Zeebrugge (q.v.).

Second World War. In the Second World War all the C. P. were taken by the Germans in the course of the campaign on the W. front in 1940, and on 21 May the R.A.F. were attacking some of the ports which were then in Ger. hands. Boulogne was taken by the enemy on 24 May. Ostend fell on 29 May, and on 30th the Brit. expeditionary force was evacuated from the Dunkirk beaches. See also WESTERN FRONT IN SECOND WORLD WAR.

Channel Tunnel. M. Mathieu, a Frenchman by birth, was the first to propose submarine communication with England.

He laid the suggestion before Napoleon I that a roadway should be built under the Eng. Channel, and that locomotion should be carried on by means of horses. After railways had come into vogue, it was suggested by some Eng. and Fr. engineers that a tube should be laid along the bed of the sea. Wm Low, in 1867, thought that 2 single-line tunnels, with numerous passages to connect them, could be engineered. At the Paris Exhibition (1867) a model of a tunnel was shown by Thomé de Gamond, and in 1872 the Eng. C. T. Co. was formed. The scheme was set on foot, and operations begun at Sangatte, near Calais, and Shakespeare's Cliff, near Dover, headways having been bored for 2000 yds under the sea at each end. But the Eng. military authorities refused to sanction it, and Parliament opposed the scheme. During the experimental proceedings coal was discovered near Dover. In May 1904 the Paris chamber of commerce passed a resolution strongly advocating the scheme, and the C. T. Co. showed intention of once more approaching Parliament on the subject. The military authorities were loath to permit of any project that would deprive Great Britain of the advantages due to her insular situation. But in the 20th cent. new factors came into being. First was the invention of the aeroplane; especially after Blériot had flown over the Eng. Channel in 1909, Britain was no longer an island. Next came the First World War with the submarine warfare of Germany on Brit. shipping, which greatly hampered the forwarding of supplies to the Brit. Army and its allies. After the war the allied generalissimo, Marshal Foch, is reported to have stated that had the C. T. been in existence in 1914 the war might have been shortened by one-half, and that such a tunnel 'would make war in W. Europe impossible.' The Brit. generals, Lord French, Lord Kitchener, and Sir Henry Wilson, declared, on the contrary, that the tunnel would have been a handicap in the war. Among economic factors that led after the war to a revival of the agitation in Great Britain in favour of a C. T. was the idea that the undertaking of so large a scheme would assist trade and employment and that it would encourage tourists, fearful of sea-sickness, to visit England. For this reason the great London drapers advocated the scheme, and some London newspapers lent their support. The rival scheme of a channel train ferry, which became an actuality in 1918, is an economic factor adverse to the tunnel, and the increasing air transport has led to further doubts. A committee appointed by the Labour administration reported in 1930 that there were certain economic advantages in the scheme, but on 30 June of that year the House of Commons, taking its cue from the Premier, MacDonald, rejected the project by the narrow margin of 179 votes to 172. The Fr. Gov. still attaches great importance to the scheme. The Brit. scheme was for a tunnel 30 m. long (of which 20 would be under the sea), costing about £30,000,000 and taking

5 or 6 years to build. M. Dautry, chairman of the Fr. C. T. Committee, suggested much the same length and cost, the depth of the lowest portion of the tunnel in his scheme being about 300 ft below sea level, and he quoted a Franco-Brit. expert agreement to the effect that the receipts for the first year would be about 577,000,000 francs and that the tunnel would be financially self-supporting. Just before the Second World War, M. André Boisdevant aroused interest by his detailed plans for a 30-m. road tunnel with a road width of 22 ft and a height from road level to roof of 18 ft, the deepest point being 450 ft below sea level, and the route being from Marquise, under Cap Gris Nez, to near Folkestone, the estimated cost being £42,000,000. Apart from the glacial moraine which is said to exist in the centre of the channel there appears to be no insuperable difficulty from the engineering standpoint in the construction of a C. T., the chalk substratum of the channel bed being eminently favourable to boring operations. At the time of going to press renewed interest was being shown in the C. T. project. Conversations were taking place between the Suez Canal Co. and the C. T. Co. in London with a view to closer investigation of the possibilities of a C. T. The exact form such a tunnel would take is not yet clear, but it is possible that both rail and road communications would be assured. Talks on a European common market, together with post-war tendencies towards a united Europe (for political implications see WESTERN UNION), favour the reconsideration of a scheme for a submarine link with the Continent, though it is clear that the Brit. and Fr. govts. would be deeply implicated were the project accepted.

Channing, William Ellery (1780-1842), eminent Amer. Unitarian preacher and writer, b. Newport, Rhode Is. He graduated at Harvard in 1798, and in 1803 became minister of the Federal Street Congregational Church, Boston, where he acquired a great reputation for eloquent preaching. C. became involved in a controversy in which he was called the 'apostle of Unitarianism,' although he himself objected to the term. C. had a gentle nature, and shrank from eccles. quarrels, and had little sympathy with those who preached dogma, of whatever kind. He preached and wrote vehemently against intemperance, war, slavery, and oppression. While on a visit to Europe he met many Eng. authors, notably Wordsworth and Coleridge. His works include *Remarks on National Literature*, 1823, *On the Character and Writings of John Milton*, 1826, *On the Character and Writings of Fénelon*, 1829, an essay on *Slavery*, 1835, and *Self-Culture and the Elevation of the Masses*, 1838. His complete works were pub. in 5 vols. in 1841, and in 1875 were reprinted in 1 vol. His sermons were collected and pub. in 1872. See life by his nephew, Wm Henry C. 1848, and that of J. W. Chadwick, 1903.

Channing of Wellingborough, Francis Allston, 1st Baron (1841-1926), politician.

b. in the U.S.A., and educ. at Exeter College, Oxford. He later became tutor and lecturer in philosophy at Univ. College. He was Liberal M.P. from 1885 to 1910, and took an active part in promoting agric., educational, and labour reforms. His pubs. include *The Truth about Agricultural Depression*, 1897, and *Memories of Midland Politics*, 1917. He was made a peer in 1912.

Chansons de Geste (Lat. *gesta*), name given to long narrative poems written by the *trouvères* of N. France from the 11th to the 15th cent. in number about 110, according to Gautier. The earliest known chanson in existence, the *Chanson de Roland*, is by far the most famous and noblest of them all. It appears to have been written between the years 1066 and 1095. Most of the C. are divided into 3 cycles, that of Charlemagne, of Doon de Mayence, and Garin de Montglane. Probably the most important cycle was that one which gave an account of the doings of Charlemagne, and was known as the *Geste du Roi*. It described the life of the mother of Charlemagne, as well as that of the emperor himself. Another interesting cycle is that of *La Geste de Guillaume*, which tells of the brave men of the N. who render faithful service to the throne. There are a great number of poems belonging to this cycle, and they are some of the earliest extant. The subjects of these *chansons de geste* are nearly all taken from Fr. hist., and written in verses of 10 or 12 syllables. Their general character is inclined to hardness and coarseness, and very little grace, but there is great energy; they are full of Gallic strength and force. Their literary value and historical interest are very considerable; the customs and ideas of the times in which they were written are faithfully reproduced, and their popularity spread into England, Italy, Spain, and even Iceland. Very many of the surviving poems were never pub. See J. Bédier, *Les Légendes épiques*, 1908-17. See also FRENCH LANGUAGE AND LITERATURE. *Literature*.

Chant, *Laura Ormiston, née Dibdin* (1848-1923), social and political reformer. She was b. at Chepstow, and prior to her marriage had been assistant matron in an asylum and also a schoolteacher. She lectured in different parts of the world on women's suffrage, temperance, liberalism in politics, and many other subjects. In 1895 she began to attack the London music-halls on the ground of social purity. She was a writer of songs and of pamphlets on social questions.

Chant, in church music a species of melody used in cathedrals and other churches. In the Church of England the psalms are usually chanted, while in some nonconformist churches certain passages of Scripture are also chanted. In the Rom. Catholic Church the earliest form, the Ambrosian C., introduced by St Ambrose of Milan, was superseded by the Gregorian C. or plainsong system of antiphonal psalmody as devised by Pope Gregory I. In this system 8 groups of chants correspond to the 8 modes (q.v.)

or church tones. The C. begins with an intoning note and then a reciting note is followed by the mediation marking the half of the C., a reciting note, and the termination. In the Anglican C. the main principle is that of the traditional Gregorian tones. See also PLAINSONG; PLAINCHANT; GREGORIAN CHANT.

Chantabun, prin. tn of the prov. of C., on the E. side of the Gulf of Thailand. It has been a stronghold of the Rom. Catholic missionaries since the 17th cent., and is considered to possess a stronger Christian element than any other place in Thailand (Siam). There is considerable export trade in rosewood, dye-woods, timber, hides, gum, and horns, and there are mines of precious stones in the vicinity. Pop. 110,808.

Chantada, Sp. tn in the prov. of Lugo, on the Asma, a trib. of the Miño (q.v.). It is an important agric. centre. Pop. 15,000.

Chantarelle, see CHANTERELLE.
Chantelaure, *François Régis* (1821-88), Fr. historian, b. Montrbrison, Loire. The majority of his pubs. deal with the 17th cent. His most important are *Le Cardinal de Retz et l'affaire du chapeau*, 1878, then in 1879, *Le Cardinal du Retz et ses missions diplomatiques à Rome*. He had previously pub. (1876) *Marie Stuart: son procès et son exécution*, which is still an important authority on this subject.

Chantenay, until 1908, a tn of France in the dept of Loire-Inférieure, situated on the R. Loire, 2 m. W. of Nantes of which it now forms part. There are large brandy distilleries, iron foundries, forges, shipbuilding works, etc.

Chantarelle, *Chantarelle*, and *Chantarella*, popular renderings of the name *Cantharellus cibarius*, an edible mushroom; in colour it is a bright orange, the cap is irregularly shaped, the gills are thick and wrinkled, and the whole plant has a pleasant fruity smell.

Chantilly, Fr. tn in the dept of Oise, on the Nonette, 25 m. N. of Paris, beside the beautiful forest of C. The magnificent Grand Château is a 19th-cent. reconstruction by Henri, duc d'Aumale (q.v.), of a historic structure, once the property of the great Condé (q.v.), which was destroyed at the revolution. In 1886 the duke presented it and its invaluable art collections to the Institut de France. C. has a famous racecourse, and gives its name to a kind of lace. Pop. 6000.

Chantrey, *Sir Francis Legatt* (1781-1841), sculptor, b. Norton, Derbyshire. The son of a carpenter, he was left an orphan at the age of 12, but was befriended by a wealthy lady, and in 1797 apprenticed to a wood-carver, frame-maker, and glider in Sheffield. Here he began modelling in clay and drawing pencil sketches, which attracted the attention of John Raphael Smith, the mezzotint engraver, who gave him some lessons in portrait painting. In 1803 he came to London and studied at the Royal Academy, where his first work, a 'Portrait of D. Wale, Esq.,' was exhibited in 1804. His work was well received, so that in 1809 he obtained a commission to execute

colossal busts of Brit. admirals—Howe, Vincent, Duncan, and Nelson—for Greenwich Hospital. In 1808 he received an order for a statue of George III to be placed in the Guildhall. His reputation for portraiture was estab., and he executed busts or statues of most of the prominent men of his time. His busts include those of Sir Walter Scott (two, 1820 and 1828), James Watt (Westminster Abbey), and Wordsworth; his chief statues are Sir Joseph Banks (1827), Washington (in Boston), the Duke of Wellington (in front of the Royal Exchange, London), George IV, Canning, and Roscoe (Glasgow). His statue-group of the 'Sleeping Children' in Lichfield Cathedral is well known. C. was knighted in 1835 and he bequeathed his fortune to the Royal Academy, to be partly expended on the purchase of works of art executed in Great Britain. See J. Holland, *Memorials of Chantrey*, 1851; G. Jones, *Sir Francis Chantrey*; D. S. MacColl, *The Administration of the Chantrey Bequest*, 1904.

Chantrey Bequest. This fund was estab. by the bequest of Sir Francis Chantrey, R.A. (q.v.), under which £105,000 was invested in consols, the available income being then about £3000. The first purchases out of the fund were made in 1877, and the collection, which now comprises some 500 works, has since 1898 been permanently housed in the Tate Gallery. In 1903 complaints with regard to the Chantrey bequest were raised on the ground that the committee was too exclusive in its choice of artists, and since then various changes have been made in the composition of the selection committee. The exhibition of the Chantrey Collection (Royal Academy, 1949) suggested that early criticisms were well founded but showed later improvement. The selectors form 2 joint committees for painting and sculpture, each composed of 3 members of the Academy and 2 of the Tate Board; proposals for purchase come before the Academy Council, who retain the power of approval or rejection.

Chantry (O.F. *chanterie*; Lat. *cantare*, to sing), term applied to a chapel or altar where masses may be sung for the repose of a soul. C. chapels are often built off the aisle or nave of a church, and have the tomb of the founder placed in the centre. The word C. is also applied to the endowment intended by the founder as a perpetual stipend for masses in such a chapel. See G. H. Cook, *Medieval Chantries and Chantry Chapels*, 1941.

Chanukah, Jewish minor festival commemorating the rededication of the Temple in 164 BC by Judas Maccabeus after his defeat of the forces of Antiochus IV. It is celebrated for 8 days from Kislev 25, chiefly by kindling lights in the Jewish home and at the synagogue.

Chanzy, Antoine Eugène Alfred (1823–1883), Fr. general, b. Nouart, Ardennes. He was present at Magenta and Solferino in 1859. He had about 30 years' service in Africa, on his return from which he commanded the second army of the Loire in the Franco-Prussian war in 1870. He was ambas. to Russia, 1879–81, and was

nominated as president of the rep. in 1879.

Ch'aochow, city of China, in Kwangtung prov., situated on the R. Hankiang, near where it flows into the China Sea.

Chaoking, city of China, in Kwangtung prov. It is situated on the West R.

Chaones, people who lived in Epirus in the N. of Greece; thus Epirus is occasionally called Chaonia.

Chaos, according to the Greeks the space and void which existed before creation (literally 'a yawning'). C. was said to be the mother of Erebus and Nyx (Darkness and Night).

Chapala, largest lake in Mexico (central) with an area of 1300 sq. m., situated between Guadalajara and Michoacán. There are numerous is., and the Río Grande de Santiago (which enters it as the R. Lerma) flows through it.

Chaparral, tn in Tolima dept., Colombia, 115 m. from Bogotá. It has agric. and forest products and copper, iron, coal, and petroleum are found near by. It stands at an altitude of 2540 ft and has a pleasant climate. Near by are the painted rocks of Alpe and a peculiar grotto, Tuluni, the haunt of birds. Pop. 3500.

Chapayevsk (formerly Trotsk), tn in the Kuybyshev Oblast (Russia), 27 m. SW. of Kuybyshev. It has agric. machinery and building materials industries. Pop. (1956) 78,000.

Chapbooks, or **Broadsides**, term believed to have come into use in the reign of George IV, and applied to small pamphlets as sold by chapmen, which at that time were the chief form of literature that the poor people enjoyed, not only in England but on the Continent. In Germany they were called *Valksbücher*, first printed in France for the populace after the invention of the printing press. The beginning of the 17th cent. is said to be about the time of their entry into England. Early in the 16th cent. some of these books were devoted to the interpretation of dreams, palmistry, astrology, etc., while others were such tales as *Jack the Giant Killer*, *Patient Griseli*, *Reynard the Fox*, etc. In Scotland a number of more or less religious books were in vogue, especially the 'prophecies' of Peden. Then humorous books were always favourites, among them being *The Merry Exploits of George Buchanan*. Thackeray describes the Irish C. in his *Irish Sketch Book*, chaps. xv, xvi.

Chapel, see FATHER OF THE CHAPEL. **Chapel** (O.F. *chapele*, from Lat. *capella*, a sanctuary), a small building used for worship. C.s were attached to cathedrals, churches, and abbeys as early as the 10th cent., and were dedicated to some saint. An altar and relics of the saint were placed in the C., so that private devotions or special services might be held there. The central C. was often called the lady C. because it was dedicated to the Virgin Mary. C.s might also be erected to hold the tombs of private individuals, as Henry VII's C., added in 1502–20 to the E. end of Westminster Abbey. C.s were also built by private families on their

own estates, and by colleges and guilds. Modern colleges and schools frequently have C.s. The term C. is also applied to places of worship built by nonconformists, as distinct from those consecrated according to the laws of the Church of England (see also CHANTRY).

Chapel-en-le-Frith, tn and par. in Derbyshire, England, 6 m. N. of Buxton, formerly known as the 'capital of the Peak.' Pop. (tn) 4110; (par.) 6050.

Chapel Royal of England. The date of its foundation is not certain. It is known, however, that it existed at the time of Edward IV. Like the Ger. *Kapelle* it was understood not as a building but as a body of clergy and musicians. This original meaning has tended to fade out and to be replaced by its secondary interpretation as a royal chapel for the use of the sovereign and royal household.

CHAPEL ROYAL, ST JAMES'S PALACE

Appointments are now made to H.M. C.s R. Formerly it attended upon the sovereign wherever he or she might be, e.g. on Henry V at Agincourt and on Henry VIII at the Field of the Cloth of Gold. This practice is still followed on some occasions. There were 13 minstrels and 8 children in the C. R. of Edward IV; in the 15th cent. began the custom of the musical members performing 'interludes' before royalty, and, later, 'masques.' Under Elizabeth I it was specially distinguished for its music. 'The Chapel Royal, as an institution, has been of the greatest value . . . in promoting the development of English music' (Scholes). Among its famous organists were Tye, Byrd, and Gibbons, and, in the 17th cent., Purcell. Still later there were accomplished organists whose names are familiar to every student of Eng. church music. The standard of musical excellence is maintained. Its staff consists of a dean, sub-dean, 3 priests-in-ordinary, with 6 gentlemen and 10 children forming the choir, and a serjeant of the vestry. There are 36 chaplains to the sovereign with the

duty to preach a sermon when summoned, and an organist who is also choirmaster and composer at the C.s R. Services were held at Buckingham Palace until the destruction by bombing of the chapel there. Now the C. R. at St James's Palace and the Queen's Chapel, Marlborough Gate, are in use. The first of these is of Tudor origin; its ceiling, the design of which is generally attributed to Holbein, bears the date of 1540. The second was built for Charles I's queen by Inigo Jones. The public are admitted to the services.

The C. R. of Scotland was founded by Alexander I at Stirling Castle, but Mary had it removed to Holyrood. The chapel now consists of the dean, appointed by the sovereign, and 6 chaplains-in-ordinary who attend on the sovereign at Balmoral Castle. Any money that belongs to the chapel is given for salaries for chairs of divinity in connection with a univ. The name used to be given to Holyrood Abbey Church which is now in ruins.

Chapelain, Jean (1595-1674), Fr. poet and critic who first came into notice through his preface to the *Adone* of Marino in the year 1623. He was considered the chief of Fr. poets, and every one thought that his *Pucelle*, which was one of the pseudo-epics of that time, would equal the *Iliad* or *Aeneid*. The popularity of this work, however, did not endure, and after the praise bestowed on the issue of the first 12 cantos in 1656 had subsided, his fame gradually dwindled, and he was laughed at by the younger poets such as Boileau. Under the patronage of Richelieu, however, he was prominent in founding the Academy, and helped to formulate the rules of the 'three unities' in Fr. drama. His most important work is *Sentiments de l'Académie sur le Cid*, which he brought out in 1637. See G. Collas, *J. Chapelain*, 1912.

Chapelhall, vil. in Lanarkshire, Scotland, with collieries and light industries. Pop. 4000.

Chapelle (-St-Denis), La. dist. in the N. of Paris, an anct vil. joined to the city in 1860, and now a populous working-class area.

Chapelle Ardente, chamber, catafalque, or hearse for the lying in state of exalted persons, lit with candles. In Westminster Abbey, at the Crossing, dead kings lay in effigy under elaborate canopies or 'hearses,' supporting a multitude of candles. The effigies, carried at the funerals, represented the actual corpses. Henry VII provided by his will that at his funeral a hearse should be set up, with 100 tapers and 4 great candles in the lantern space, until the king's great chapel was finished (see under WESTMINSTER ABBEY). The hearse of Edmund Crouchback (Earl of Lancaster) had no fewer than 559 candles, an odd number which suggests that there was a single one at the apex. This custom is first recorded as occurring at the obsequies of the Frankish king, Dagobert I, in the 7th cent. See W. R. Lethaby, *Westminster Abbey Re-examined*, 1925.

Chapeltown, large vil. of Yorks, England, in one of the pars. of Wortley (q.v.) rural dist., 6 m. from Sheffield, and giving its name to a ward sending representatives to Wortley Rural Dist. Council. Pop. 7000.

Chaperon (Fr. 'hood') has a variety of meanings: 1. It is the name often given to the plumes seen on horses' heads in funeral or other processions.

2. Also applied to the cap which is worn by members of the Eng. Order of the Garter.

3. The name given to the academic hood worn by all people who have taken a degree of any kind, such as Doctor of Music, Bachelor of Arts, etc.

4. Most commonly known as the term applied to a married lady who is acting as 'guardian' to an unmarried woman when appearing in public. This custom arose in the reign of Queen Anne. Prior to this no unmarried girl or woman could appear in public except under the guardianship of a near relation.

Chaplain, Jules Clément (1839-1909), sculptor of medals and busts, b. Mortagne, helped to revive the decayed art of engraving on medals. He executed a series for various societies and functions, including one for the Universal Exhibition of 1887, another in commemoration of the resistance of Paris, a third for the Salons, and a fourth to be given as a recognition of acts of heroism. Among his medallion portraits are those of Meissonier, Renan, Gambetta, Faure, and Loubet.

Chaplain, minister of religion attached to some private or official person, institution, or society. The name *chapelain*, Lat. *capellanus*, belonged originally to the priest in charge of the cloak (*cappa*) of St Martin of Tours (q.v.). This sacred relic was preserved in an oratory called the *capella* (whence 'chapel'). The title of C. gradually spread to all keepers of relics, and of such oratories, especially of the Chapel Royal, whose C. acquired great dignity and power by the time of Charlemagne. In England the sovereign has 36 Anglican C.s-in-ordinary who officiate in turn in the Chapels Royal, as well as honorary and domestic C.s. In Scotland Royal C.s are of the Church of Scotland (Presbyterian). C.s are also appointed by the Foreign Office to embassies and consulates abroad, and the Church of England (through various societies) maintains chaplaincies for Anglicans in most of the prin. cities of Europe. Anglican diocesan bishops have C.s who serve as private secretaries and attend them at religious functions; they also appoint examining C.s to test their ordinands. Anglican convents also have their C.s. In the Rom. Catholic Church there are chaplaincies endowed or maintained under lay or episcopal trusteeship for the performance of specific services, masses, etc. Parochial or auxiliary C.s may be appointed to assist in pars.; C.s (secular) are appointed by bishops to care for convents and communities; bishops also have their C.s at mass, and as private secretaries. Pope Pius X in 1907 gave his Pontifical C.s the title of Monsignore.

C.s of all denominations in the U.K. serve in prisons, hospitals, and in the armed forces. C.s of the Royal Navy are officers, but are not promoted to any specific non-spiritual rank, nor until the Second World War did they wear naval uniform. Every ship and estab. of a certain complement carries an Anglican C. selected, licensed by, and serving under the C. of the Fleet. C.s of other denominations are appointed to minister to their adherents on a capitulation basis. Rom. Catholic C.s are controlled and appointed by the Senior Rom. Catholic C., with the approval of the Rom. Catholic Ordinary of the Forces, and the preliminary permission of the candidates' diocesan or religious superior. C.s of the Free Churches are appointed by and serve under their Senior C. (Methodist or United Board).

Army C.s, known as C.s to the Forces, serve under conditions laid down by the War Office. Anglican C.s serve under the C. General, and all C.s are officers and are promoted in definite rank within the C.s Dept.

C.s of the R.A.F. are granted the relative rank of flight lieutenant on appointment. Anglican C.s must have been 3 years in priest's orders, and be commended in writing by their bishop to the C.-in-Chief, R.A.F. C.s of other bodies (Rom. Catholic, Presbyterian, Methodist, United Board, Jewish) are selected on the recommendation of their respective governing bodies or eccles. superiors.

Though C.s are non-combatants they have shown notable valour and devotion to duty, as is indicated by the following figures for the R.N.: the smallest in personnel of the 3 services, in the Second World War: total number of C.s serving, 653; killed in action, 18; d. on active service, 10; decorations, 44; mentions in dispatches, 17.

In the U.S. forces, until the National Defence Act, 1920, C.s, though always employed and recognised, had more liaison with the churches than with the military power. One aspect of their organisation is peculiarly American: within each branch of the service the supervisory C. may vary from one denomination to another. C.s carry the same rank as other officers, and are promoted in the same way. The high value and appreciation of C.s in the U.S. forces in the Second World War is shown by the fact that 1512 were decorated and 328 wounded. C.s had the third highest percentage of casualties of any officer corps or branch.

In France military and naval C.s were abolished on the separation of Church and State. Ministers of religion are subject to National Service, and perform their religious duties at the same time as their ordinary military functions.

Chaplin, Charles (1825-91), Fr. painter, b. Andelys (Eure) of Eng. parents. He soon found that his real vocation lay in painting portraits of women in the Watteau and Boucher style. He managed to catch the piquant charm of Parisian

women in his pictures. In 1860 he painted the apartments of the Empress Eugénie at the Louvre, and afterwards the bath-room at the Elysée. His best works are 'Les Bulles de Savon,' 'The Birth of Venus,' 'The Bath,' and 'Rising in the Morning.' He was also an excellent engraver, and made engravings of many of Decamp's and Watteau's pictures, and also of some of his own.

Chaplin, Charles Spencer ('Charlie Chaplin') (1889-), cinema actor, producer, and director, son of Charles C., a variety comedian. His boyhood home was in Kennington, S. London. He was on the stage from an early age, and in 1899 was appearing in music halls as one of the 'Eight Lancashire Lads.' He appeared at the opening of the London Hippodrome, 15 Jan. 1900, in *Giddy Ostead*; as Billy in Wm Gillette's version of *Sherlock Holmes*; as a wolf in the first production of *Peter Pan*, Duke of York's Theatre, 27 Dec. 1904; as Billy in *The Painful Predicament of Sherlock Holmes*, with Wm Gillette and Irene Vanbrugh, 3 Oct. 1905. Subsequently he joined Fred Karno's company, with whom he first appeared in the U.S.A., 1910. In 1913 he was engaged by Joseph Schenck for the Keystone company, for which he made his first film, *Making a Living*, 1914. Until 1940 he never deviated from the characteristic make-up and costume he introduced in his second film, *Kid Auto Races at Venice*, 1914. His little bowler hat, smudge moustache, slack trousers, and long-toed boots, his flat-footed gait and imperturbable impassivity, became so famous that by the end of the First World War he was the most widely recognised personality in the entire world. In 1919 C. was a co-founder with Griffith, Fairbanks, and Mary Pickford (qq.v.) of the United Artists Corporation. He lived for many years in the U.S.A., but now lives in Switzerland.

C.'s prin. films include: for Keystone 35 films, including *Tillie's Punctured Romance*, 1915. For Essanay 15 films, including *The Champion*, 1915, *The Tramp*, 1915, and *The Bank*, 1915. For Mutual 12 films, including *The Vagabond*, 1916, and *Easy Street*, 1917. For First National 9 films, including *A Dog's Life*, 1918, *Shoulder Arms*, 1918, *The Kid*, 1921, and *The Pilgrim*, 1923. Since 1923 C.'s films have been produced by himself: *A Woman in Paris*, 1923 (a serious film which C. directed, but in which he appeared only briefly), *The Gold Rush*, 1925, *The Circus*, 1928, *City Lights*, 1931, *Modern Times*, 1936, *The Great Dictator*, 1940, *Monsieur Verdoux*, 1947, and *Lime-light*, 1952. In 1956 C. produced his first film in England, *A King in New York*.

Chaplin, Henry, 1st Viscount (1840-1923), statesman, educ. at Harrow and Christ Church, Oxford. He first entered Parliament in 1868 as a Conservative. He was also a well-known figure on the racecourse, and his horse Hermit won the Derby in 1867. In 1889 he became president of the new Board of Agriculture, with a seat in the Cabinet, and he kept this position till 1892. He was always

an advocate of Protection; and when Joseph Chamberlain began his Tariff Reform campaign, C. was one of its most ardent supporters. He was president of the Local Government Board, 1895-1900, and was responsible for the Agric. Rating Act. In 1916 he was raised to the peerage.

Chapman, George (c. 1559-1634), dramatist, poet, and translator, b. Hitchin, Herts. (Anthony Wood is responsible for the very dubious connection with Kent.) A fine classical scholar, he is said to have been educ. at Oxford, which he left for London about 1576. Here he settled at once to a literary career, was patronised by Sir Thomas Walsingham, Henry, Prince of Wales, and Carr, Earl of Somerset, and became friendly with Shakespeare (C. has been plausibly identified with Shakespeare's rival poet of the *Sonnets*), Spenser, Daniel, Marlowe, Jonson, and Inigo Jones, the architect, who after his death designed a monument for him in St Giles-in-the-Fields. His trans. of Homer, the earliest in England, appeared in various parts, the *Iliad*, 1598-1611, and the *Odyssey* 1614-16. These trans. occupied his leisure through much of his lifetime. His version of Homer is one of the most faithful to the original we possess in verse, his *Iliad* using the sonorous 14-syllabled rhyming line of Drayton's *Polyolbion*. It was warmly praised by Dryden, Pope, and Coleridge. His version of the *Odyssey* is in 10-syllabled heroic couplets and is hardly less deserving of the same high praise.

His first play was a comedy, *The Blind Beggar of Alexandria*, 1596, which, like its successor, *A Humorous Day's Mirth*, 1597, is poor. But his *All Fools*, 1605, is entertaining comedy, with ingenious situations, sprightly characters, and a well-constructed plot. *The Gentleman Usher*, 1606, and *Monsieur d'Olive*, 1606, have some good features, but are defective in construction. *The Widdowes Teares*, 1612, is also among his better comedies. The comedy, *Eastward Hoe*, 1605, regarded as his best, was written in conjunction with Jonson and Marston and was the inspiration of Hogarth's 'Idle Apprentice.' Many of his tragedies are melodramas of bloodshed, with many horrors, no little rant and fustian, and deficient skill in characterisation. Among his tragedies are *Bussy d'Ambois*, 1607, *The Conspiracie*, and *Tragedie of Charles Duke of Byron*, 1608, *The Revenge of Bussy d'Ambois*, 1613, and *The Warres of Pompey and Caesar* (pub. 1631, but probably written much earlier). He also pub. sev. other trans. and various poetical works, including the euphuistic *Ovid's Banquet of Sense*, 1595, the continuation of Marlowe's *Hero and Leander*, 1598, *The Tears of Peace*, 1609, a dignified funeral song in memory of Prince Henry, 1612, and a masque performed by the societies of Lincoln's Inn and the Middle Temple to celebrate the betrothal of the Palsgrave and the Princess Elizabeth in 1613. See T. M. Parrott, *Plays and Poems of George Chapman* (3 vols.).

1910-14; R. L. Hine, *Hutchins Worthies*, 1932; H. Ellis, *George Chapman*, 1934; P. Brooks Bartlett, *Poems of George Chapman*, 1942.

Chapman, John (1801-54), political writer, b. Loughborough, Leics. He failed in business, in 1834, and went to London and became ed. of the *Mechanics' Magazine*. He invented improvements in the 'four-wheeler,' which eventually led to the hansom cab.

Chapman, Sir Sydney John (1871-1951), economist, b. Wells, Norfolk. Educ. at Manchester Grammar School and Cambridge Univ. Prof. of political economy, Owens College, Manchester, 1901-17. Permanent under-secretary Board of Trade, 1920-7; chief economic adviser to the Brit Gov., 1927-32. Chairman of the Imperial Economic Committee, 1931-1932. Pub. *Outlines of Political Economy*, 1911.

Chapman, Walter, see CHEPMAN.

Chapman, small itinerant tradesman. In the 18th cent. he sold chapbooks, needles, laces, linen, and all sorts of things, and bought up old brass, old clothes, and sometimes human hair.

Chapone, Hester, nee Mulso (1727-1801), essay writer, b. Twywell, Northants. She was an ardent admirer of Richardson the novelist. She wrote *Letters on the Improvement of the Mind* in 1773, which was very popular in girls' educational circles. Her complete writings may be found in vol. xviii of Chalmers's *British Essayists*, 1856-7.

Chappe, Claude (1763 - 1805), Fr. mechanician, b. Brulon, Normandy, the nephew of Abbé Chappe d'Auteroche, the astronomer. He was the inventor of a form of telegraphic communication founded on the theory of Robert Hooke (q.v.) (1684) as modified and practically demonstrated by Guillaume Amontons (q.v.), which he presented to the National Assembly in 1792. It was successfully tried between Paris and Lille, and soon came into general use.

Chappell, William (1582-1649), Bishop of Cork and Ross, b. Laxton, Notts. Archbishop Laud favoured him, and through his influence he was made dean of Cashel in 1633. Afterwards he was provost of Trinity College, Dublin, from 1637 to 1640, and became Bishop of Cork and Ross in 1638. After Strafford's fall, he was put into prison for a short time in Dublin in 1641 and at Tenby in 1642.

Chappell, William (1809-88), musical antiquary. He managed his father's business (a firm of piano-makers). He pub. *A Collection of National English Airs, consisting of Ancient Song, Ballad, and Dance Tunes*, in 2 vols., from 1838 to 1840, which he afterwards extended and reissued under the name of *Popular Music of the Olden Time*, 1855-9. In 1841 he founded the Musical Antiquarian Society as well as the Percy Society. For this latter society he ed. Dowland's songs, and assisted in the preparation of the *Percy Folio* in 1868. He also produced (1871-5) in 3 vols. his notes on the *Roxburghe Ballads*, of which only 1 vol.

was pub.; they contain a vast amount of antiquarian information.

Chaptal, Jean Antoine, Comte de Chanteloup (1756-1832), Fr. chemist and statesman, b. Nojaret, Lozère; graduated in medicine at Montpellier in 1777, and settled to scientific study in Paris. In 1781 he became prof. of chem. at Montpellier, and made many discoveries of considerable commercial value. Though in the main a supporter of the revolution, he was imprisoned by the popular party in 1793, but was soon released to become director of the saltpetre works at Grenelle. In 1796 he became a member of the Institute, in 1800 a councillor of state, in 1801 minister of the interior, and in 1805 grand officer of the Légion d'Honneur, and a senator.

Chapter, originally an assembly of monks or canons, now usually the body of ecclesiastics, known as canons, attached to a cathedral or collegiate church. They are presided over by a dean, and are considered as the council of the bishop. The term is used in both the Anglican and Rom. Catholic churches.

THE NORMAN CHAPTER-HOUSE OF
BRISTOL CATHEDRAL

An engraving of a drawing by
R. Garland, 1838.

Chapter-house, building in which the canonical chapter (q.v.) of a monastery, cathedral, or collegiate church meets for the discussion of its affairs. They are often elaborately designed and ornamented, and usually polygonal, or octagonal, as at Lichfield and York, in shape. Benedictine Cs. are usually square, as at Canterbury, but Westminster has an octagonal C. and Worcester a circular. The C. at Lincoln is a decagon. York C. is remarkable for still preserving the beautiful original stained-glass windows,

while the original frescoes are still to be seen on the walls at Westminster. At Ripon the usual central shaft is replaced by 2 central pillars supporting the ceiling, and there is an apsidal end. In position the C. usually lies to the W. of the transepts of the church, from which it opens either directly or by a passage. Crypts are occasionally found beneath the floor.

Chapu, Henri Michel Antoine (1833-91), Fr. sculptor, b. Mée, Seine-et-Marne, a pupil of both Pradier and Duret. He became a member of the Ecole des Beaux Arts in Paris in 1849 and won the Grand Prix, and in 1855 the medal. His first work shown in the Salon was 'Mercury inventing the Caduceus' (Luxembourg). His strong point in sculpture was his extremely able portrayal of tenderness and charm in woman. His most typical pieces of work are 'Princess Hélène at the Tomb of the duc d'Orléans,' now at Dreux; and 'Youth' in memory of Henri Regnault. His 'Joan of Arc at Domrémy' in the Luxembourg is not his best work.

Chapultepec, castle and park 1½ m. SW. of the centre of Mexico City, where the last Aztec kings resided. A castle was built on this site in the 18th cent. for Sp. viceroys; it was used by Maximilian, and later by Mexican presidents. It now serves as a national museum. Here the Mexicans were finally defeated by the Americans in 1847. In consequence Texas, New Mexico, and California were ceded to the U.S.A. The 1945 Inter-American Conference of Amer. Reps. was held here. C. Heights is a residential suburb of Mexico City adjoining the NW. of the park.

Char, see CHARR.

Char-à-banc was originally a large 4-wheeled vehicle in the form of a wagonette with benched seats from side to side and facing the driver. There was an alleyway in the middle. It was drawn by 2 or 4 horses according to size and used principally for picnic parties. It has in the motor age developed into the motor coach and the older meaning has fallen into disuse.

Characeae, family of the green Algae of which the species inhabit fresh and brackish water of pools and slow streams. They emit a nauseous offensive odour, and near home they are pestiferous. They are interesting on account of the facility with which they exhibit the circulation of their fluids.

Characteristic, see LOGARITHM.

Charade, kind of riddle, consisting of the subdivision of a complete word, which forms the answer, into its component syllables or letters. A certain amount of information is given of each syllable or letter, and also of the reunited whole, which then has to be guessed. C.s may be either written or acted. In the latter, which form a favourite drawing-room amusement, the scenes—one for each syllable of the word, and one for the word itself—are arranged to introduce plainly, though not obtrusively, the syllable or word in question. C.s are usually extemporised, half the company retiring and

concocting scenes which they return and act to the remaining half, who attempt to guess the word. Written C.s for acting may also be bought. In dumb C.s the acting is entirely in dumb show.

Charadriiformes, plover-like birds, comprise sev. hundreds of species of various habits. The group is subdivided into 3 suborders: Charadrii (plovers, oystercatchers, snipe, woodcock, etc.), Lari (gulls, terns, skuas, etc.), and Alcae (auks, guillemots, razorbills, and puffins).

Charaeus, genus of moths of the owlet-moth family or Noctuidae, is represented in Britain by sev. species. The larvae feed upon roots and pupate underground. *C. graminis* is common in Sweden, where the caterpillar frequently proves destructive to the pastures.

Charalá, agric. tn of Santander dept, Colombia, 120 m. N.E. of Bogotá. Pop. 2500.

Charcoal, blackish residue consisting of impure carbon, obtained by removing the volatile constituents of animal and vegetable substances. It is a porous solid, burning without flame or smoke, obtained by the imperfect combustion of organic matter. Various kinds are produced from wood, sugar, bone, and coal (giving coke and gas carbon). Wood charcoal results from strongly heating wood. If for fuel, it is best prepared by partial combustion of wood in heaps; for gunpowder the wood is charred in externally heated cylinders to avoid the introduction of grit. Brown C. used in preparing 'cocoa' powder, is prepared at a lower temp. Wood charcoal is used as a fuel, a filter, and an absorbent of gases and aqueous vapours; also as a non-conductor of heat, for packing round cold storage-rooms or refrigerators.

Animal C., or bone black, is produced by dry distillation of bones and ivory. It contains mainly calcium and magnesium phosphates, and is often manuf. from residues obtained in glue and gelatin industries. Its decolorising power was applied in 1812 to the clarification of syrups obtained in sugar refining, but other reagents have now replaced it for this purpose. It is also used as a deodorant and for artists' materials. See also CARBON.

Charcoal Burners. Men employed in the manuf. of wood charcoal could formerly be seen in large numbers in the woodland and forest dists. of Britain. Those in the New Forest who discovered the body of William Rufus in 1100 have passed into out legendary hist. Charcoal burning on a large scale took place particularly in the Weald of Kent and Sussex where charcoal was used as fuel in the manuf. of iron. The change from charcoal fuel to coal, and subsequently coke, and the legislation against timber-felling were the chief reasons for the decline of the industry. Until the 17th cent. Sussex was the prin. source of Brit. iron. In the same areas charcoal was also burned for use in hop-drying and for the making of gunpowder, underwood being preferred for this purpose. The knowledge and practice of the 'colyers' was traditional.

their skill being handed down from family to family. A few such families still exist, each working its own hearths or pits. Former sites of pits can often be traced by field-names such as 'coalpit' or 'coaldane.' The essence of the process is a carefully controlled slow combustion which continues for about 5 full days and nights, the burner staying close to his hearth the whole time. The logs and billets of wood are raised into a domed pile of considerable size, which is covered with earth, sand or turf. The centre is hollow to allow of firing and the subsequent cooling and putting-out. Draught is controlled by screens of sacking (usually old hop bags) and by turf-sealing. At the present day wood charcoal of quality is in demand for artists' materials, for the manuf. of absorbent medicinal biscuits, and for metallurgical processes. It is interesting to note that the primitive C. B. huts used in Sussex, Kent, and Essex until recent years differed little in form from those of Saxon days.

Charcot, Jean Baptiste Étienne Auguste (1867-1936), Fr. doctor and Antarctic explorer, b. Neuilly-sur-Seine, the son of Jean Martin C. He commanded the Fr. Antarctic expeditions of 1903-5 and 1908-10. The first expedition roughly charted the W. coast of Graham Land to Adelaide Is. The latter expedition sailed in the *Pourquoi Pas?*, then one of the best fitted-out vessels that ever put out on such a quest. The expedition brought back much valuable scientific information. More of the W. coast of Graham Land, including Adelaide Is., Alexander I Land, and Deception Is. were charted. Much hydrographic work was done, such as soundings, surface and deep-sea temps., deep-sea dredging and fishing with tow and vertical nets. Dr C. pub. an account of his explorations in *Le Français au Pôle Sud* in 1905, and *Le 'Pourquoi Pas?' dans l'Antarctique* in 1910 (C. Is. in Antarctica is named after him); *Rapports des croisières scientifiques de 1912 à 1914 et de 1919 à 1930, and Autour du Pôle Sud*, 1912. He d. at sea. See Marthe Oulic, *Charcot of the Antarctic*, 1938.

Charcot, Jean Martin (1825-93), Fr. physician, b. Paris, where he graduated M.D. in 1853. Three years later he became physician of the central hospitals bureau. In 1862 he was appointed physician to the Salpêtrière (a hospital for mental and nervous diseases). Here he created the greatest neurological clinic of modern times. A wonderful lecturer, he presented his cases in a most dramatic fashion on a small stage. He was a pioneer of psychotherapy, a great clinical observer and pathologist, and a talented artist, illustrating many of his case reports himself. He spent much time in the study of obscure morbid conditions; he also wrote on gout, diseases of the liver and kidney, etc. He became prof. of pathological anatomy, Paris Univ., in 1872, and prof. of neurology in 1883. His collected works appeared in 9 vols., 1888-1894. Axel Munthe, one of his pupils, has recorded many incidents at the Salpêtrière in *The Story of San Michele*;

see also G. Guillaud, *J. M. Charcot, sa vie et son œuvre*, 1955.

Chard, John Rouse Merriott (1847-97), engineer officer who defended Rorke's Drift successfully with Lt. Bromhead and 140 men against 3000 Zulus, on the night of the Isandhlwana disaster, 22 Jan. 1879.

Chard, municipal bor. and mkt tn of Somerset, England, situated within a mile of the Devon border, on high ground, between the Bristol and Eng. Channels. It is of great historic interest, being the scene of a victory gained by the parli. forces during the Civil war. Judge Jeffreys held here in 1681 one of his 'bloody assizes.' There are manufs. of linen shirts and collars, lace, and iron and brass goods, also pencils and bearings. C. was the bp. of John Stringfellow, inventor of a heavier-than-air machine. Pop. 5260.

Chardin, Jean Baptiste Siméon (1699-1779), Fr. painter, b. Paris. He was a pupil of Coypel, whom he copied in details of nature. He became a member of the Académie Royale in 1728, in 1752 received a pension from the king, and was lodged in the Louvre from 1757. His early work was in still-life pictures, and they were often believed to be by Flem. artists. He was the first notable Fr. artist to depict middle-class life, which he did with truth and refinement. As a genre painter, he is in contrast with the court painters of his time who produced elegant artificialities, and is now admired as one of the greatest Fr. artists. Among his best paintings are 'Le Bénédicte', 'L'Enfant au Toton' ('Child with Teetotum'), 'Le Buffet', 'Le Jeune Violoniste', 'La Toilette du Matin', and 'Les Tours de Carte' ('Card Tricks'). Most of his pictures are in the Louvre. The National Gallery has 3, though the 'Still Life' formerly attributed to him is now pronounced to be by an imitator. Dublin has his 'Card Tricks.' See lives by E. and J. de Goncourt, 1864, E. Pilon, 1909, and G. Wildenstein, 1933.

Chardin, Sir John (1643-1713), Fr. traveller, b. Paris, the son of a jeweller. During 1664-70 he visited India and Persia, spending some years at Isfahan, where he acquired much useful knowledge, and was employed as a royal agent for the purchase of jewels. After revisiting Paris, he returned to Persia in 1671, remaining there till 1677. In 1681 he settled in London, where he was knighted by Charles II, elected a fellow of the Royal Society, and employed on diplomatic missions. His *Travels in Persia and the East Indies* (3 vols.) appeared 1686-1711.

Chardonnet Rayon, rayon yarn made from cotton waste. See RAYON.

Chardzhou: 1. Oblast (prov.) of the Turkmen S.S.R. of the Soviet Union. Some cotton is cultivated on the banks of the Amu Darya R., but the oblast is mainly given over to industry, particularly chemicals. Pop. 240,000.

2. Tn. cap. of oblast. A cotton and silk centre. Pop. 80,000.

Charente, dept of France, formed of the ant. prov. of Angoumois, and parts of Saintonge, Poitou, Marche, Limousin, and

Guyenne. It is watered by the C., Vienne, and Dronne, the last forming the S. boundary. The surface is, in general, undulating, the dept being crossed by the low spurs of the Limousin, Guyenne, and Poitou Mts. There is considerable forest and heathland. The dept is predominantly agric., cereals, potatoes, beet, hemp, flax, and truffles being grown, but the most important product is the brandy made from grapes grown in the C. basin. There are metallurgical, chemical, paper, and textile manufs. The prin. tns are Angoulême (the cap.), Cognac, and Confolens (qq.v.). Area 2306 sq. m. Pop. 313,650.

Charente, River, riv. of France, rising in Haute-Vienne, 14 m. NW. of Chalus, and flowing W. through C. and C.-Maritime into the Atlantic opposite the is. of Oléron. Length 200 m. Tribs., Boutonne on the r. b., and Trouve and Né on the l. b.

Charente-Maritime, dept of SW. France, formed out of parts of the anc. provs. of Aunis, Saintonge, Poitou, and Angoumois, and including the is. of Ré and Oléron. It is watered by the Charente, Boutonne, Sèvre-Niortaise, Touvre, and Giroude. The countryside is extremely diverse. Cereals, vines, beet, potatoes, hemp, and fruit are grown, and much livestock is reared. There are pichard and oyster fisheries, and brandy, iron, chemical, and salt industries. The prin. tns are La Rochelle (the cap.), Jonzac, Rochefort, Saintes, and St-Jean-d'Angély (qq.v.). Area 2791 sq. m.; pop. 448,000.

Charenton-le-Pont, Fr. tn in the dept of Seine, a SE. suburb of Paris, at the confluence of the Seine and the Marne. In the 16th and 17th cents. C.-le-P. was a Huguenot centre. Its historic bridge has been rebuilt 17 times. In the part of C.-le-P. called St-Maurice is a celebrated lunatic asylum. The tn has mechanical and chemical manufs. and some boat-building. Pop. 21,000.

Chares, Athenian general of 4th cent. BC. In 366 he was sent to assist the Philistians against the Argives, Arcadians, and Thebans; in 361 defeated the democratic party at Corevra; in 358 compelled the execution of the Convention of Athenodorus in Thrace, and in 357 took over the command of the Social war. C. led the Athenians at Chæronea (338).

Chares of Lindus, in Rhodes, Gk sculptor of about the 4th cent. BC, a pupil of Lysippus. He is the traditional designer of the Colossus at Rhodes, one of the 7 wonders of the world. See COLOSSUS and APOLLO OF RHODES.

Chares of Mytilene, master of ceremonies at the court of Alexander the Great. He appears to have held sev. military commands, but in this connection he is sometimes confused with an Athenian officer of the same name who led his countrymen at Chæronea. Small portions of C.'s book of anecdotes about Alexander are still extant.

Charlotte de la Contrie, François Athanasie (1763-96), a leader of the Vendean rebellion (in its latter stage) against the Fr. Revolution. He was b. at Couffé,

near Oudon (Loire-Inférieure). He took part in the unsuccessful attack on Nantes, 1793, and subsequently began a harassing guerrilla warfare. An armistice was made between C. and the Convention early in 1795, but it did not last long. After the defeat at Quiberon (1795) Hoche pursued him relentlessly, and defeated him again and again, finally taking him prisoner. C. was then executed at Nantes.

Charge, in law, in a wide sense denotes a duty or obligation imposed upon some person in a will, or deed, or contract, or in some transaction collateral thereto. More strictly C. denotes a mortgage, lien, hypothecation, or pledge over a specific thing by virtue of which a creditor may in certain events be entitled to satisfy his claim out of the thing itself or proceeds thereof.

Chargé d'Affaires, diplomatic agent, ranking next below a resident minister, and holding his credentials from the head of the foreign office. He may either act as a representative at a minor court or be empowered to take the place of an ambas. in his absence.

Charging Current: 1. Of an accumulator, see ACCUMULATOR.

2. Of a capacitor, the rate of flow of electricity required to establish a potential difference between the plates. The current at any instant is the (capacitance) \times (rate of change of the p.d.). See CURRENT, ELECTRIC.

Charing Cross, dist. of London, at the W. end of the Strand. It is generally regarded as the centre of London (i.e. the point from which distances are taken) and is so marked by a plaque N. of the statue of Charles I. The first part of the name derives probably from O.E. *cierring*, 'turning, turn,' referring either to the great bend of the Thames here or to the bend of the Rom. road that ran W. from London. The second part of the name is due to the erection of a cross (1291), where now the statue of Charles I stands, to mark the last resting place of the coffin of Eleanor of Castile, queen of Edward I, before interment in Westminster Abbey. A modern copy stands in the courtyard of the station in the Strand.

Charing Cross Bridge Scheme, plan for giving greater traffic facilities, at the same time improving on the shortcomings of London in the matter of architectural beauty. The bridge over the Thames at Charing Cross is for railway traffic, with a footway beside the metals. It stands on the site of the old Hungerford suspension bridge; and the red-brick pier in the riv., near the Surrey side, forming part of the old bridge, has been incorporated in the present structure, which is of steel with round steel caissons, or pillars. While adequate for the purpose for which it was built, namely to carry the S. Region line into Charing Cross station, and admirable from the point of view of traffic on the riv., it has been denounced as an eyesore. Further, a road bridge at Charing Cross would greatly relieve the congested traffic in the Strand, and the existence of a tube railway under the Thames connecting Charing Cross with Waterloo has obviated

the necessity of a terminus on the Middx side of the riv. What finally brought the question to a head was the serious subsidence of 2 of the central arches of Waterloo Bridge (q.v.). The subsidence made the question of a new, or repaired, Waterloo Bridge urgent and the gov. of Mr Baldwin appointed a royal commission presided over by Lord Lee of Fareham to consider the whole question of the Thames bridges in London. This commission produced a report dealing, *inter alia*, with the Charing Cross scheme, and on 6 Mar. 1927 the gov. announced that

J. H. Forshaw and Sir Patrick Abercrombie in 1943, the erection of new bridges at Charing Cross and the Temple is regarded merely as a prerequisite of a proper development of the S. bank of the riv. It is suggested in this plan that the proposal for new bridges at Charing Cross and the Temple would be more than compensated for by the removal of 3 railway bridges and the substitution of tunnels. On the N. bank of the riv. the plan proposes that the riverside stations at Charing Cross, Cannon Street, and Blackfriars might be replaced by underground

HUNGERFORD BRIDGE, CHARING CROSS, FROM COUNTY HALL ON THE SURREY SIDE

it would find 50 to 75 per cent of the money needed for new bridges and riverside improvements in connection with them. On 30 July 1929 the London Co. Council and the shareholders of the S. railway approved the agreement reached between the leaders of these 2 bodies to build a new bridge from Charing Cross to the Surrey side, the scheme involving the placing of the terminus of the SE. section of the S. railway on the site of the Lion Brewery. This approval having been given, a Bill was promoted in Parliament in 1930 to obtain the necessary sanction to proceed with this work. It was, however, rejected by the House of Commons, which was not satisfied with the site of the terminus and the effect it would have on the amenities of the Surrey bank. Two years later further preparation of the scheme lapsed for reasons of economy, the estimated cost being about £12,000,000.

In the elaborate Co. of London Plan prepared for the London Co. Council by

stations below their present sites and the 3 connected on an underground system to continue from Charing Cross to Victoria station and thence under the riv. to Battersea. The N. bank loop would be supplemented by a deep-level link from Charing Cross to London Bridge via Waterloo junction. By means of 2 underground loops it is hoped to dispense with the existing high-level approaches to Charing Cross and Cannon Street, as well as the existing high-level stations at London Bridge and Waterloo junction and their viaduct connections. All stations concerned would be replaced by underground 'through' stations on each loop. See J. H. Forshaw and Patrick Abercrombie, *County of London Plan*, 1943.

Chariot, kind of 2-wheeled carriage, used both in peace and war in ancient times by the Egyptians, Assyrians, Babylonians, Greeks, Romans, and Britons, etc. Various forms of C.s for different purposes

are depicted in monuments, etc. The most familiar type is the war C., usually drawn by 2 horses. That of the Homeric heroes is partly formed of open rail work; the Rom. pattern is rather heavier, and that of E. nations still more solid. Some peoples attached scythes to the wheel-axes of their war C.s. The quadriga, or racing C., was drawn by 4 horses harnessed abreast, as was also the Rom. *curvus triumphalis*, on which generals made triumphant entries into Rome. This was round in shape and, unlike most C.s, closed behind.

Charisius Aurelius Arcadius, Rom. jurist of about the 4th cent. AD. His works are quoted in the *Digest*, and from internal evidence he is supposed to be the last jurist of the classical period of Rom. jurisprudence. The 3 books of which portions remain are *Liber singularis de Testibus*; *Liber singularis de Muneribus civilibus*; and *Liber singularis de Officio Praefecti praetorio*.

Charité, La (-sur-Loire), Fr. tn in the dept of Nièvre. There are the ruins of an 11th-cent. priory, to which the tn owes its origin, and a magnificent 12-cent. church. There are wine and textile industries. Pop. 4300.

Charites (Lat. *Gratiae*). Graces, daughters of Zeus and goddesses of beauty and grace. Three in number, Aglaea (Brilliance), Euphrosyne (Mirth), and Thalia (Bloom), they attended Aphrodite. They presided over physical exercises, dancing, and festivals, and were the patrons of poetry and art, in close alliance with the Muses. They are generally represented as young, beautiful, naked, holding hands.

Charities (Charitable Trusts and Uses, Superstitious Uses). The term charity popularly connotes the relief of poverty. In Eng. law it has a wider meaning and has been judicially defined as a gift to the general public purpose so that it may benefit rich and poor alike. The preamble to a statute of Elizabeth I enumerated a long list of varied objects which the law regarded as 'charitable.' Although there is no comprehensive definition of a legal charity, the 4 types described by Lord Macnaughton in Commissioners of Inland Revenue v. Pemsel (1891) provide a reasonable test. He included 'trusts for the relief of poverty, for the advancement of education, for the advancement of religion, and trusts for other purposes beneficial to the community, not falling under any of the preceding heads.' In law C. and charitable uses and trusts are synonymous. A charity must be capable of benefiting a section of the community (e.g. the aged and infirm of a particular place, the foundation of a particular school). A trust for a particular individual would not be charitable and would fail, if it transgressed the rule against perpetuities (q.v.). A trust expressed to be for 'philanthropic or benevolent' purposes is not charitable, if it is not accompanied by an intent to benefit 'charitable' purposes. The practical advantages of a 'charitable' trust over other trusts include: (1) The rule

forbidding perpetuities does not apply, thereby permitting trust funds to be settled for an indefinite period. (2) Income from charitable trust funds is exempt from income tax. (3) Provided that the donor of the trust funds has expressed a paramount charitable intent, the charity will not fail for 'uncertainty of objects' (e.g. if a testator creates a trust for a hospital or school which ceases to exist, the funds will be applied to a similar object under a charity commissioners' scheme approved by the court—this is the doctrine of a *cy-près*). Attempts are often made by the next-of-kin to obtain declarations from the court that trusts do not satisfy the legal test of 'charity' and are therefore void; the effect of such declarations is that the trust funds either form part of the testator's residuary estate or pass to his next-of-kin as though he had died intestate (see *INTESTACY*). When certain nonconformist sects suffered legal disabilities, trusts in their favour were declared void as 'superstitious uses.' Although the extension of religious toleration has now made such declarations rare, as recently as 1948 a gift to the Carmelite order for devotion to prayer was held to be void. Scots law contains no prohibition against donations in perpetuity for a public purpose or any distinction between charitable trusts and any other public trust. In Ireland the Charitable Donations and Bequests (Ireland) Acts, 1844, 1867, and 1871, allowed of bequests for saying masses either generally or to commemorate the named dead. As to the statutory inalienability of C. to hold lands, and the exceptions under the Mortmain Acts, see *MORTMAIN*.

Statutes governing charities. The law on C. is of great antiquity, but in former times charitable benefactions were administered in a casual unsystematic manner. Prohibition against alienation in mortmain dates from feudal times, the earlier statutes being directed against the growing accumulation of land by the religious houses, whereby the mesne lords lost the incidents of tenure. Thus the famous statute *De Viris Religiosis*, passed in the reign of Edward I, prohibited the acquisition and retention of land in such manner as to deprive the king and his lords of their feudal dues. A succession of statutes followed, until what are known as the Mortmain and Charitable Uses Acts were evolved. The first serious attempt to encourage charitable benefactions and to protect the foundations administering C. dates from the statute 43 Eliz. I, c. 4, repealed by the Mortmain and Charitable Uses Act, 1888. The definition of the term charity, in so far as it is capable of legal definition, is to be found in the Mortmain and Charitable Uses Act, 1888 (section 13), preserving the preamble to the repealed statute of Elizabeth I. The Charities Procedure Act, 1812, popularly known as Romilly's Act, is the basis of the jurisdiction of the chancery div. of the high court to deal with charity matters on petition, and the forerunner of the Charitable Trusts Acts. The Charitable Trusts Acts, 1853-1939,

form the basis of modern charity administration; under these the charity commissioners, sitting as a board, exercise a controlling influence over charitable foundations (see CHARITY COMMISSIONERS). The Mortmain and Charitable Uses Act, 1888, consolidated the law relating to mortmain and the disposition of land for charitable uses. It did not apply, however, to testamentary dispositions; hence an amending Act was passed (1891) providing, *inter alia*, for devises of land for charitable uses; but required such land, notwithstanding anything in the will, to be sold within a year of the testator's death or such extended period as might be determined by the court or the charity commissioners, unless, being satisfied that the land is required for actual retention for the purposes of the charity, they allow it to be retained. There are a number of statutes relating to Rom. Catholic C. (see also MASS STIPENDS), War C., C. for the disabled, etc.

Some C. are cents. old and began before the introduction of public pensions and social services in the present cent. The Nathan Committee on C. has recently recommended amendments to the law which would permit trust funds to be applied more usefully and realistically. Up to 1956 no legislative reforms had been introduced. See Tudor's *Law of Charitable Trusts*, 1932, and Halsbury's *Laws of England*, title 'Charities.'

Chariton, Gk romance-writer of (probably) the 4th cent. AD, b. at Aphrodisias in Caria. His *Loves of Chaereas and Callirhoe*, some episodes of which are historical, is set in the time of the Peloponnesian war. Ed. R. Hercher, 1859.

Charity, Orders of, religious orders of men and women devoted to the service of the poor or afflicted. The earliest sisters of charity in the Rom. Catholic Church were founded by S. Vincent de Paul in Paris in 1633. Sisterhoods of charity were formed in the Anglican Church during the 19th cent. See also SISTERHOODS.

Charity Commissioners. The C. C. were estab. by the Charitable Trusts Act, 1853, for the better administration of endowments subject to charitable trusts (see CHARITIES). Their functions in this field were extended by amending Acts, and they have special functions under the Mortmain and Charitable Uses Acts, 1888-92, the War Charities Act, 1940, the National Assistance Act, 1948, and other Acts.

The Charitable Trusts Acts, 1853-1939, extend to every institution in England or Wales endowed for charitable purposes, subject to express exemptions, notably the univs. of Oxford, Cambridge, London, Durham, and others, Eton and Winchester Colleges, cathedral and collegiate churches, buildings registered and used as places of meeting for religious worship, the Brit. Museum, funds controlled by the Church Commissioners, friendly or benefit societies, and societies for religious or other charitable purposes wholly maintained by voluntary contributions.

The C. C. can remove and appoint

trustees of charities and advise trustees on the administration of charities, trustees who act on such advice being indemnified against all liability. The authority of the C. C. is normally needed to sell, mortgage, or grant leases of land held subject to a charitable trust. The C. C. can establish schemes for effectuating the charitable intentions of founders when altered conditions make performance impracticable. (See as to *cy-près* under CHARITIES.) Orders of the C. C. have the same effect as those of the high court. The C. C. have adequate powers of demanding accounts, inquiring into the condition and management of charities, supervising the expenditure of income, and controlling the disposition of capital funds by trustees.

The powers of the C. C. in regard to educational charities and certain quasi-educational charities are exercisable by the Minister of Education. Under the Act of 1853 an ann. report must be laid before Parliament, and must set forth such schemes approved by the C. C. as require enactment by Parliament. Since 1903 there have been 3 C. C., 2 being barristers-at-law of 12 years' standing and salaried, and the third a member of the House of Commons, from which paid commissioners are debarred. The Secretary of the C. C. is the Official Trustee of Charity Lands and certain officials of the C. C. are appointed the Official Trustees of Charitable Funds. In 1955 they held stocks and investments in trust for charities of a nominal value exceeding £128,000,000.

A Gov. White Paper presented in July 1955 proposed changes in the constitution and powers of the C. C. See works mentioned under CHARITIES and ann. reports of the commissioners.

Charity Organisation Society, see FAMILY WELFARE ASSOCIATION.

Charivari, Fr. term of uncertain origin, used for a wild uproar caused by the banging of pans and kettles, mingled with hissing, groaning, and shouting, expressive of disapproval of the people against whom it is directed. It was originally a regular wedding custom in France in the Middle Ages, but later it was only used at unpopular weddings, particularly for widows or widowers who remarried too soon. The violence and coarse nature of the C.s were strongly opposed by the Church, and in the 17th cent. the Council of Tours forbade them entirely under pain of excommunication. The custom still continues in some rural dists., and is similar to the 'Haberfeld-treiben' of the Bavarian peasants. It is still found in Spain, and a similar custom is common in primitive societies (e.g. the 'Drum-song' of the Eskimo). In modern times the name C., from its suggesting satire and derision, has been taken as the title of various satirical papers, e.g. the *Charivari* (Paris), 1832, and as a subtitle for the Eng. *Punch*.

Charlatan (It. *ciarlatano*, from *charlare*, to chatter), introduced in the 16th cent. as the name for a group of the *jongleurs* who amused the people by their 'patter' and buffooneries. The name quickly

became associated with cheap-jacks and quack doctors, hence it has come to be used of any impostor.

Charlemagne (*Carolus Magnus*), or **Charles I** (c. AD 742-814), son of Pépin le Bref, King of the Franks, and emperor of the W. On his father's death, 768, he became King of Austrasia and Neustria, and on the death of his brother Carloman, 771, added his dominions, becoming supreme ruler of the whole empire.

C. was an outstanding statesman, legislator, and soldier, and founder of the 'Holy Roman Empire.' His success was largely due to his championship of Christianity. His war against the Saxons lasted from 772 to 804, some of the chief incidents being the storming of Eresburg, and the May-field at Paderborn (777), and the submission of the Saxon leader, Wittkind. The result was the complete subjugation and Christianisation of the Saxons. C. divorced his first wife, daughter of Desiderius of Lombardy, and married a Ger. princess, Hildegard. (He married 4 times in all.) In 773 Pope Adrian I appealed to C. to crush Desiderius, and C. eagerly seized the chance to make himself King of Lombardy (774). In 778 he fought against the Arabs in Spain. On his return he met with a reverse at Roncesvalles, where Roland and other famous paladins were slain by the Saracens. Then he waged border wars against Lombards, Bavarians, Avars, Bretons, and others (c. 788-800). In 800 Pope Leo III crowned him at Rome as emperor of the W., with the title 'Caesar Augustus.' In 808-10 he defeated the Danes, driving them back behind the Elbe. To protect his kingdom he erected marks or margraves in the border districts. In 813 he associated his son, Louis le Débonnaire, with him in the gov. Louis was the only legitimate son who survived him, and became his successor. His empire at its height stretched between the Elbe and Ebro, reaching eastward to Hungary and S. to Calabria.

C. was a notable patron of music and learning, welcoming such scholars as Einhard and Alcuin to his court. Einhard's (q.v.) biography of C., a model of its kind, is largely responsible for the traditional picture of C. as a devout Christian, brilliant man of action, and inspired legislator. Though this is true it is also true that C. remained, in personal character, much of a barbarian, and that, in fact, neither the empire he created nor the culture he patronised survived his death intact. He had, however, a genuine sense of religious mission: and the picture of the traditional C., the protagonist of European unity, has had a profound influence on European hist. lasting to the present day. His descendants (and, loosely, his immediate forbears) are known as Carolingians (q.v.) forming the second dynasty of Fr. kings. See Einhard's *Vita Caroli Magni* (Eng. trans. A. G. Grant, 1905; H. W. Garrod, 1915). See also lives by T. Hodgkin, 1894; H. W. C. Davis, 1900; G. P. Baker, 1933; D. Woodruff, 1934; R. Winston, 1956.

Charlemont, anct Fr. fort, now in ruins, on a height of 700 ft by the R. Meuse, near the Belgian frontier, opposite Olivet (q.v.). It was built by Charles V, and improved by Vauban (q.v.).

Charleroi, industrial tn in the prov. of Hainaut, Belgium, on R. Sambre, 30 m. S. of Brussels. It is the centre of a great coal-producing region, and stands at the junction of numerous railways which distribute the coal all over Belgium. There are large iron foundries, machine shops, factories of cutlery, glass, mails, electrical industries, fire-bricks, etc. The C. canal connects the tn with Brussels. Formerly a fortress. At the battle of C., which took place 22-3 Aug. 1914, the Fifth Fr. Army was overwhelmed by the Germans and forced to retreat. C. was taken and 160 houses were burnt. C. fell to the 3rd Armoured Div. of Hodges' Amer. First Army after a rapid advance of 40 m., 2-3 Sept. (1944) which carried them across the Belgian border. Pop. (1955) 26,100.

Charles I, King of the Franks, see **CHARLEMAGNE**.

Charles II, the Bald (823-77), Holy Rom. emperor and King of the W. Franks, son of Louis the Pious. The div. of the empire on the death of Louis the Pious was the cause of the outbreak of war between his sons. C. and Louis the German forced the Emperor Lothaire to make peace at Verdun, 843. On the death of Louis II C. received the crown of the empire, but Louis the German immediately invaded his kingdom and ravaged it.

Charles III, the Fat (832-88), King of the Franks and Emperor of the Romans. He was the youngest son of Louis the German, and received from his father the kingdom of Swabia. On the death of his 2 elder brothers he became sole king of the E. Franks (882) and was also crowned Holy Rom. Emperor. Two years later he became King of the W. Franks. But he found it impossible to hold his kingdom together. His attempt to drive out the Saracens from Italy failed entirely, and he was only able to obtain terms with the Norsemen—who penetrated at this time as far as Paris, which they besieged—by heavy payments. He was deposed in 887.

Charles IV (1316-78), emperor of the Holy Rom. Empire and King of Bohemia. He was educ. in France and married the sister of the Fr. king, Philip VI. He was chosen as the Ger. candidate for the empire in opposition to Louis IV, who had quarrelled with the papacy. He took part with his father in the battle of Crécy. He succeeded Louis IV as emperor in 1347, and was crowned in Rome in 1355. His main interest was in Bohemia, however, where he did much to promote culture and commerce. He founded Prague Univ. See life by B. Jarrett, 1935.

Charles V (1500-58), emperor of the Holy Rom. Empire and King of Spain (as Charles I). He was the son of Philip of Burgundy and Joanna (Juana), the daughter of Ferdinand and Isabella, and was b. at Ghent. Six years later his

father d., and C. succeeded to the Netherlands and the Franche Comté. In 1516 Ferdinand d., and C. was recognised as the sovereign of Castile and Aragon in 1518, his mother being insane. In 1519 he succeeded to the Hapsburg possessions on the death of his paternal grandfather, Maximilian, and, in spite of considerable opposition on the part of France and the papacy, he was elected emperor and crowned (1520). C.'s dominions were very widespread; he ruled Spain and the Americas, parts of Italy (Naples, Sicily, and Sardinia), together with the Hapsburg possessions, which were themselves a scattered collection of different races. He was hampered in Spain by the Cortes, in Germany by the Diets, and there was in almost every different part of his empire a different system of gov. The difficulties of the beginning of his reign can be shortly stated as coming (1) from Lutheranism, a force with which he was confronted right from the beginning of the reign, and with which, though he himself was personally opposed to its dogmas, he was, for political reasons consistently and sincerely to seek to compromise; (2) from the opposition of France, whose armies he had to fight in the first few years of his reign in order to keep possession of his It. dominions; (3) from the continually increasing Turkish power in Europe, which was made more formidable by its alliance with the piratical races of the N. of Africa. These difficulties were only solved transitorily by C., and were constantly recurring.

At the Diet of Worms in 1521, presided over by C., Luther and Lutheranism were condemned; but the condemnation never had any practical force and was cancelled by the Diet of Spire. The early part of C.'s reign is most notable for the struggle with Francis I of France, a struggle which ended only with the defeat and capture of Francis at Pavia. C.'s successes in Italy antagonised the papacy; but in 1527 an army of the emperor, gathered from almost every part of his wide empire, attacked, captured, and sacked Rome, making the Pope a prisoner. C. immediately disclaimed all responsibility for the act, but made full use of the political advantages which it gave him. In 1529 Francis and C. made peace at Cambrai, C. receiving Lombardy from France, and in the following year was held the Diet of Augsburg, which reiterated the decisions of the Diet of Worms, and this brought about the formation of the 'Protestant' League of Schmalkald. But the persecution of the Protestants implied in the decisions at Augsburg was stayed by political events. Whilst C. was emperor, he would always be dependent upon the goodwill of his Protestant subjects for aid against the natural enemies of the empire. This time the difficulty arose in the E. The Turks were again threatening the E. border, but the danger was avoided without war, and C. returned to Spain. In 1535 he stormed and captured the pirate stronghold of Tunis. In 1539 C. commenced his policy of crushing the power of the prov. Cortes of Spain, which from this time gradually

sank into disrepute, and in the same year he crushed a rising in the Netherlands, depriving the tn of Ghent of all its privileges. In 1541 he again attempted to attack Tunis, but was unsuccessful, attributing his lack of success to an 'act of God.' War again broke out with Francis, who this time allied with the Turks, and Europe was horrified when the Turkish fleet anchored and wintered in Toulon. C. invaded France, imposing the treaty of Crépy (1544), when the Fr. claims on Italy were again repudiated. C. was now free to carry out the policy upon which he had set his heart, namely the subjugation of the Ger. princes to the imperial authority. Helped by the Protestant Maurice of Saxony (q.v.) C. crushed the Schmalkaldic League at Mühlberg (1547), and consequently imposed reforms which considerably increased the imperial authority. But in 1551 Maurice turned on C., and at Passau (1552) C. had to abandon the political gains made after Mühlberg, and the religious peace of Augsburg (1555) recognised the legality of Protestantism by establishing the principle of '*cuius regio, eius religio*.' In the same year C. resigned the Netherlands, the most dearly loved of all his possessions, to his son Philip, in the following year he resigned the Sp. possessions, and in 1558 he formally resigned the empire, although his brother Ferdinand had been emperor in all but name since 1555. He spent the remaining 3 years of his life in retirement at Yuste in the valley of Estremadura, where he d. in Sept. 1558. C.'s prin. aim was the preservation of the medieval ideal of the empire; this explains his subjugation—or attempted subjugation—of separatist movements, whether religious or political throughout his dominions, during his reign. Extremely conscientious, but utterly lacking in imagination, he never saw the impossibility of his task; he was seeking to preserve something which no longer existed, and which indeed had never existed in the ideal form in which he saw it; and his failure was inevitable. Personally neither fanatically religious nor politically savagely reactionary, it remains true that the religious and political persecutions and repression resultant in his attempts at centralisation were at least partially responsible for the difficulties of his successors. See lives by E. Armstrong, 1902, D. B. Wyndham Lewis, 1932, C. Brandt (trans. by C. V. Wedgwood), 1939, and R. Tyler, 1956.

Charles VI (1685-1740), Holy Rom. Emperor, second son of Leopold I, was b. at Vienna. When the extinction of the Sp. Hapsburg house became apparent, he was put forward as the Austrian claimant to the Sp. inheritance. By the second Partition Treaty he was to be recognised as the King of Spain, but on the death of Charles II of Spain Louis XIV abrogated the Partition Treaties. He was, however, proclaimed by the allies as King of Spain, and went to Spain in the early stages of the War of the Sp. Succession. He remained until 1711, having little success, although supported by the Catalans, and even entering Madrid. But he was never

popular with the Sp. people, and in 1711 virtually forfeited his claim when he became emperor. He ultimately abandoned Spain (treaty of Utrecht, 1714) and turned his attention to securing the succession to the Austrian throne for his daughter, Maria Theresa. He foresaw the struggle which must arise on his death without male heirs, and he sacrificed much in order to get the Pragmatic Sanction recognised by the powers, though in fact it was ignored after his death. During his reign the war with the Turks was brought to a successful issue by the treaty of Passarowitz, but before the end of his reign he had lost almost all that he gained by it.

Charles VII (1697-1745), Holy Rom. Emperor, elector of Bavaria, the son of the elector of Bavaria. He succeeded to the electorate in 1736, and his reign was taken up (in spite of having recognised the Pragmatic Sanction) in plotting to obtain the imperial crown on the death of Charles VI, uncle of his wife Maria Amelia. In 1740 he claimed the imperial crown and was put forward as the puppet of the anti-Austrian faction. He was crowned in 1742, but his sovereignty was merely nominal. His hereditary dominions were overrun by armies of both sides, and he d., worn out by his illnesses and troubles.

Charles III, the Simple (879-899), King of France, the posthumous son of Louis the Stammerer. In 894 he was recognised by a section of the nobility as king, and was crowned at Rheims. He forced the *de facto* king, Odo, to cede him Neustria, and ultimately, on the death of Odo, he became king of all France. C. ceded Normandy to the Norse leader Rollo, and thus established the future duchy of Normandy. The growth of the power of the king, however, roused the jealousy of the nobles, who made a conspiracy against him and placed Robert, Odo's brother, on the throne. The Robertians were later defeated, but C. himself was captured and imprisoned (922). He d. at Péronne.

Charles IV, the Fair (1294-1328), King of France, last of the direct Capetian line, succeeded his brother, Philip V, in 1322. He tried to continue the policy of augmenting the power of the crown at the expense of the nobility, but in order to obtain money he resorted to dubious methods, such, for example, as the confiscation of the property of the Lombard merchants. He helped his sister Isabella in arranging the plot which finally overthrew Edward II.

Charles V (1337-80), King of France, sometimes called C. the Wise, b. at Vincennes. He was the son of John II, and narrowly escaped the fate of his father at the battle of Poitiers. During the imprisonment of John in England he acted as ruler of the country. The beginning of the Hundred Years War with England had brought many difficulties to the Fr. monarchy; the nobility's power had increased; the merchant classes had seized their opportunity to compel the ruler to make reforms; and in 1358 the Jacquerie (q.v.) added to the difficulties of the crown. C.'s greatest struggle

during the regency was with the King of Navarre (Charles the Bad), whom he ultimately managed to subdue. The treaty of Brétigny brought the return of John, who, however, was unable to raise his ransom, and returned to England, where he d. in 1364. C. with the help of Bertrand du Guesclin (q.v.) now tried to put down the most formidable of his foes and to get rid of the free companies that were ravaging the country. War was renewed with the English in 1369 and C. was successful in winning it after ten years until by 1380 only a few towns remained in Eng. hands. In 1378 he made a premature attempt to annex the duchy of Brittany to the Fr. Crown, and his attempt brought in its train a national rising. Before a settlement was made C. died. C. owed his successes largely to his well-chosen advisers and administrators. His extravagances further increased the misery of an already impoverished people, however. He collected a large library of works on astrology, law, and philosophy, at the Louvre, which eventually formed the nucleus of the *Bibliothèque Royale*.

Charles VI (1368-1422), King of France, son of Charles V and the first of the Fr. princes to bear the title of Dauphin (q.v.) from birth. He succeeded to the throne at the age of 12, and during his minority France was governed by the dukes of Berry, Bourbon, Burgundy, and Anjou. The excesses of the regents resulted in serious rebellions in the towns of both N. and S. France, which were encouraged by the English, and which were only suppressed with difficulty. In 1388 C. asserted his authority by driving from power the royal dukes and appointing ministers of his own, who, because of their humble origin, were called the *marmousets*. But, though the first few years of his personal rule showed some promise, his mental instability became increasingly obvious. The royal dukes regained their power in France, and the struggle began between the Burgundians and the Orleansists. Matters were brought to a head by the murder of Orleans in 1407. The Burgundians for the time held the upper hand, and in league with the Parisians forced the king to do their will. In 1413 the Orleansists entered Paris and drove the Burgundians into the arms of England, with whom they concluded an alliance. Henry V (q.v.) again put forward the Eng. claim to the Fr. crown and invaded France. In 1415 Agincourt was fought, and in 1418 Paris was captured by the Burgundians. In the following year John the Fearless was assassinated, and the Burgundians definitely became the allies of the English. In 1420 the treaty of Troyes, followed by the marriage of Henry V to the daughter of C. took place, and Henry became practically master of France, C. by now being quite incapable of ruling. See Froissart's *Chronicles*, and F. Funck-Brentano, *Le Moyen Age*, 1923.

Charles VII (1403-61), King of France, son of Charles VI, became lieutenant-general of the kingdom in 1417. His power and authority, however, sank after

the murder of John the Fearless in 1419, and by the treaty of Troyes he was passed over in the succession to the crown, his legitimacy being disputed. He retired to Mehun, near Bourges. On his father's death he was recognised as King of France by the S. provs., but he gradually lost all hold on the N., and the victories of the English during the early part of his reign lost him still more power. The central provs. of France were involved in internal civil struggles, and C. seems to have considered his cause quite hopeless until Joan of Arc (q.v.) appeared, and led him to success after success. Orleans was captured, and he was crowned at Rheims. In 1435 the Duke of Burgundy joined forces with C. in driving out the English. The English were gradually driven out of their Fr. possessions until by 1453 they retained only Calais. Though notorious for his indolence and indifferent leadership in his youth, C. later showed considerable drive in asserting the royal authority in France; and at his death the worst of the anarchy of the past cent. had been suppressed. See life by F. de Beaucourt, 1891.

Charles VIII (1470-98), King of France, the only son of Louis XI. He succeeded his father in 1483 and although he was declared capable of ruling he left the gov. of the country in the hands of his sister, Anne of Beaujeu. He married in 1491 the Duchess of Brittany, thus uniting the last independent duchy in France to the monarchy. In 1492 he took over the gov. for himself. Ambitious and romantic, he decided to attempt to obtain the kingdom of Naples, to reconquer the E. empire, and to become its emperor. To obtain this desire he sacrificed everything; he entered Naples in 1495, but was unable to proceed any further with this plan since a coalition of the powers was formed against him. He was forced to return to France, and here, whilst preparing for a second expedition, he died. The second part of Comines' *Memoires* give a full contemporary account of C.'s reign.

Charles IX (1550-74), King of France, son of Henry II and Catherine de' Medici. He succeeded to the throne at the age of 10, and the effective gov. was exercised by his mother. C. appears to have been a moral degenerate, but he was not without intelligence or occasional sensitivity. He married in 1570 Elizabeth of Austria. His patronage of Colligny, after 1570, aroused his mother's acute jealousy, and she finally seems to have cajoled her son into agreeing to the Huguenot leader's assassination. This led directly to the indiscriminate massacre of Fr. Protestants on St Bartholomew's Day, 24 Aug. 1572, which Catherine and her son almost certainly never anticipated. C. was already broken in health, but the massacre preyed on his mind and he d. prematurely aged and mentally sick. See L. Romier, *Catholiques et Huguenots à la cour de Charles IX*, 1924.

Charles X (1757-1836), King of France, younger brother of Louis XVI and Louis XVIII, b. Versailles. Before his accession

to the throne he was known as the Comte d'Artois. He became the leader of the ultra-Royalists on the outbreak of the Fr. Revolution, and in 1789 he left France to become the leader of the Emigrés. He visited many of the courts of Europe, trying to obtain help for the Royalist party. In 1795 he landed in France to put himself at the head of the rising of La Vendée, but he soon retired, leaving the

Hansstaenpl

CHARLES IX OF FRANCE

From the painting by François Clouet.

Royalists of the W. totally unsupported. He lived for the rest of his exile chiefly at Holyrood Palace. In 1814 he returned to France, and during the reign of his brother, Louis XVIII, he led the ultra-Royalist faction. He succeeded his brother in 1824, and his reactionary measures soon made him exceedingly unpopular. In 1825 he was openly insulted in the streets. He had no intention of becoming a constitutional monarch, and although he was compelled to get rid of his unpopular minister Villèle, he still showed no signs of giving up his absolutist pretensions. In 1830, the elections having gone against him and finding violent opposition in the Chamber of Deputies, he suspended the constitution. The result was the outbreak of a revolution which C. at first did not treat seriously. But he retired from Paris, and when the seriousness of the situation was evident, he abdicated in favour of his grandson, Louis Philippe, Duke of Orleans, however, was chosen king, and C. retired to England. He d. at Gorizia where he had gone for health reasons. See P. Vedrenne, *Vie de Charles X*, 1879; J. M. S. Allison, *Thiers and the*

French Monarchy, 1926; J. Lucas-Dubreton, *Le Comte d'Artois, Charles X*, 1927.

Charles VII (d. 1167), King of Sweden from 1160. He helped to establish Christianity in Sweden and created the archbishopric of Upsala, 1164.

Charles VIII (d. 1470), first elected King of Sweden in 1436, when the Swedes broke away from Denmark and Norway. His name was originally Karl Knutsson Bonda. He was forced to retire before Christopher of Bavaria in 1441, but after the death of the latter prince was restored, 1449. He was subsequently forced into exile on 2 more occasions. After his death the 3 kingdoms of Scandinavia were again united.

Charles IX (1550-1611), King of Sweden, third and youngest son of Gustavus Vasa; he is remembered for his fervent Protestantism, and his struggles in order to obtain the recognition of Sweden as a Protestant nation. In 1568 he was the leader of the rebellion against Eric XIV, and he was involved in struggles with John III during the greater part of John's reign. When Sigismund, a Catholic, and already King of Poland, succeeded to the Swedish throne in 1592, C. came forward as the champion of Protestantism. He was appointed regent in 1595, and in 1600 Sigismund was deposed. C. assumed the title of king in 1604, but was not actually crowned until 1607. Lutheranism was then made the estab. religion of Sweden. His foreign policy involved him in wars with Russia and Denmark, which were not successful.

Charles X (1622-60), King of Sweden, and nephew of Gustavus Adolphus. He is important solely as a great warrior king, and took part in the later campaign of the Thirty Years War. He was the recognized heir to the Swedish throne, to which he succeeded on the abdication of Christina in 1654. In 1655 he determined upon war with Poland, and called the Riksdag to grant him supplies. He gathered together a great army and navy and attacked the Poles. Warsaw was easily won, and after a long siege Cracow fell too, and Poland appeared to be conquered, but the Poles then rose against C. in a war of national liberation. C. was forced to buy the support of the elector of Brandenburg at the price of Prussian independence, and in the following year the Danes too declared war against him. C. gave up the Polish campaign and concentrated on Denmark. He attacked from the S., but his most astounding feats were the crossing of the Little and Great Belts with his army over the ice. The effect of his unique movement was to crush the Danes who immediately opened negotiations for peace (1658) and agreed to the cession of large tracts of ter. In 1660, when he was meditating an attack upon Norway, and had crossed to Sweden to persuade the Riksdag to grant him further supplies, he d. worn out probably with the strenuous life he had led. While he brought great military glory to Sweden, the effect of his wars was fundamentally to exhaust the country.

Charles XI (1655-97), King of Sweden, succeeded to the throne at the age of 4, being the only son of Charles X. His effective rule began in 1672, the country having been generally neglected during the preceding regency. The Danes soon seized the chance to attack what appeared to be a declining Sweden: but C. soon showed he had the courage and military genius of his predecessors. He defeated the Danes at Fyllebro in 1676 and in the same year he again defeated Christian V of Denmark in the great battle at Lund. The latter battle was bitterly contested, and although the losses of the Swedes were great, their eventual victory practically annihilated the forces of Denmark. In 1678 he again defeated the Danes at the battle of Malmö, and in the following years consented to a peace dictated by Louis XIV. The rest of his reign was devoted to the estab. of Sweden upon a sound basis, and to the rectification of her financial position. Practically every side of the administration was overhauled, the finances were reformed, commerce encouraged, and church gov. and education improved. C. was one of Sweden's wisest kings, combining the military talent of the Vasas with an appreciation of the pressing domestic needs of his country.

Charles XII (1682-1718), King of Sweden, the only surviving son of Charles XI. At an early age he showed considerable natural ability. He was a good rider, a good marksman, and excelled in mathematics and languages. He was also carefully trained in matters of administration, and at an early age was instructed by his father in all affairs of state. He succeeded in 1697, and was given the full sovereignty at once. The great N. war of 1699 in which Russia, Poland, and Denmark allied in an attempt to crush what they assumed to be a weak Sweden, under a king who was little more than a boy, forced C. into the military career in which he was to show himself so outstanding. He first defeated the Danes, forcing them to a humiliating peace at Travendal (1700), and then marched against the Russians who were besieging Narva, and after a week of forced marches succeeded in defeating the besieging force with only small loss to himself. He now turned to pursue the enemy he hated most, Augustus of Saxony, King of Poland. He captured Warsaw and marched against Cracow, defeating the Poles and Saxons at Klissow. In 1703 C. won the battle of Pultusk, and later another battle at Plenitz. He deposed Augustus (1704), and set up a candidate who was crowned in 1705. In Sept. 1707 he forced Augustus to sign a treaty by which he permanently resigned his claims to the Polish crown and his hostility to Sweden. He now marched against Russia, defeated her at Holowczyn, and as the Russians fell back followed slowly towards Moscow. Realizing too late he could not reach Moscow, he now marched southward to join the hetman of the Cossacks, Mazeppa. The Czar had already destroyed Mazeppa's conspiracy, and when the hetman joined C. it was as a fugitive. The winter of 1708

was one of the most severe Europe had known for 100 years and the unprepared Swedish Army suffered terribly. Finally, when the frost broke and the Russians were attacked, the Swedes were practically annihilated at Poltava (1709), and C. with the remnant of his army took refuge in Turkey, trying to persuade the Turks to embark on a major war with Russia. Eventually, realising that Sweden herself was again in danger, he arrived in Stralsund in Nov. 1714. C. immediately raised an army which was strong enough to prevent his being attacked by his enemies, and in 1717 he began an attack on Norway. But in the following year, while leading an expedition to Norway, he was shot in the trenches whilst besieging Fredrikstun. C. was a brilliant soldier and a born leader, able to inspire his men in victory and defeat, as is shown in his disastrous Russian campaign; but his lust for military conquest was insatiable, and rather than accept offers of peace he preferred to fight on even when the odds had become unrealistically heavy against him. His constant wars brought Sweden to the verge of internal collapse. One of the most interesting lives is still Voltaire's *Histoire de Charles XII*, 1731. See also lives by R. N. Bain, 1896, and E. Godley, 1928.

Charles XIII (1748-1818), King of Sweden, second son of Frederick Adolphus. b. Stockholm. He distinguished himself as an admiral in the Russo-Swedish war, and was regent of the country (1792-6). In 1809 he was elected king in place of the deposed Gustavus IV. In 1810 Bernadotte (Charles XIV, q.v.) was elected crown prince and practically took all power out of the hands of the king, who had by this time become decrepit. In 1814 he became the first king of a united Norway and Sweden, and in 1818 he died, having for 10 years been king only in name.

Charles XIV (1763-1844), King of Sweden and Norway, known also as Jean Baptiste Jules Bernadotte; the son of a lawyer at Pau. He was b. at Pau and entered the Fr. Army in 1780, soon showing considerable ability. On the outbreak of the revolution he received speedy promotion. He was at the battle of Fleurus and took part in the campaigns in Germany. In 1797 he took reinforcements to Napoleon in Italy, and in the following year he became ambas. in Vienna. In the same year by his marriage to Désirée Clary he became the brother-in-law of Joseph Bonaparte. He did not take an active part in the *coup d'état* by which Napoleon became First Consul, but he was given in 1801 the command of the army in La Vendée. In 1804, when the empire was declared, he was made a marshal of France, and was also appointed Governor of Hanover. He took part in the campaigns of Ulm and Austerlitz, and was later made governor of the Hanse towns. For his conduct at Austerlitz he was created Prince of Pontecorvo in 1805. After the battle of Jena he pursued the Prussians to Halle and Gen. Blücher to Lübeck, driving him into surrender. In

1810 he was appointed to command in the Netherlands. In the same year he was elected Crown Prince of Sweden. In Nov. he went to Sweden, where he was adopted by the king, Charles XIII, under the name of Charles John. He became exceedingly popular and was soon the effective ruler of the country. He took part in the later Ger. campaign against Napoleon, and in 1818 he succeeded his adopted father, Charles XIII, with the title of Charles XIV. His policy from the beginning had been to bring about a union with Norway, and in this he was (1814) successful. His reign on the whole was one of development and peace, and he proved himself an enlightened monarch. See Sir D. P. Burton, *Bernadotte and Napoleon*, 1921, and *The Amazing Career of Bernadotte*, 1929.

Charles XV (1826-72), King of Sweden and Norway. He was the eldest son of Oscar I. and succeeded to the throne in 1859. He was a popular and enlightened king, and during his reign a number of great reforms took place. The laws of the Church and the criminal laws underwent considerable revision, and the king gave his whole-hearted support to the laws which reformed the constitution (1866). He himself had considerable artistic ability.

Charles I (1226-85), King of Naples and Sicily, Count of Anjou, and seventh son of Louis VIII of France. He was b. before the accession of his brother, Louis IX, and was later, on the decease of another brother, given the cos. of Anjou and Maine. In 1245 he married the heiress of Provence. He accompanied St Louis on his first crusade, and was with him when he was defeated and captured, he himself sharing the same fate. Ransomed and released before the king, he returned to France to intrigue with the Countess of Flanders against the emperor. In 1257 he captured the important cit. of Marseilles and began to make his influence felt in N. Italy. His great opportunity came when the Pope decided to break down the power of the Hohenstaufen in Italy. He was offered the crown of Naples and Sicily, for which he was to pay a yearly tribute to the Pope, and which also he would have to win from their allegiance to Manfred, the natural son of Frederick II. He finally accepted the papal offer, and dispatched an expedition to Italy in 1264. In the following year he was crowned King of the Two Sicilies, and a year later he defeated and killed Manfred at Benevento. In 1268 a battle was fought at Tagliacozzo with Conradin, the last descendant of Frederick II, which resulted in the defeat of the supporters of the Hohenstaufen and the capture and execution of Conradin. C. was recognised as one of the most powerful monarchs in Europe, and his power was the greater owing to his influence over the papacy. In 1270 he took part in the second and ill-fated crusade of Louis IX, after whose death he returned to Italy. In 1282 occurred the massacre and expulsion known as the Sicilian Vespers, inspired by the cruelty and misrule of the French.

C. determined to avenge this disaster. After 2 defeats he was preparing another attempt from Naples when he d.

Charles I (1600-49), King of Great Britain and Ireland, the second son of James I and his wife Anne of Denmark, b. at Dunfermline. He was created Duke of Albany on his birth, Duke of York in 1605, and 4 years after the death of his elder brother he received the title of Prince of Wales (1616). From about 1620 C. fell under the influence of Buckingham, his father's favourite, whose vivacity was in strong contrast with C.'s own slow, serious nature. In 1623 he went to Spain

CHARLES I

Detail from oil-painting by Van Dyck.

In disguise with Buckingham in an ill-judged attempt to win the infant's love by this romantic adventure. Buckingham and C. returned home, their mission unsuccessful, loudly denouncing the ill faith of the Spaniards and calling for war, and in 1624 Parliament voted supplies for war with Spain. In 1625, the year in which he became king, C. married Henrietta Maria of France, a Catholic, who, after Buckingham's death, exercised a great and generally unhealthy influence on him in political matters. From 1625 to 1629 C. was engaged in a constant struggle with Parliament, where his religious and fiscal policies met with increasing opposition. In 1628 his third Parliament met and passed the Petition of Right, which forbade taxation without consent of Parliament, and arbitrary and illegal imprisonment. C. signed this under pressure, but probably never considered it binding, in view of his theory of the divine right of kings; and the defection of Wentworth from the parl. opposition at

this point suggests that it was at this stage that Parliament really ceased to defend its estab. rights and became, instead, the innovator in the constitutional struggle. Sev. of C.'s future actions, though unrealistic, were in fact more firmly based on precedent than those of his opponents. In 1629 Buckingham was assassinated. In the same year C. dissolved his third Parliament, but not until they had passed a resolution condemning his alleged innovations in religion and the collection of tonnage and poundage. From 1629 to 1640 C. ruled without a Parliament. The 11 years' 'tyranny' involved C. in many attempts to raise money for his immediate needs. In almost every way he roused antipathy; he levied tonnage and poundage; in 1634 he made his first levy of ship money, and in the following year he made another levy, this time on the inland trns as well. In 1638 came the great Hampden case, when C.'s right to levy ship money was acknowledged by the courts. His religious policy also roused the ill-feeling of many of his most influential subjects. The High Church party was favoured, the Catholics intermittently tolerated, and the Puritans persecuted. His Scottish policy precipitated matters. In 1633 he had visited Scotland for his Scottish coronation; in 1636 Laud's liturgy was introduced; in 1637 this led to a riot in St Giles's Cathedral and to the signing of the Covenant. A general assembly was called, but when this assembly proposed to discuss episcopacy it was dissolved by the high commissioner. The assembly, however, refused to dissolve and abolished episcopacy. Having done this, it prepared to meet the king in arms. The king, finding himself unable to raise sufficient forces, on the advice of Strafford called Parliament. Strafford apparently believed that, faced with a Scottish war, Parliament would forget its quarrels with C. and vote him supplies; but he was mistaken. The Short Parliament met in 1640; it immediately began to discuss grievances and was immediately dissolved. C. again went N. to attack the Scots, and again found it impossible to meet force with force. The result was that peace was made with the Scots practically on their own terms, and C., his finances utterly exhausted, was forced (Nov. 1640) to call what became known as the Long Parliament. The 11 years' arbitrary rule was over. Fervent Parliamentarians might rejoice; but to the mass of the people, the conflict that was to follow it was infinitely more painful in its effects. The Parliament which met in 1640 was in no mood for trifling. Its first aim was to bring about the destruction of its former champion, Strafford, and, all other means failing, this was done by attainting him. C. signed Strafford's death-warrant, sacrificing his most loyal and capable servant to fears for the queen's safety. His treatment of Strafford throughout shows to the full the weaknesses in C.'s own character. Parliament forced concession after concession out of C. Parliament was only to be dissolved with its

own consent, the Star Chamber and High Commission Court were abolished, and ship money was declared illegal. In 1641 C. was forced to listen to the Grand Remonstrance (q.v.), and early in Jan. 1642 he made the disastrous attempt to imprison the 5 members (q.v.). The next Parliament demanded control of the army. By this time it had alienated a strong body of opinion by its extremist policy. When C. made it clear that he would give in no further this moderate section rallied to his support. In Aug. 1642, after a series of abortive negotiations with Parliament, C. raised his standard at Nottingham. The early stages of the war went on the whole in his favour, but after the formation of Cromwell's Ironsides victory after victory fell to the Parliamentarians. The 2 great disasters with which the king met were Marston Moor and Naseby (qq.v.) where the New Model Army crushed the Royalists utterly. On 5 May 1646 the king surrendered to the Scots, who handed him over to the Eng. parl. forces. He was kept 4 months at Holmby House, near Northampton, but in the midst of his negotiation with Parliament he was seized by the army, who imprisoned him at Hampton Court (1647), clearly anxious to avoid at all costs the possibility of his coming to terms with Parliament. C.'s subsequent attempts to escape, and his efforts to ally with the Scots against his captors, made the extreme army Puritans, Cromwell (q.v.) among them, convinced that only his death could ensure that the principles for which they had fought were not endangered. In Jan. 1649 Parliament, having been cleared of all possible supporters of the king by Pride's purge, resolved to bring the king before a high court of justice. On the 19th the trial began. The king refused to recognise the jurisdiction of the court, and throughout behaved with magnificent dignity and self-possession. His execution, however, was resolved upon, he was brought up to hear the sentence passed upon him on the 27th, and was not allowed to make any answer to the charges. He was executed before Whitehall Palace on 30 Jan. The manner of his death, the blatant illegalities and irregularities of his trial made him appear a martyr, and eventually produced a popular reaction in favour of his family. Probably to C., more than to anyone else, the Church of England owes its survival in its present episcopal form. Though many of his actions are not free from the taint of double-dealing, his religious sincerity is undisputed: it was the one aspect of his policy in which his wife never influenced him, and his stubborn pursuit of religious objectives that were fundamentally unrealistic (for example his attempt to impose Laud's liturgy in Scotland) was a primary cause of the events which set in motion the conflict which was to cost him his life. See the *Maseres Papers*, which include much contemporary evidence of the relations between C. and Parliament, including an account by Denzil (Lord) Holles, *Calendars of State Papers, 1625-1649*, 1858-97; S. R. Gardiner, *A History*

of the Great Civil War, 1893; lives by F. M. G. Higham, 1892, and E. Wingfield-Stratford, 1949; C. V. Wedgwood, *The King's Peace*, 1955; A. French, *Charles I and the Puritan Upheaval*, 1956.

Charles II (1630-85), King of Great Britain and Ireland, b. at St James's Palace, London, son of Charles I. During the Civil War he was with his father during the early events, but after the defeat at Naseby he went to Falmouth, and from thence to Scilly. From Scilly he went to join the queen in Paris, and he remained there for 2 years. On the execution of his father in 1649, he was immediately proclaimed king in Scotland, and in 1650, having signed the Solemn League and Covenant, which he can hardly have intended keeping, he embarked for Scotland. On 1 Jan. 1651 he was crowned at Soane, and on 3 Sept. his forces, having penetrated England as far as Worcester, were defeated by Cromwell. C., who distinguished himself by his bravery during the battle, fled, and after wandering in disguise throughout the country for 6 weeks, at last escaped to France. In 1654 relations between England and France having altered, he was forced to quit France, and spent the rest of his years of exile in wandering from one country to another. These years of exile undoubtedly marked C.'s character permanently, making him determined in the future to keep his crown at all costs; while the poverty of this period undoubtedly accounts in part at least for the extravagance and dissipation of his later life. After Cromwell's death in 1658 it was soon obvious that C.'s restoration was only a matter of time, and it was eventually brought about through the influence of George Monck. Duke of Albemarle, who conducted the negotiations with the exile. On Monck's advice C., in April 1660, issued the Declaration of Breda (mainly the work of Clarendon), and early in May he was declared King at Westminster. Towards the end of the month he set forth from Breda and landed at Dover, where he was received with great enthusiasm everywhere, the nation as a whole being heartily sick of Puritanism and military despotism. In 1662 C. married Catherine of Braganza.

The first 7 years of C.'s reign were passed under the tutelage of Clarendon (q.v.). The Restoration settlement was not followed by any very great persecution of Cromwell's supporters; a number of the regicides were executed, but on the whole the Restoration was tolerant, except in religious matters, and some of the bitterest complaints were to come from Royalists, who, having sacrificed their possessions and property in the Stuart cause, never received complete restitution as this would have alienated important ex-Cromwellian interests. The Cavalier Parliament, however, restored the episcopal church and the prayer book in England, and in a similar manner bishops were restored to Scotland. The early years of the reign were disgraced by the Dutch war, during which the

Dutch sailed up the Thames and destroyed the shipping there. In 1667 Clarendon was dismissed, and Buckingham and Arlington became the chief ministers; these, together with Lauderdale, Ashley, and Clifford, formed in 1672 the famous Cabal (q.v.). It was during this period that C. entered into those close relations with France which made him almost the pensioner of the Fr. king, gained him incidentally a fresh mistress in Louise de Kéroualle, and which have been criticised as costing England her natural foreign policy, i.e. to attack the aggrandisement of France. In 1670 was

N.P.G.

CHARLES II

The painting by J. M. Wright.

signed the secret treaty of Dover, which pledged C. to becoming a Rom. Catholic, and gave him a pension of £200,000 per annum. While it is true that this treaty led to England becoming involved with France in the second Dutch war, from C.'s personal point of view it was a most astute political manoeuvre, and probably caused considerably less harm to his country than later Whig historians have alleged. C. was always anxious to prevent himself becoming the financial prisoner of Parliament, and Louis's money provided the solution. In return, C.'s promise to become a Catholic was not restricted to a particular date, and in fact C. did not declare himself a Catholic until he was dying, though he had undoubtedly had Catholic sympathies for many years before this, and made various attempts to increase toleration for Catholics and Dissenting Protestants. The Cabal ministry met with considerable opposition in the country, and many of the acts of the king and his ministers at this time were extremely unpopular. The 'stop of the exchequer' ruined a number of

people, and the second Declaration of Indulgence was declared illegal by Parliament, and the Test Act was passed. In 1677 William of Orange married Mary, the elder daughter of James, Duke of York, an incident which proves C.'s ability to act independently against Fr. interests when he so desired. Foreign affairs were soon overshadowed by the affair of the 'Popish Plot,' 1678-80, which C. eventually turned to his own advantage. He recognised that it had received general credence in the country, and he allowed it to continue, knowing full well that in the course of time the falseness of it would be discovered. The Protestant party next pressed for the exclusion of James, Duke of York, from the crown. C., whilst reiterating that he would never consent to the Exclusion Bill, sent James out of the country for a short time, and declared his pleasure at the attempts to convert James to Protestantism. The exclusionists, however, went too far in asserting the claim of James, Duke of Monmouth, who was C.'s illegitimate son by Lucy Walters. In the Parliament of Oxford, by insisting on the recognition of the Duke of Monmouth, they played into C.'s hands. Parliament was dissolved, and C. appealed to the nation at large, which supported him against the extremists. For the rest of the reign C. was supreme, his position strengthened by the standing army which he now controlled, which he had been able to raise quite legitimately during the various crises, but had refrained from disbanding. His popularity was immense, and was increased by the discovery of the Rye House Plot, for which Sidney and Russell were executed. C. left no children by his wife, but a numerous progeny by his many mistresses. By Nell Gwynn (1650-1687) C. was father of Charles Beaulieu, Duke of St Albans (1670-1726). Louise de Kéroualle (1649-1734), who was made Duchess of Portsmouth (1672) and Duchesse d'Aubigny in 1684, was mother, by C., of Charles Lennox, Duke of Richmond (1672-1723). Other mistresses included 'la belle Stewart' (Duchess of Richmond) and (before the Restoration) Lucy Walters. C. was the most capable of the Eng. Stuarts, his indolence and extravagant living concealing a shrewd sense of politics, an ability to sense the exact moment at which compromise was essential, or when ruthless action was safe. If his policy was amoral, it was in fact no more so than that of the vast majority of politicians of the time, and their characters make it hardly surprising that C. should prefer to put his trust in his own judgment and in Fr. gold. He was a patron of the arts, and genuinely popular with the common people. See the diaries of Pepys and Evelyn, and Clarendon's *History*; see also lives by O. Airy, 1904, and A. Bryant, 1931.

Charles II (1661-1700), King of Spain, son of the old age of Philip IV, whom he succeeded in 1665. He was from infancy weak, deformed, and diseased, and it was soon obvious that he would never be

capable of ruling for himself and would probably not live long. The whole of his reign was taken up with struggles between the Austrian and Fr. parties at court. Each of these scored a triumph by arranging marriages for the king. The Fr. party married him to a Fr. princess, and on her death he was married to an Austrian princess, but both marriages were childless, and the question of his succession absorbed Spain and all Europe for sev. years before his death. Finally, on his death-bed, he was persuaded to sign a will leaving the Sp. dominions to Philip of Anjou, grandson of Louis XIV. This led directly to the War of the Sp. Succession (q.v.).

Charles III (1716-88), King of Spain, eldest son of Philip V of Spain by his marriage to Elizabeth Farnese of Parma. He was Duke of Parma by right of his mother, and spent his early youth in Italy. In 1734 he became King of the Two Sicilies, and on the death of his half-brother, Ferdinand VI of Spain, he succeeded to the Sp. throne (1759). He signed the family compact with France, and took part in the later phases of the Seven Years War against England (against which he had a personal animosity) disastrously. He again joined the French in 1779 in their attacks upon England during the Amer. War of Independence. His internal policy was considerably more enlightened and successful. He had already made substantial internal reforms in Sicily. He expelled the Jesuits from Spain, encouraged the construction of new roads and canals, and followed the pattern of contemporary 'benevolent despots' in Europe. See J. Addison, *Charles the Third of Spain*, 1900.

Charles IV (1748-1819), King of Spain, the second son of Charles III. He succeeded his father in 1788, but devoted his time to pleasure, leaving the gov. of the country to be administered by the queen and her lover, Godoy (q.v.). He was terrified by the excesses of the Fr. Revolution, and attempted by a policy of extreme reaction to prevent the growth of a 'reforming' party in Spain. He was a man of great credulity, and it seems possible that he never understood the relationship between Godoy and his queen. In 1808 he abdicated in favour of Joseph Bonaparte, and lived in exile until his death in Rome.

Charles I (Karl Franz Josef) (1887-1922), last Emperor of Austria-Hungary, eldest son of Archduke Otto and Princess Maria Josepha of Saxony, and became heir-presumptive to his great-uncle, Francis Joseph, in 1906. In 1911 he married Princess Zita of Bourbon-Parma. He succeeded to the throne, 21 Nov. 1916, in the middle of the First World War; he made unsuccessful efforts to conclude a separate peace in 1917. In Nov. 1918 C. renounced control of affairs of Austria, and, temporarily, of those of Hungary. He left Austria for Switzerland in Mar. 1919, and next month the Austrian Parliament formally deposed him. In 1921 he made 2 unsuccessful attempts to

regain the Hungarian throne, and d. in Madeira the following year.

Charles I and II, of Rumania, see CAROL.

Charles, Elizabeth, née Rundle (1828-1896), b. Tavistock, Devon. She was the author of many books of a semi-religious character, the chief of which, *The Chronicles of the Schönberg-Cotta Family*, 1864, is about Martin Luther, and has been trans. into most of the European languages, into Arabic, and many Indian dialects. Others of her books are *The Diary of Mrs Kitty Trelvelan*, 1865, dealing with the rise of the Methodists in England; *The Draytons and the Davenants*, 1867, about the Eng. Civil War; *On Both Sides of the Sea*, 1868, a tale of New England. Among her friends were Dean Stanley, Charles Kingsley, Jowett, and Fussy (q.q.v.).

Charles, Robert Henry (1855-1931), theologian, b. in co. Tyrone, N. Ireland; educ. at Queen's Univ., Belfast, and Trinity College, Dublin. He left parochial work in 1880 to devote himself to the studies which made him famous, choosing a line of research, the Testaments of the Twelve Patriarchs, till then little known and involving the acquisition of oriental languages. He began the series of these eds. in 1893 with *The Book of Enoch*, continued with kindred documents, and ended with the *Testaments of the Twelve Patriarchs* in Greek, with variants from the versions in Hebrew, Aramaic, Armenian, and Slavonic, in 1907. He was Schweich lecturer for the Brit. Academy, and received the first award of the academy's medal for biblical studies. His industry as an editor made him a master of the thought and doctrinal development of the age of the Apocrypha, as appears in his historical study, *A Critical History of the Doctrine of a Future Life*, 1899, and in *Religious Development between the Old and the New Testaments*, 1914. His ed. of *The Apocrypha and Pseudepigrapha of the Old Testament* was issued in 1913, and throughout the years of the First World War he laboured at his great work on the Book of the Revelation of St John, with a succession of students to assist him. This book is notable for positive pronouncements on points generally regarded as largely conjectural, and it roused the resentment of the advocates of literal inspiration; but, generally speaking, it has met with the widest commendation. C. was appointed to a canonry at Westminster Abbey in 1913 and became arch-deacon there in 1919.

Charles, Thomas (1755-1814), Welsh preacher and author. He early came under the influence of Rees Hugh, a disciple of Griffith Jones, and joined a Methodist society. He met many noted evangelical leaders at Oxford from 1775 to 1784; in the latter year became curate of a charge in Somerset. His opinions made it difficult for him to retain a post in the Estab. Church, and after 1784 he threw in his lot altogether with the Methodist Church. He did much valuable work in the introduction of Sunday schools, and

the printing and distribution of religious books in Welsh.

Charles Albert (1798-1849), King of Sardinia, the son of Prince Charles of Savoy-Carignano. In 1831 a revolution forced the king (Victor Emmanuel I) to abdicate, and C. A., who was regarded as a liberal by traditional monarchists, became regent for the new king, Charles Felix. He granted a constitution which was repudiated by the king, and he was forced into exile. In 1823 he fought in Spain, and in 1831 he succeeded Charles Felix. He attempted to reform the finances and administration of Piedmont, but was only partially successful. In 1848 he granted a liberal constitution, and in the same year declared war on Austria, and was badly beaten at Custoza. The following year he was beaten at Novara, and subsequently abdicated in favour of his son and retired to a monastery, where a few months later he died. *See* L. Cappelletti, *Storia di Carlo Alberto*, 1891; C. de Beauregard, *La Jeunesse du roi Charles Albert*, 1899; A. di Saluzzo, *Carlo Alberto della restaurazione all'avvenimento al trono*, 1926.

Charles Augustus (Karl August) (1757-1828), Grand Duke of Saxe-Weimar. His father d. when he was very young, and the duchy was administered by his mother until C. A. came of age in 1775. His reign is noted for the enlightenment of the policy which he adopted. Wieland had been his tutor, and he introduced Goethe to the court and into his councils, and allowed his people an unusual amount of civil freedom. His policy speedily made the univ. of Jena the most important in Europe. The revolutionary wars found him fighting in the ranks of the Prussian Army, and he fought against Napoleon until the Jena campaign forced him to join the confederation of the Rhine. Again in 1812 he was in arms against Napoleon, and continued so until the end. In 1815 he took part in the Congress of Vienna and pleaded hard for the recognition of the rights of the people. He granted a liberal constitution to his own people, and was one of the few princes who were not driven by the excesses of the Fr. Revolution to a policy of reaction.

Charles Edward, *see* STUART, CHARLES.

Charles Louis (1771-1847), Archduke of Austria and Duke of Teschen, the third son of the Emperor Leopold II; became one of the most distinguished generals of the Napoleonic period. He began his career as a soldier during the revolutionary wars, being at that time stationed in the Netherlands. He commanded a brigade at Jemappes, and during the subsequent campaigns proved himself a general of such ability that in 1796, after serving for a year with the army of the Rhine, he was given the chief command of that army. His campaign of 1796 was one of the most brilliant of the whole of the war. He defeated Jourdan twice during the year, and finally drove the French across the Rhine. Although in the following year he found Napoleon more than a match for him, he again showed his consummate

skill as a general in the manner in which he conducted the retreat of his armies. The campaign of 1799 found him again in command of the Austrian armies of the Rhine and again opposed to his old enemy Jourdan. He defeated the Fr. general twice during the year, and even tried conclusions successfully with Masséna, and once more he forced the French to retire over the Rhine. After this campaign ill health drove him for a short time into retirement in Bohemia, but he again commanded the Austrian armies during the short campaign which preceded the Hohenlinden, and after that battle concluded an armistice with the French. In 1805 he took up the command of the armies in Italy, but events in Germany soon drew him from there, where he had fought the battle of Caldiero and defeated Masséna. The peace which followed the disasters of Ulm and Austerlitz was used by the archduke to reorganise the Austrian forces. In 1809 he again became commander-in-chief of the Austrian Army, which he had not yet been able completely to reform. The struggles of the Austrians against Napoleon were not altogether unsuccessful, and the victory of Aspern had certainly a good moral effect on the rest of Europe. Aspern was followed by Wagram, where the Austrians were totally defeated, although not before they had made a most desperate struggle. This was the last battle in which the archduke took part. He lived the rest of his life in retirement, becoming Duke of Saxe-Teschen in 1822.

Charles Martel ('the Hammer') (c. 689-741), Frankish king, son of Pépin d'Héristal (q.v.), mayor of the palace under the later Merovingian kings, grandfather of Charlemagne. In 714 the Austrasian Franks chose him as their duke: by force of arms he united the kingdoms of Neustria and Austrasia, 720, becoming actual ruler of the Franks, the titular kings (among them Chilperic II and Clotaire IV) being merely his puppets. He fought against Saxons, Alemanni, and Bavarians, and rolled back the tide of Muslim conquest in the decisive battle between Tours and Poitiers, 732. For this crushing defeat of the Saracens he was given his surname, and looked upon as the saviour of Christendom. C. tried to convert Saxony and Frisia to Christianity and helped St Boniface in his missions. He again drove the Saracens out of Burgundy and Languedoc, 737. On his death he left the kingdom to his sons, Carloman and Pépin le Bref.

Charles of Blois (1319-64), Duke of Brittany, also known as C. of Châtillon. A nephew of Philippe VI of France, he married the daughter of Guy of Brittany and thus acquired a claim to succeed to the Duchy of Brittany. On the death of John III, Duke of Brittany, in 1341, this claim matured but was disputed. C., aided by his uncle, took prisoner his rival, John, Count of Montfort-l'Amaury, who was supported by Edward III of England. However, C. soon suffered a reverse of fortune and was himself taken prisoner in 1347. He was released in 1356 and

continued the war against his old rival's son, also called John. C. was killed at the battle of Auray. A man noted for his personal piety, he was beatified by the Rom. Church in 1904.

Charles of Orleans, *see* ORLEANS, CHARLES, DUKE OF.

Portrait by Anthony Armstrong-Jones
H.R.H. PRINCE CHARLES

Charles Philip Arthur George, Duke of Cornwall (1948-), was b. at Buckingham Palace on 14 Nov., the first child of Princess Elizabeth (subsequently Queen Elizabeth II) and the Duke of Edinburgh. On the death of his grandfather, George VI, in 1952 he became heir-apparent to the Brit. throne, and Duke of Cornwall. In the peerage of Scotland he is Duke of Rothesay, Earl of Carrick, and Baron Renfrew, Lord of the Isles, and Prince and Great Steward of Scotland.

Charles the Bold (le Téméraire) (1433-1477), Duke of Burgundy, son of Philip the Good. In 1465, owing to his father's illness, he became the practical ruler of the duchy, and adopted at once his policy of opposition to the centralising aims of Louis XI. He succeeded after hard fighting in wresting from Louis XI, by the treaty of Conflans, some of the privileges which Louis had gained some years earlier, and also married Louis's daughter, Catherine. Just before the death of his father, he had to subdue a serious revolt of the townsfolk of Liège, a revolt which was renewed when he succeeded to the duchy (1467). Negotiations to reach some kind of settlement with Louis took place at Péronne, with little effect, and in the following year Louis seized some towns on the Somme, whilst C. invaded France and laid it waste as far as Rouen. From 1470 onwards C. was intent on wider schemes than simply checking the ambition of Louis. He

desired the restoration of the middle kingdom, and aspired to the crown himself. He had added to his ter. and power, but in so doing he had made many enemies. He had offended the emperor, he was at enmity with the Lorrainers and Swiss, and finally, after sev. defeats, he was overthrown and slain before Nancy. The death of C. extinguished the male line of the Dukes of Burgundy, and with it the grandeur and importance of the duchy. C. had left an only daughter, Mary, who succeeded to all the dominions of her father out of France. She married the Archduke Maximilian, through whom her Flem. possessions descended to the Sp. branch of the house of Austria. *See* lives by R. Putnam, 1908, and J. Bartier, 1944.

Charles's Law, *see* GAS AND GASES.

Charles's Wain, *see* URSA MAJOR.

Charleston: 1. Cap. city and seaport of C. co., S. Carolina, U.S.A., standing on a low tongue of land between the R.s Ashley and Cooper, 7 m. from the Atlantic. The 2 rivs. unite just below the city and form a spacious harbour, about 15 sq. m. in area. Across the entrance is a sandbar with only about 18 ft. of water, but having a deeper channel near Sullivan's Is. By recent improvements vessels of 24-ft draught can safely enter. The city is regularly and handsomely built, retaining many of the features of old S. architecture, and having a profusion of trees and gardens. Standing as it does in a rich cotton and rice dist., C. has a large trade, and is the chief commercial city of S. Carolina. It is the terminus of railway and transportation lines, and steamships run regularly to and from the chief ports of the U.S.A., the Antilles, S. America, and Europe. The chief exports are cotton, rice, phosphate, naval stores, lumber, and grain. There are machine-shops, shipyards, dry docks, and manufs. of cotton, petroleum, chemicals, pulp and paper products, steel, ferro-alloys, asbestos, paint, textiles, canned goods, cigars, flour, baggage, and fertilisers, the last being the main industry owing to the large deposits of lime-phosphates found on the Ashley R. C. is the seat of a Catholic bishop, the College of C. (1785), the Medical College of S. Carolina, and the Citadel (military college). Here also are a seaplane base and navy yard. The city was founded by the British under Wm Sayle about 1670. The Civil war began in 1861 with the capture by the S. Carolinians of Fort Sumter, on an is. 1 m. below the city. It suffered terribly in an earthquake in 1886. Pop. 70,175.

2. Cap. of W. Virginia, U.S.A., and co. seat of Kanawha co., on the N. bank of the Kanawha R., at the mouth of the Elk, about 200 m. E. of Cincinnati, Ohio. It is the centre of a dist. containing bituminous coal, oil works, iron and salt mines. The manufs. include axes, chemical fire-extinguishers, lumber, furniture, and woollen goods. Huge chemical industries utilise the resources of salt brine, coal, oil, gas, etc. Pop. 73,500.

Charlestown: 1. Fishing vil. and seaport of Cornwall, England, 2 m. SE. of

St Austell, exporting china clay. Pop. 500.

2. Chief tn of Nevis Is., Leeward Is., W. Indies. Pop. 1100.

3. Originally a city in the state of Massachusetts. It is now, however, a part of Boston, and contains the Bunker (or Breed's) Hill monument (221 ft high) commemorating the battle of that name.

Charlet, Nicolas Toussaint (1792-1845), Fr. painter and draughtsman, b. Paris. He served in the National Guard in 1814, but lost his employment as clerk in the *mairie* (1816) owing to the political changes. He then studied art under Gros, and was particularly successful in military subjects ('Grenadier de Waterloo,' 1817) and sketches of children. See Lu Combe, *Charlet, sa vie et ses lettres*, 1858.

Charleville: 1. See RATHLUIRC.

2. Tn in Queensland, Australia, 483 m. W. of Brisbane, centre of sheep-grazing area. Pop. 4510.

3. Fr. tn in the dept of Ardennes, on the Meuse, opposite Mézières. It was founded in 1606 and built to a plan. It has manufs. of metal goods, firearms, and nails. Rimbaud (q.v.) was b. and is buried here. Pop. 19,500.

Charlevoix, Pierre François Xavier de (1682-1761), Fr. Jesuit missionary and traveller, b. Saint-Quentin; joined the Jesuits, 1698; taught in their college at Quebec, 1705-9; travelled up the Great Lakes and down the Mississippi to New Orleans, 1720-2. Wrote a jour., sev. hist., and *Histoire et description générale de la Nouvelle France*, 1744 (Eng. trans. by J. G. Shea, 1866-72).

Charlieu (anc. Carilocus), Fr. tn in the dept of Loire, on the Sornin. It has the remains of an 11th-cent. priory, and many old buildings. Silk is manuf. Pop. 5000.

Charlock. There are 2 species: *Sinapis* (synonym *Brassica*) *arvensis*, also known as Wild Mustard, a yellow-flowered, troublesome weed of arable land, and *Raphanus raphanistrum*, White C., or Wild Radish, or Runch, a weed of non-calcareous soil; both of the *Cruciferae* family. Now controlled by spraying with selective weed-killers or acids.

Charlotte (1896-), Grand-Duchess of Luxembourg and Duchess of Nassau. She became Grand-Duchess in 1919 on the abdication of her sister; she married Felix of Bourbon-Parma in the same year. During the Ger. occupation of Luxembourg during the Second World War C. went into exile in England with her family. The heir-presumptive is her son, Prince Jean, b. 1921.

Charlotte (Sophia) (1744-1818), Queen of Great Britain and Ireland, wife of George III, whom she married in 1761. She was a Princess of Mecklenburg-Strelitz. The marriage was extremely happy, the queen devoting herself entirely to her large family (she bore George 15 children) and taking no part in public life.

Charlotte Amalie, the only tn on the is. of St Thomas (q.v.) in the Virgin Is. group (belonging to the U.S.A.). It was so

named after the consort of King Christian V of Denmark, to which country the is. belonged up to 1917, when it was purchased by the U.S.A. The U.S. Geographic Board decreed on 5 Jan. 1921 that the tn would in future be known as St Thomas, but its more picturesque name was restored to it in 1937. The harbour is one of the finest in the W. Indies; there is a large fuelling station, a floating dock, an international cable station, and an airport. Bay rum, rum, and handicraft products are made in the tn. Pop. 10,400.

Charlotte Augusta, Princess (1796-1817), only child of George, Prince of Wales (afterwards George IV), and Caroline of Brunswick. Her parents separated when she was a few months old, and while she lived she was a source of contention between them. On 2 May 1816 she married Prince Leopold of Saxe-Coburg, and died in childbirth on 5 Nov. of the following year. C. was extremely popular. See lives by Lady Rose Weigall, 1874, and G. J. Renier, 1932. There is a biography by Lady S. M. Weigall, 1874.

Charlotte, co. seat of Mecklenburg co., N. Carolina, U.S.A., on Sugar Creek, in the SW. of the state, 175 m. SW. of Raleigh. It is the terminus of sev. railways, and has manufs. of cotton and woollen goods, hosiery, machinery, electrical equipment, dyestuffs, cottonseed oil, fertilisers, flour, paper boxes, and furniture. A branch mint was estab. here in 1837, and the Queens College (women) in 1857 and Johnson C. Smith Univ. (for coloured students) in 1867. Pop. 134,042.

Charlottenburg, former tn of Brandenburg, incorporated in 1920 into Berlin (q.v.). It is 5 m. W. of the city centre, and is a residential as well as industrial dist. It grew up around the palace built here in 1696 by Frederick I (q.v.) of Prussia for his second wife. In the mausoleum of the palace park are the tombs of Frederick William III and Queen Louisa (qq.v.). C. was heavily damaged during the Second World War in allied air-raids and during the Russian advance into Berlin. Chemicals, glass, paper, and iron goods are manuf.

Charlottesville, city in (but independent of) Albemarle co., Virginia, U.S.A., on R. Rivanna, 65 m. NW. of Richmond. It is the seat of the univ. of Virginia, founded by Thomas Jefferson in 1819, which has a fine natural hist. museum, an observatory, and a library. It is also the seat of the Institute of Textile Technology. It manufs. textiles, machinery, wood products, clothing, beverages, and metal products, and there is soapstone and slate quarrying. Pop. 25,965.

Charlottetown, cap. of Prince Edward Is., Canada, situated on the S. side of the is., in Queen's co., on Hillsborough Bay, possessing a large and safe harbour. Its chief buildings are 2 hospitals, a sanatorium, St Dunstan's Basilica, and the Federal and Prov. Buildings. Its manufs. include canned goods, woollens, powdered milk, and butter. It has an airport, also a meat packing plant and one for

mixing commercial fertilisers. Pop. 16,446.

Charlton, dist. of London, in the NE. of the bor. of Greenwich. C. House, built 1607-12, is a fine Jacobean building. Spencer Perceval, the only Eng. prime minister to be assassinated, is buried in the par. church.

Charm (through Fr. from Lat. *carmen*, a song), form of words, generally a verse, which when said or sung is supposed to have power to avert evil or bring good luck. When worn in written form about the person it is called an amulet. The meaning of the term has been extended figuratively to pleasing qualities of appearance or manner. See AMULET and INCANTATION.

Charmey, vil. in the canton of Fribourg, Switzerland, 15 m. S. of the tn of Fribourg. A favourite tourist resort, and the centre of the Gruyère cheese industry.

Charmouth, par., vil., and watering-place in W. Dorset, England, 6 m. SE. of Axminster. Pop. 700.

Charnel-house, place for the deposit of bones thrown up in digging. Sometimes a separate building, but often a part of the crypt of a church.

Charnock, Job (d. 1693), Eng. founder of Calcutta. Arrived in India about 1655, and entered the E. India Co. He refused to move when besieged by the Mogul's viceroy at the vil. of Sutanati, and finally obtained the grant of the site upon which Calcutta now stands.

Charnwood Forest, tract in the NW. of Leics. England. Though no longer thickly wooded, C. F., with its outcrops of pre-Cambrian rocks and rugged outline, is an area of considerable charm. It lies over 400 ft. above sea level, and its highest point is Bardon Hill (912 ft). Geologically it is an area of great interest. The soil is of only moderate quality and at the time of the Norman Conquest C. F. was an uninhabited waste; settlement did not begin to take place until the 12th cent. It contains granite quarries from which come the Mountsorrel setts and the Whittle Hill houses, and the Leics. coal-mines lie on the W. and NW. fringe. It was enclosed in 1829, by Act of Parliament passed 21 years earlier. In the forest are the remains of Ulverscroft Priory, founded c. 1153, but largely dating from the 14th cent. Part of the ruins are now incorporated in a farm. Also in C. F. is the Cistercian Abbey of Mount St Bernard.

Charolais, or **Charollais**, old dist. of France, in the S. of Burgundy, now part of the dept of Saône-et-Loire. The counts of C. took their title from it. The dist. now is famous for its cattle. Charolles (q.v.) was the cap.

Charolles, Fr. tn, cap. of an arron., in the dept of Saône-et-Loire, at the confluence of the Arceonne and the Semence. The ruined hill-top castle of the Counts of Charolais (q.v.) has been incorporated into the tn hall. There is a cattle market, and pottery and light metal manufs. Pop. 3400.

Charon, son of Erebus and Nyx, ferried the souls of the dead across the

riva. of the lower world. Each shade paid him one obolus, which was placed in the mouth of the body before burial.

Charon of Lampasus, Gk. historian, probably of the early 5th cent. BC, and certainly before Herodotus. He is known to have been alive in 464 BC. His works, which include hist. of Lampasus, Crete, and Persia, have survived only in fragments, which have been ed. by F. Creuzer (Heidelberg, 1806) and by O. and T. Müller (Paris, 1841). He is mentioned by Tertullian and Suidas.

Charondas (fl. c. 500 BC), celebrated Gk. law-giver of Catana, Sicily. His laws were adopted by the Chalcedonian colonies in Italy and Sicily, and according to Aristotle their chief import lay in the precise rules against perjury, fines on judges who neglected their duties, etc. The story of his suicide because he broke one of his own laws is also told of Diocles and Zaleucus.

Charonne, dist. in the W. of Paris, a former tn joined to the city in 1860. In the churchyard of Ste-Marguerite's Church here is the supposed grave of Louis XVII (q.v.).

Charpentier, Gustave (1860-1956), Fr. composer, b. Dieuze, 25 June. After studying at the Lille Conservatoire, he was awarded a scholarship to enable him to continue study in Paris, where he went in 1881. Six years later he received the Prix de Rome for his cantata *Didon*. In 1902 he founded the 'Cercle Mimi Pinson' and the Popular Conservatoire to give free courses of popular music and in classical dancing. He succeeded Massenet in 1912 as a member of the Institute. His fame rests mainly on his opera *Louise*, 1900. His appeal is essentially popular and romantic, and he tries, not without success, to give social questions an appropriate musical setting, but *Julien*, a sequel to *Louise*, was a failure in 1913. Among his other works are *Impressions d'Italie* (orchestral suite), 1888, and *La Vie du poète* (symphonic drama), 1892. His songs include *Poèmes chantés*, 1894, *Les Fleurs du mal* (from Baudelaire), 1895, and *Impressions fausses* (from Verlaine), 1895. Consult Marc Delmas, *Gustave Charpentier*, 1932.

Charpentier, Jean de (1786-1855), geologist, b. Freiberg in Saxony. His fame as a geologist rests on his book *Essai sur les glaciers, et sur le terrain cratérique du bassin du Rhône*, 1841, in which he extended and proved the theory, which had previously been evolved by Venetz, that the blocks on the slopes of the Alps and Jura, although of quite different sorts and periods of rocks, had been brought there by glaciers, and left when the glaciers themselves disappeared.

Charpentier, Marc-Antoine (1634-1704), Fr. composer, b. and d. Paris. Studied painting in Italy but gave it up for music, which he studied under Carissimi, whose work C. greatly admired. He was master of music in the household of Mlle de Guise, and he also gave music lessons to the Duke of Orleans, Regent of France. Became chapel master of the Sainte-Chapelle in 1698, and remained so till his

death. He was associated with Molière in the performance of some of his plays. His *Médée*, described as 'une tragédie lyrique,' words by Thomas Corneille, was performed in Paris (1693) with success, yet was never repeated. His other works include the operas *Circé* and *Amours d'Acis et Galatée*, but he is chiefly remembered for his oratorios, in the style of his *It. master*, and his masses.

Charr, or **Char**, name of sev. species of *Salvelinus*, a genus of the family Salmonidae; they differ from their allies in having teeth on the head only of the vomer. The deeper parts of fresh-water lakes are their favourite habitation; *S. alpinus*, the N. C., is common to England and Switzerland; *S. willughbi* is a native of Lake Windermere; and *S. fontinalis* is the Amer. brook trout.

Charrière, Isabelle Agnes van Tuyll, Madame Saint-Hyacinthe de (1741-1803), Swiss writer, b. Utrecht, Holland; married her brother's tutor and settled at Colombier, near Lausanne. Her *Lettres neuchâtelaises*, 1784, and *Lettres de Lausanne*, 1785, are valuable documents of the cultural hist. of the time. From 1789 to 1794 she was the close friend of Benjamin Constant. See P. Godet, *Mme de Charrière et ses amis*, 1904.

Charrington, Frederick Nicholas (1830-1938), social reformer, b. Bow, son of Frederick C., a wealthy brewer. He gave up the succession to a fortune of over £1,000,000 in order to devote his time to temperance work. In 1885 he founded the Tower Hamlets Mission; he made the Great Assembly Hall in the Mile End Rd a centre of Christian work in the E. end of London. One of the original members of the L.C.C., 1889-95. Prominent in an attack on music-halls. See C. A. E. Ranger-Gull, *The Great Acceptance; the Life Story of Frederick Charrington*, 1912.

Charron, Pierre (1541-1603), Fr. philosopher, b. Paris, son of a bookseller. An unsuccessful lawyer, he sought advancement through the Church and became preacher-in-ordinary to Marguerite, wife of Henri IV. In 1594 he pub. *Les trois vérités*, advocating the Catholic faith; but his notorious treatise, *De la Sagesse*, 1601, in the preparation of which he was largely indebted to his friend Montaigne (q.v.), reveals a strong atheistic current, and has caused C. to be recognised as the founder of modern secularism. See W. E. H. Lecky, *Rationalism in Europe* (2nd ed.), 1910.

Charruas, tribe of S. Amer. Indians, noted for their warlike propensities. At one time they inhabited Uruguay and part of S. Brazil, and Gauchos, who now occupy that part, have a strain of Charrua blood in them. They were well-made, dark-skinned people, and used horses in their wars with the Spaniards, their weapons being the bolas, or weighted lasso, and bows and arrows. Juan Díaz de Solís lost his life at their hands, 1516.

Charadda, tn of W. Pakistan, 14 m. NW. of Peshawar. It is supposed to be the same as Pushkalavati, which was in existence at the time of Alexander the Great's invasion, and the Penkelesos mentioned by Gk historians.

Chart, or **Sea-chart**, marine map, showing the coasts, is., lighthouses, and ships, soundings, currents, etc., of a part of the sea, compiled for the use of navigators. C.s seem to have been made as early as the 13th cent., the invention being variously ascribed to the Italians and to Prince Henry of Portugal. The first C. to recognise the roundness of the earth was produced by Mercator in 1569, and his system was improved by Edward Wright in 1594. Modern C.s are prepared in Great Britain by the hydrographic dept. of the Admiralty. They are supplied gratis to the navy and sold to the merchant service through agents. Valuable C.s of the coasts of the U.S.A. have been pub. since 1807 by the Coast Survey. C.s are constructed with the greatest possible accuracy, and the use of recognised symbols admits of the inclusion of considerable detail. Prominent features on land which may serve as landmarks, shorelines at high and low water, details of tide in harbours, the proper courses for entering ports and channels, and the buoys marking them, etc., are shown. Signal stations and lights receive detailed attention, lights being shown by a yellow circle surrounding a red dot, with abbreviations describing whether the light is fixed, flashing, or revolving. Deep-water soundings are given in fathoms, and shallow-water soundings in feet. The character of the sea-bottom is also indicated, and sandbanks, bars, rocks (hidden, awash, or protruding), currents, and sunken wrecks are clearly shown. Lines of lat. and long. are drawn in, and sev. compass-roses, showing magnetic variation, appear on different parts of the C. The Mercator projection is generally used, but polyconic C.s are issued of small areas, and the gnomonic projection is used for mariners wishing to follow great-circle courses. After the Second World War, the hydrographic dept. of the Brit. Admiralty commenced the task of recharting the oceans of the world with the assistance of the 'echo-sounder,' a device based on radar (q.v.), which records electric impulses reflected off the sea-bed, thereby giving a picture of its configuration. The aeroplane is also employed in modern chart-making in shallow waters. Simultaneous vertical air pictures on panchromatic film are taken by dual cameras, fixing the depth by contrast to within 3 ft. See Hydrographic Dept., *Charting the Seas in Peace and War* (H.M.S.O.), 1948.

Charter (Lat. *charta*, paper). The usual import of the word indicates any formal writing in evidence of a contract, or agreement between persons. In England the word is no longer used to signify a written document, though in France it is still in use. A C. is nowadays a document usually issued by the Crown to a corporation or institution conferring certain privileges and functions (e.g. professional bodies such as Chartered Accountants' Institute, and univs.). In Scotland, a C. is the written evidence of a grant of heritable property, under certain conditions enforced by the feudal law, i.e.

that the person receiving shall pay at stated times a sum of money to, or perform certain duties for, the person conferring the property.

Charter, the Great, *see* ENGLISH HISTORY and MAGNA CARTA.

Charter-party (Fr. *charte-partie*, divided deed, one given to each party concerned), in maritime law a contract by which the owner or master of a ship lets the ship or part of her to a second party for the purpose of conveying goods from one port to another. It is one form of the contract of affreightment, the other being the bill of lading (used when the goods shipped form only part of the intended cargo). A C. may be a lease of the vessel (the charterer then assuming entire charge, while the master is only his agent), but more often it merely gives the shipper permission to have his cargo conveyed in the chartered vessel, the master assuming the responsibilities of a common carrier. Usually the C. describes the contracting parties, the ship, and the voyage. The shipowners state the ship is seaworthy, will take the cargo at a certain charge, and make the voyage as quickly as possible, delivering the cargo within a fixed time. The freighter agrees to load and unload within a certain number of lay or running days. The rate and time of payment for the freightage, and date of the beginning of demurrage, are also stated. The contract may be for a definite time, or for definite voyages. Perils of the sea for which the shipmaster declines to be responsible are noted down. *See* Scrutton, *Contracts of Affreightment as expressed in Charter-parties and Bills of Lading* (16th ed.), 1955.

Chartered Accountants in England and Wales, Institute of, incorporated by Royal Charter in 1880. Membership, which exceeds 19,500, is open only to persons who have passed the Institute's professional examinations and served in England or Wales under articles with a member practising as a public accountant. The normal period of service is 5 years, but a graduate of a univ. of the U.K. need not serve for more than 3 years. Members use the description 'Chartered Accountant' which has become a hall-mark of professional integrity and ability in business and finance. The Royal Charters confer the right to use the distinctive letters F.C.A. and A.C.A., denoting fellow and associate respectively. The H.Q. of the Institute are at Moorgate Place, London, E.C.2. *See also* ACCOUNTANT and INCORPORATED ACCOUNTANTS, SOCIETY OF.

Chartered Companies. The common element in C. C. at all stages of their development is the possession of a special charter from the Crown, granting them certain trading privileges in a particular locality, to be exercised subject to a varying degree of control by the Crown.

There appear to be 3 phases in the development of C. C. *First*, associations of individuals, emanating from early trading guilds, and enjoying a monopoly of trade in the exportation of Eng.

products to other European nations. England first granted a charter to a foreign country, the Hanseatic League, and, later, charters were granted to Eng. companies trading in the Baltic, Russia, and Turkey. *Secondly*, chartered associations possessing delegated sovereign powers of extraterritorial jurisdiction in the countries in which they traded. These came in consequence of the impulse given to foreign trade by the discovery of the New World and the opening out of trading routes to the Indies and America. Their object was to foster commercial intercourse with distant countries. The Russia Co., the Turkey Co., the Eastland Co. developed such relations with Russia, Turkey, and Persia. But the more important were the Hudson's Bay Co., and a number of other C. C. that opened up the Brit. N. Amer. colonies, and the famous E. India Co. The significance of these companies lies in the part they played in the building up of the foundations of the Brit. colonial empire through their acquisition of ter. either by the process of planting and settling in unoccupied regions or by conquest or cession of occupied land, as in the case of India. *Thirdly*, the purely joint-stock companies possessing no delegated sovereign powers, and trading under the direct control of the Brit. Gov. This phase of their development, or rather revival, was the expression of the desire for colonial expansion and commercial prosperity universally prevalent among the European nations towards the end of the 19th cent. The prin. Eng. C. C. formed during this period were the Royal Niger Co., chartered in 1886 and bought out by the gov. in 1899 for £865,000; the Imperial Brit. E. Africa Co., formed in 1889 to exploit Uganda and neighbouring districts, which fell into financial straits in 1892, with the result that Uganda became a Brit. protectorate some 2 years later; the Brit. S. Africa Co., chartered in 1889, and owing its origin to the activities of Cecil Rhodes, who secured various mining concessions from Matabele chiefs; and the Brit. N. Borneo Co., incorporated in 1881 to take over the concessions and ter. acquired from the sultan by a syndicate formed in Labuan in 1878. Some of the C. C. of the latter 2 places still exist as companies, but in most cases they have been merely a step, though an important one, in the transition from exploitation to colonial expansion, and their rights and treaties have for the most part been bought out by the Crown. The greater degree of success of the later companies in this direction was due to their more economic organisation, their control of a larger capital, enjoyment of better credit, their closer surveillance by the Brit. Gov. with a view to safeguarding the rights of native rulers, and the absence of any monopoly in trading rights. The rights of the Brit. N. Borneo Co. were bought out by the Crown in 1946 when N. Borneo became a crown colony.

Charterhouse, corruption of *Chartreuse*, formerly a religious house of the order of Carthusians (q.v.). The name occurs in

sev. places in England where members of the order estab. themselves, the most celebrated being the C. in Clerkenwell, London. It was founded in 1371 by Walter de Manny, famous as a soldier under Edward III, beside a chapel he had built in 1349, but Michael Northburgh, Bishop of London (d. 1361), is entitled to be regarded as co-founder. The monastery became noted for the austere purity of its life. The last prior, John Houghton, and the monks were barbarously executed (1535) for denying Henry VIII's headship of the Church. After the Dissolution the property passed through sev. hands, and much additional building was carried out until the C. was bought by Thomas Sutton (1532-1611), a native of Knaith, Lincs, who had made an enormous fortune out of coal, and was reputed the richest commoner in England. In 1611 he founded and endowed a hospital and free school, but the exact objects of the foundation were determined after his death in the same year. The hospital was set up for 80 'gentlemen' soldiers, merchants, or servants of the Crown, who had become poor through misfortunes, and the school for 40 poor boys. The number of men admitted to the hospital, though embracing more professions than in the original scheme, has progressively dwindled to the present figure of 17, but is to be increased to about 40. The school has become one of the great public schools of England, largely owing to Wm Haig Brown, appointed headmaster in 1863; to him was chiefly due the decision to move the school to Godalming, Surrey, in 1872, when the buildings were sold to the Merchant Taylors' School (q.v.). Scholars, until then nominated, were henceforth elected by examination. Latterly C. has widened its education beyond the traditional classical curriculum. Among its scholars have been Addison, Steele, and John Wesley, but the most notable was Thackeray, who introduced the school and hospital into some of his works, particularly *The Newcomes*. There are at present over 600 scholars. The original C. buildings, containing the finest Elizabethan hall in London, were severely damaged in the Second World War, but are being restored. See G. S. Davies, *Charterhouse in London*, 1921, and D. Knowles and W. F. Grimes, *Charterhouse: the Medieval Foundation in the Light of Recent Discoveries*, 1954.

Charteris, Leslie (1907-), Amer. novelist, b. Singapore, son of a Chinese surgeon and an Englishwoman. Educ. at Rossall and Cambridge, he was by turns rubber planter, miner, gold prospector, pearl-fisher, seaman, travelling showman, and bar-tender. His stories about a gentleman-burglar nicknamed 'the Saint', began in 1930 with *Enter the Saint*, became extremely popular, and ran to some 2 dozen vols. In 1941 C. became a United States citizen.

Charters, Town, royal grants of certain privileges, rights, or immunities made to tns from early times. William I, seeing the importance of the tns, included most

of them in the royal demesne, and the practice arose of granting C. of incorporation, with privileges. Such privileges were, generally, the right of independent jurisdiction and the right of paying *firma burgi*, or a fixed sum as rent to the king in lieu of submitting to the exactions of the sheriffs. These C. were granted to the 'fully qualified members of the township or hundred court of the town,' either by the king, or, in the case of tns belonging to nobles, by the owner; thus Leicester obtained a charter from its earl and Beverley from Archbishop Thurstan. Most of the large tns seem to have been vested in the Crown in the time of Henry I, and by the reign of Henry III had succeeded in obtaining a clear recognition of their privileges and immunities. The readiness with which the tns undertook municipal gov., and the ease with which they were incorporated by charter, were due to the fact that they already had a more or less complete organisation in the guild system (*Stubbs's Select Charters*). When in course of time the election of the mayor of a municipal bor. passed from the whole body of burgesses to the aldermen and councillors, the latter formed themselves into a close corporation, ignored the rights of their fellow townsmen, and secured their position by applying for and obtaining C. of incorporation framed according to their wishes and modifying any charter or C. which the tn might already have possessed. This restrictive tendency was carried still further towards the end of the 15th cent. The rights of the freemen disappeared; the corporation came to be looked upon as the owner of the tn property, and developed into an exclusive oligarchy; and even the election of members of Parliament was, in some cases, entrusted into their hands. In this way the Crown could secure the return to the Commons of its own candidates; but the independence shown by the corporations under the Stuarts moved Charles II to remodel their C. He proceeded against the corporations by writ of *quo warranto* (q.v.), calling on the corporation to show by what authority it exercised its prerogative powers (it may be noted that in 1890 an Act of 2 William & Mary c. 8 declared all these legal proceedings null and void). The C. of the tns surrendered through the instrumentality of the notorious Judge Jeffreys were replaced by others 'framing the constitution of these municipalities in a more oligarchical model and reserving to the Crown the first appointment of those who were to form the governing part of the corporation' (Hallam). The very use of the word oligarchical shows that the king was concerned not for the rights of the burgesses but for his own powers. James II, in the hope of conciliating the nation over the abrogation of its privileges, restored a number of the old C.; but this in no way improved the position of the burgesses as a whole, and throughout the 18th cent. the principle of the close corporation was maintained and all the bor. patronage was in the hands of the cornellors, who almost

invariably neglected their duties to the tn in order to further their own private interests. This corrupt state of things continued until the Municipal Corporations Act of 1835, which made provision for the election of the tn councillors by the burgesses or resident ratepayers. The Municipal Corporations Act, 1882, consolidated the law on the subject, which is now incorporated in the Local Government Act, 1933. See LOCAL GOVERNMENT; MUNICIPALITIES; and under the names of the various large cities and tns of Britain.

Charters Towers, tn in Queensland, Australia, 82 m. SW. from Townsville. Industries: pastoral (cattle), dairying, fruit growing, and mining. Pop. 6965.

Chartier, Alain (c. 1385-1433), Fr. poet and political writer, b. Bayeux, studied at the univ. of Paris. His first poem was *Le Livre des quatre dames*; his *Belle Dame sans merci*, 1426, was trans. into English by Sir Richard Ros about the middle of the 15th cent. He was made secretary to the dauphin, afterwards Charles VII. In 1422 he wrote his famous prose work *Quadrilogue invectif*, appealing to national patriotism to combine against the common enemy. By his eloquence he cheered his countrymen with the belief that the cause of France was not lost. His satire on the court, *Le Curial*, originally written in Latin, was trans. by Caxton, 1484. He attacked the vices of the clergy in the *Livre d'espérance*, 1429, and his *Breviaire des nobles* was studied by the youthful members of every noble household. His influence on Clément Marot, John Lydgate, and others was great. See E. J. Hoffman, *Alain Chartier*, 1942.

Chartists, name given to a body of political reformers (largely working men) formed in England about 1838. Discontent and disappointment were felt among the workers of Britain after Grey's reforms and the Bill of 1832, which did not enfranchise the working class, and this resulted in the movement known as Chartism, from the document or charter in which the agitators presented their demands publicly. In 1838, 6 members of the House of Commons held a conference with representatives of the Workingmen's Association, and together they drew up the People's Charter for alleviating the sufferings of the artisans and labouring classes. They petitioned for (1) universal suffrage (of men), (2) abolition of the property qualification for a seat in Parliament, (3) ann. Parliaments, (4) equal representation, (5) payment of M.P.s, (6) vote by ballot. Among the chief Chartist leaders were Feargus O'Connor, Thomas Attwood, the Rev. J. R. Stephens, Richard Oastler, Wm Lovett and Henry Vincent (both working men), Ernest Jones, and Thomas Cooper. The *Northern Star* became the newspaper organ. Members of the extreme section favoured resort to arms, or popular risings and riots, if their demands could not be obtained by peaceable methods. This section of the C. were called physical-force men; but

the more moderate C., who advocated only constitutional agitation, were in the majority. Their demands were adopted from earlier reformers, John Cartwright's (q.v.) *Plan of Reform*, 1776, and the Duke of Richmond's Bill, 1780, known as the People's Rights measure. The struggle of the C. may be divided into 2 periods—1836-9, aiming merely at industrial amelioration, and 1840-8, when the extremists gradually took over leadership, and the movement became more revolutionary and lost much moderate support. The C. refused to support the Anti-Corn Law League, as helping only the middle classes. Disturbances were most frequent in the N. Finally it was announced that a great demonstration was to be held on Kennington Common. The Gov. forbade the procession, and Wellington posted troops to guard London. But the demonstration and the Chartist petition were a failure. As a party the C. disappeared after 1849, the movement declining partly owing to improved conditions of labour, partly to the legislative concessions made in reform Bills, and partly to internal dissensions in the party itself. See M. Hovell, *The Chartist Movement*, 1920; J. L. and B. Hammond, *The Age of the Chartists, 1832-1854*, 1930; G. D. H. Cole, *Chartist Portraits*, 1941.

Chartres, Fr. city, cap. of the dept of Eure-et-Loir, and chief tn of Beauce (q.v.), on the Eure, 55 m. SW. of Paris. It was burnt by the Normans in 858, but withstood a Norman siege in 911. In 1417 it fell into the hands of the English, who lost it again, however, in 1432. In 1591 it was taken by Henry IV (q.v.), who was crowned in the city in 1594. During the Franco-Ger. war it was captured by the Germans and was an important centre of operations. It was again in Ger. hands in the Second World War; it fell to the troops of Gen. Patton (q.v.) on 17 Aug. 1944. C. is in 2 parts—the upper and the lower tns—which are connected by very steep roadways. C. is famed for its wonderful cathedral, Notre Dame, founded in the 11th cent. by Bishop Fulbert, which is regarded by many as the most perfect of the Gothic cathedrals of France. The main part of the structure was built in the years 1194 to 1225. There are fine rose-windows, doors, and statuary, and there are 2 magnificent spires, of which the *clocher vieux* dates from the years 1145-65, and the *clocher neuf* (the higher—371 ft—and more richly designed spire) was begun in 1134 and completed in the 16th cent. C. has also other medieval churches and some fine old houses. There is an important grain market, and there are metal, wood, and tanning industries. Pop. 26,400. Its Rom. name was Autricum.

Chartreuse, La Grande, Carthusian monastery, founded in the year 1084 by St Bruno (q.v.). It is situated in a wild, picturesque valley in the Fr. dept of Isère, about 13 m. N. of Grenoble (q.v.). Its name was derived from a neighbouring vil. called *Cartusia*, now known as St-Pierre de C. The original monastery, built to the N. of the present site, was

ruined in an avalanche in 1132, and a new monastery was constructed on the spot occupied to-day. This second edifice was destroyed by fire in the 17th cent., and the present buildings date mainly from that time. The 4 halls were intended for the entertaining of the priors of other monasteries in France, Burgundy, Germany, and Italy. The chapel dates from the 15th cent. (though the vaults were rebuilt in the 17th cent), and the great cloister belongs to the 14th and 16th

first Republican governor of Ohio, which position he held from 1855 to 1859, but was unsuccessful as Republican candidate in the presidential election of 1860. From 1861 to 1864 he was secretary of the treasury, managing the country's finances with the greatest ability and credit during the years of the Civil war. The estab. of a national banking system and the issue of treasury notes ('greenbacks') were 2 of his most successful measures. In 1864 Lincoln appointed him chief justice of the

CHARTRES CATHEDRAL

E.N.A.

cents. The monks of C. had to leave the monastery in 1795, and did not return until 1816. They were expelled again in 1903, and reoccupied the monastery in 1940. The famous liqueur called C. is made by the monks; the proceeds from its sale are used for the upkeep of Carthusian monasteries, and in the maintenance of various charities. See CARTUSIANS.

Chartreuse Liqueur, see LIQUEUR.

Charybdis, see SCYLLA AND CHARYBDIS.

Chase, John (1810-79), water-colour painter, *b.* London; was a pupil of Constable. One of his best-known works is of the interior of Westminster Abbey.

Chase, Salmon Portland (1808-73), Amer. lawyer and statesman, *b.* Cornish, New Hampshire. In 1830 he settled in Cincinnati where he won a great reputation as counsel for sev. fugitive slaves whose cause he enthusiastically upheld. On account of the question of slavery he left the Whig party in 1841. He was the

U.S. Supreme Court, in which capacity he presided at the trial of President Andrew Johnson, 1868. See A. B. Hart, *Salmon Portland Chase*, 1899, and J. W. Schuckers, *Life and Public Services of S. P. Chase*, 1874.

Chase, Samuel (1741-1811), Amer. jurist, *b.* Maryland; admitted to the Bar at Annapolis. Was a member of the Continental Congress and was sent with Franklin to win over Canada to the revolting colonies; he signed the Declaration of Independence and helped to draw up a constitution for Indiana. An ardent Federalist, he was made a justice of the Supreme Court. Impeached by the House of Representatives, 1804, the impeachment fell through. See *Trial of Samuel Chase* (Washington, 1805).

Chase, William Merritt (1849-1916), Amer. painter, *b.* Franklin, Indiana. He was a pupil of B. F. Hays of Indianapolis and of J. O. Eaton in New York, and

later of Piloty and A. Wagner in Munich. He taught painting in New York for some years. He was a most successful portrait painter, his pictures of Whistler, Duveneck, Gen. Webb, etc., being well known. He was president of the Society of Amer. Artists.

Chasing (Lat. *caelatura*; It. *ceselatura*; Ger. *Ciselieren*; Fr. *ciselure*; signifying chiselling), the art of producing figures and various ornamental designs, which can be either raised or hollowed on metallic surfaces with steel implements. It is employed chiefly for the ornamentation of goldsmith and silversmith articles, electro-plate, etc., being used to create flutings and bosses; it is also used to imitate engraved surfaces. (See GOLD-SMITH'S ART AND WORK.) Very delicate results may be achieved by this method, the most perfect examples of which may be seen in the chasing on the watch-cases by G. M. Moser, 1704-83. The worker first outlines the design on the surface he wishes to ornament; then, should bold and high embossments be the desired effect, these are blocked out by a process called *snarling*. The snarling-iron is a long iron tool turned up at the end, and made so that when it is securely fixed in a vice, the end that is turned up can easily reach and press against any part of the inside of the article that is to be chased. The part of the article to be embossed is held firmly against the upturned end of the snarling-iron, then a strong blow is given by the worker at the opposite end of the iron, with the result that the point touching the object gives it the sudden stroke that is needed to throw up the surface of the metal just where it meets the tool. When the blocking-out process from the interior is accomplished, or when the process of C. instead of embossing is required, the object to be chased is filled with molten pitch, which is allowed to harden. It is then fastened to a sandbag, and all the details of the design—lined, smooth, or rough—are worked out by a hammer and sev. small punches of varying outlines.

Chasles, Michel (1793-1880), Fr. mathematician, b. Épernon, was prof. at the Ecole Polytechnique and later at the Sorbonne. In 1867 he made a report to the Academy that he had obtained a number of letters of Pascal which proved that the latter had anticipated the discoveries of Isaac Newton. These letters, as well as thousands of others alleged to be of Dante, Shakespeare, and other famous men, were proved to be forgeries committed by one Vrain Lucas, who was duly convicted. In his chief work, *Aperçu historique*, etc., 1837, C. gives a brilliant account of the progress in modern times of geometrical methods. Other works are *Traité de géométrie supérieure*, 1852. and *Traité des sections coniques*, 1865, etc.

Chasles, Victor Euphémien Philariète (1798-1873), Fr. writer and critic, b. Mainvilliers near Chartres. C. was brought up in accordance with Rousseau's theory in *Émile*, and learned the printing trade. He was imprisoned for his share in a Jacobite plot, 1815, and on his release

went to England, where he worked for Valpy the printer and pub. critical articles in the reviews. On his return to France in 1826 he did much in introducing Eng., Russian, and Scandinavian literature. He was made librarian of the Bibliothèque Mazarin in 1837; and in 1841 he became prof. of comparative literature at the Collège de France. Some of his voluminous literary and critical works are pub. in *Trente Ans de critique*, 20 vols. of studies in comparative literature, 1846-75.

Chassé, David Hendrik, Baron (1765-1849), Dutch general. He served with the Fr. Army after 1793 and during the Peninsular war; in 1815 with the Dutch at Waterloo. In 1830 he was Governor of Antwerp and conducted a brave defence against the French. He was named by his soldiers 'Gen. Bayonet,' from his devotion to that weapon in attack.

Chasseloup-Laubat, François, Marquis de (1754-1833), Fr. officer of engineers. Was a divisional general under Napoleon in 1799, but later he went over to the Bourbons and was made a Fr. peer. Was an expert in fortifications and on warfare generally.

Chassepot, Antoine Alphonse (1833-95), Fr. inventor of the rifle known by his name. He was b. at Mutzig, and was a mechanic in the gov. arsenal. The Chassepot was a breech-loading rifle, calibre .433 in., muzzle velocity 1328 f./s., sighted to 1200 metres. It was adopted by the Fr. Army, 1866, and was most successful in the Franco-It. war, 1867. The Prussian needle-gun was matched against the Chassepot in the war of 1870. The Gras rifle replaced the Chassepot in 1874. C. received the cross of the Legion of Honour.

Chassériau, Théodore (1819-56), Fr. painter, b. Samana, Santo Domingo. He was a pupil of Ingres, and subsequently studied in Rome. He was influenced by Delacroix. His 'Tepidarium at Pompeii' is in the Louvre. His frescoes at the Cour des Comptes, Paris, were partly ruined in the Paris Commune. His reputation rests on his excellent portraits. See L. Bénédite, *Th. Chassériau, Sa vie, son œuvre*, 1931.

Chasseurs (Fr. 'huntsmen,' cf. Ger. *Jäger*). In the 18th cent. the name was given to soldiers who formed a light company of skirmishers attached to a regiment; in the modern Fr. Army it is used of a class of light regiments capable of rapid movement. They are both mounted (*C. à cheval*) and on foot (*C. à pied*). The C. d'Afrique, first organised in 1831 and stationed in Algeria, are famous for their speed and endurance, and for their Arab horses. The C. Alpains are regiments of infantry stationed on the S.E. frontier of France, and are trained to cover 37½ m. of mt ground in a day in full marching order. In the 7 months of snow they are trained to use skis and snow-shoes.

Chassidim, religious sect, zealous defenders of the unity of the Deity and the belief of their ancestors, who opposed Antiochus Epiphanes (175-164 BC) and his

successors when they endeavoured to put aside the Jewish religion and to introduce idolatry. Their leader was Mattathias, who killed the commander of the tyrants at the idolatrous altar in Modein, near Joppa. The name C. was given by later Jews to those persons who devoted their lives entirely to religious exercises and bodily chastisements, to expiate their own sins, or those of others, or to hasten the coming of the Messiah. They studied the Cabbalah (q.v.), fasted, and by mortifying the flesh thought to free the spirit from the body, and so to enter into communion with God and angels. About the middle of the 18th cent. a new sect of C. arose, who held the belief that communion of man with God was effected by contemplation and prayer. This sect increased in number; some were considered representatives of God and their works were regarded as oracles. At first viewed with suspicion, and even excommunicated, by the orthodox majority, the C. were later tolerated and accepted as a permanent feature of Judaism.

Chastelard, Pierre de Boscosel de (1540-1563), Fr. poet, b. Dauphiné. He was a descendant of the family of the Chevalier Bayard, and became a page in the household of the Constable Montmorency and of Marshal Damville. In 1561 he accompanied the latter to Scotland in the suite of Mary Queen of Scots, with whom he fell violently in love. Entering the queen's service, he wrote passionate poems to her, and if she did not encourage him, she at least accepted his verses. He was found under her bed by her maids of honour, but was forgiven. A second offence was unpardonable, and he was hanged. According to Brantôme he went to his death reciting Ronsard's hymn to death. His last words, addressed to the queen in Holyrood, 'Adieu, toi si belle et si cruelle, qui me tues et qui je ne puis cesser d'aimer,' have often been quoted. He is the subject of Swinburne's *Chastelard* (1865) the first of his Scottish trilogy written after the Elizabethan model.

Chastellain, Georges (c. 1404-75), Fr. poet and chronicler, b. Alost, Flanders. He was in the service of the Dukes of Burgundy, and celebrated as the author of the *Grande Chronique des ducs de Bourgogne*, and similar chronicles. He also wrote a number of epitaphs, rondeaux, and ballads, and was considered as the head of the *rhétoriqueurs*. See K. Urwin, *Georges Chastellain*, 1937.

Chastellux, François Jean (1734-88), Fr. author and general, b. Paris. He served with honour during the Seven Years War, and fought in the Amer. War of Independence. His best-known works were *De la félicité publique*, 1772, and *Voyages dans l'Amérique septentrionale*, 1788. He was elected to the Fr. Academy in 1775.

Chasuble, eccles. vestment, worn by W. bishops and priests during the celebration of mass, formerly known as *planeta*. Essentially it is a round of cloth with a hole in the centre for the head, but its shape has been modified and revised from age to age. The C. was formerly plain, but it is now frequently embroidered

and adorned with orphreys. It should be of silk. The C. owes its origin to the Rom. *paenula*, a cloak worn by both sexes and all classes. It had no special significance in early Church use, and it was first definitely reserved as a eucharistic vestment in the 11th cent., and formally assigned to the celebrating priest at the mass in the 13th cent. It was retained at the Reformation by the Lutherans, and is authorised in the Church of England Prayer Book by the Ornaments rubric. See G. Dix, *The Shape of the Liturgy*, 1945.

CHASUBLE

Chat, popular name for certain birds of the family Turdidae, such as the stonechat, *Saxicola torquata* and the whinchat, *S. rubetra*.

Chat Moss, peat bog in Lancs. England. It lies between Manchester and Liverpool, and stretches over about 6000 ac. One of the finest feats of engineering accomplished by George Stephenson was the railway that he built across it (1828-30). Many attempts have been made to drain it, works being constructed for the purpose by Roscoe in 1805, and by Edward Baines in 1821; the greater part of it is now cultivated.

Chata, or *Pterocles alchata*, representative member of the Pteroclididae, or sandgrouse family. It is a desert bird living in S. Europe, Africa, and Asia, and is considered to be good eating.

Chatala, see CATALCA.

Château, Fr. word (from Lat. *castellum*, fortress) for a castle (q.v.). During the late 15th and 16th cents., when houses began to be built for residence only and not as castles for defensive purposes, the term became applied to all large country houses. The fortified castle was termed

C. fort, and the residence *C. de plaisance*; the latter often retained some, at least, of the architectural features, *tournelles*, etc., of the medieval castle of defence.

Belgian Embassy

WALZIN: THE CHÂTEAU

Château, term which, when applied to wine, more especially in Bordeaux, implies that the wine so labelled is produced every year from the same vineyards. Château-bottling is a guarantee of authenticity, though the name of a good wine merchant is equally trustworthy.

Château Gaillard, ruined Fr. fortress on the Seine, not far from Les Andelys. Built at the close of the 12th cent. by Richard Cœur de Lion to defend the dukedom of Normandy against the Fr. king. Captured by Philippe Auguste in 1204.

Château-Gontier, tn in the dept of Mayenne, France. There are chalybeate springs near by. There is an agric. market, and some textile manufs. Pop. 6300.

Château-Grillet, *see* RHÔNE WINES.

Château-Renault, François Louis de Rousselet, Marquis de (1637-1716). Fr. vice-admiral, who fought at the battle of the Dunes, and, with Turenne, at the siege of Dunkirk. Fought the Levantine corsairs and captured a number of their vessels. Was made Governor of Brittany and a Marshal of France. Became Baron of Poulmic and Vicomte of Artols.

Château-Salins, Fr. tn, cap. of an arron., in the dept of Moselle. The anct château of the Bishops of Metz is here. It has salt and soda works. Pop. 1600.

Château-Thierry, Fr. tn, cap. of an arron., in the dept of Aisne, on the Marne. Napoleon defeated the Prussians and the Russians near here in 1814. During the First World War it was the scene of fierce fighting—in 1914, during the Ger. advance on Paris, when it was for a time in Ger. hands, and again in 1918, when it was taken by the Germans during their final advance. It was severely damaged during the Second World War. La Fontaine (q.v.) was b. here in 1621. Chemicals, crockery, and mathematical and musical instruments are manuf. Pop. 8000.

Châteaubriant, François René, Vicomte de (1768-1848), Fr. writer, b. St Malo, and after a somewhat unhappy childhood, entered the regiment of Navarre. In 1791, inspired by a desire for adventure and the natural life, he went to America, but was recalled by the news of the arrest of Louis XVI. He married immediately on his return, and then joined the ranks of the 'émigrants.' After being wounded at the siege of Thionville, he lived in England till 1800, earning his livelihood by giving Fr. lessons. In 1797 he pub. his *Essai sur les révolutions*, a confused work marked by much ill-digested learning. It is sceptical and despairing, and its very uneasiness prepares one for the conversion which the deaths of his mother and sister brought about. This conversion led to his great apology for Christianity in poetry. In 1801 he pub. *Atala*, an episode detached from the greater work, *Le Génie du christianisme*. It showed a new, daring, and brilliant writer, a reformer both in prose and in poetry. In 1802 appeared *Le Génie du christianisme*. C. does not attempt directly to prove that Christianity is true, but that it is beautiful, and that it is capable of inspiring far higher poetry than is the pagan mythology. His romanticism appears in a more concentrated form in *René*, 1803, another episode detached from the main work, the first expression of 'mal du siècle.' On his return to France, C. received an appointment under Napoleon, and in 1809 pub. *Les Martyrs*, which contains the argument of *Le Génie du christianisme* cast in an objective form. Two years later he pub. *L'Itinéraire de Paris à Jérusalem*, after a pilgrimage to the latter tn. Of even greater influence was his *Mémoires d'Outre-Tombe*, 1848-50, an account, often purely imaginary, of his own life. C. is, with Mme de Staël, the leader of the Romantic movement of the early 19th cent. He reformed poetry, hist., the novel, and in addition to this he was one of the greatest masters of Fr. prose. *See* C. A. Sainte-Beuve, *Châteaubriant et son groupe littéraire sous l'Empire*, 1860; É. Faguet, *Le XIX. Siècle*, 1887; M. H. Miller, *Châteaubriant and English Literature*, 1925; A. Maurois, *Châteaubriant*, 1938; M. Levaillant, *Splendeurs et misères de Châteaubriant*, 1948.

Châteaubriant, tn in the dept of Loire-Inférieure, France, situated on the R.

Chère. Parts of the 11th-cent. castle, after which it is named, still remain. There are foundries, and the manuf. of leather goods and agric. machinery is carried on. There was a Ger. concentration camp here during the Second World War. Pop. 9300.

Châteaudun, Fr. tn, cap. of an arron., in the dept of Eure-et-Loir, overlooking the Loir. It was known to the Romans, and was destroyed by the Normans in 875. There is a remarkable château, partly 12th-cent., and 2 fine churches, both also partly 12th-cent. C. was burnt by the Germans in 1870 after a heroic defence (see FRANCO-GERMAN WAR). It bears the Legion of Honour in its arms. It is a mkt tn. Pop. 8100.

Châteaulin, tn in the dept of Finistère, France, on the R. Aulne. It has an agric. market. Pop. 4000.

Châteauneuf-du-Pape, see RHÔNE WINER.

Châteauvieux, Fr. tn, cap. of the dept of Indre, on the Indre. It is named from a 10th-cent. château built by Raoul of Déols; the present château is 15th cent. There are 2 auct churches, and a museum of relics of Napoleon and Gen. Bertrand (q.v.), who d. here. It is a railway junction, and manufs. textiles, agric. machinery, and furniture. Pop. 34,600. See also DÉOLS.

Chatel, Ferdinand Toussaint François (1795-1837), b. Gannat, Allier, a religious fanatic who apostatised from the Catholic Church to found the Gallic Church. He denounced celibacy and confession, and wrote many religious essays.

Châtelet, tn in the prov. of Hainaut, Belgium, on the R. Sambre, 3 m. E. of Charleroi. It is a mining centre, and manufs. explosives. Pop. 15,200.

Châtelet, Le Grand, old fortress on the r. b. of the Seine in Paris, on the site now occupied by the Place du C. The first mention of it is in a charter of Louis le Jeune, 1147. It was the city prison in the time of the Renaissance, and a court of justice, but was destroyed in 1802. Le Petit C., a smaller fortress on the opposite bank of the riv., also used as a prison, was destroyed in 1782.

Châtelet-Lomont, Gabrielle Émilie le Tonnelier de Breteuil, Marquise du, see VOLTAIRE.

Châtellaneu, tn in the prov. of Hainaut, Belgium, situated on the R. Sambre, 3 m. E. of Charleroi; it is a mining tn with big coalfields and iron works. Pop. 20,100.

Châtelleraut, Fr. tn, cap. of an arron., in the dept of Vienne, on the Vienne. It manufs. small arms, cutlery, and preserves, and has a distillery. Pop. 22,800.

Chatfield, Sir Alfred Ernie Montacute Chatfield, 1st Baron (1873-), admiral, son of Adm. A. J. C. Entered the navy, 1886; captain, 1909; rear-admiral, 1920; vice-admiral, 1926; admiral of the fleet, 1935. Served as flag-captain to Beatty, H.M.S. *Lion*, in action off Heligoland, 1914; Dogger Bank, 1915; battle of Jutland, 1916. Fourth sea lord, 1919; assistant chief of naval staff, 1920-2; commanded light cruiser squadron, 1923-4; third sea lord and controller of the navy, 1925-8;

commander-in-chief of Atlantic fleet, 1929-30, of Mediterranean fleet, 1930-2; first sea lord and chief of the naval staff, 1933-8; chairman of expert committee on Indian defence, 1938-9; minister for co-ordination of defence, 1939-40, with seat in the War Cabinet. K.C.B., 1922; G.C.B., 1934; O.M., 1939. In the inter-world-war decades he held key posts which placed him in a position to warn the gov. and the people of the risk that the country might once again find itself facing a world war without being prepared. As assistant chief of the naval staff he attended the Washington Conference of 1921-2 as expert adviser to the Brit. delegation, being instrumental in securing such concessions on battleship tonnage as enabled the Admiralty to build 2 new 16-in.-gun ships. As controller of the navy he served at a time when the efficiency of the navy was dangerously impaired by false economy. When, in 1933, C. was once more appointed to the Admiralty, he aimed at 3 objectives: to rebuild the battle fleet; to increase Brit. cruiser strength to a minimum of 70; and to free the Fleet Air Arm (q.v.) from Air Ministry control; and generally he was successful. As chief of the naval staff he set as the basic aim the unity of the 3 services and, through that unity, the strengthening of the chiefs of staff committee in their task of rebuilding the fighting services, which, by 1933, had been reduced to 'such a serious state of unreadiness for war'. C. succeeded Lord Caldecote (then Sir Thomas Inskip) as minister for the co-ordination of defence, with a seat in the Cabinet, the appointment being hailed with enthusiasm by public opinion. As deputy chairman of the committee of imperial defence (q.v.) he deputised for the Prime Minister on all ordinary occasions. He was raised to the peerage in 1937. Pubs.: *The Navy and Defence*, 1942; *Defence after the War*, 1944; *It Might Happen Again* (written in 1940, pub. 1947) (autobiographical).

Chatham, William Pitt, 1st Earl of (1708-78), statesman, b. Westminster, and educ. at Eton and Trinity College, Oxford. Early in 1731 he was gazetted cornet in Lord Cobham's Horse. Four years later he entered Parliament as member for the family bor. of Old Sarum. He supported the opposition, and for a speech made on the marriage of Frederick, Prince of Wales, which the king found offensive, he was dismissed from the army (1736). Shortly afterwards the prince rewarded his supporter by making him one of his grooms of the bedchamber. Pitt soon took an active part in the debates of the House of Commons, and his great powers of oratory quickly gained him a great reputation. He had, however, to struggle against the king's dislike, which blocked his political progress for a long time. Under Pelham he was appointed early in 1746 joint vice-treasurer of Ireland, but in May of the same year he was promoted to the position of paymaster-general of the forces. This was the most lucrative office in the ministry, owing to the numerous and valuable perquisites attaching thereto; but Pitt, setting an example unusual in

his age, declined to accept anything but the actual salary. On Pelham's death, Pitt had hoped to lead the House of Commons, and, disappointed in his ambition, he attacked the new leader, Sir Thomas Robinson, and the new Prime Minister, the Duke of Newcastle. He was dismissed late in 1755, but a year later he was invited to form an administration. In April 1757, dismissed by the king, whose dislike of him was even stronger than before, he was, after a few weeks, recalled to power, and held office (under the nominal leadership of the Duke of Newcastle, though he himself was the dominating member of the gov.) until Oct. 1761.

EARL OF CHATHAM

Engraving after a picture by Richard Brompton.

It was during this period that he was able to give the fullest proofs of his ability as a war minister, for he had returned with full powers to direct the war and to take charge of foreign affairs. His efforts were to secure Britain her N. Amer. Empire, and to raise Brit. prestige to a level unknown for a hundred years. He declined office in 1763, but continued to take as active a part in debate as his health would allow. When Rockingham was dismissed in July 1766, Pitt was invited to form another administration, but he was not well enough to do more than take the sinecure office of Lord Privy Seal in his own ministry. This necessitated his accepting a peerage—a step that made him for a time very unpopular. The city especially resented the 'Great Commoner' becoming the Earl of C., and actually cancelled a banquet that was to have been given in his honour. His health now completely gave way, and he resigned the office of Prime Minister in Dec. 1767 to the

Duke of Grafton, holding, however, that of Lord Privy Seal until the Oct. of the following year. He was taken ill while making a vigorous speech in the House of Lords against the acknowledgment of Amer. Independence (albeit he had never approved the war) in 1778, d. shortly afterwards, and was buried in Westminster Abbey. C. is one of the greatest figures among Eng. statesmen, and was an outstanding parl. orator. He combined great administrative ability with an integrity of character not often found in politicians of the day. See lives by Lord Macaulay, 1851, B. Williams, 1914, and B. Tunstall, 1939. See also Sir C. Grant Robertson, *Chatham and the British Empire*, 1946.

Chatham, riv.-port tn in Kent, England, on the r. b. of the Medway, and joined on the W. side by Rochester and the E. by Gillingham. The tn possesses very few objects of interest, and owes most of its importance to its military fortifications and dockyards. It is one of the most celebrated shipbuilding centres in England, the length of the dockyards being nearly 2 m., which contain sev. building slips and wet docks, the latter capable of holding the largest ships. In the Middle Ages C. was merely a suburb of Rochester, but Henry VIII, to whom we owe the foundation of a regular navy, estab. dockyards, and the natural harbour formed by the deep channel of the riv. was made use of by Elizabeth I, who built a dockyard and an arsenal here. The defences of C. constitute a fortification of great strength, and are a great protection to London should invaders succeed in landing on the S. coast, in order to march on the cap. Fort Pitt, rising above the tn to the W., built in 1779, is now a girls' technical school. Almshouses built in 1592 by Sir John Hawkins for disabled seamen, have since those days been entirely rebuilt. At one time traces of old Rom. remains were discovered in the form of weapons, Rom. bricks, and tiles; also human remains. The modern church of St Mary's, opened in 1903, stands on the site of an old Saxon church. There is also St Bartholomew's Chapel, which was formerly attached to the hospital for lepers, one of the first founded in England, by Gundulph, Bishop of Rochester, 1070, partly of Norman architecture. Pop. 52,000. With Rochester C. forms a parl. bor. returning 1 member.

Chatham, co. tn of Kent co., Ontario, Canada, on the Thames R. 12 m. from its mouth, 64 m. SW. of London and 180 m. W. of Toronto. Connected with Detroit and the cities on Lakes Huron and Erie by steamboat service. It is the centre of a large natural gas field, and has also cheap hydro-electric power. The chief industrial products are motor cars, pumping and well machinery, textiles, malleable steel, flour, lumber, sugar, cigars, furnaces, gloves, and fertilisers. The crops of the co. are husking corn, tobacco, tomatoes, and soy-beans. C. has 2 large parks and 4 more on the nearby lakes. There are 2 business colleges, a new collegiate institute or senior high school, and a

vocational school; also there are 2 hospitals. The community was first surveyed in 1794 by Governor Simcoe, as a naval shipyard; hence its name. It became a city in 1895. It was famous in pre-Amer. civil war days as the N. terminus of the 'underground railway' for escaped Negro slaves. Pop. 22,720.

Chatham, tn and port in Northumberland co., New Brunswick, Canada, on the Miramichi R., 24 m. from its mouth. Extensive fisheries are carried on, also a trade in lumber; it is the site of a large Royal Canadian Air Force training station. Pop. 5225.

Chatham Chest, charitable fund originated by Sir Francis Drake and Sir John Hawkins in 1588 to assist sick and wounded seamen. It takes its name from the money having been placed in a chest kept at Chatham that had 5 locks, the keys of which were held by the officers who had charge of it. Four supervisors and 7 directors were appointed to look after the accounts, which had to be placed before Parliament every year. Twelve ac. of land were assigned to the charity by Charles II, and the fines imposed by the courts martial were also handed over to it in 1688. In 1802 the chest was moved to Greenwich and the fund incorporated with Greenwich Hospital; up till 1829 a considerable part of the money was raised by deductions from seamen's pay.

Chatham Islands, small group of is., including some rocky islets, in the Pacific Ocean, lying 360 m. E. of New Zealand, to which they belong. These is. were discovered in 1791 by Lieut. W. R. Broughton, who named them after the boat which he was commanding at the time of the discovery. The natives he called Morioris, after the name which the New Zealand natives gave themselves (see MAORI), and their dress consisted of sealskins or mats. In 1831 they were conquered by 800 Maoris from New Zealand, and in 1849 there were only 90 survivors out of a total pop. of 1200, the race being therefore all but exterminated. The chief export of the is. is wool, and the industries comprise cattle- and sheep-breeding, and seal-fishing. The climate is colder than that of New Zealand, while the soil is extremely fertile, with luxuriant growth of fern and flax. Area 372 sq. m.; pop. 533.

Châtillon-sur-Seine, Fr. tn in the dept of Côte-d'Or, on both banks of the Seine, near the forest of C. It has many ant. buildings of interest. There are quarries, metal industries, and an agric. market. Pop. 4200.

Chatou, Fr. tn in the dept of Seine-et-Oise, on the Seine, 8 m. from Paris. Pop. 12,800.

Chatsworth, vil. in Derbyshire, England, containing the famous seat of the dukes of Devonshire. The original C. House was commenced by Sir Wm Cavendish (d. 1557) and completed by his widow. It was in this building that Mary Queen of Scots was imprisoned under the care of the Earl of Shrewsbury. Later it was pulled down and the present house was built in 1688 by Wm, 1st Duke of

Devonshire. It is a quadrangular building with an open courtyard in the centre, and Ionic in style, standing on the l. b. of the R. Derwent about 2½ m. from Bakewell. The magnificent gardens with the vast conservatory and numerous fountains were designed by Sir Joseph Paxton. The house contains priceless collections of pictures and statuary, and some very beautiful wood carving.

Chattahoochee, riv. in Georgia, U.S.A., forming part of the boundary on the W., and joining the Flint, after which it becomes the Apalachicola. It is navigable for about 200 m., up to Columbus, the total length being 436 m.

Chattanooga, cap. of Hamilton co., Tennessee, U.S.A., on the Tennessee R. It is important as a commercial and railway centre, doing a large trade in lumber, grain, and coal, and manufacturing iron, steel, machinery, etc. It is famous for the battle fought there during the Amer. Civil War, which consisted of a series of engagements including that of Chickamauga, that of Lookout Mt., known as the 'battle above the clouds,' and that of Missionary Ridge, when the Federals under Grant defeated the Confederates under Bragg, 23-5 Nov. 1863. The national cemetery to the E. of the city contains the graves of over 13,000 Federal soldiers. The city contains some fine buildings, and possesses a univ. known until June 1907 as the Grant Univ. This, the univ. of C. (Methodist Episcopal), was founded in 1867 and now comprises schools of law, medicine, and theology. It has about 2900 students. Pop. 131,040.

Chattels (O.F. *chatel* from Low or late Lat. *capitale*, Lat. *capitale*, 'property,' as also 'cattle,' which is essentially the same word as chattel, but the latter is much more modern). The phrase goods and C. in Eng. law means all property not included under one or other of the terms 'lands, tenements, and hereditaments' (q.v.), and is thus the equivalent of personality. This property is divided into C.-real and C.-personal. The former include any estate or interest in lands or buildings which does not amount to a freehold, because it is a fundamental principle of Eng. real property law that a lease or tenancy for a term of years of any length is classified as personal property, and descends as such on intestacy. The latter are either corporeal, i.e. having an actual physical existence, such as money, plate, furniture, and minerals when severed from the land; or incorporeal, i.e. having a mere notional existence, such as debts, patents, stocks and shares, and copyrights.

Chatterer, in ornithology, is a word that has been applied in a loose sense to many birds without special regard to its applicability. It is often used particularly for *Ampelis garrulus*, the waxwing, but is frequently used for other passeriform birds which are members of the family Cotingidae.

Chatteris, mrkt tn in Cambs, England, situated in the administrative co. of the Isle of Ely. A thousand Rom. coins of

305-6 and part of the skeleton of an elephant have been found here. There is the site of a Benedictine convent of the 10th cent. and axe heads of the Stone and Bronze Ages and a Rom. quern have been found and are in the council's museum. Pop. (1953) 5528.

Chatterton, Edward Keble (1878-1945), author and journalist, b. Sheffield and educ. at Oxford. Entered journalism in London in 1902 and, for a time, took up art criticism, publishing *T. Sydney Cooper, R.A.*, 1903, and *Modern Journalism*, 1909. But he was chiefly known as a copious writer on ships and the sea. His book *Sailing Ships: the Story of their Development from Earliest Times to the Present Day* appeared in 1909. *Steamships and their Story* in 1910, and also in 1910 *Down Channel* in 'Vivette,' on his yachting experiences. Other books were *The Story of the British Navy*, 1911, *King's Cutlers and Smugglers*, 1912, and, after an interval of employment in the historical section of the committee of imperial defence, *Q-Ships and their Story*, 1922, *The Epic of Dunkirk*, 1940, and *Beating the U-Boats*, 1943.

Chatterton, Thomas (1752-70), poet, b. Bristol, the son of a poor schoolmaster. He is said to have been a dull child, but after he entered Colston's Hospital at Bristol at the age of 8, he began to draw, and became an omnivorous reader, his tastes inclining to poetry. At the age of 12 he wrote a poem, *Elinore and Juga*, on old parchment and with obsolete spelling, which deceived the junior usher of the school, Thomas Phillips, who was convinced of its antiquity. Thus encouraged, he continued what was to him a delightful game, and forged a pedigree of the De Berghams, which was accepted by their descendant, a pewterer named Henry Burgum. In 1767 he was apprenticed to an attorney at Bristol, and in the following year hoaxed that whole city with a description, alleged to be from an old MS., of the opening of Bristol Bridge in 1248. He now carried the joke further. He sent to Horace Walpole a 'transcript' of *The Ryse of Peyncteynge yn Englande*, written by T. Rowleie, 1469, for *Maistre Canynge*. Walpole was deceived, and had some thought of printing it at his own press, but before doing so showed it to Gray and Mason, who pronounced it a forgery, whereupon Walpole returned the MS. to the lad. C. came to London in 1770, and, living in a garret, wrote many verses, including the *Excelente Balade of Charitie*. He seemed to have a fair prospect of making his way, for Alderman Beckford became his patron; but Beckford d. on 21 June, and he could find no publisher or editor to employ him. Rendered desperate by his penniless condition, on 24 Aug. he poisoned himself with arsenic. That C. should have d. at the age of 18 is one of the crying pities of literature, for the *Balade of Charitie* shows great poetic power. The Rowley controversy survived the author's death, but the question of authenticity was definitely settled by Prof. W. W. Skeat in his ed. of Chatterton's works, 1875. See

D. Willson, *Chatterton*, 1869; J. H. Ingram, *The True Chatterton*, 1910; E. H. W. Meyerstein, *A Life of Thomas Chatterton*, 1930; J. C. Nevill, *Thomas Chatterton*, 1948.

Chatto, Andrew, see HOTTEN, J. C.

Chaucer, Geoffrey (c. 1340-1400), poet, b. Thames Street, London, the son of a vintner. At about 16 years of age he became page to Elizabeth, the wife of Lionel, Duke of Clarence, and continued at court till 1359, when he joined the army which invaded France under Edward III. He was made prisoner, but ransomed some months before the treaty of Bretigny in 1360. Nothing is known

CHAUCER

An engraving after the 'Occleve' portrait.

of the next 6 years of his life, but in 1366-72 he was again connected with the court, being at one time a valet of the king's household. At the death of his patron, Prince Lionel, in 1368, his services were transferred to John of Gaunt, Duke of Lancaster. It was at this time that he first began to write. For the next 12 or 14 years C. was constantly employed as a foreign diplomatic agent. During 1372-3 he was in Italy, first visiting Genoa on a commercial mission, and later Pisa and Florence. On his return he was rewarded by the grant of sev. privileges, including, in 1374, the office of comptroller of the customs and subsidy of wools, skins, and leather for the Port of London. In 1375 he received the custody of the lands and person of Edmond Staplegate of Kent, and in 1376 was employed upon a secret mission in conjunction with Sir John Burley. During 1377 he went to Flanders, and later to France, to treat for peace with Charles V. In 1378 to France and Lombardy; in 1382 was appointed comptroller of the petty customs. He became a justice of the peace in Kent in

1385, and in 1386 became member of Parliament and a knight of the shire for Kent. Later in the year he was reduced to comparative poverty by being removed from both his offices of comptroller, apparently at the instigation of Thomas, Duke of Gloucester. In 1387 he lost his wife, Philippa, and in 1389, on the return of his patron, John of Gaunt, from an absence abroad, was appointed clerk of the works at the palace of Westminster and the Tower of London. In 1390 he superintended works at St George's Chapel, Windsor, at Woolwich, and at Smithfield, but in 1391 lost his position. In 1394 Richard II granted him a new pension of £20, and in 1398 a yearly tun of wine; and in 1399 Henry IV promised him an additional pension of 40 marks. He d. on 25 Oct. 1400, in a house he had recently rented in the grounds of St Mary's Chapel, Westminster, and was buried in St Benet's Chapel (now Poets' Corner) in Westminster Abbey.

The works of C. fall into 3 periods, named, from the main influences exhibited in them, respectively French, Italian, and English. During his life at court, previous to 1372, his work was entirely imitative, and based on the popular Fr. poems which would be the natural models of a young poet of the time. He himself tells us that he made a trans. of the famous romance, *Le Roman de la Rose*, but of this all trace has been lost except 3 fragments of doubtful authenticity except, perhaps, the first. Probably his earliest poem which remains to us is the *A B C*, a prayer rendered out of French at the request of Blanche, Duchess of Lancaster. To this period also belong the *Complaint to Pile*, a poem of rejected love, possibly autobiographical, and *The Delite of Blanche the Duchesse*, written in 1369, to commemorate the death, at the age of 29, of the wife of his patron, John of Gaunt. The second, or It., period (1372-84) is marked throughout by a love and knowledge of It. poetry, gained during his first mission to that country. Fr. romance was thrown over as he came to learn more of the full range and power of poetry, and the work of this time shows an enormous advance in form, simplicity, and directness of diction, humour, and, above all, the art of telling a story. Parts of sev. of the *Canterbury Tales*, such as the Second Nonnes tale, the Clerkes tale, the Knights tale, the Man of Lawes tale, the Monkes tale, the Doctors tale, the tales of the Prioress, Squire, Franklin, and the rhyme of Sir Thopas, were probably composed during this period, but the most important complete poem produced under It. influence was *Troilus and Cressida* (c. 1382), a very free trans., with many additions, of Boccaccio's *Filostrato*. The additions are excellent and full of originality, and while the passionate description of the ruined love of Troilus and Cressida may be reminiscent of the *Complaint to Pile*, the character of Pandarus foreshadows the humour of the *Canterbury Tales*. Other poems of this period are the *Complaint of Mars*; *Anelida and Arcite*; *The Former Age*, mainly taken from

Boethius; the *Wordes to Adam*; the *Parlement of Foules*, full of delightful humour; and the *House of Fame*, an unfinished poem, showing the influence of Dante. The prose trans. of Boethius was also written at this time.

The third, or Eng. period, beginning about 1384, shows C. an entirely original poet except in the subject-matter of his work, and establishes his claim to be called the father of Eng. poetry. Between 1388 and 1389 he composed many of the most characteristic of the *Canterbury Tales* and the *Prologue*, revised and completed earlier tales, and consolidated the whole work. He also wrote the *Legende of Good Women*, 1385-6, which was left unfinished; the *Treatise on the Astrolabe*, 1391, compiled mainly from Messahala, for his little son Lewis, and left unfinished; the *Complaint to his Purse*; and sev. minor poems of doubtful date, such as *Truth*. The *Canterbury Tales*, upon which C.'s fame chiefly rests, owe their plan to the *Decameron* of Boccaccio, in which stories are told by a band of fashionable ladies and gentlemen who had retired to a garden outside Florence to escape the plague. C. transposes the idea to contemporary Eng. life by making the tellers of his tales members of a party of pilgrims on the road from Southwark to the shrine of Thomas à Becket at Canterbury. The pilgrims include men and women of every rank of social life, and represent the Church, the army, the court, law, medicine, trade, the sea, and the kitchen. The plots of their tales come from various sources. Many are foreign in origin, but much skill is shown in assigning these to suitable characters and bringing them into harmony with the general scheme by adaptation and addition. Many, such as the tales of the Miller, the Reeve, the Cook, the Wife of Bath (prologue), the Merchant, the Friar, the Nun's Priest, and the preamble of the Pardoner, are typically English, shrewd, good-tempered, inclined to be boisterous and full of a humour, which, if at times too broad for modern taste, is frank, hearty, and healthy. Among the numerous eds. of C.'s works may be mentioned those of John Stow, 1561, W. W. Skeat, 1894-7 and 1895, and F. N. Robinson, 1933. Bibliographies have been pub. by E. P. Hammond, 1908, D. D. Griffith, 1926, and W. E. Martin, 1935. See also W. Godwin, *A Life of Geoffrey Chaucer*, 1803; G. G. Coulton, *Chaucer and his England*, 1908; E. Legouis, *Geoffrey Chaucer*, 1910 (revised ed. 1934); G. L. Kittredge, *Chaucer and his Poetry*, 1914; G. K. Chesterton, *Chaucer*, 1932; J. L. Lowes, *Geoffrey Chaucer*, 1934; H. S. Bennett, *Chaucer and the Fifteenth Century*, 1947; N. Coghill, *The Poet Chaucer*, 1949; R. Preston, *Chaucer*, 1952; J. S. P. Tatlock and A. G. Kennedy, *A Concordance to the Complete Works of Geoffrey Chaucer and to the Romance of the Rose*, 1927.

Chaucer, Thomas (c. 1367-1434), statesman, possibly son of Geoffrey C. (q.v.). He had large estates in Oxon., which he represented in numerous parliaments. In 1407, 1410, 1411, and 1414 he was Speaker

of the House of Commons. He served on sev. diplomatic missions, and in 1424 became a member of the council.

Chaucer Society. The, founded in London (1867) by F. J. Furnivall with the aim of supplying scholars with MSS. and early texts relating to Chaucer not accessible to the public generally, and of facilitating Chaucerian research, and encouraging knowledge of his works by all. Furnivall issued in 1868 a six-text print of the *Canterbury Tales* for the society, and an index of proper names and subjects has been prepared by it (1911).

Chauli, Ger. tribe, mentioned by Tacitus as a people of great nobility, who lived in the dist. stretching between the R.s Elbe and Ems.

Chaudesaigues, Fr. spa in the dept of Cantal. Its hot mineral springs were known to the Romans. Pop. 1200.

Chaudet, Antoine Denis (1763-1810), Fr. sculptor, b. Paris. After obtaining the Grand Prix he left his bp. and went to Rome in 1784; here, influenced by the enthusiasm which prevailed in those days for the antique under Canova, he wrought his most famous works, 'Love,' 'Pence,' 'Paul and Virginia,' all of which are in the Louvre; 'Oedipus' and the bas-relief 'Fine Arts' being in the Musée Napoléon. He produced also a bust of Napoleon.

Chaudfontaine, Belgian vil. charmingly situated on a hill above the R. Vesdre, 5 m. SE. of Liège. It possesses hot mineral springs. Pop. 2000.

Chaudière, riv. and lake in Quebec, Canada. The riv. rises in the vicinity of Maine, U.S.A., flows into Lake Megantic, and from thence travels in a NW. direction to join the St Lawrence R., 7 m. distant from the city of Quebec. The C. Falls occur about 2½ m. from its mouth. The lake is 18 m. in length, and 5 m. in width. The R. Ottawa flows through it, and the lake has its termination at its E. end in the Great and Little C. Falls, close to which lies the city of Ottawa.

Chaud-medley, see CHANCE-MEDLEY.

Chau-doo, prov. of Cochín-China (q.v.), on r. b. of Bassac R. The country is mountainous in the SW. but flat in the remainder of the prov., and flooded by the R. Mekong (q.v.). The chief products are rice, maize, vegetables, and indigo. The inhab. are composed of Malays, Vietnamese, Cambodians, Chinese, and Chams. The cap. tn, C., stands at the head of a canal which forms a connection with the riv. and the port of Ha-tien.

Chaulieu, or **Chaulieu,** Guillaume Amfry, Abbé de (c. 1639-1720), Fr. poet and wit, b. Fontenay, Normandy, styled the 'Anacreon of the Temple,' the coterie of which the grand prior Vendôme was the head. He received the abbey of Aumate and other livings from his patron Louis Joseph, Duc de Vendôme. He and his friend, the Marquis de la Fare (1644-1712), were the most prominent Fr. poets at the beginning of the 18th cent., and their works were ed. together in 1714 and twice later in the same cent. Both derive, on the one hand, from the artificial school of Voiture (1598-1648), and, on the other,

from the Bacchic sect of St Amand. C.'s compositions were generally lyrical quatrains of the kind ridiculed by Molière, yet some are not without merit, as *La Solitude de Fontenay*, *La Goutte*, and the *Ode sur l'Inconstance*.

Chaulmoogra, E. Indian tree, *Gymnocardia odorata*, of the family Flacourtiaceae. Its fruit yields a light brown oil of soft fat, acrid in taste, containing glycerides of lauric and linoleic acids, together with the active principle gynocardine. This oil is used in the treatment of leprosy.

Chaumette, Pierre Gaspard (1763-94), Fr. revolutionary, b. Nevers. He became a medical student in Paris, and a leading orator at the club of the Cordeliers. Later, while expressing extreme revolutionary views, he worked hard to improve the social conditions of the poor of Paris. His anarchism made him hated by Robespierre, who eventually had him guillotined.

Chaumont (-en-Bassigny), Fr. tn, cap. of the dept of Haute-Marne, situated on a height at the confluence of, and between, the Marne and the Suize. Here, in Mar. 1814, Great Britain, Austria, Russia, and Prussia bound themselves by treaty against Napoleon; this partnership became the Holy Alliance (q.v.). Gloves, paper, cutlery, and leather goods are manuf. Bouchardon was b. at C. Pop. 16,900.

Chaumont-sur-Loire, Fr. vil. in the dept of Loir-et-Cher, 12 m. SW. of Blois (q.v.), on the Loire. Its fine, towered château (begun in 1465 by Peter of Amboise) was once the property of Catherine de' Medici, who forced Diane de Poitiers (q.v.) to accept it in exchange for Chenonceaux (q.v.). The château now belongs to the State. Pop. 800.

Chauncey, Isaac (1772-1840), Amer. naval commander, b. Black Rock, Connecticut; entered the U.S. Navy as a lieutenant in 1799. Served with distinction against the Barbary pirates in Tripoli, and on the lakes during the war of 1812. Taking the command at Sackett's Harbour in 1812, C., then a commodore, increased the strength of Amer. ships from a single vessel (the brig *Oncida*) to 20 ships. Later, when Sir James Yeo was sent out from England, he lost 2 of his schooners in a skirmish with the Eng. commander, but Yeo's resources proving inadequate, C. compelled him to give up the blockade of Sackett's Harbour. Was president of the Board of Naval Commissioners from 1832 till his death.

Chauncy, Charles (1592-1672), nonconformist divine, b. Herts; became Gk prof. at Cambridge, and later vicar of Ware, Herts. His religious convictions wrought him into difficulties, and in 1638 he emigrated to Massachusetts. He preached for 12 years at Scituate, and in 1654 became president of Harvard College.

Chauny, Fr. tn in the dept of Aisne, on the Oise and the St-Quentin canal. There was much fighting here during the Hundred Years War (q.v.). C. was destroyed in the First World War, rebuilt, and again

damaged in 1940. Chemicals, sugar, metal and leather goods, and glass are manuf. Pop. 9200.

Chausey, group of small is. belonging to France, in the Eng. Channel, nearly opposite the port of Granville (cf. CHANNEL ISLANDS). The largest is about 10 m. long by 4 m. wide. Granite is quarried in large quantities during the summer months.

Chausée, Pierre Claude Nivelles de la, see LA CHAUSSEE.

Chausson, Ernest (1855-99), Fr. composer, b. Paris, where he attended the Conservatoire for less than a year in 1880 and then became a pupil of Franck until 1883. He was greatly influenced by his master. Of independent means, he never held a professional post and was too aloof and diffident to make a success in his lifetime. He d. from a bicycle accident. His works include 3 operas, of which only *Le Roi Arthus* was produced, in 1903; incidental and church music; choral works; a symphony, and the symphonic poem *Viviane*, a *Poème* for violin and orchestra; chamber and piano music, and 32 songs which are the largest section of his small output.

Chautauquus, beautiful lake of glacial origin in the co. of C., New York, U.S.A. It is 1300 ft. above sea level. Its length is 18 m., while the greatest breadth is 3 m. It lies 8 m. away from Lake Erie, and is 700 ft. above it. On its shores stands the C. Institution, an adult school, founded by John H. Vincent and Lewis Miller in 1874 for instruction in literature, art, and science. The C. Assembly grounds, lying to the N. of the lake, cover about 165 ac. and contain about 500 cottages, a hall with seating accommodation for 5000 persons, a fine hotel, and a museum.

Chauvinism, term used for unreasonable and exaggerated patriotism and pride in one's own country, with a corresponding contempt towards other nations. It is the Fr. equivalent of the Eng. 'Jingoism.' Nicolas Chauvin was a veteran of the *Grande Armée* noted for his devotion to the Emperor, and his name became a synonym for the blind worship given by Frenchmen to Napoleon. Chauvin has been represented on the stage as a patriotic character by many writers, e.g. in T. and H. Cogniard's *La Cocarde tricolore*, 1831.

Chaux-de-Fonds, La, industrial tn in the canton of Neuchâtel, Switzerland (3250 ft.). It is the chief centre of the watchmaking industry, and has a school for the engraving and enamelling of watch-cases. Pop. (1955) 36,700.

Chavanne, Joseph (1846-1902), Austrian traveller and geographer, b. Graz. From 1867 to 1869 he travelled in N. America, Central America, Morocco, and the Sahara; and from 1884 to 1885 he explored the Congo.

Chavannes, Pierre Cécile Puvion de, see PUVION.

Chavasse, Francis James (1846-1928), bishop, son of Thomas C. of Sutton Coldfield. He became vicar of St. Peter-le-Bailly, Oxford, 1878; succeeded Dr Ryle as Bishop of Liverpool, 1900. The

building of Liverpool Cathedral owed much to his energy and zeal.

Chaves, tn of Portugal, in Vila Real dist., on the Tâmega, 35 m. NNE. of Vila Real (q.v.). It has a Romanesque church and an anct castle of the dukes of Bragança. There are silk and linen industries, and thermal springs. Pop. 9000.

Chazelles, Jean Mathieu de (1657-1710), Fr. mathematician, b. Lyons, who assisted Cassini in measuring the meridian, and in 1685 was appointed hydrographical prof. at Marseilles. Later he went to Egypt and measured the Pyramids, discovering that the 4 sides of the pyramid of Cheops answer to the cardinal points of the compass.

Chazelles-sur-Lyon, Fr. tn in the dept of Loire, 23 m. from Lyon. It manufs. felt hats and silk. Pop. 6100.

Chazy, name given by Amer. geologists to the limestone found at C., New York, and elsewhere in N. America.

Cheadle, mrkt tn in Staffs, England, 13 m. NE. of Stafford. There are important collieries in the neighbourhood; also manufs. of brass, copper, and tin. The silk mills and tape factory form other considerable industries. The Rom. Catholic church of St Giles was designed by Pugin, and erected in 1864. Pop. 6000.

Cheape, Sir John (1792-1875), general, who in 1849 did admirable service in the battle of Gujarat under Lord Gough. It was owing to his efforts that Pegu and Tenasserim were added to the E. India Co.'s possessions in 1850.

Cheapside, street in the city of London, between St Paul's and Poultry. The name derives from O.E. *ceap* ('barter'), and in anct times it was Cheap or West-cheap, the latter in distinction to East-cheap. The form C. was in use early in the 15th cent. and possibly earlier. It became the chief market-place in the city, and its former extent was considerably greater than now. Various streets off C. attest their functions in the old market: Milk Street (where Sir Thomas More was b.), Bread Street, Wood Street, etc., and it was a centre of goldsmiths and silversmiths. Until modern times C. witnessed more pomp and pageantry than any other street in London, and it was also a place of penance and punishment. In the Middle Ages royal tournaments were held in the open ground on the N. side, the king and nobility watching from a balcony on Bow Church (q.v.). An Eleanor Cross stood at the junction with Wood Street until its destruction by Parliament in 1643. Between Friday Street and Bread Street stood the famous Mermaid Tavern (q.v.). C. suffered severely from bombing in the Second World War, when Mercers' and Saddlers' Halls were destroyed. Poultry, the eastward extension of C., was formerly that part of the Cheap where poultry was sold, and was noted before the Great Fire for numerous inns. See Kenneth Rogers, *Old Cheapside and Poultry*, 1931.

Cheating, see FRAUD.

Cheb (Ger. Eger), Czechoslovak tn in the region of Karlovy Vary (q.v.), on the

Ohfe (q.v.) near the Ger. border. It was once an important border fortress, and was taken by the Swedes in 1631 and 1647, and by the French in 1742. Wallenstein (q.v.) was murdered here in 1634. Before the Second World War, C. was the centre of the Sudeten Ger. movement (see SUDETENLAND) and was in Ger. hands, 1938-45. There is a 13th-cent. church, an anct keep, and many other old buildings. The tn is a railway centre and has a textile industry. Pop. (1939) 32,000; (1947) 14,600.

Chebishev, Pafnutiy Lvovich (1821-94), Russian mathematician. b. Borovsk, educ. at Moscow Univ. He was a member of the Royal Society of London. He wrote treatises on the theories of prime numbers, probabilities, and integrals; on quadratic forms, gearings, etc. He came near to devising a straight-line motion, but this was finally devised by one of his pupils. Pub. *Traité de la théorie des nombres*.

Cheboksari, see CHEROKSARY.

Cheboksary, tn on the Volga, 85 m. W. of Kazan, cap. and cultural centre of the Chuvash (q.v.) Autonomous Rep. It has been known since 1371. It has textile and timber industries, and a hydro-electric power station (800,000 kw.) is projected. Pop. (1956) 63,000 (1926 9000), mainly Russian.

Cheboygan, city, cap. of C. co., Michigan, U.S.A., on S. Channel of Straits of Mackinac in agric. and resort area with limestone quarrying and fisheries. Pop. 5700. Not to be confused with Sheboygan, Wisconsin.

Chechen-Ingush Autonomous Republic, administrative div. in N. Caucasus (Russia), re-estab. in 1957, with Grozny as cap. (For a description of the area see GROZNYI.) The area was included in the Mt Peoples' Autonomous Rep. (q.v.); Chechen Autonomous Oblast was singled out in 1922, Ingush Autonomous Oblast in 1924, and they were combined in 1934 into C.-I. Autonomous Oblast, transformed into an autonomous rep. in 1936. The native pop. was deported in 1943 for alleged collaboration with the Germans, and the rep. abolished and dismembered in 1944, the major part forming the core of the Grozny Oblast and smaller parts being annexed to Georgia, N. Ossetia, and Daghestan.

Chequy, Cheeque, or Checky, heraldic term describing a shield patterned with small squares of alternate tinctures.

Cheddar, vil. in Somerset, England, 22 m. SW. of Bristol. Famed for the large stalactite caves which form a source of great attraction for summer visitors. The remains that have been found in these caves prove the existence of Rom. settlements at C. The beautiful rocky way which leads from the Mendip Hills down into the vil. is known as the C. Gorge. The noted C. cheese is made here and in the surrounding dist. Pop. 3500.

Cheddite, generic name of various blasting (q.v.) explosives consisting essentially of a chlorate incorporated with a nitro-compound dissolved in castor oil, which acts as a phlegmatizer. The salt

generally employed is potassium chlorate. See EXPLOSIVES.

Chedorlaomer (Kudur-Lagamar, servant of Lagamar), king of Elam, chief of 4 kings who fought a victorious campaign against 5 rebel Canaanite princes (Genesis xiv). Lot was taken by the kings, but rescued by Abraham. Lagamar was an Elamite god.

Cheduba, or Man-aung, ls. in the Bay of Bengal, 10 m. from Arakan. The soil is fertile, the chief crops being rice and tobacco, also cotton, indigo, and the sugar cane.

Cheera, see CHIRA.

Cheering, or American College Yells.

There is little analogous in Eng. univs. and schools, in Brit. C. or in the Fr. *riyal*, or in any other known conventional C. or form of acclamation, to the Amer. college 'yells.' The yell in univs. both in the U.S.A. and in Canada is a cry consisting of certain sounds or words agreed or fixed on to be used by the students as distinctive of the particular college or institution to which they happen to belong. The Amer. college yell is rhythmical; though C. conducted rhythmically is familiar enough in England and elsewhere, it is generally no more than a preconcerted rhythm with nothing of the habit or usage so characteristic of the student of W. nations. In all probability the college yell has evolved itself out of the primitive war-cry like the *houz* or *riyal* of France, and this origin indeed is certain in the case of the yell adopted by the 'All-Blacks' or team of rugby footballers that first visited England in 1907 from New Zealand. The yell of this team was admittedly a kind of war-cry adapted from some customary cry of the Maoris. The oldest cheers are those of the New England colleges, Yale and Harvard, in which the basic element *rah* is really nothing more than an abbreviation of the Eng. *hurrah*. The original yells of these 2 leading univs. are identical in form, being simply the cry 'rah' shouted in unison 9 times with the name of the univ. at the end of the repetition; but the yell of Yale is uttered more quickly than that of Harvard. Most institutions have a number of different yells and variants of the original yell, Yale itself favouring a cheer which runs thus:

'Brokekekex, ko-ax, ko-ax
'Brokekekex, ko-ax, ko-ax
O-op, O-op, parabaloou
Yale, Yale, Yale.
Rah, rah, rah, rah, rah, rah, rah,
rah, rah,
Yale! Yale! Yale!'

The yell of Princeton Univ. runs:

'H'ray, h'ray, h'ray, tiger
Siss, boom, ah; Princeton!'

and this college also expands this into a triple cheer on occasion. The U.S. Naval Academy adopts a yell or cheer which is aptly enough an imitation of a nautical steam siren. The Amherst cheer is very similar to the original yells of Yale and Harvard, while the Toronto Univ. students repeat or spell the word

'varsity' sev. times and end with the stereotyped 'rah, rah, rah.' There are also, besides these individualised cheers, yells or cheers common to all Amer. colleges and generally made use of in acclaiming some successful athlete or popular prof. For the most part the college yell is used at athletic contests. In most of the large colleges there are sev. carefully chosen leaders, who stand in front and call for the different songs and yells, directing and synchronising with their arms and bodies in a manner more elaborate than that of an orchestra conductor.

Swiss National Tourist Office

CHEESE BEING SALTED AND STORED

Cheese (Lat. *caseus*), preparation of milk, produced by separating the proteinous or nitrogenous substance known as casein or curd from the whey. The fatty matter in milk forms an important constituent of C., and often there is present in C. a greater percentage of fat or butter than of casein. Therefore the finest C.s are made from the richest milk, and the various kinds of C. on the market are as much due to the different qualities of milk in various dists. as to the different processes of making. C. was known in very early times; frequent references to it occur in Gk and Rom. authors, and the methods used in C.-making are described by Columella. The casein in milk is separated by acids in the case of sour milk, or by rennet prepared from the stomach of sucking calves.

Fresh milk is warmed to a temp. of about 80°-86° F., when the rennet is added in a liquid form, which causes the milk to ferment. The curd thus produced is cut across into sev. pieces. The mass is stirred for a few minutes, and then heated up to 90°-100° F. The object of the operator is to bring about the proper consistency of curd, without losing any of the fat of the butter in the whey. The whey is finally drawn off, and the curd left to settle until it becomes a firm solid. The fermenting action of the rennet continues during the period of ripening the curd. The curd is tested from time to time with a hot iron. If the development of acidity has been allowed to go too far, the curd becomes brittle and cracks easily. When the hot-iron test shows fine long flakes the curd is cut up into slabs and passed through a small grinder. Salt is now added to the substance to prevent any further development of acidity, and the substance is wrapped in cloths, and left to mellow in a cool room or cellar. The hard C.s, made in the U.K. and in America, improve in quality by keeping. They are generally left for sev. months to ripen, and when finished are fairly hard in substance. Continental C.s, on the other hand, are soft, and most of them require to be eaten when quite fresh. The chief hard C.s are Cheddar, Stilton, Eng. Cheshire, Gloucester, Wiltshire, Gorgonzola, and Gruyère. The best-known soft C.s are Brie, Neuchâtel, Camembert, and Limburg, and Philadelphia cream. C. is a very nutritious food. Well cured C.s contain 30-40 per cent of moisture, 30-37 per cent of fat, 20-26 per cent of protein, and 3-7 per cent of sugar and ash. The amount of salt (being an added constituent) is variable. See E. H. Ling, *A Text Book of Dairy Chemistry*, 1930; A. L. Simon, *A Catechism concerning Cheeses*, 1936; J. Squire (ed.), *Cheddar Gorge: a Book of English Cheese*, 1937; L. C. van Slyke and W. V. Price, *Cheese*, 1938.

Cheese-hopper, or **Cheese-skipper**, is the larva of a small dipterous insect, *Prophila casei*, of the family Sepsidae.

Cheese-mite, or *Tyroglyphus siro*, is an arachnid related to many other mites which are either parasitic or live on organic matter such as carrion and plants.

Cheese-rennet, or *Galium verum*, species of Rubiaceae allied to the cleavers (q.v.), and obtains its popular name from having been formerly employed to curdle milk. See also BEDSTRAW.

Cheetah, **Cheeta**, **Chita**, and **Hunting Leopard** are all names of *Acinonyx jubatus*, which with the various species of *Felis*, e.g. lion, tiger, and leopard, constitute the family Felidae in the group Aeluroidea, or cat-like carnivores. It differs from other members of the family chiefly in having longer limbs with non-retractile, blunt claws, and the upper carnassial tooth has no inner tubercle. With such claws it is more adapted to obtaining its prey in chase, like the dog, rather than by cat-like stealth, and it is readily domesticated, again like the dog; when tamed it will purr

like a huge cat. It is distributed over the whole of Africa, W. Asia, and India, and in S. India it is largely used in hunting. At full speed it may attain a speed of from 60 to 70 m.p.h. and is probably the swiftest of all mammals.

CHEETAH

Chefoo, or **Yentai**, port in the prov. of Shantung, China, with a Chinese pop. of 132,000. C. is noted for its large fruit-growing industry. Silk thread and twist are largely made and exported to France and America. A railway was built in 1955 to link with Tsingtao on the S. side of the Shantung Peninsula. C. is a beautiful seaside city, and is much frequented by wallflowers as a health resort in summer. The port was of considerable importance during the Russo-Jap. war.

Cheilanthes, genus of Polypodiaceae, contains about 130 species of small but beautiful ferns. The fronds are often curved and bear small hairs. *C. pteridoides* will grow in Britain under sheltered conditions.

Cheiranthus, genus of Cruciferae of 10 species of biennial or perennial herbs, natives of temperate regions. *C. cheiri*, Wallflower (q.v.), and *C. x allionii*, Siberian Wallflower, are grown in gardens.

Cheirromancy, see PALMISTRY.

Cheiroptera, see BAT.

Cheirostemon Platanoides, Hand-tree or Hand Plant, is the single species of its genus, family Sterculiaceae. It inhabits Mexico and is a lofty evergreen tree with the habit of a plane and a trunk the thickness of a man's body; at the head are dense branches, brownish at the tip from the short, fawn-coloured hairs that beset them. The leaves are heart-shaped, and the bright red flowers bear stamens arranged in the form of a hand. The tree has been an object of curiosity and veneration from time immemorial.

Cheks (Russian abbreviation for Extraordinary Commission), name of the Soviet political police, 1917-22. The local, territorial, and 'functional' (in the transport system and the armed forces) C.s were

directed by the 'All-Russian Extraordinary Commission for fighting counter-revolution and sabotage' headed by Dzerzhinskiy. The C. carried out the policy of Red Terror which was considered necessary by the Bolshevik leadership for the survival of the regime. It exercised press censorship, set up internal security troops, and a system of concentration camps, and carried out arrests and executions of arbitrarily selected individuals or groups (including shooting of hostages). In 1922 the C. was renamed G.P.U. (q.v.). The word *chekist* is still used to refer to members of the Soviet security organs. See E. J. Scott, 'The Cheka,' in *St Antony's Papers*, No. 1, Soviet Affairs, 1956.

Cheke, Sir John (1514-57), classical scholar, b. Cambridge, where he was educ. at St John's College. Elected fellow in 1529. On account of his great abilities he gained an exhibition from the king, and in 1540 was made prof. of Greek at the univ. He numbered amongst his pupils at St John's Roger Ascham, who always spoke of him in high terms of praise, both for his learning and character. He introduced a new pronunciation of Greek, which at first raised much opposition at the univ.; but C. finally prevailed, and the system was used in England until quite recent years. He was apostrophised by Milton in his 'Tetrachordon' sonnet. In 1544 he was made tutor to young Prince Edward. In later years he was banished from England on account of his religious opinions. He remained abroad from 1554 to 1556; then, whilst travelling one day from Brussels to Antwerp, he was arrested by order of Philip of Spain and sent to the Tower of London. Here he publicly renounced the tenets of Protestantism and submitted to the Church of Rome into which he had been baptised.

Chekhov, Anton Pavlovich (1860-1904). Russian author. His grandfather was a serf, his father a prov. grocer. By taking tutoring posts and writing for humorous periodicals he managed to pay his way through univ. and qualify as a doctor. He practised for a short period but then decided to devote himself entirely to literature, though his medical training was of considerable value in his writing. In 1890-1 he travelled to the penal colony of Sakhalin Is., which he described on his return with great frankness and insight. From his youth he suffered from tuberculosis, finally dying of it. C. wrote many short stories, sev. long stories (*The Step*, *A Dreary Story*, *Ward No. 6*, *Pearls*, etc.) and curtain-raisers, and the plays *Ivanov*, 1887, *The Seagull*, 1896, *Uncle Vanya*, 1897, *The Three Sisters*, 1901, and *The Cherry Orchard*, 1903. He became famous during the nineties; the Moscow Arts Theatre grew up on his plays, and in 1900 he was elected to the Academy of Sciences, resigning 2 years later in protest against the Tsar's refusal to allow the Academy to elect Gor'kiy. He was friendly with both Tolstoy and Gor'kiy, being to some extent influenced by the one and influencing the other. C.'s writing

reflected the social life in Russia of the 1880's and 1890's, but through non-descript Russian prov. families he attempted to portray universal aspirations and emotions, giving an original interpretation of human behaviour. He initiated a 'Chekhovian trend' in the Russian literature of the 1900's, and from the 1920's his influence spread to W. Europe and America; Katherine Mansfield, Virginia Woolf, Elizabeth Bowen, and Ernest Hemingway, among others, were clearly indebted to him. See life by D. Magarshack, 1952; studies by W. A. Gerhardt, 1947, W. H. Bruford, 1948, R. Hingley, 1950; bibliography by A. Heifetz, *Chekhov in English*, 1949.

Chekiang, coastal prov. of China. The Hsienhsia and T'ientai ranges run through the centre of the prov. from SW. to NE., and divide it into a N. portion, the greater part of which is drained by the Chientang R., and a S. portion, which is chiefly occupied by the Tangchi basin. The hilly portion of the prov. provides large supplies of tea, and in the plains a great quantity of silk is produced. Minerals are poor—a little coal and iron and occasionally some copper are found—but other products such as cotton, rice, ground-nuts, wheat, indigo, and beans may be had in abundance. The R. Hsian in the W., a trib. of the C., has enormous hydro-electricity potentiality, and an underwater power station supplies electricity to the big cities in the Yangtze Delta, including Shanghai and Nanking. The prin. cities are Hangchow, Wushing, Kashing, Ningpo, Shaoching, and Wenchow. Area 39,020 sq. m.; pop. 22,865,747.

Chelan, Lake, in Okanogan co., Washington, U.S.A. It is c. 50 m. long, and from $\frac{1}{2}$ to nearly 1 $\frac{1}{2}$ m. wide. All round are rock walls 4000–5000 ft. high, and the greatest depth is about 14,000 ft. It drains into the Columbia R. through the C. R. (4 m. long; source of hydro-electric power).

Chelate Compounds, compounds in which a ring occurs, some part of the ring being formed by a linkage which is partly electrovalent and partly covalent, thereby differing from the ordinary type of ring, in which all the valencies in the ring are covalencies.

Chelický, Petr (c. 1390–1460), Czech writer. He has been called the Tolstoy of the 15th cent., for his horror of bloodshed and determination to accept unresistingly even the tyrannical rule of worldly authorities. Born at Chelice, near Vodňany, the son of a small landowner, he studied for some years at Prague. During the Hussite wars he took no part, although opposed to the Church of Rome. His prin. work is *Svěřba* (The Net of Faith).

Chelidonium Majus, see CELANDINE.

Chelifer, genus of arachnid in the order Chernetidea, and typical of the family Cheliferidae, the only one of the order. *Ch. cancrivorus*, the book-scorpion, is sometimes found in houses among old papers and furniture; it occurs in Britain with 4 other species.

Chelm (Russian Kholm), tn of Poland, in Lublin prov., 40 m. ESE. of Lublin (q.v.). It was made an Orthodox bishopric in the 13th cent. During the First World War there was much fighting in its neighbourhood, and in the Second World War it was the first Polish city taken in the Russian advance (1944). C. is an important railway junction, and has metal, brick, and foodstuff manufs. Pop. 25,000.

Chelmno (Ger. Kulm), tn of Poland, in Bydgoszcz prov., on the Vistula, 24 m. NE. of Bydgoszcz (q.v.). In 1231 it came into the hands of the Teutonic Knights (q.v.), in the 15th cent. it went to Poland, and in 1772 it went to Prussia. It was once a member of the Hanseatic League (q.v.). Machinery, foodstuffs, ironware, and furniture are manuf. Pop. 12,000.

Chelmsford, Frederic Augustus Thesiger, 2nd Baron (1827–1905), eldest son of the 1st Baron C. He was educ. at Eton, and in 1844 entered the Rifle Brigade. From an ensign in 1854 C. became a general in 1888. After serving in the Indian Mutiny, and taking part in the capture of Magdala, C. was made C.B. and aide-de-camp to Queen Victoria. He routed the Zulus under Cellinaga at Ulundi in the war of 1879, and in 1884 was appointed Lieutenant of the Tower of London, which post he held until 1889. See Maj. G. French, *Lord Chelmsford and the Zulu War*, 1939.

Chelmsford, Frederic John Napier Thesiger, 1st Viscount and 3rd Baron (1868–1933), administrator, eldest son of Frederic Augustus, 2nd Baron. He was educ. at Winchester and at Magdalen College, Oxford. He succeeded to the barony in 1905, and was Governor of Queensland 1905–9. In Aug. 1909 he was transferred to New S. Wales, where he governed till 1913. In 1916 he was appointed Viceroy of India, and in the following year he produced jointly with E. S. Montagu, the secretary of state, a report on constitutional progress, recommending a limited application of representative gov., which, introduced in 1919, created what was called dyarchy. On 13 April 1919, occurred the famous Amritsar riot (q.v.). In April 1921 Lord C. was replaced by Lord Reading. In 1924 he was First Lord of the Admiralty in the Labour Gov.

Chelmsford, Frederic Thesiger, 1st Baron (1794–1878), lord chancellor of England. He entered Gray's Inn in 1812, and became a member of Parliament for Woodstock in 1840. In 1844 he became solicitor-general, and in 1845 attorney-general. He was appointed lord chancellor in 1858 by Lord Derby.

Chelmsford, co. and mkt tn in Essex, England, 29 $\frac{1}{2}$ m. NE. of London; situated between London and Colchester. The prin. industries are the manuf. of agric. implements, electrical and engineering works, iron foundries, malt works, and corn mills. The corn and cattle markets are among some of the most important in the co. The tn possesses a grammar school founded by Edward VI. Pop. 37,888.

Chelonia (Gk *chelonē*, tortoise), name of a sub-class of reptiles which comprises such well-known animals as the tortoises, turtles, terrapins, and loggerheads, and of which many fossil species have been found. There are about 300 living species, dwelling chiefly in warmer climates, some as terrestrial animals, while others are aquatic, and may inhabit either fresh or salt water.

Chelsea, parl. and metropolitan bor. of W. London, on the N. bank of the Thames. The name means 'landing place for chalk or limestone.' Until the 18th cent. C. remained a riverside vill., although Charles II had founded (1682) the Royal Hospital for old and disabled soldiers, designed by Wren and completed under William III in 1694. Henry VIII had a manor house here which was demolished c. 1760. C. Old Church, a medieval structure of various dates, was, except for the SE. or More Chapel, mostly destroyed by bombing in 1941, but is being rebuilt. Some of the monuments survived, including that of Sir Thomas More. Crosby Hall, set within the hostel building of the Brit. Federation of Univ. Women, is a 15th-cent. structure (with a magnificent timber roof) transferred here from Bishopsgate in the City of London in 1910. More lived in it for a short time; he spent the last years of his life in C. The C. Physic Garden, for botanical research, was founded c. 1673 by the Society of Apothecaries. Owing to its riverside and architectural charm and air of quiet seclusion many artists and men of letters have lived in C. since the early 19th cent., including Turner, Rossetti, Oscar Wilde, Whistler, and Carlyle, and the home of the last is now a public museum. C. was formerly famous for its buns and its porcelain. It returns 1 member to Parliament. Area 660 ac.; pop. 52,000. See Wm Gaunt, *Chelsea*, 1934.

Chelsea, city in the co. of Suffolk, Massachusetts, U.S.A., situated on the estuary of the Mystic R. It manufs. elastic goods, shoes, rubber goods, chemicals, paints, and wood products, and has a printing industry. Pop. 38,910.

Chelsea (London) (c. 1745-84), factory producing the finest soft-paste porcelain (q.v.) in England. See W. King, *Chelsea Porcelain*, 1922.

Chelsea Hospital, see ROYAL HOSPITAL. **Chesham**, tn and par. of Surrey, England, in Godstone (q.v.) rural dist., with a 14th-cent. church. Pop. 1643.

Cheltenham, municipal and parl. bor. and spa of Glos., England, 8 m. ENE. of Gloucester, and lying on a gentle slope at the foot of the Cotswolds. To the S. and W. is an open plain with the R. Severn (6 m.) and the source of the Thames (4 m.). St Mary's church, now modernised, was built between the Norman period and the 14th cent. In 1716 mineral springs were discovered, and after a pump-room had been built in 1738 C. soon became an important and fashionable health resort, particularly after George III came to take the waters in 1788. The tn has some excellent examples of Regency archi-

ture and ironwork. C. is also an educational centre: the O. Ladies' College (q.v.) is one of the most celebrated girls' schools in England, and C. College (q.v.) is a well-known public school for boys. The composer Gustav Holst (1874-1934) was b. here; an annual Festival of Contemporary Music is held during July (the second and third weeks), and of Contemporary Literature during October (first week). Pop. 62,823.

Cheltenham College, public school for boys, founded in 1841, incorporated in 1894. There are 450 boys in 8 boarding houses and a day boy house. The College is famous for its old Army connections and for the beauty of its buildings.

Cheltenham Ladies' College, public school for girls, founded in 1853 by the Rev. W. Dobson, principal of Cheltenham College, and the Rev. H. Walford Bellairs. Incorporated in 1880, it is now one of the most important English girls' schools, and was one of the first in England to provide a sound education on the public school boarding system for girls. Miss Dorothea Beale (q.v.) was the principal from 1858 until her death in 1906.

Chelyabinsk: 1. Oblast in Russia, on the E. slopes of the S. Urals, steppe in the S. and partly covered with mixed forests in the N. There are large deposits of high-grade iron ore, ferro-alloy, copper, zinc and aluminium ores, gold, and lignite. Area 33,900 sq. m.; pop. (without C. city, 1956) 2,155,000, Russian (since the 18th cent.) and Bashkir. It has the biggest iron and steel industry in the Urals, and highly developed engineering, non-ferrous metallurgy, and chemical industries. Wheat-growing and cattle-raising for meat and milk are other activities. The prin. tns are C., Magnitogorsk, Kopeysk, Zlatoust, and Miass. It is the area of the most rapid industrial development in the Urals during the Soviet period.

2. Cap., economic and cultural centre of the above, directly subordinated to the gov. of the Russian Federal Rep.; it is the second largest industrial centre of the Urals (q.v.) and an important transportation centre (5 railway lines). The leading branches of industry are engineering (tractors, aircraft, machine tools) and metallurgy (steel, ferro-alloys, zinc). There is a large lignite-fed power-station. Formerly a Tatar vil., C. became a Cossack fortress in 1746, and until 1890 was an important trading point between Siberia, with its agriculture, and the mining centres of the Urals. The construction of the Trans-Siberian Railway (q.v.), which started at C., further increased its commercial importance, the first industries also appearing at that time (flour mills, railway workshops); C. replaced Tyumen as the 'gateway to Siberia' for goods and settlers. The pre-war Five-Year Plans and the Second World War raised the city to its present industrial significance. Pop. (1956) 612,000 (thirteenth in the U.S.S.R. and second in the Urals; 1897, 20,000; 1917, 47,000; 1926, 59,000; 1931, 117,000; 1939, 273,000; 1945, 400,000).

Chelyuskin, Cape, of the Taymyr peninsula in N. Siberia, is the northernmost point of the Asian continent (lat. 78° N.).

Chemical Action, see **CHEMISTRY.**

Chemical Affinity, see **AFFINITY** (*Chemical Affinity*) and **CHEMISTRY.**

Chemical Analysis, see **ANALYSIS, CHEMICAL.**

Chemical Energy. Since molecules and atoms are conceived of as being in a state of motion, it is evident that by virtue of this motion they must contain *energy* (q.v.). In most chemical reactions heat is evolved, and they are said to be exothermic. On the other hand, heat may be absorbed, in which case the reaction is endothermic. This contained energy cannot be measured directly, but the energy set free during chemical reaction can, and this is termed chemical energy. It can even then only be measured by converting it into heat or electric energy. It might here be noted, perhaps, that the amount of energy measured only represents the difference between the contained energy in the resultant compound and that contained in the substances which took part in the reaction. See **THERMO-CHEMISTRY.**

Chemical Engineering, Technology or applied science comprising the design, construction, and operation of plants for the chemical and process industries, and the scientific study of their operation. Although the chemical and process industries are diverse they are related by the fact that in them materials are changed in composition or physical state; a number of the more important ones are described below. In each, the initial factors to be considered in the design of a plant will probably be chemical—the chemical properties of materials being processed, the nature, rates, and equilibria of reactions recurring between them, and the corrosiveness of reactants and products. Knowledge of mathematics, physics, and physical chem. will be needed to work out how the necessary heat can be supplied or removed from the reactor and how to separate and isolate products, and detailed mechanical engineering knowledge to work out the wall thicknesses of vessels and to design the plant items for convenience and simplicity in fabrication, operation, and maintenance.

Although the chemical and process industries are so diverse in their products, many of the individual steps in their different manufacturing processes are very similar, and we find, for example, that methods originally developed by sugar refiners for concentrating their syrups have since been adopted by sulphuric acid manufacturers. Thus the chemical engineer has evolved as a specialist in these 'unit operations' of common interest. The chemical engineer is not a chemist who has picked up a good deal of engineering, or the reverse, but a man whose training in the principles of the common 'unit operations' and 'rate processes' of the chemical and process industries is based on a carefully

dovetailed and interrelated knowledge of chem., engineering, mathematics, and physics.

Foremost amongst the industries in which the chemical engineer is employed is the chemical industry in which plants range from those making fertilisers and heavy chemicals in hundreds or thousands of tons per week, through those making dyestuffs, solvents, detergents, or plastics, to elaborately engineered plants making only a few pounds per week of a pharmaceutical chemical. Next in number of chemical engineers employed is the chemical plant manufacturing industry. This comprises the growing class of specialist contractors with large-scale research laboratories, fabricating and assembly shops, who can design, engineer, and erect complete plants for the production of particular chemicals, and contractors who concentrate on plant of particular types or made of special materials. The petroleum industry, with its post-war policy of refining in this country, had already in 1954 become the third largest employer of chemical engineers, and the number employed is increasing rapidly. Once a matter mainly of distillation, oil refining to-day involves many chemical conversions quite apart from the production of organic chemicals from refinery by-products or specially cracked oil, and necessitates the application of C. E. principles on the largest possible scale. Of the remaining industries, 3, namely food, fermentation, and metal extraction, merit special mention for their economic importance and technical interest.

In no field are the contributions of the chemical engineer more conspicuous than in that of food production. Through the chemical industry's manuf. of fertilisers and weed and pest control agents he greatly assists its production. But his contribution is not less great in assisting its long-distance transport and storage, and its processing and preservation. Sugar refining, margarine and baker's yeast manuf., canning and deep freezing of fruit and vegetables are obvious large-scale examples. On the small scale the extraction of vitamins may be cited.

After agriculture, fermentation is probably our oldest industry and to-day it is being increasingly extended from the production of food and drink to the production of drugs and vitamins. In contrast to many of the older fermentations, maintenance of high yields in antibiotic and vitamin fermentations usually requires aseptic conditions, as well as the accurate control of the many process variables. The large-scale conduct of these fermentations and the extraction and concentration of the delicate exercise to the full the highest C. E. skill.

In the extraction of metals from ores C. E. is becoming increasingly important as more and more of the lower-grade ores have to be treated. An unusual example of extractive skill is the extraction of magnesium and bromine from sea water, made possible by the accurate C. E.

control of chemical conditions in vast vols. of water.

Finally, the industrial development of atomic power is demanding the services of more and more chemical engineers. From the extraction of uranium and thorium and the separation of the desired isotopes, through the construction and operation of reactors and the harnessing of the power released, to the separation of fission products and the safe disposal of radioactive wastes, the chemical engineer is involved at every stage.

Further information concerning C. E. as a career, including ways of qualifying, may be obtained on application to the Institution of Chemical Engineers, 16 Belgrave Square, London, S.W.1.

Chemical Industry, Society of, founded in 1881 and incorporated by royal charter in 1907, was estab. to 'advance applied chemistry in all its branches.' There are 16 local sections in Great Britain, and 1 each in Australia, Canada, and the U.S.A. In addition there are special subject groups for agriculture, chemical engineering, corrosion, fine chemicals, food, microbiology, oils and fats, pesticides, plastics and polymer, and road and building materials. The society publishes weekly, *Chemistry and Industry*; and monthly, *The Journal of Applied Chemistry* (with abstracts of the literature), *The Journal of the Science of Food and Agriculture* (with abstracts of the literature); also ann. reports on the progress of applied chem., and separate pubs. on special topics from time to time. The society awards a number of lectureships and gold medals; its H.Q. are at 14 Belgrave Square, London, S.W.1.

Chemical Society, formerly the C. S. of London, estab. in 1841 and incorporated by royal charter in 1848 for the advancement of chemical science by the discussion and pub. of new discoveries. Its main pubs. are the *Journal and Proceedings of the Chemical Society*, *Annual Reports on the Progress of Chemistry*, *Quarterly Reviews*, and *Current Chemical Papers*. The C. S. maintains an extensive library and makes grants to promote chemical research. Applicants for fellowship should apply to the General Secretary, the C. S., Burlington House, London, W.1.

Chemical Warfare, although now regarded as a barbarous practice, is by no means new. The ancients in Greece, cents. before the Christian era, poisoned or choked each other with sulphur fumes. It was also a practice to place dead animals in such a position that the gases emitted from the carcass during decay would drift towards the enemy and cause disease. The use of poisonous gases in the Middle Ages is also on record. With the 'humanising' of war and the recognition of laws of war, drawn up and agreed to by most civilised nations, C. W. was prohibited by a declaration of The Hague Conference in 1899. Great Britain at first withheld assent to the rule, because the conference was not unanimous, but agreed in 1907. The U.S.A. never agreed to the rule, on the ground that sufficient

information on the subject was not available on which to base a decision. During the wars of the latter half of the 19th cent.—the Crimean, Amer. Civil War, and Franco-Ger. War—suggestions for the employment of poisonous gases were not wanting, but in no case were they adopted. Poisonous gases are not mentioned specifically in the Convention of 1907, but Article 23 prohibits the signatories from employing poison or poisoned weapons. Although Germany was one of the signatories to this convention, she was the first to use poisonous gas during the First World War. On 22 April 1915, in the Ypres salient, Germany launched a gas attack from cylinders charged with a mixture of phosgene and chlorine, causing its victims either intense pain or death. It appears to have been a foregone conclusion in military circles that Germany would break the convention on this point, the belief being based on the fact that an official pub. of the Ger. Army dated 1910 advocated the fullest use of modern inventions, however dangerous. The effect of this attack was terrible, because the forces of the Entente were not prepared for the violation. As the greenish-grey cloud spread over the unprotected troops it blasted everything it touched and shrivelled up the vegetation. A cry went up at once for protective methods against gas, and a simple respirator was immediately devised and issued to the troops in the trenches. The Entente retaliated in kind, and new methods of attack with, and defence against, gas were devised. In attack the gases were either released from cylinders and carried to the enemy lines by a favourable light wind (and usually in damp weather) or were enclosed in shells fired from artillery or dropped in bombs from aircraft. The defensive measures usually consisted of some form of respirator containing a chemical which neutralised the harmful gas. The most dangerous gas was mustard gas, which burned the body, piercing clothing and equipment with ease. Gas drill became essential, and sentries were regularly posted to watch and give warning of its approach. Dug-outs were partially protected by hanging damp curtains before the doors. At the Washington Conference in 1922 the great powers agreed to prohibit the use of every kind of asphyxiating and poisonous gas in war. C. W. was not employed in the Second World War. See also CHLORINE IN WARFARE. See J. B. S. Haldane, *Callinicus: a Defence of Chemical Warfare*, 1925; M. Sartori, *The War Gases*, 1939; C. Wachtel, *Chemical Warfare*, 1941.

Chemin de Fer, Baccarat, one of the 2 forms of the anct card game of baccarat, the other being *baccarat banque*. It is almost entirely a game of chance. The object of the game of baccarat, whether C. de F. or *baccarat banque*, is to hold such cards as shall together amount to the point of 9. Every card of the value of 10, and every 10 occurring as part of a total, is disregarded, or, as it is called, is *baccarat*, i.e. zero. For C. de F. 6 packs of

cards are required. The croupier then hands an arbitrary quantity from the top of the pack to the player on his right, who for the time being is dealer or banker. The latter then places in front of him the amount he wishes to stake, and the rest, the punters, make their stakes. Any punter may, if so disposed, 'go bank', i.e. play against the whole of the banker's stake. If the total staked does not equal the amount in the bank, other players standing round may add stakes. The banker then deals 4 cards, face downwards, the first for the player on his right, the third for the player to his left, the second and fourth to himself. The player who has the highest stake represents the other punters, but if 2 have staked equal amounts, the first in rotation has the preference. If the banker wins he takes the stakes, but if the punters win the amount of his stake is paid to each punter in rotation out of, but only to the extent of, the amount in the bank, the banker not being liable for more than his stake. If the banker wins he deals again; if not, the player next in rotation becomes banker. The game may not end, however, in the way above described. If either the banker or representative punter finds that he can score neither 9 nor 8 (the next best point) with his 2 cards, he need not turn up his cards. The punter may then draw another card on the offer of the banker. Apparently by the etiquette of the game, the punter, if his point is 0, 1, 2, 3, or 4, must accept this third card; if his point is 6 or 7 he must refuse; if 5 he has a real option. It is then the banker's turn to decide whether he himself will draw a card, and having drawn or not drawn, as he elects, to expose his cards. A tie neither wins nor loses, the stakes abiding the result of the next hand. In the variation, *baccarat banque*, the bank is put up to auction. The same rules as to offering and accepting and turning up the cards apply as in *C. de F.* As before, if the stakes exceed the amount in the bank, the banker on losing does not have to pay out beyond the amount of his own stake. The punters are paid in rotation so far as this stake extends, and those who have got nothing must wait for another successful coup. Both forms of *baccarat* are included in the games made illegal by the Eng. criminal laws against keeping common gaming-houses.

Chemins des Dames, area in France situated just N. of the R. Aisne, between Rheims and Laon, and the scene of much fighting during the First World War, in the Champagne prov. (q.v.). In their initial offensive in the autumn of 1914, the Germans swept over this area, and in the counter-attack the Entente pushed them back as far as this point, on which they rested for many months. A Fr. offensive commenced in the middle of April 1917, and after much fighting at great sacrifice the French gained a little ground in the C. des D. sector. Another Fr. offensive was commenced in the middle of Oct., and by the 26th so much progress had been made on the flanks of

the position that the Germans considered it wise to evacuate it. Being on the direct road to Paris from Belgium and NE. France, C. des D. became the scene of much fighting when the Germans made their offensive during the spring of 1918. Here their overwhelming numbers, aided by secrecy of their intentions, easily overran the surprised Fr. garrisons and drove them across the R. Aisne. In the following July the Entente delivered its counter-offensive and drove back the Germans the way they came. This necessarily brought C. des D. once more to the fore as a scene of action, and much fierce fighting took place in this region. In this sector the Fr. troops were under the command of Gen. Mangin, a vigorous and able man who knew every detail of the ground over which the fighting was taking place. The Germans held this stepping-stone to Paris as long as possible, and it was not until the end of Sept. 1918 that they were eventually driven beyond this area. See ALSO FRANCE AND FLANDERS, FIRST WORLD WAR CAMPAIGNS IN.

Chemist and Druggist, or Pharmacist. Under the Pharmacy Acts of 1852 and 1868, now consolidated in the Pharmacy Act, 1954, the titles pharmaceutical chemist, pharmacist, pharmacist, chemist and druggist, druggist, or member of the Pharmaceutical Society are restricted to persons registered as a pharmaceutical chemist. In connection with the sale of goods by retail the title of chemist is similarly restricted. The Pharmaceutical Society of Great Britain (q.v.) has the statutory duty of examining students and determining the requisite educational standard for registration as a pharmacist. The Pharmaceutical Chemist Diploma awarded by the Society involves 5 years' study, 3 years as a full-time student at a recommended school. Degrees in pharmacy are awarded by the univs. of Glasgow, Leeds, London, Manchester, Nottingham, and Wales.

Chemistry, branch of that science which consists in the study of the changes which matter is capable of undergoing. These changes may be divided into physical and chemical, and although in the higher stages it is impossible to draw a definite distinction between them, C. and physics being converging sciences, examples can be given of both varieties of changes. For example, a steel needle rubbed on a magnet in a definite way undergoes physical change by means of which it acquires the power of the magnet. On the other hand, a match rubbed on a match-box undergoes a chemical change by means of which flame is produced. Thus it is possible to make a distinction between the sciences of C. and physics. A chemical change involves some alteration in the composition of the substance. The match having been ignited has undergone a permanent change, whereby it is no longer combustible. The physical change quoted above involves no alteration in the substance itself, and the acquired property is further only temporary and can be continually lost and reacquired. The difficulty occurs in this fact, however,

that every chemical change is accompanied by physical change, and the physical change may often be the only sign that chemical change has taken place. But it might be said that C. is concerned with the investigations of the changes that occur when the molecular structure of any substance is altered.

For the numerous articles in this encyclopaedia relating specifically to C., see under names of individual persons and substances. See also ACID; ALCOHOL; ANALYSIS; ASSAYING; ATOM; BIOCHEMISTRY; COMBUSTION; CRYSTALLOGRAPHY; ELECTROCHEMISTRY; FORMULA; GEOLOGY;

base metals, and in their search for the philosophers' stone (see ALCHEMY); and in the course of their studies they discovered many potent medicines. Their writings are preserved, but the majority of them are of doubtful value from a scientific standpoint, for they are so mixed with philosophical extravagances that they are unintelligible. At the same time it must be remembered that their work was not entirely valueless, although it might possibly have been better directed—the discovery of radium and its congeners having proved the theory that the transmutation of elements is possible.

AN OLD CHEMICAL LABORATORY

METALS; MINERALOGY; MOLECULE; ORGANIC CHEMISTRY; OSMOSIS; SOLUTIONS; STEREOCHEMISTRY; SYMBOLS; THERMOCHEMISTRY.

History. The anct civilisations, Egyptians, Phoenicians, Greeks, and Romans, were familiar with sev. of the metals and the processes of extracting them from their ores, while they also knew how to make alloys, usually copper, lead, and tin. In addition to this the ancients were familiar with the manufacturing processes concerned in the making of soap, starch, glass, leather, stoneware, wine, and beer, before they were familiar with the process of distillation. Geber (Jabir ibn Hayan), an Arabian chemist of the 8th or 9th cent. A.D., knew white arsenic, borax, common salt, alum, copperas (ferrous sulphate), and possibly sulphuric, nitric, and acetic acids. The apparatus used by him was similar to that used until the 18th cent. From the 8th to the 17th cent. the science of C. drifted into the hands of the alchemists. They were concerned with the production of gold from

Modern C. may be said to commence with Robert Boyle (q.v.), for he was the first to endeavour to rid C. of its alchemic tendencies. In his book the *Sceptical Chymist* (1661, 1680) he discredited the alchemic theory regarding salt, sulphur, and mercury as the elements of substances, and at the same time gave a scientific definition of an element. He it was who introduced the air-pump and the thermometer to this country, and his experiments on the physical properties of gases gave us Boyle's law (q.v.). Following him we have Becher (1635-82), and Stahl (1660-1734), who formulated the phlogiston theory of combustion (q.v., see also ATOM and ATOMIC THEORY). In the meanwhile Boerhaave (q.v.) pub. a system of C., and Marggraf (q.v.) studied alumina and magnesia and worked on the quantitative analysis of substances in solution. Among famous Eng. chemists of this time may be named Cavendish (q.v.), who studied hydrogen and atmospheric air, and made the important discovery of the compound nature of water

and nitric acid, and Priestley (q.v.), who discovered oxygen and studied nitric oxide, nitrous oxide, hydrochloric acid, and ammonia gases, etc. Lavoisier (q.v.) was the first to lay down a real system of chemical nomenclature (see SYMBOLS and FORMULA). Scheele (q.v.), who lived in Sweden, discovered a large number of acids, chlorine, and oxygen. Richter (q.v.) discovered the law of reciprocal proportions, i.e. that if the weights of various elements, which combine with a given weight of another element, be compared, then they bear a simple relation to the proportions in which those elements will combine amongst themselves, e.g. chlorine and hydrogen combine with phosphorus in the proportions of weight—phosphorus : chlorine = 1 : 3.43; phosphorus : hydrogen = 1 : 0.097. Chlorine and hydrogen also combine to make hydrochloric acid, and they do so in the proportion—chlorine : hydrogen = 35.5 : 1; and 35.5 : 1 = 3.43 : 0.097. Berthollet (1748–1822) studied chemical affinity and applied chlorine to bleaching, and Dalton (q.v.) stated the atomic theory which placed C. on the basis of an exact science. Among the great chemists since may be mentioned Gay-Lussac, Dulong, Wollaston, and Davy (q.v.), who discovered the use of electricity for decomposing caustic soda and caustic potash with the consequent separation of the metals sodium and potassium. Berzelius (q.v.) confirmed the law of constant proportions, fixed many atomic weights, and formulated the electro-chemical theory of the constitution of salts. Those chemists mentioned above, while not regardless of organic C., devoted their attention to the study of inorganic C. In 1828 Wöhler (q.v.) discovered that urea could be made in the laboratory, and this has led to a great research into organic C., so making it a distinct and important sub-science. This work has been led by Dumas, Liebig, Laurent, Gerhardt, Wurtz, Kolbe, Frankland, Williamson (q.v.), and others. Among general chemists of more recent times may be mentioned Faraday, Rose, Bunsen, Regnault, Mendeleëv, Ostwald, Van't Hoff, Sir Wm Ramsay, Sir Wm Crookes, Sir James Dewar, Mme Curie, and Irving Langmuir (q.v.).

Elementary principles of chemistry.

Now to proceed from the general consideration of the science, in the first place we must recognise that to the chemist all matter, solid, liquid, or gaseous, is composed of minute particles called *molecules* (q.v.). The molecules of any substance are all similar. Then, further, molecules themselves are in most cases possessed of a structure. These particles of which molecules are formed are called *atoms* (see ATOM AND ATOMIC THEORY). With this in mind it is now possible to say that any change which leaves the molecules intact is a physical change, while any change in the structure of the molecule itself may be said to be chemical. It is now known that the atom is not the simple, ultimate particle of matter once supposed, but that atoms consist of an electrically positive nucleus, where

resides most of the mass, surrounded by electrons, or units of negative electricity, which revolve and rotate in different orbits, variously inclined to each other, and at different distances from the nucleus. The atom may be roughly compared to a miniature solar system with the nucleus representing the sun. In the case of the lightest element, hydrogen, the atom has the simplest structure, and consists of 1 electron revolving and rotating about the nucleus, while the most complicated structure is presented by the heaviest known element, uranium, the atom of which has 92 electrons. Many names, such as those of Rutherford, Thomson, Lewis, Langmuir, and Bohr, are associated with theories of the structure of the atom, but undoubtedly much work remains to be done. The latest theories are due to Schrödinger, Dirac, de Broglie, Chadwick (q.v.), and others.

Elements and Compounds. Some molecules contain atoms of the same kind, while others contain atoms of different kinds. Thus, in a molecule of water there are atoms of hydrogen and oxygen, while in that of sulphur all the atoms are alike. When all the atoms are similar, we call the molecule an *elementary* one and speak of the substance as an *element* (q.v.). On the other hand, we speak of the molecule with different atoms as a *compound* molecule, and the substance as a *compound*. Now it is evident that if a substance is composed of more than one kind of matter, i.e. is a compound, it can be built up from the component substances (synthesis), or separated into these simpler substances (analysis or decomposition). If any substance can neither be split up into simpler substances nor built up from them it is said to be an element, and we assume that it consists only of similar atoms. At the present time there are about a hundred elements. It is possible that some of these may, in time, be proved not to be elements, but at present it has not been possible to decompose further any of them, except into electrical particles. The number of compounds is practically infinite, since they consist of combinations of these elements. All substances which are not elements are not necessarily compounds. They may be *mechanical mixtures* (q.v.). Chemical compounds are only produced by *chemical action*, which really consists in the rearrangement of various atoms into new molecules. This may result by: (1) the direct union of 2 molecules to form a more complex molecule; (2) an exchange of atoms between molecules; (3) the rearrangement of atoms within a molecule. As an example of (1) we may take the union of a molecule of carbon with 1 of oxygen to form carbon dioxide; of (2) the union of a molecule of hydrogen with 1 of chlorine, each containing 2 atoms, to form 2 molecules of hydrogen chloride, each containing 1 atom of hydrogen and 1 of chlorine; of (3) ammonium cyanate warmed gives urea. Both contain the same atoms, only in different arrangements, yet their properties are entirely

different. Chemical action may result from a variety of causes. In some cases it is sufficient just to bring 2 substances together. In others heat is required to cause it. Chemical action is always accompanied by the evolution or the absorption of heat. In the latter case, heat must be supplied to the substances to cause the action, e.g. if iron be brought to a dull red heat and it be placed in oxygen, it burns fiercely with the formation of oxides of iron. White phosphorus, on the other hand, combines with the oxygen in the air at the ordinary temp. with the evolution of heat and light. In some cases light is essential to chemical action, as, for example, when chlorine and hydrogen gases are mixed, unless light be given them they will not combine. Photography depends entirely upon the fact of light causing chemical action. Again, in some cases while heat is required to start chemical action, the great evolution of heat in the process is afterwards sufficient to keep the action proceeding, e.g. it is necessary to heat a strip of magnesium in order that it may take fire. Then, however, no further heat is required, the great heat evolved being sufficient to set the strip burning furiously until the end is reached. Pressure also may cause chemical action, e.g. the 2 gases hydrogen chloride (HCl) and hydrogen phosphide (PH₃) will combine to form the solid phosphonium chloride under pressure. Sound also may cause chemical action. An explosion of mercury fulminate causes acetylene gas to break up into the solid carbon and hydrogen gas. A peculiar process of chemical action can only be brought about in the presence of a third substance. In some cases this third substance is known to take a part in the action, while in others its action cannot be traced. In any case, however, that third substance is, at the end, unchanged. This type of action is known as *catalytic* (see CATALYST). Further, some forms of chemical action require moisture. The rusting of iron, or the combination of sodium and chlorine to form common salt, cannot take place in an absolutely dry atmosphere if the substances have also been thoroughly dried.

Chemical symbols. In order that we may shortly express chemical compositions, certain symbols (q.v.) are used to denote the various elements (q.v.). Formulae (q.v.) are used for compounds. By means of formulae chemical reactions can be shortly expressed in the form of an equation (see EQUATIONS, CHEMICAL). They have a quantitative use which will be better understood after a consideration of the laws of chemical combination (see ATOM AND ATOMIC THEORY).

Atomic theory. Dalton connected these laws together and revived the atomic theory. Briefly, it is that matter is made up of minute particles called atoms. Chemical combination takes place between these atoms, i.e. they are drawn and held together by chemical affinity. Should they come into contact with other atoms for which either of the already combined atoms has a much greater

affinity, then a process of redistribution of these atoms will take place. The atoms of different elements are supposed as having different relative weights and these relative weights are supposed as being the same as those numbers which represent their combining proportions. So the equivalent weight of an element is supposed as being its *atomic weight*. Now this theory will satisfactorily account for the laws of chemical combination, and it is a generally accepted fundamental of the science of C. Dalton's theory has to be revised in particular instances. For reasons which need not be given here, the combining proportions of oxygen, carbon, and sulphur, with 1 of hydrogen, are respectively 8, 6, and 16, while in any table of atomic weights the numbers will be 16, 12, and 32.

Chemical combination between gases is governed by 2 laws (see GAS AND GASES), and equations governing any chemical reaction have a quantitative use (see EQUATIONS, CHEMICAL). Among other principles which underly the science may be mentioned that of *valency* (q.v.). The modern electron theory enables us to distinguish (a) positive valency, which represents the number of electrons that an atom—or group of atoms—loses, (b) negative valency, which represents the number of electrons an atom—or group of atoms—gains, and (c) co-valency, which is the sharing of pairs of electrons between atoms. Loss of electrons is characteristic of metallic elements while gain of electrons is characteristic of non-metallic elements.

Periodic system. Chemists divide the whole range of matter into 2 great classes: metals and non-metals (qq.v.). Thus we could classify elements either as metals and non-metals or according to their valency. But Newlands (1864) developed a system, afterwards improved and established by Mendeleev, now known as the Period system. It depends upon the atomic weights of the elements. It can be noticed that if a group of elements be taken which closely resemble each other in their general properties, then the atomic weight of one element will be approximately the mean of the atomic weights of the nearest before and after it, ranged in order of atomic weights: e.g. lithium, sodium, and potassium have atomic weights of 7, 23, and 39. Now $(7 + 39) \div 2 = 23$. If the elements in the various families or groups are arranged in the order of atomic weights it will be seen that the increase in these weights in each group is practically the same. Thus fluorine, chlorine, and bromine have atomic weights of 19, 35.5, and 80, while nitrogen, phosphorus, and arsenic have atomic weights of 14, 31, and 75, and oxygen, sulphur, and selenium are represented by 16, 32, and 79. Now each 3 mentioned together here belong to the same family, and the differences between the atomic weights of the first and second in each group are 16.5, 17, and 16, while between the second and third in each they are 47, 45, 47, and these numbers are approximately equal. This cannot

be pure chance, and Newlands pointed out that if the elements be arranged in order of increasing atomic weights, the properties of the first 7 would reappear in the next 7, so that the first and the eighth, the second and the ninth and so on, would belong to the same group or family. This he called the law of octaves. Mendeleev, as we have before stated, developed this into the periodic law. This, of course, depends upon the hypothesis that the properties of elements are related to their atomic weights. The first 7 elements after hydrogen are lithium, beryllium, boron, carbon, nitrogen, oxygen, fluorine, with atomic weights of 7, 9, 11, 12, 14, 16, and 18. The next 7 are sodium, magnesium, aluminium, silicon, phosphorus, sulphur, and chlorine with atomic weights of 23, 24, 27, 28, 31, 32, 35.5—the approximate difference of 16 being evident through all—and the element in the second row which corresponds in order with the element in the first row does possess similar properties, and will be found to belong to the same family. As we traverse the rows and pass from lithium and sodium to fluorine and chlorine, we pass from electro-positive soft white metals to electro-negative corrosive gases, while the valency increases as one passes along either row or any succeeding row from 1 to 4 and back again to 1. After the second row, however, the table gets complex, for the next row consists of 17 elements: 7 take their right places under the other 2 rows, then come 3 elements (iron, cobalt, and nickel) which are termed transitional elements, and then 7 others which, while they exhibit certain likenesses to the 7 preceding, can hardly be placed directly under them. These 17 elements are known as a *long period* as against the short period of the sevens. From here on the periods are all long, and should consist of 17 elements, but 2 gaps occur, representing elements of which we yet have no knowledge. The vertical columns in these rows of 7 are taken and the alternate elements after the first 2 rows are placed together and form a family, with similar properties. Thus group 1 will consist of lithium, sodium, potassium, copper, rubidium, silver, caesium, and gold. Of these, copper, silver, and gold form 1 family, and the rest fall together. This periodic table is of the utmost value in the study of inorganic C. It has aided in the true estimation of atomic weights of elements, and has aided in the discovery of new elements; e.g. Mendeleev himself predicted the discovery of an element which he called eka-aluminium, and gave its properties by a study of the series and families in his table. Four years later gallium was discovered by means of the spectroscopic (as he had predicted) and justified his predictions completely. A study, however, of a periodic system based upon atomic weights brings out several anomalies; for example, argon and potassium, iodine and tellurium, cobalt and nickel would, judging from their properties and behaviour, be placed in wrong positions if arranged according to atomic weights.

For long this remained unexplained, but it is now known that the atomic number (see ATOM) of an element is of more fundamental importance than its atomic weight. The above anomalies disappear when the elements are arranged according to their atomic numbers.

Isotopes (q.v.). The discovery of radium and the phenomenon of radioactivity, which revealed the startling fact that the atoms of certain heavy elements, such as uranium, thorium, and radium, were undergoing spontaneous disintegration, led Soddy (1910) to suggest that elements might exist which were chemically identical but differed in atomic weights ('isotopes' or 'isotopic elements').

Atomic numbers. Kaye (1909) found that a solid element, when bombarded by a rapid stream of cathode rays, emits a characteristic X-radiation, which may be resolved into a spectrum by reflection from a crystal, because as shown in the classical researches on crystal structure by the late Sir W. H. Bragg, and his son Sir Laurence Bragg, the internal surfaces of crystals act as diffraction gratings towards X-rays. Moseley (1913-14) used a crystal of potassium ferrocyanide and photographed the spectra of various elements. In this way he obtained what are known as the atomic numbers of the elements. These are whole numbers and when the elements are arranged according to them the periodicity of properties is shown without any anomalies. Briefly defined, the atomic number of an element is numerically equal to the charge on the nucleus of its atom.

Chemical nomenclature. If a substance is a *binary compound*, i.e. is composed of 2 different elements, then its chemical name is made up from the names of its composing elements, e.g. when hydrogen and sulphur enter into chemical combination the resultant substance is termed hydrogen-sulphide. Sometimes, however, the same 2 elements will combine together in more than 1 proportion. Names are then necessary to distinguish 1 from the other. Prefixes or terminal endings are used for this purpose. Phosphorus unites with either 3 or 5 atoms of chlorine, when it is known as phosphorous or phosphoric chloride according as there are 3 or 5 atoms of chlorine in the compound. Another and perhaps better method is that by which it is known as phosphorous trichloride or phosphorous pentachloride. The latter is the more general method. *Sub-* and *pre-* were terms generally in use, but they have fallen into disuse. When oxygen is 1 of the 2 elements in the compound, the substance is known as an oxide. Some of these oxides, when combined with water, form acids, and are known as acid-forming oxides or anhydride. All the non-metallic elements except hydrogen form these oxides, and the so-formed acids are called oxyacids. Metals give rise to oxides which form hydroxides with water, and these oxides are called basic oxides. When an acid is brought into contact with a basic oxide a salt is formed. All oxides are named after the substance with which

the oxygen is united, and oxyacids are also named after the same substance. Thus carbon dioxide gives rise to carbonic acid. When a substance forms 2 acid-forming oxides the terms *ic* and *ous* are used to denote the one with the greater and the lesser amount of oxygen respectively. Thus sulphur trioxide forms sulphuric acid, while sulphur dioxide forms sulphurous acid. Acids used to be considered as always containing oxygen, but this view is incorrect, as can easily be seen from the fact that chlorine,

Organic and inorganic chemistry. Organic C. (q.v.) is the C. of the carbon compounds. The element carbon is unique in its remarkable power of forming compounds, principally with hydrogen, or hydrogen and oxygen. The special branch of organic C. is necessary on account of their great and increasing number. The term 'organic' has lost its original significance, that of bodies which could only be produced by the so-called 'vital force' in living matter. That view was practically overthrown in 1828,

Imperial Chemical Industries

PLASTICS: AN ACHIEVEMENT OF MODERN CHEMISTRY

One of the most interesting and important of the synthetic plastics is the acrylic resin 'Perspex,' made by chemical reactions between acetone, hydrocyanic acid, wood alcohol or methanol, and sulphuric acid. The photograph shows 'Perspex' cocktail-glasses.

fluorine, bromine, and iodine, known in C. as the halogen group, form acids when in combination with hydrogen. When acids are added to bases, salts are formed, and acids which contain more than 1 atom of hydrogen (all acids have, at least, 1 atom) can form more than 1 salt, for a salt is formed by the replacement of the atom or atoms of hydrogen in the acid by the metallic atoms of the base. Thus sulphuric acid (H_2SO_4) contains 2 atoms of hydrogen, and it can give rise to 2 salts of any metal, e.g. normal potassium sulphate represented by K_2SO_4 and $KHSO_4$. Hydrochloric acid, on the other hand, has only 1 atom of hydrogen in it, and can only give rise to 1 salt. Thus according as there are 1, 2, 3, or 4 atoms of hydrogen in an acid, it is known as mono-, di-, tri-, or tetra-basic, while a normal salt is 1 in which all the displaceable hydrogen atoms have been replaced by the base.

when Wöhler synthesised the organic body urea from the inorganic compound ammonium cyanate. A phenomenon found with extraordinary frequency in the case of carbon compounds is that known as 'isomerism' (q.v.).

Physical chemistry. Although of very recent development this is now an absolute essential to the study of any branch of C. with any design. It seeks to explain processes, and to formulate laws for these processes, and is divided within itself again into electro- and thermo-C., etc. One branch of physical C. in which great strides have been made is the study of the general properties of gases. It is really as much in the realm of physics as it is in the realm of C. (see GAS AND GASES). A further dept of physical C. which has received great attention is that of the theory of solutions. It has been estab. that the pressure exerted by a substance in dilute solution, its osmotic pressure

(see Osmosis), is the same as would be exerted by the same amount of the substance if it existed as gas, and occupied the same volume at the same temp. Much research has been carried out on what is known as the colloidal state (see COLLOIDS). This may be regarded entirely from the point of view of size of particle. The particles are of greater molecular dimensions than exist in true solutions, and yet sufficiently small to be kept in suspension, against the action of gravity, by molecular bombardment. Such particles represent an enormous surface area and to this fact many of the properties characteristic of the colloidal state are due. Further the laws relating to gaseous pressure are similar to those relating to osmotic pressure, and diffusion of dissolved substances can be compared with the diffusion of gases, although it is a much slower process. This theory involves the theories connected with electrolysis (q.v.), for solutions of some substances act in such a manner that it is necessary to suppose that molecules of the dissolved substances unite in solution to form complicated molecular structures, while in the case of certain acids, bases, and salts, their resultant action can only be explained on the hypothesis that their molecules dissociate into ions. Dissociation (q.v.) is a term used of reversible reactions. The conception of ions in C. is a branch of electrolysis (q.v.). It will be sufficient for the purposes of this article to mention that the theory of electrolytic dissociation at present held is that it involves a flow of electrons. The primary factors in electrolysis are known as ions. Those which proceed to the positive pole are negatively charged, and vice versa. Among electronegative ions may be named fluorine, chlorine, bromine, and acidic radicals such as SO_4 , while electropositive ions include hydrogen and the metals. Among the laws of electrolysis may be mentioned Faraday's, which says that if the same quantity of electricity be passed through different electrolytes, then the ratio between the liberated products of the electrolysis is the same as that between their chemical equivalents. It used to be supposed that the electricity caused the dissociation of the electrolyte into ions, but it has been shown that electricity travels as freely through electrolytes as along metals, and that consequently work is not done. Arrhenius (1887) proposed that some of the molecules of an electrolyte are always in a state of dissociation (q.v.). A development of this theory leads to the conclusion that a solution, say, of sodium chloride has sodium and chlorine existing in the free state within the solution. This goes against all preconceived ideas, particularly as sodium causes immediate chemical action if brought into contact with water. To support this theory, however, they must be in such a state and highly charged with electricity. Whenever they lose their charges they either reunite into sodium chloride or form molecules of sodium and chlorine and assert their usual properties. It is now

believed that electrolytes consist not of molecules but of assemblages of ions, even in the solid state. Solution merely sets the ions free to move, and passage of a current directs their movement. Thermo-C. is concerned with the thermal changes which accompany chemical changes. Determinations in this branch of the science are made by means of calorimeters in which the heat that is liberated in chemical action is transferred to definite volumes of water, and its application chiefly lies in its efficacy for determining economic commercial processes. The structure of the atom is, of course, of fundamental interest and importance to C., but the methods employed in this study are almost entirely physical. Finally, it may be stated that a knowledge of C. is evidently essential in many walks of life, whether it be the surgery, the kitchen, the dairy, the farm, the factory, the mine, or the great iron and steel industries. The arts and, of course, the great chemical and dye works are dependent upon it, and it stands out as the first study in any scheme of technical education.

Chemnitz, Bogeslaw Philipp von (1605-1678), Ger. historical and political writer, grandson of Martin C. (q.v.). He was an officer in the service of Sweden during the Thirty Years War, becoming historiographer to Queen Christina in 1644, councillor in 1675. His *Dissertatio de ratione status in imperio nostro romano-germanico* appeared in 1640 under the pseudonym of 'Hippolytus a Lapide.' C. also wrote *Der königlich sächsische in Deutschland geführte Krieg*, 1648 (new ed., 1855-9). The *De Ratione* was answered by an anonymous writer, 1657; by Brugemann, 1667; and Boecler, 1674. It was trans. into French by de Chastelet, 1712; by Formey, 1762.

Chemnitz, or Kemnitz, Martin (1522-

1586), Lutheran divine, son of a cloth-worker, b. Treuenbrietzen, Brandenburg; followed his father's trade, but became a student at the univ. of Frankfurt-on-Oder, and then at Wittenberg, where he came under the influence of Luther and Melancthon. He won notice as an orator and controversialist. Bitterly opposed to the Jesuits, he inveighed against them in many pamphlets, especially in his *Theologiae Jesuitarum praecipua capita* and *Examen concilii Tridentini*, 1563-73. He was recognised as the head of his church throughout Saxony.

Chemnitz, see KARL-MARX-STADT.

Chemosh, national deity of Moab, called by the Israelites the 'Abomination of the Moabites' (1 Kings vii. 7). The latter were also called the children of C. (Jer. xlviii. 46). C.'s name frequently occurs in the O.T. (cf. Judges xi. 24), and is found on the Moabite stone (q.v.). Human sacrifices were sometimes offered to him (2 Kings iii. 27). Solomon built an altar to him, which was not removed until Josiah's accession.

Chemotaxis, see FERTILISATION.

Chemotropism, see TROPISM.

Chemulpo (Kinsen), port on the W. coast of Korea, was opened to foreign trade in 1883 when it was a poor fishing vil.; it was later a flourishing and rapidly increasing centre of trade with a pop. of 103,000 (Japanese 25,000).

Chemung, name given by Amer. geologists to a div. of the Devonian.

Chenab, riv. of Kashmir, India, and E. Punjab, Pakistan. Together with the Sutlej, Beas, Ravi, and Jhelum it forms the R. Punjab or Panjnad (Five Waters), which finally flows into the Indus. When the C. reaches the Punjab dist., it attains to a breadth of 600 ft. It takes its rise in Lahul at an altitude of nearly 14,000 ft. It is 590 m. long.

Chencanfu, tn of Kwangsi prov. in S. China.

Chenchine, see FER.

Chenchow, or **Yuanling**, tn of central China, Hunan prov., on the Yuankiang, 169 m. W. of Changsha, 110 m. from Lake Tungting.

Chenchu, an aboriginal people of S. Hyderabad in India. They are divided into 3 groups: (1) The 'Jungle C.s.' who rely mainly on the gathering of wild forest produce and are largely nomadic, are the most important. There are also (2) C.s. living in settled vils., who have adopted the type of life of their Hindu neighbours; and (3) a third section in Madras, now settled in permanent vils. See C. Fürer-Haimendorf, *The Chenchus*, 1943.

Chénédollé, Charles Julien Lioult de (1769-1833), Fr. poet who fought in the army of Condé against the revolutionaries. His prin. works are *Le Génie de l'homme*, 1807, and *Études poétiques*, 1820. He belonged to the romantic school of poets, and his works were ed. by Sainte-Beuve in 1864, who has also paid tribute to his memory in his *Chateaubriand et son groupe*, 1860.

Chénée, tn situated near the conjunction of the R.s Ourthe and Vesdre in the prov. of Liège, Belgium. Pop. 11,300.

Chenery, Thomas (1826-84), Brit. so. Ei. Bi.

in the Crimean War. A fine Hebrew and Arabic scholar, he was on the revision committee of the O.T. and from 1868 to 1877 was prof. of Arabic at Oxford. Thereafter, till his death, he was editor of *The Times*.

Chenevix, Richard (1774-1830), Irish writer, chemist, and mineralogist, of Fr. parentage, F.R.S. of London and Edinburgh. He was a Copley medallist in 1803. Among his scientific works are *Chemical Nomenclature*, 1802, and *Observations in Mineralogical Systems*, 1808. He also wrote the comedy *Mantuan Revels*; the tragedy *Henry VIII*, 1812; *Essay on Natural Character*, 1830; papers on palladium, nickel, and platinum; *Lemora*, and other poems.

Chengchow, cap. of Honan prov., China, 80 m. from Kaifeng, in the cotton-growing dist. It is the junction of 2 main arterial roads, the Peking-Hankow and the Lung-Hai. The latter is now being extended to Russia. C. used to be an industrial centre of Honan. Since 1950 many of the textile mills in Shanghai have moved to C. and more mills were built there in 1954-6. It was made cap. of Honan in 1951, and a new univ. has been estab. there. Pop. approx. 1,000,000.

Chengteh, tn of inner Mongolia, 115 m. NE. of Peking. Under the Manchu dynasty it was the summer resort of emperors. From 1913 to 1953 it was the cap. of Jehol prov. The palaces and Lama temples built in 1703 by Emperor Kanghsi are comparable in grandeur and beauty with those in Peking. C. is the military junction of the Peking-Chengteh and Chaoyang-Chengteh railways. Pop. approx. 50,000.

Chengtu, cap. of prov. of Szechwan, W. China, situated in a fertile plain watered by the Min, a trib. of the Yangtze. It is an important railway centre and the seat of the Szechwan Univ. Rice and silk are its chief products. Its Takiangyen dam and irrigation system, built in the 3rd cent. BC, are in good repair. The temples of the poet Tu Fu and many other historical celebrities are the pride of C.

Chengyangkuan, tn in the prov. of Anwei, China; noted for its market.

Chénier, André Marie (1762-94), Fr. poet and miscellaneous writer, son of the Fr. consul at Constantinople, his mother being Greek. He was educ. at the Collège de Navarre, and began to write verse at the age of 16, with imitations of Homer and Virgil. He held at one time a commission in the army, but soon devoted himself to literature. He wrote many idylls and elegies, which show his powers as poet, although little was pub. during his life-time. Singularly chaste in style, he approached the Greeks in their powers of eloquence and choice selection of words. He was largely influenced by Milton, whose classic style he sought to imitate. In 1787 he accepted a post in the Fr. embassy in London, but after 3

years returned to France, where, after joining the revolutionary movement for a short time, he threw in his lot with the Moderate party, being disgusted with the extreme methods adopted by the revolutionaries. Most of his political writings appeared in the *Journal de Paris*. When his party was defeated and the king executed, he paid for his outspokenness, was arrested and thrown into the St Lazare prison, and guillotined 4 months later. C. is regarded as the foremost Fr. poet of the 18th cent. A classicist, he differed only from the great classicists in that he was more of a Hellene than they—a trait which he owed to his Gk mother's influence. The only long works he projected were in the spirit of the 18th cent.

Dimoff, *La Vie et l'œuvre d'André Chénier*, 1936; G. Walter, *A. Chénier, son milieu et son temps*, 1947.

Chénier, Marie Joseph Blaise de (1764-1811), Fr. dramatist and poet, younger brother of André. He was a Jacobin, and served in the legislative assembly for a period of 30 years. C. was a keen politician with democratic principles, which account largely for the popularity of his tragedies, chief of which are his *Charles IX*, 1790, *Henry VIII*, 1791, *Jean Calas*, 1791, and *Timoléon*, 1794. He became a member of the Convention, and was on the Council of Five Hundred. He was distinguished for his satires, amongst which may be mentioned his *Épître à l'ollaire*, 1806.

D. McLeish

THE CHÂTEAU OF CHENONCEAUX

and belonged to the Encyclopaedic movement. The best known of his poems belong to the *Bucoliques*: *La Jeune Tarentine*; *L'Acceugle* (on the legend of Homer wandering and blind); and *Le Jeune Malade*. Of the odes the best known are the *Pindaric Jeu de Paume* and one addressed to Charlotte Corday. The *Iambes*, which contain some of his finest poetry, were all written during his incarceration in St Lazare. In style his importance lies in his use of *enjambement*, and he was the first who in this manner systematically modified the somewhat monotonous uniformity of the Alexandrine so as to lend it more life and flexibility. His works on scientific questions or current problems include *L'Amérique* (planned as a poetic geography of the known world); *L'Hermès* (a universal philosophy in verse); *L'Astronomie*; *La Superstition*; and *L'Invention*, later works which show a deeper skill in literary craftsmanship. His *Poésies lyriques* were pub. after his death in 1819. See E. Faguet, *A. Chénier*, 1902; P.

Chenille, special kind of pile yarn used in millinery manuf., curtains, and carpets. It may be of silk or worsted according to the purpose required. It is made by weaving a gauze cloth of very open texture which is then cut into strips and finished off into a rounded-pile thread.

Chenkiang, port in the Kiangsu prov. of China, on the S. bank of the Yangtze, about 150 m. from its mouth. Its existence as a port is gravely threatened by the deterioration of the harbour. Pop. 200,000.

Chenonceaux, Fr. vil. in the dept of Indre-et-Loire, 22 m. E. of Tours (q.v.), on the Cher. It is famous for its magnificent Renaissance chateau, which is constructed over the riv. The building was begun by Thomas Bohier, a tax collector, in 1515. The great gallery, 199 ft long, which crosses the Cher, was added by Phillibert Delorme (q.v.) in 1560. The chateau, confiscated by Francis I in 1535, was given by Henry II to Diane de Poitiers, from whom it was forcibly taken by Catherine de' Medici (qq.v.) in exchange

for Chaumont (q.v.). Later it was possessed by the Vendôme and Bourbon-Condé families.

Chenopodiaceae, family of Dicotyledons, contains over 500 species many of culinary value. Many grow on salt or alkaline soils, and frequent seashores. Most of the plants are herbaceous, with dense inflorescences of small flowers. There is usually a simple, persistent perianth of sepaloid leaves, 1 to 5 in number, the stamens typically equal the perianth-leaves in number, the ovary is superior and unilocular with a single campylotropous, basal ovule; there are no stipules, and the fruit is a nut or an achene. Genera include *Atriplex*, *Beta*, *Chenopodium*, *Gratia*, *Habitzia*, *Salicornia*, and *Spinacia*.

Chenopodium, important genus of the Chenopodiaceae, of about 110 species of temperate regions. Among those found in Britain are *C. bonus-henricus*, All-good, Mercury, or Good King Henry, a perennial with edible shoots like asparagus; *C. polyspermum*, All-seed; *C. vulvaria*, Stinking Goosefoot; *C. scifoilium*, Fig-leaved Goosefoot; *C. murale*, Nettle-leaved Goosefoot; *C. urticum*, Upright Goosefoot; *C. rubrum*, Red Goosefoot; *C. glaucum*, Glaucous Goosefoot; *C. album*, Fat Hen; and *C. hybridum*, Sowbane—all annuals. *C. quinoa*, the annual Quinoa of Peru, yields very large seeds used for food, growing where other cereals do not ripen; *C. ambrosioides* is the annual Mexican Tea, and its variety *anthelminticum*, Wormseed, provides an essential oil used as a vermifuge; *C. capitatum* is the Strawberry Blite of Europe, with bright red seeds; and *C. amaranticolor* is often used in S. France as a substitute for spinach.

Chengyuen, tn in the prov. of Kweichow, China, 100 m. ENE. of the cap., Kweichow. It is noted for its gold and copper mines. The volume of trade transacted in C. is about one-third of that of the whole prov.

Cheops, Khufu, second king of the 4th Dynasty of Egypt, and the builder of the Great Pyramid of Giza. The construction of this great tomb and that of his successor, Cephren, exhausted Egypt. According to Herodotus, all the Egyptians were put to work in relays of 100,000 working for 3 months, quarrying, constructing the road for transport, and preparing the site. All this work took 10 years, and the work of building the pyramid 20 years more.

Chepman, Walter (c. 1473-c. 1538), printer and merchant of Edinburgh, one of the first Scottish printers. He was introduced to the court of James IV, and was trained as a clerk and writer under Panter, the royal secretary. C. and Andrew Myllar were granted the sole patent to print books in Scotland, 1507. They set up their printing-press (the first in Scotland) at the foot of Blackfriars Wynd in the Cowgate, Edinburgh. Two of their pubs remain, one, the first book printed in Scotland, consisting of 11 small quartos bound together, 1508, the other *Breviarium Aberdonense*, 1510. See introduction by D. Laing, *The Chepman and Myllar Prints, 1508, 1527,*

and R. Dickson, *Introduction of the Art of Printing into Scotland, 1885.*

Chepping Wycombe, see WYCOMBE, HIGH.

Chepstow, tn of Monmouthshire on the R. Wye, near its junction with the Severn. The tn lies on a slope between steep cliffs, and is surrounded by beautiful scenery. It possesses the ruins of a castle which sustained sev. sieges during the Great Rebellion, and in its neighbourhood are the remains of the famous Tintern Abbey. The Wye is crossed near here by Brunel's tubular suspension bridge, and here occur the highest tides in the Brit. Isles, the water sometimes rising 70 ft above low level. It is a holiday centre for the Wye Valley and the Royal Forest of Dean. Pop. 5473.

Cheque, money order on a banker drawn out by a person who has money in the bank, and payable on presentment by the person to whom the C. is written out or by the bearer. The rules with regard to a bill of exchange (q.v.), defined in the Bill of Exchange Act, 1882, are also applicable to C.s. A C. must bear a two-penny stamp, and must be signed by the drawer, and presented within a reasonable time. A banker who pays a forged C. cannot debit his customer with the amount. When the amount is fraudulently altered, the banker who pays it can recover from his customer only the amount originally placed on the C. Negligence on the part of the customer causing or giving facilities for fraud may excuse the banker, if it be gross; but merely leaving one's C. book in an unlocked drawer will not *per se* be sufficient for this. Bankers paying on forged endorsements stand on somewhat different footing. A banker who pays in good faith and in the ordinary course of business a C. on himself to order on demand, bearing a forged endorsement, will not be held liable to his customer for the amount (Section 60, Bills of Exchange Act, 1882—a section which protects only bankers). The banker is bound to pay the C. on demand, except in cases when the drawer has previously given notice to him not to pay on his account, or when the drawer has d. or committed an act of bankruptcy. In England C.s may be crossed in order to lessen the risk of loss by theft or fraud.

A *crossed C.* has 2 parallel lines drawn across it, in which may be written a particular banker's name, or merely the words '& Co.' In the former case it is said to be *specifically crossed*, and will only be paid through the banker mentioned. When it is *generally crossed*, it is payable only through a bank. If the words 'not negotiable' are added, the person taking the C. does not have, and cannot give a better title to it than that of the person from whom he took it. C.s are returned by the banker after payment to the person who originally drew them. Since 17 Oct. 1957 the endorsement of C.s by payees has been unnecessary. By the Cheques Act, 1957, an unendorsed C. which appears to have been paid by the drawer's banker is evidence of receipt by the payee of the sum payable by the C.

Chequers, popular name for C. Court, a country mansion and estate in Bucks, England, the official country residence of Brit. Prime Ministers. The house is situated in a sheltered hollow of the Chiltern Hills at just over 600 ft above sea level, and its grounds contain Coombe Hill, 852 ft, one of the highest points in the Chilterns. The estate, which lies near Princes Risborough, is about 38 m. from London, and contains 1500 ac. of farmlands and woods. The nation owes this picturesque and historic mansion to the munificence of Lord Lee of Fareham, who in 1917, when Sir Arthur Lee, M.P., created a trust for the upkeep, staffing, etc., of the house and estate for the use, on his death, of Brit. Premiers. In 1920 he decided not to await that event, and on 8 Jan. 1921 Mr Lloyd George first occupied the residence. The mansion dates from the 15th cent., and contains a collection of Cromwell portraits and relics.

Cher, 1. Fr. riv., rising near Aubusson, and flowing generally NW. to join the Loire about 12 m. below Tours. It is navigable from Vierzon. Length about 220 m.

2. Dept. of central France, formed from part of the anct. prov. of Berry and a small part of Bourbonnais. The climate is temperate, the surface generally level and well wooded. The soil is fertile, and corn, vines, fruit-trees, beet, hemp, and flax are produced. Livestock is raised, and there is much bee-keeping. The chief occupation is agriculture, but there are some manufs., including woollen goods, cutlery, porcelain, glass, and confectionary. The prin. tns are Bourges (the cap.) and St-Amand-Mont-Rond (q.v.). Area 2819 sq. m.; pop. 284,400.

Cherasco, It. tn in Piedmont (q.v.) on the Tanaro. An armistice was signed here in 1796 between Napoleon (q.v.) and the Piedmontese. There is a silk industry. Pop. 9000.

Cherbourg, fortified seaport tn and naval station in the dept. of Manche, France, situated at the head of the peninsula of Cotentin, 85 m. W. of Havre. It has tribunals of the first class, and is the seat of a sub-prefecture. It is the H.Q. of one of the 5 naval armos. of France, and possesses a lycée and a naval school. Its prin. industry is centred in the works of the dockyard, but there are manufs. of hosiery and lace, chemicals and leather, as well as sugar and salt refineries, sawing, and flour mills. Nothing certain is known of the origin of C., but a common supposition is that it occupies the site of the Rom. station of *Cortallum*, and the name C. was long regarded as a corruption of *Caesaris Burgus*. The tn certainly existed in the 10th cent. In the 11th cent., under the name of Carusbur, it was a favourite resort of the Norman kings of England. In 1686 Vauban planned the harbour works, which were continued under Napoleon I, but not finally completed until 1856, when they were formally inaugurated by Napoleon III in the presence of Queen Victoria. Thirty years later the gov. expended 49,000,000 francs on the construction of

fresh works. The commercial and naval ports are quite distinct from each other. The latter consists of 3 basins cut out of the rock, 55 ac. in area with a minimum depth of water of 30 ft. Adjoining are dry docks and some of the largest ship-building yards in France. The bay is sheltered on the N. by a huge *digue*, or breakwater, 2½ m. from the harbour, over 2 m. long, 650 ft wide at its base, and 30 ft at its summit. The passages for vessels on the E. and W. of the *digue* are protected by batteries, the chief being Fort National with 100 guns on the *Île de Pelée*, and there is a fort in the centre of the breakwater. A series of coast redoubts and large fortifications behind this outer ring of defence renders C. almost impregnable from the sea. In the Second World War the Port Militaire and the Gare Maritime were heavily damaged, and the naval arsenal completely destroyed. The Allies captured C. by a land attack up the Contentin Peninsula. Americans entered C. on 25 June 1944. Pop. 40,000. See further under WESTERN FRONT in SECOND WORLD WAR, *Battle of Normandy*.

Cherbuliez, Charles Victor (1829-99), Fr. novelist, b. Geneva. He studied philosophy, philology, and mathematics. He was first a teacher, and afterwards wrote, besides his works of fiction, critical essays on various topics. His novels are a blend of narrative and philosophic reflection, and the amusing, if eccentric, originality of their style appealed to a large class of readers. Some of his most popular novels are *Le Prince Vitale*, 1864, *Samuel Brohl et Cie*, 1877, *Noirs et rouges*, 1880, and *Le Secret du précepteur*, 1893, most of which appeared in the *Revue des deux Mondes*. He also contributed political and serious articles, such as *L'Art et la nature* and *L'Espanne politique*, 1874. His works were very popular in other countries. He was made member of the Fr. Academy in 1881. See A. Célières, *V. Cherbuliez*, 1936.

Cherchel, see CAESAREA.

Cherdyn', tn in the Perm' Oblast of the Urals, 170 m. N. of Perm'. Pop. (1932) 5000. It was the old cap. of the N. Urals (until 1708; Komi (q.v.) princelings till 1505, under Moscow from 1472).

Cheremissas, see MARI.

Cheremkovo, tn in the Irkutsk Oblast of SE. Siberia, 80 m. NW. of Irkutsk on the Trans-Siberian Railway. C. is the centre of the C. coal basin which stretches 300 m. along the Trans-Siberian from Nizhneudinsk to Lake Baykal. It is the second centre of the Irkutsk-C. industrial area. Pop. (1956) 114,000 (1926, 14,000; 1939, 66,000).

Cherepovets, Russian tn in Vologda Oblast, 72 m. W. of Vologda, on the Rybinsk Reservoir (q.v.). It was founded in 1780. It has iron and steel plants (Murmansk ore, Vorkuta coal, scrap) and is a transportation centre (railway, Marinskoy Water Way, q.v.). Pop. (1956) 73,000.

Cherethites and **Paletithes**, foreign mercenaries forming the royal bodyguard of King David, and probably Philistines

(q.v.). The Gittites, who were Philistines, were coupled with them. C. is another form for Creteans, and the Philistines came from Caphtor, which is identified with Crete. The Carites (a scribal error for Cherethites) brought about Athaliah's downfall, and made Joash king. The C. were settled in the Negeb (I Sam. xxx, 14).

Cherhill, par. of Wilts, England, 10 m. W. of Marlborough. It is noted for its old Tithe Barn, and for the White Horse cut out on the Downs, which together with the lofty Lansdowne Monument above forms a noted landmark. Pop. 367.

Cheribon, tn of Java, Indonesia, on the Java Sea, 125 m. SE. of Jakarta. A manufacturing centre (chemicals, textiles, tobacco). C. also exports sugar, rice, and copra. Pop. 54,000.

Cherimoyer, or Cherimola, edible fruit of a Peruvian, downy-leaved, evergreen tree, *Annona cherimola*, closely allied to the custard-apple of the W. Indies. The fruit is much esteemed by the people of the W. parts of S. America. Its cultivation has spread to Central America and to Europe, India, and Africa.

Cherith, Brook of, the brook 'before,' i.e. E. of, the Jordan (I Kings xvii). It was Elijah's hiding-place during the first part of the 3 years' drought.

Cheriton, par. of E. Kent, England, now forming part of the bor. of Folkestone (q.v.).

Cherkassy: 1. Oblast in central Ukraine, S. of Kiev, situated largely on the r. b. of the Dnieper, in the wooded steppe, black earth belt. Pop. (1956) 1,500,000, almost entirely Ukrainian (before the war also Jewish). Sugar-beet and wheat are grown, and hogs and cattle raised for milk and meat; there are also food industries. The area belonged to the medieval Kiev state; in 1362 it became Lithuanian, in 1569 Polish, and in 1793 Russian.

2. Cap. and an economic and cultural centre of the above, on the Dnieper, 96 m. SE. of Kiev. Pop. (1956) 62,000 (1897, 30,000; 1926, 40,000; 1939, 52,000). It was probably founded at the end of the 13th cent.; 1386-1649, cap. of the Ukrainian hetmans (q.v.).

Cherkesses, see CIRCASSIANS.

Cherkessk (formerly Batalpashinsk, in 1930's Sulimov, Yezhov-Cherkessk), tn in the Stavropol' Krai of N. Caucasus, 60 m S. of Stavropol', cap. of the Karachay-Circassian Autonomous Oblast (q.v.). Pop. (1956) 37,000, predominantly Russian and Ukrainian. It was founded in 1803 as a Cossack vil., and has been a tn since 1880.

Cherleria, genus of Caryophyllaceae, of which one species, *Ch. sedoides* (synonym *Alsine cherleri*), the Mossy Cyphal, a perennial herb, is found on Scottish mts.

Chermes, see ADELGIDS.

Chernigov (Ukrainian Chernihiv): 1. Oblast in N. Ukraine, NE. of Kiev, situated in the Poles'ye (q.v.), and partly covered with mixed forests. Rye, wheat, and potatoes are grown, and hogs and cattle raised for milk and meat; there are

lumbering, peat-cutting, and food industries. The prin. tns are C. and Nezhin. The area belonged to the medieval Kiev state, then variously to Russia and Lithuania-Poland; in 1654 it finally became Russian. Area 12,200 sq. m.; pop. over 1,500,000, almost entirely Ukrainian (before the war also Jewish).

2. Cap., economic and cultural centre of the above, on the R. Desna, 78 m. NE. of Kiev. It has sev. 11th-12th-cent. churches and interesting 17th-cent. buildings. It was the main tn of the Severyane tribe from the 7th cent.; from 1024 to 1239 it was cap. of C. Grand Principality stretching to the Oka and the N. Caucasus. Pop. (1956) 74,000.

Chernikovsk, former city in the Urals. It originated in the 1930's as an industrial suburb NE. of Ufa where most of Ufa's industries were concentrated. It was made a separate tn in 1944, but again fused with Ufa in 1956. Pop. (1956) 206,000.

Chernov, Viktor Mikhaylovich (1873-1952), Russian politician, leader of the Socialist Revolutionaries (q.v.), occupying a central position in the party. In 1917 he was minister of agriculture in Kerensky's provisional gov.; in 1918 he was elected chairman of the Constituent Assembly. He emigrated in 1920 and d. in America. See his *The Great Russian Revolution*, New Haven, 1936.

Chernovitsi, or Chernovitsy, see CHERNOVITSY.

Chernovitsy: 1. Oblast in W. Ukraine, comprising N. parts of Bukovina and Bessarabia, lying in the Carpathian foothills, traversed by the R. Prut and partly covered by beech forests. It has wheat and sunflower growing, sheep raising, lumbering and woodworking, and food industries. For its hist. see BUKOVINA and Bessarabia. Area 3200 sq. m.; pop. (1956) 767,000, mostly Ukrainians.

2. (Ukrainian Chernivtsi, Rumanian Cernauti, Ger. Czernowitz, Russian Chernovitsy until 1944) Cap., economic and cultural centre of the above, on R. Prut. It has textile, engineering, and food industries. There is a univ. (1875). C. has been known since 1407, became a tn in 1786, and cap. of Bukovina in 1849. From the late 19th cent. it has been a centre of the Ukrainian national movement. Pop. (1956) 142,000 (1930, 111,000), Ukrainians and Jews.

Chernyakhovsk, see INSTERBURG.

Chernyshevskiy, Nikolay Gavrilovich (1828-89), Russian publicist and literary critic, the leader of the Radical intelligentsia in the 1850's and 60's; he spent 19 years in banishment in Siberia. His dissertation *The Aesthetic Relations of Art and Reality*, with its strictly utilitarian view on art, his many articles (1854-84) in the Radical monthly *The Contemporary* (q.v.), his novel *What is to be Done?* and his *Notes on J. S. Mill's 'Political Economy'* laid the foundations of revolutionary Populism (see POPULISM), prepared the ground for Marxism in Russia, and provided an important element of the Bolshevik ideology.

Cherokees, tribe of N. Amer. Indians of

the Iroquoian language stock, numbering 45,000. They formerly possessed a large tract of land on either side of the S. Appalachian Mts. They sided with the English in most of the disputes between the European colonists and with the Royalist party in the revolutionary war. The failure of the Royalist party led to their subjugation by the new rep. and the loss of a large part of their ter. The increasing number of white settlers led to disputes with the original owners of the land, and those who had not already moved were driven, in 1838, to their present position in the NE. corner of Oklahoma, while others live in Tennessee. The C. have a written alphabet of 85 characters invented in 1821 by George Guess, or Sequoyah, a half-breed. Until 1906, when they disbanded as a tribe to become U.S. citizens, they had a constitutional gov., consisting of an elected chief, a senate, and a house of representatives.

Cherrapunji, vil. in Assam state, India, in Khasi Hills. It has the heaviest known ann. rainfall in the world, the average being 426 in. per annum. In 1861 the total recorded for the year was 905 in., of which 366 in. fell in the month of July.

Cherry. *Prunus cerasus* is the Sour C., and crossing with *P. avium*, the Wild C., has given the Duke or Sweet C.; family Rosaceae. The C.-trees differ from the plum-trees very slightly, and there is little to distinguish them from one another beyond the folding of the leaves in the bud—in the C. they are flat, in the plum rolled up. The fruit in both cases is stony and is termed technically a drupe. From early times the C. has been cultivated for its edible fruit, and Lucullus, the epicure, is said to have brought it into Europe. *P. chamaecerasus*, the ground C., a dwarf species, never rising above 3 or 4 ft high, is common to Lower Austria, Hungary, and Siberia; *P. nigra*, the black Amer. C., is a handsome tree with loose umbels of pinkish flowers; *P. serrulata*, the fine-toothed C., is a native of China, and in W. gardens bears double flowers; *P. depressa*, the sand C., grows well in N. America, and in Britain is a handsome, but short-lived bush; *P. prostrata*, the spreading C., is a small prostrate bush which brightens the rocks of Dalmatia, Candia, and Asia Minor with its pink blossoms; *P. japonica*, the Japan C., is a beautiful plant with double flowers which appear in Great Britain in Mar. In all the above species of true C.s the leaves come out later than the flowers, but in the bird C.s the racemes of flowers appear after or at the same time as the leaves. Of these may be mentioned *P. mahaleb*, the Mahaleb or perfumed C., a sweet-smelling shrub with a bitter and nauseous fruit; *P. padus*, the common bird C., a species which grows wild in the woods and hedges of central Europe; *P. virginiana*, the choke C., a large tree with shining deciduous leaves, used in cabinet-making in N. America; *P. capollim*, the capollim or Mexican bird C., which has a pleasant-smelling fruit, while the bark is reputed to be a valuable febrifuge. The C. laurels are allied to the bird C.s and

true C.s, and are distinguished from them by having evergreen leaves and long racemes of flowers which appear with the leaves. *P. caroliniana*, the evergreen or Carolina C. laurel, is an ornamental tree with poisonous leaves; *P. laurocerasus*, the common or broad-leaved C. laurel, is a hardy evergreen much cultivated in Brit. shrubberies and is remarkable for the amount of hydrocyanic acid secreted in its leaves; *P. lusitanica*, the Portugal laurel, a native of Portugal and the Canaries, flourishes in Britain, where it is readily propagated from its abundant fruit.

CHERRY

Cherso, see CRES.

Cherson, see KHERSON.

Chersonesus (Gk *chersonēsos*, continent-is., i.e. a peninsula), anct name of sev. peninsulas in Europe and Asia, the most important being C. Taurica, or Scythica (Crimea), C. Cimbrica (Jutland), C. Thracica (Gallipoli), C. Aurea (Malay). By the C. Athenian writers usually meant C. Thracica. See CRIMEA; GALLIPOLI; JUTLAND; MALAYA.

Chersonesus (or Chersonese, Russian Kherones), ruins of an anct Gk city in SW. Crimea, 2 m. W. of Sevastopol'. Founded in the 5th cent. BC, C. was the commercial and administrative centre of W. Crimea until its decline in the 14th cent. AD. Excavations have been made since 1827.

Chert, variety of quartz (q.v.) which occurs in limestone in much the same way as flints occur in chalk, though in tabular masses rather than in nodules. Its formation is due to concretion; that is silica derived from sponges passed into solution, then filtered down through the calcareous ooze and was reprecipitated when conditions were suitable for the deposition of the silica and the solution of the limestone. Thus in certain localities the calcium carbonate in the limestone has given place to silica. C. occurs in a variety of colours (grey, white, red, yellow, and brown), is coarser than flint, and is generally more

brittle. The coarser varieties are called hornstone (q.v.).

Chertsey, tn in Surrey, England, on the r. b. of the R. Thames, 20 m. WSW. of London. The riv. is crossed here by a 7-arched bridge. C. possesses the remains of a famous abbey, in which Henry VI was buried. The poet Cowley d. here and Charles James Fox lived at St Ann's Hill. Partly residential, partly industrial, and still partly agric., C. is one of the most attractive Thames-side tns in Surrey. Sev. thousand workers are engaged in engineering industries in the dist., and others in large factories in the tns just outside. Agriculture and market gardening also provide employment for considerable numbers. Pop. 31,029.

Cherubim, plural of the Heb. word cherub (*kérûb*), one of the 9 choirs of angels (see ANGEL).

Cherubini, Luigi (1760-1842). It. composer, b. Florence, the son of a musician at the Pergola Theatre. He began to study composition at the age of 9 under the Felici, and after their deaths under Bizzarri and Castrucci. In 1773 he composed a mass, and by 1778 his growing success as a writer of church music led to his being sent to study under Sarti, who not only taught him well, but gave him minor parts of his own scores to finish. From 1780 dramatic compositions occupied C. almost exclusively until his appointment in a minor post at the Paris Conservatoire in 1795. In 1785-6 he visited London, and produced *La Finta Principessa*, *L'Artaserse*, and *Giulio Sabino*. In 1788 he produced *Ifigenia in Aulide* at Turin, but from 1788 Paris was his home, and he produced there among other operas *Demophon Lodoiska*, *Elisa, Médée*, *Les Deux Journées*, and *Anacréon*. In 1806 he produced *Faniska* at the Imperial Theatre, Vienna. In 1815 he composed an overture and a symphony for the Philharmonic Society, London. In 1816 he was made one of the superintendents of the royal chapel, and in 1822 had become director of the Conservatoire. In 1833 he produced his last work for the theatre, *Ali Baba*. Henceforward he devoted himself to church music, and his Requiem in D minor (1836) is one of his finest works. As a composer, he is, with Gluck, an austere representative of a nobler classical style in Fr. opera; as a teacher his influence was harmful in restricting his pupils by the narrow rules of an earlier age. Beethoven greatly admired him, and was influenced by his *Deux Journées*, in his opera *Fidelio*, but C. neither understood nor appreciated Beethoven. Mendelssohn was the only young contemporary whom he openly praised.

Chéruel, Pierre Adolphe (1809-91), Fr. historian, b. Rouen. He held chairs of hist. successively at Rouen, Strasbourg, and Poitiers. His prin. books are *Dictionnaire historique des institutions, mœurs, et coutumes de la France*, 1849, and *Histoire de France pendant la minorité de Louis XIV.*, 1879-80. He also ed. *Lettres du Cardinal Mazarin pendant son ministère*, 1870-91, the memoirs of Saint-Simon,

1865, and the memoirs of Mlle de Montpensier, 1891.

Cherusi, Ger. tribe occupying the basin of the Weser, N. of the Harz Forest. In AD 9 Arminius (q.v.), a chief of the C., revolted and destroyed the Rom. general Quintilius Varus and his army. Their prestige was wrested from them towards the end of the 1st cent. AD by their neighbours, the Chatti, and their ter. was later occupied by the Saxons. (Tacitus, *Annals*, i. 2, 11, 12, 13).

Chervil, name given to various species of Umbelliferae. Common C., *Anthriscus cerefolium*, is an ann. herb, introduced from S. Europe, and grown for its leaves, used for salads, garnishing, and seasoning. Bulbous-rooted C., *Chaerophyllum bulbosum*, a S. European biennial, is sometimes grown like carrots for its edible yellowish roots. Bur C., *Anthriscus neglecta*, and Rough C., *Chaerophyllum temulum*, are annuals native to Britain and Europe, introduced to N. America.

Cherville, Gaspard Georges Pescow, Marquis de (1821-98), was b. Chartres. He was a collaborator of Dumas père, but he wrote independently a number of books on country life and sport. He also wrote *Au village, légendes et croquis rustiques*, 1887, and *Les Chiens et les chats*, 1888.

Cherwell, Eng. riv., trib. of the Thames, rising 12 m. NE. of Banbury, and flowing S. for 30 m. through Northants and Oxon. to join the main stream near Oxford.

Chesapeake Bay, in Maryland and Virginia, and dividing the former into 2 parts, is the largest inlet on the E. coast of the U.S.A., extending 195 m., with a width of from 3 to 30 m., from the mouth of the Susquehanna R. southward to Hampton Roads. Its entrance has on its N. side Cape Charles, and on the S. Cape Henry, 13 m. apart. The land on either side of the inlet is greatly indented, and receives the R.s. Susquehanna, Severn, Patapsco, Patuxent, Potomac, Rappahannock, and York on the W., and James on the SW., all navigable rivs. The water is so deep that the largest ships can proceed almost to the mouth of the Susquehanna, and Baltimore is virtually washed by the ocean. The bay is connected near its head with the Delaware R. by the C. and Delaware Canal. The Dismal Swamp Canal and the C. and Albemarle Canal connect it with Albemarle Sound.

Cheselden, William (1688-1752), anatomist and surgeon, b. Somerby, Leics. He studied anatomy in London under Cowper (1666-1709), and in 1711 himself began to give lectures on the subject. He was elected a fellow of the Royal Society in 1712, and pub. a series of interesting papers, one of which recounted the sensations of a boy of 14 on recovering his sight through the formation of an artificial pupil (by C.) after being blind from infancy. In 1713 he pub. *Anatomy of the Humane Body*, long the standard book on the subject, and in 1733 *Osteographia, or the Anatomy of the Bones*, with beautiful illustrations. He was surgeon at St Thomas's, St George's, and Westminster hospitals, and his skill as an

operator has seldom been surpassed. The lateral operation for lithotomy as it is now practised was his invention. In 1737 he retired from practice owing to the jealousy of his colleagues, and d. of apoplexy at Bath, 1752. Alexander Pope (q.v.) was one of his intimate friends. Life by Sir Zachary Cope, 1953.

Chesham, urb. dist. and mrkt tn of Bucks, England, 26 m. WNW. of London, in the valley of the R. Chess (a riv. noted for its watercress and trout-fishing). C. manufs. boots and shoes, brushes and other hardwood products, scientific and surgical instruments, jewellery, chocolates, gas-fired boilers, toys, and valves. Pop. (urb. dist.) 11,500.

Cheshire, co. of England, bounded on the N. by the Irish Sea and the Mersey, also by Lancs and Yorks, and on its other sides by the shires of Derby, Stafford, Salop, Flint, Denbigh, and by the estuary of the Dee. The co. contains numerous antiquities, including Rom. roads, barrows, remains of religious houses, and many old castles and manor houses. William the Conqueror made it a co. palatine under Hugh Lupus; Henry VIII subordinated it to the crown, but the co. did not send representatives to the Eng. Parliament until 1543. Its greatest length from E. to W. is 48 m., its breadth from N. to S. is 32 m., total area (of land and water) 1015 sq. m., 76 per cent of which is under cultivation. The surface of the co., except on the extreme E. border, is level, well-wooded, and in parts studded with small lakes or meres. The plain rests on red sandstone, crossed by a ridge running from N. to S. The chief rvs. are the Dee, Mersey, and Weaver, all navigable, and the co. has also a splendid system of canals—including the greater part of the Manchester Ship Canal—and an extensive railway network. The soil is chiefly clayey or sandy loam with marl or peat, and is very fertile. The land is divided into grazing and arable regions, potatoes being an important crop in the latter. Cereals grow well here, especially oats, but the chief product of the co. is its milk, only a small proportion of which is made into cheese. There are more cows to the sq. m. than in any other part of England, and the pasture land is very fine. The climate is moist and temperate. Cottons, silk, and other textiles are manuf. at the tns near the Lancs and Yorks boundaries. Shipbuilding and all forms of engineering are important, and there are large oil refineries at Ellesmere Port. Port Sunlight, with soap and margarine factories adjacent to the garden vil., is in the Wirral peninsula. One of the most remarkable products of C. is the rock-salt found in abundance in the Northwich, Winsford, Middlewich, Sandbach, and Lymm areas. To this C. owes its flourishing chemical industry, notably the Imperial Chemical Industries' works at Northwich (q.v.). There is also a factory for nuclear products at Capenhurst (q.v.). Chester is the cap., and other big tns are Birkenhead, with its world-famous docks, Wallasey, Bebington, Ellesmere Port, Macclesfield, Stockport,

Crewe, Northwich, Altrincham, and Hyde (see separate articles). C. is divided into 10 co. and 8 bor. constituencies for parl. electoral purposes, each returning 1 member. Pop. 1,258,000. See F. H. Crossley, *Cheshire* (County Books Series), 1949; J. H. Ingram, *Companion into Cheshire* (second ed.), 1949; A. Mee, *Cheshire* (new ed.), 1951.

Cheshire Regiment, The (formerly 22nd Foot), raised in 1689. Fought under Marshal Schomberg in Ireland and took part in the defence of Gibraltar in 1727, and the capture of the is. of Louisburg in 1758. Its grenadiers served under Wolfe at the capture of Quebec. Served many years in W. Indies, then participated in the Amer. War of Independence. Under Sir Charles Napier it gained great distinction in the Scinde war of 1843. Bears honours for S. African War, 1899-1902. During First World War it raised 38 battalions which served in France, Flanders, Gallipoli, Macedonia, Palestine, and Mesopotamia. It first received its Cheshire co. title in 1782. In the Second World War the regiment fought in NW. Europe and Italy. Its badge is the well-known acorn issuing from oak-leaves within an 8-pointed star.

Cheshunt, urb. dist. of Herts, England, on the R. Lea, 14 m. N. of London. Here is C. Great House which belonged to Cardinal Wolsey. From here Charles I set out for Nottingham (1642) at the onset of the Civil War. Temple Bar (1672) stands in Theobald's Park (q.v.). Bishop's College (a Church of England theological college) was formerly the home of a theological college founded by the Countess of Huntingdon which moved to C. in 1792. C. is the centre of the great Lea Valley horticultural industry, with the largest concentration of glasshouses in the world. Pop. (dist.) 23,880.

Chesil Bank, or Beach (A.-S. *ceosil*, pebble-bank), curious shingle beach on the coast of Dorset, England. It runs 18 m. SE. from Bridport, and ends in the so-called isle of Portland. At Portland end the bank is 35 ft above spring-tide level, and 200 yds broad. A peculiar fact about it is that the pebbles decrease in size from 1 to 3 in. in diameter at Portland to the size of peas at the W. end.

Chesné, André du (1584-1640). Fr. geographer and historiographer to Louis XIII. He was b. in the prov. of Touraine and became famous for his historical and philological learning, which won him the name of 'father of French history.' The work for which he is best known in his collection of the oldest Fr. chroniclers, *Historiae Francorum Scriptores coactani*, ab *Gentis Origine usque ad Philippum IV tempora*, of which he ed. 4 vols., and his son pub. the fifth after his father's death.

Chesney, Charles Cornwallis (1826-76), lieutenant-colonel, prof. of military strategy at Sandhurst, and a nephew of the explorer, Francis Rawdon C. He held the position of chairman of Sandhurst in 1861, during which time he acquired fame for his 'Waterloo Lectures' delivered there.

Chesney, Francis Rawdon (1789-1872),

general and explorer, b. in co. Antrim, Ireland. It was his report, drawn up in 1829, on the subject of the isthmus of Suez that made de Lesseps project his canal scheme. The one great wish of his life was to have an overland route to India via the Euphrates, but the Fr. and Russian opposition was so great that the idea was abandoned. In connection with the scheme, however, he made 3 separate journeys to prove how far the Euphrates was navigable. He wrote the histories of his expeditions, one of which was *Narrative of the Euphrates Expedition, 1835-7*.

arranged: Queen's rook (the rook is known also as the castle), queen's knight, queen's bishop, queen, king, king's bishop, king's knight, king's rook. The front line is composed entirely of pawns. Considering the back line, it will be seen that each piece is directly opposite to an opposing piece of the same denomination; that queen faces queen and that king faces king. The white queen is on a white square and the black queen on a black square. The object of the game is to force the king of the adverse party into such a situation that he can neither move nor remain

CHESS-BOARD AND CHESS-MEN

Chesney, Sir George Tomkyns (1830-95), soldier and author, brother of Charles Cornwallis C. (q.v.). In 1848 he joined the Bengal Engineers; served in the Indian Mutiny, and in 1892 became a general, and entered Parliament as member for Oxford. He wrote sev. novels, *The Private Secretary*, 1881, being the best known. He also wrote a highly imaginative description of a supposed invasion of England, entitled *The Battle of Dorking*, 1871.

Chess, game played by two persons on a board composed of 64 squares, alternating black and white, so placed that a white square is on the right-hand extremity of the board before each player. Thirty-two chessmen are used, 16 being black and 16 white. One player takes the black men, the other takes the white, and each arranges his pieces on the board before him as shown in the illustration. Naming them from the white square on the players' right, the pieces in the back line are thus

without the danger of being taken by some other piece, for the law of the game, as will be seen later, does not allow of his being actually captured, but only threatened, and he must then remove, if possible, out of danger. If he cannot, the game is lost. From the accompanying diagram, the names of the various squares on the board may be seen. That in front of the queen's rook is known as the queen's rook's second square. Two squares in front of the queen's rook is the queen's rook's third square. Similarly Q R 4 signifies the queen's rook's fourth square, etc. The pawns are known from the piece before which they stand. Thus, in front of the queen's rook is the queen's rook's pawn, in front of the king's knight is the king's knight's pawn, and similarly for the other pieces. It is necessary to consider now the ways in which the pieces move, as the complicated nature of these moves forms one of the main difficulties for the beginner. The king has the power

of moving one square from that which he is occupying, so long as the move does not expose him to capture by any of the enemy's pieces. Neither the king nor any other piece may move to a square which is already occupied by a piece of its own colour. Thus from his own square the king could move to Q square, Q 2, K 2, K B 2, and K B square, but no further by one move. The queen may move any distance in a straight line, either laterally or diagonally, but neither queen, rook, nor bishop may pass over an intervening

or backward. Its first move may be two squares or one, i.e. it may move to its piece's third or fourth square, but after this first move it can only move forward one square at a time. Whereas it moves laterally, it can take diagonally alone. Thus, a pawn on Q 4 may take pieces on Q B 5 and K 5, but is stopped by a piece on Q 5. If a player succeeds in getting one of his pawns into a square occupied at the beginning of the game by one of his adversary's back line, he may exchange it for any piece except a king, either a queen,

NUMERICAL POSITIONS OF A CHESS-BOARD

piece. The rook also can move any distance, but his motion must always be lateral. The bishop, on the contrary, may move any distance diagonally, but may not move laterally. It will thus be noticed that the bishop always remains on squares of the same colour as his own. The white Q B can never be on a white square, and the white K B can never be on a black square. The knight's move is limited in distance and is composed of two short moves, a lateral move of one square followed by a diagonal move of one square. Thus, the Q Kt might move to Q R 3, Q B 3, or Q 2. The knight alone has the power of passing over another piece. The 'taking' of an opponent's piece is done by moving one of one's own pieces into the square occupied by one's opponent's piece and removing the latter. The pawn can only move in a forward direction (laterally) whereas all the other pieces may move either forward

rook, bishop, or knight, so that he may possibly have two queens on the board at once. A king, as has been said, cannot be taken. When another piece attacks him and he is in such a position that he might be taken at his adversary's next move, he is said to be *in check*. A player whose king is in check must do one of three things at his next move. He must move out of check, or interpose another piece so as to shield the king, or take the checking piece. When he can do none of these things he is said to be *checkmated*. 'Checkmate' is called, and the game is over. Should a player be in such a position that he can move none of his pieces without putting his king in check, but yet his king is not in check at the moment, the game is drawn, the result being given as a *stalemate*. A drawn game also results through neither player being able to checkmate the other. An important privilege allowed to the king, once in

each game, the privilege of *castling*, yet remains to be mentioned. The operation consists of a double move performed in conjunction with either the king's rook or the queen's rook, and counts as an ordinary move. In the first case K moves to K Kt square, and K R moves to K B square. In the second K moves to Q B square, while Q R moves to Q square. This move is only allowed if neither the king nor the rook has yet been moved, and it is further necessary that no piece should intervene between the two, that no square passed over should be commanded by one of the enemy's pieces, and that the king should not be in check. Note must also be made of a particular method of taking by the pawn known as taking *en passant*. It may occur when a white pawn is on a fifth square, say K B 5. If, then, the black K Kt pawn makes its initial move of two squares (i.e. to K Kt 4 or K 4), it may be taken *en passant* by the white pawn on K B 5, the white pawn moving to K Kt 3 or K 3 as the case may be. In 1955 the Fédération Internationale des Echecs (F.I.D.E.—World C. Federation) formulated a revised set of rules and the most important of these are given in the following extracts from the official trans. (pub. by Pitmans in 1956 by arrangement with the Brit. C. Federation). Provided that he first warns his opponent, the player whose turn it is to move can adjust one or more pieces on their squares. Apart from the above case, if the player whose turn it is to move touches one or more pieces, he must make his move by moving or taking the first piece touched which can be moved or taken.

The game is drawn by agreement between the two players; or, at the request of one of the players when the same position appears three times, and each time the same player has had the move. This right of claiming the draw belongs to the player (a) who is in a position to play a move leading to such repetition of the position, if he declares his intention of making this move; or (b) who is about to reply to a move by which such repeated position has been produced. If a player makes a move without having claimed a draw in the manner prescribed in (a) or (b) he then loses his right to claim a draw; this right is, however, restored to him if the same position appears again with the same player having the move. The game is also drawn when the player whose turn it is to move proves that at least 50 moves can be increased for certain positions providing that this increase in number and these positions have been clearly laid down before the commencement of the game. A *gambit* is a method often used to secure an opening for attack. By it a pawn or piece, usually a pawn, is sacrificed in order to enable a piece to secure a better position. There are various gambits, such as king's gambit, queen's gambit, etc., to each of which there is a recognised defence. The various methods of opening a game of C. may soon be learnt. White makes the first move, and so it is usual for the players to draw for colours. The commonest first move is

that of the king's pawn to K 4. The commonest second move is that of K Kt to K B 3, and these two form an excellent opening for beginners. Sometimes the stronger player gives *odds* to the weaker player to make the game more even. It may consist of the removal of any piece from the stronger player's ranks according to the odds to be given. If a pawn be given, it is almost invariably the king's bishop's pawn. It is not necessary to go into further detail as to the method of playing C., as there are many valuable handbooks to which reference may be made. On account of the interest derived from the infinite variety of its combinations, and from success depending entirely upon skill wholly independent of chance, it has become a favourite game among the educated persons of all nations, and in the course of cents, a vast literature has gathered round it.

History. The game is of the greatest antiquity, and much dispute has arisen as to the country whence it first took its rise. The game was not known to the ancients (Greeks or Romans). A distinct balance of historical tradition inclines to Hindustan. Here it has been known immemorially under the name of *chaturanga* (from *chatur*, four, and *anga*, a part or member), that is, the four *angas*, or members of an army, which are said in the *Amarakosha* to be elephants, horses, chariots, and foot soldiers. As applicable to real armies, the term *chaturanga* is often used by the epic poets of India. In a Sanskrit MS., *Bhāwishya Purāna*, is given a description of a four-handed game of C. played with dice, and some historians consider this to be the most ancient form of the game. But it is not shown precisely how the four armies commanded by four kings in the above MS. became converted into two opposing armies (see on this Van der Linde, *Geschichte und Literatur des Schachspiels*, Berlin, 1874). From India the game passed into Persia and became known there by the name of *shatranj*. The game passed from the Persians to the Arabians after they took possession of Persia in the 7th cent., and from them, directly or indirectly, it is conjectured that it came to Spain and other parts of Europe, perhaps about the 11th cent. It was known to the cultured classes throughout Europe by the time of the Crusades. The original method of play differed widely from the present one, the development of the game continuing until the 16th cent., when castling, the latest addition, was introduced. The first book printed in England was *The Game and Play of the Chess*, issued by Wm Caxton in 1475, and this fact shows the popularity of the game. The most masterly treatises on C. begin in the 16th cent. with the Portuguese Damiano, whose work is, however, distinctly inferior to the treatise by Ruy Lopez, a Sp. cleric, pub. at Alcalá in 1561. By the end of this cent., the chief home of the game had shifted to Italy, where the city of Venice had the pre-eminence. Among the C. masters of this period may be named Salvio, Greco, and Polerio. The 17th cent. is comparatively

unimportant, but the 18th cent. saw a great revival in the study of C. In the N. of Europe the name of Philidor stands alone, and in the S. the names of Ercole del Rio, Lolli, and Ponziani deserve mention. In the 19th cent. England became the supreme C. country, and Howard Staunton was generally recognised as the world's greatest player. A greater genius, however, Paul Morphy (1837-84) by name, arose in America, and defeated the strongest players of Europe. He never actually encountered Staunton, who evaded his challenges, but after Morphy had retired from the game, Staunton was defeated by Anderssen, who was in turn succeeded as champion by Steinitz. Anderssen belonged to the older school, advocating combinative methods, and Steinitz, who has had great influence on modern theory, believed in positional methods. In 1894 he was defeated by the third Ger. champion, Emanuel Lasker, who held the title for 27 years. A long projected match between him and Capablanca, the Cuban C. genius, eventually took place in 1920, and Lasker resigned after losing four games and drawing 10. Since that date C. was dominated by the personalities of Capablanca (q.v.) and the Russian, Alekhine (q.v.). In 1927 Alekhine challenged Capablanca to defend his title, and after a match of 34 games Alekhine won six, Capablanca three, and 25 were drawn. In 1934 Alekhine defeated Bogoljubov, winning eight, losing three, and drawing 15. Max Euwe became champion in 1935, beating Alekhine, 15-14½ points, but in 1937 Alekhine beat Euwe 17-12½ points. Alekhine d. in 1946 whilst still in possession of the title, and in 1948 a match-tournament was held among the best five players in the world (Botvinnik, Smyslov, Keres, Reshevsky, and Dr Euwe), out of which the Soviet champion, M. M. Botvinnik, emerged as the winner. After 1948 the world championship was organised on the basis of a three-year cycle of tournaments. In the first year zonal tournaments were held all over the world, in the second year an Interzonal tournament, and in the third year a Candidates' Tournament of which the winner had the right to challenge the world champion to a match. The 1950 Candidates' Tournament at Budapest was won by Bronstein, but Botvinnik retained his title by drawing a match with him 12-12 in the following year. Smyslov won the 'Candidates' Tournament at Zurich in 1953, and again the world champion drew his match by 12-12 in 1954 at Moscow. International C. is governed by the F.I.D.E., which held its first tournament at Budapest in 1926. Ann. Eng. championships are held by the Brit. C. Federation, founded 1904. In this event the most successful players have been H. E. Atkins (nine times champion), F. D. Yates (six times), H. Golombek (three times), and M. Sultan Khan (three times), R. J. Broadbent, Sir George Thomas, and W. Winter all of whom won the championship twice. In 1927 the Brit. C. Federation held an international team tournament in

London under the auspices of F.I.D.E. and the champion country was Hungary. This tournament has been held on an average once every two years since 1927, the winning countries being as follows: Poland at Hamburg 1930; the U.S.A. at Prague 1931, Folkestone 1933, Warsaw 1935, and Stockholm 1937; Germany at Buenos Aires 1939; Yugoslavia at Dubrovnik 1950; the U.S.S.R. at Helsinki 1952 and Amsterdam 1954. F.I.D.E. has also organised world championship events for women, the invariable winner before the Second World War having been Miss V. Menchik (later Mrs Stevenson) of England. After her death in the war during a bombing raid the title remained vacant until once again F.I.D.E. reorganised it and the winners since then have all been Russians. See J. R. Capablanca, *Chess Fundamentals*, 1922; A. Alekhine, *My Best Games of Chess*, 1927 and *My Best Games of Chess 1924-1937*, 1939; A. Nimzowitsch, *My System*, 1929; R. Reti, *Masters of the Chessboard*, 1933; M. Euwe, *Judgement and Planning in Chess*, 1953; H. Golombek, *The Game of Chess*, 1954; G. Stahlberg, *Chess and Chessmasters*, 1955.

Chest, or **Thorax**, anatomical term for the uppermost section of the trunk, or that part of the body which is above the abdomen and below the neck. It contains the heart and lungs, the great arteries and veins, the windpipe and its branches, the gullet and the thoracic duct, and is conical in shape, with rounded sides which are flattened at front and back. (For the organs of the chest, see the diagram accompanying article on ABDOMEN.) The upper end is small, slopes downwards and forwards, and contains the gullet and windpipe, and those arteries and veins leading from and to the heart through the neck, together with certain nerves. The lower end is larger, slopes downwards and backwards, and is enclosed by the diaphragm, which is convex when viewed from above, and which separates the C. from the abdomen. Muscles radiate from this diaphragm to the body wall, and in respiration, by the contraction of these muscles and the consequent flattening of the diaphragm, together with the action of the layer of muscles covering the C., which draw the ribs upwards and outwards, the cavity of the C. is enlarged. The C. is constructed of 12 pairs of ribs starting from the *vertebral* or *spinal column*, together with the *breast-bone*, the *diaphragm*, and the *intercostal muscles*. Since the C. contains the heart and lungs, two of the 3 vital organs of the body, the other being the brain, it is the seat of a large number of the diseases of the human system. See HEART; LUNGS; MAN; SKELETON; ANATOMY; PHYSIOLOGY, etc.

Chest, large box made of wood or iron with a hinged lid, used as a receptacle for treasure, records, or linen, etc. It is of very ancient origin, being one of the oldest pieces of household furniture. In the old days C.s were sometimes covered with leather and often very much ornamented.

They were frequently transferred from place to place as personal luggage. C.s are now often found in churches for the reception of vestments, plate, and par. records, etc., being equivalent to modern safes or strong-boxes. Coffre (O.F. *cofre*; Low Lat. *cofrum*) is a C. or box for money or valuables, and the word was used as a synonym for treasury (cf. 'Comes to the privy coffe of the State,' *Merchant of Venice*). See FURNITURE.

Chester, Earl of, see BLUNDEVILLE.

Chester, episcopal city, parl. and co. bor. and the administrative and geographical cap. of the co. of Cheshire. England, on the banks of the Dee, 16 m. S.E. of Liverpool. It is an important shopping and residential centre to which has been added the development of progressive specialised light industries such as the manuf. of electrical switch-gear and metal window frames, aided by the fact that it is an important road and rail centre.

It is almost 2000 years ago since the 20th Rom. Legion chose as the site for its fortress a low sandstone hill at the head of the estuary of the R. Dee and called it after the riv.—Deva; this was the beginning of C. In late Saxon times, it was a place of consequence with its own mint and royal palace, and not until 6 years after the battle of Hastings did it submit to Norman rule. The early Middle Ages were perhaps the time of C.'s greatest glory; its port had by then become the centre for the trade with Ireland, and the city itself was the base for many a warlike royal expedition into Wales. In 1237, on the death of the last of the Norman earls, the earldom was taken into the hands of the Crown and has since always been one of the titles of the eldest son of the king—Prince of Wales and Earl of Chester. King Richard II held the city in especial esteem, elevating the earldom to the dignity of a principality. By the 15th cent. the silting up of the R. Dee had begun to interfere with traffic to the harbour and in time it gradually strangled the seaborne trade of C. The city has possessed sheriffs since the time of the Norman earls, and mayors since 1238. Its constitution was confirmed by the great charter of Henry VII in 1506, the city being constituted a co. of itself. The mayor is by virtue of his office admiral of the Dee (a relic of C.'s former maritime greatness).

C.'s most distinctive architectural feature is its rows. These consist of a double tier of shops, one at ground level and the other at first-floor level, each provided with a footway, the upper one being set back and covered by the second storeys of the buildings. The first historical reference to the rows occurs in the early 14th cent. C. is the only city in England which still possesses its walls perfect in their entire circuit of 2 m. Built originally by the Romans in the 1st cent. AD, and later extended, they still contain substantial portions of Rom. work. The old gateways have been rebuilt but some of the towers still

remain. There are many picturesque timber-framed houses, notably Bishop Lloyd's House (early 17th cent.), God's Providence House (built 1652 and reconstructed 1862), Leche House (16th cent.), Stanley Palace (1591) in Watergate Street, the 'Bear and Billet' (17th cent.), Tudor House (17th cent.), and the Falcon Café (1626) in Lower Bridge Street.

The cathedral, which up to the time of Henry VIII was a Benedictine abbey, dates from 1053. Built in a combination of every style from Norman to Late Perpendicular, it was restored in 1876. In a comparatively modern set of corbels

GOD'S PROVIDENCE HOUSE, CHESTER

on the walls of its S. transept are included the old story of Alexander and the griffins, besides caricatures of Disraeli, represented as the Brit. lion defending the Crown against Dr Kenealy, and Gladstone with daggers and lion's body, in the act of overthrowing the Irish Church. Also noteworthy are the churches of St John the Baptist (traditionally said to have been founded by King Ethelred in AD 689 and perhaps more probably by Earl Ethelred in 901); St Mary-on-the-Hill (belonging mainly to the 15th and 16th cents.); and St Peter (a church has occupied this site since AD 907). The chief modern buildings are the In hall (1869); Grosvenor Museum and School of Art, built at the suggestion of Charles Kingsley, who was then canon of C.; and the King's School, founded by Henry VIII (1541) and reorganised as a public school in 1873. Roodee Common (69 ac.) is the scene of the ann. race meeting in May. The city returns 1 member to Parliament. Pop. 48,229.

Chester, port city in Delaware co., Pennsylvania, U.S.A., 15 m. from Philadelphia. The Pennsylvania Military College and the Crozier Theological Seminary are both estab. here. It has large shipyards, boiler and engine works, factories and foundries, etc. Pop. 66,039.

Chester-le-Street, mrkt tn in the co. of Durham, 6 m. N. of Durham city. Its par. church of St Mary and St Cuthbert was formerly collegiate, and the vil., situated on the anct Ermine Street, was the seat of the Bishop of Bernicia from 883 to 995, under the name of Cunceceastre. In its neighbourhood are Lambton, Lumley, and Ravensworth Castles. Collieries surround C., though the tn is semi-residential in character. Pop. 18,700.

Chester Plays, see MIRACLE PLAY; MORALITY.

Chesterfield, Earl of, title formerly borne by the family of Stanhope, later Scudamore-Stanhope, created 1628. In 1883 the direct line failed, and Henry E. Scudamore-Stanhope became the 9th earl. The title devolved on the 7th Earl Stanhope on the death, in 1952, of the 12th Earl of C., but it has not been claimed by him.

Chesterfield, Philip Dormer Stanhope, 4th Earl of (1694-1773), statesman, courtier, and letter-writer, eldest son of the 3rd earl, and educ. at Trinity Hall, Cambridge. He succeeded to the earldom in 1726, and 2 years later went as ambas. to The Hague, where he remained until 1732. He had formed an intimacy with Mlle du Bouchet, by whom he had a son, but the connection did not endure, and in 1733 he married the daughter of the Duchess of Kendal, an act which seriously offended George II. Soon after he became the recognised leader of the opposition in the House of Lords, and subsequently held important ministerial and diplomatic appointments. Nowadays, however, he is remembered principally for his literary connections. He was a friend and correspondent of Voltaire, and at one time offered to befriend Johnson, who in 1747 addressed to him the 'plan' of his dictionary. C. thought no more of Johnson until the pub. of that work was announced 7 years later, when he wrote in the *World about it, a belated attention which the lexicographer resented. 'The notice which you have been pleased to take of my labours, had it been early, had been kind; but it has been delayed until I am indifferent and cannot enjoy it; till I am solitary, and cannot impart it; till I am known, and do not want it.' This letter has been universally acknowledged as a masterpiece of indignant rebuke. C.'s fame also rests on the letters to his natural son, in which he, the most elegant of mankind, endeavoured to teach his son the art of being agreeable in society. These letters were pub. by his son's widow, Eugenia Stanhope, in 1774, and were included in Lord Mahon's *Letters of Philip Dormer Stanhope, Earl of Chesterfield, 1845-53*. See W. Ernst, *Memoirs of the Life of Philip Dormer, fourth Earl of Chesterfield*, 1893; R. Coxon, *Chesterfield and His Critics*, 1925.*

Chesterfield, mrkt tn and municipal bor. in Derbyshire, England, 24 m. NNE. of Derby on the R. Rother. The tn is famous for the crooked spire of the 14th-cent. par. church. George Stephenson, the 'father of railways', is buried in Trinity Church. Industries include engineering, and the manuf. of earthenware products, surgical dressings, and cardboard boxes. To the S.E. are extensive coal-fields. Pop. 68,540.

Chesters, residence near Chollerford, Northumberland, England. It is in the midst of a park containing a section of the Rom. wall and remains of the Rom. station of Cilurnum. Much excavation work has been carried out and a fine collection of Rom. remains is housed in the museum in the park.

Chesterton, Cecil Edward (1879-1918), journalist and author, b. London, brother of G. K. C. (q.v.). He was educ. at St Paul's School. His first book, *Gladstonian Ghosts*, 1905, was directed against traditional liberalism. In 1910 appeared *Party and the People*, and *Nell Gwynne* in 1911; and in the latter year, in collaboration with Hilaire Belloc (q.v.) he wrote *The Party System*. He was on the executive of the Fabian Society, 1905-7, first secretary of the Anti-Puritan League, 1907, sub-editor of the *Eye Witness* (afterwards *New Witness*), 1911-12, then editor. He became a Rom. Catholic in 1912. His persistent criticism of the circumstances connected with a contract between the gov. and the Marconi Wireless Telegraph Co. led to the House of Commons appointing a committee of inquiry, and he was fined for criminal libel. In the war period, before he joined the colours, he pub. *The Prussian hath said in his Heart—*, 1914, and *The Perils of Peace*, 1916; his *History of the United States* was pub. in 1918. He d. in a military hospital in Boulogne.

Chesterton, Gilbert Keith (1874-1936), journalist and author, b. Campden Hill, Kensington. He was educ. at St Paul's School until 1891, and then entered the Slade School to study art. He soon began literary work, however, at first reviewing art books for the *Bookman* and the *Speaker*, and working in a publisher's office. He definitely took up literature as a career in 1900, and contributed largely to a great variety of periodicals. It was his *Browning* in the *Eng. Men of Letters* series that first gave him a place among the critics. With *The Napoleon of Notting Hill*, 1904, he began the fantastic romances which, together with the 'Father Brown' detective stories, captured the larger public. A Saturday column in the *Daily News* stung the party Liberals through a decade. For 30 years he wrote the Notebook page of the *Illustrated London News*—an astonishing feat for the most anarchic of journalists. Prose and verse flowed unceasingly from his pen. In 1901 he married Frances Blogg. He is popularly regarded as merely a fountain of brilliant paradox, but that is a very superficial reading of him. Largely influenced by his friend Hilaire Belloc, he gradually discarded, or

became aware of his innate mistrust of, all ideas of evolutionary development—which appeared to him to involve a mechanistic conception of mankind. It was noteworthy that almost every critic of C. claimed him as great in his own field, whether fiction, belles-lettres, poetry, literary criticism, or philosophy. C.'s reception into the Church of Rome was announced in Aug. 1922.

C. applied the same principle in his positive politics. Regarding the conscious will as the cause of all action, he saw no reason why a past state of affairs should not be resuscitated anywhere if desirable. So he was president of the Distributist League, of which *G.K.'s Weekly* was (more or less) the organ. Distributism is a term invented by Belloc (q.v.) to denote a revolt against Capitalism in the direction opposite to Socialism. It was C.'s view that it would strengthen the 'small man,' discourage 'big business,' and endeavour to re-localise the pop.

Among his books are *The Wild Knight and other Poems*, 1900, *The Defendant*, 1902, *Twelve Types*, 1902, *G. F. Watts*, 1904, *The Napoleon of Notting Hill*, 1904, *The Club of Queer Trades*, 1905, *Dickens*, 1906, *Orthodoxy*, 1908, *The Man who was Thursday*, 1908, *George Bernard Shaw*, 1909, *The Innocence of Father Brown*, 1911, *The Ballad of the White Horse*, 1911, *Manalive*, 1912, *The Victorian Age in English Literature*, 1913, *The Flying Inn*, 1914, *The Wisdom of Father Brown*, 1914, *Poems*, 1915, *A Short History of England*, 1917, *Irish Impressions*, 1918, *The Uses of Diversity*, 1921, *Eugenics and other Evils*, 1922, *The Man who knew too Much*, 1922, *What I saw in America*, 1922, *St Francis of Assisi*, 1923, *William Cobbett*, 1925, *The Everlasting Man*, 1925, *The Incredulity of Father Brown*, 1926, *The Queen of Seven Swords*, 1926, *The Secret of Father Brown*, 1927, *The Return of Don Quixote*, 1927, *Generally Speaking*, 1928, *Catholic Essays*, 1929, *Chaucer*, 1932, *The Scandal of Father Brown*, 1935, *Autobiography*, 1936, *The Paradoxes of Mr Pond*, 1937.

See E. Cammaerts, *The Laughing Prophet*, 1937; H. Belloc, *On the Place of Gilbert Chesterton in English Letters*, 1940; Maisie Ward, *G. K. Chesterton*, 1944, *Return to Chesterton*, 1952; H. Kenner, *Paradox in Chesterton*, 1948.

Chesterton, see NEWCASTLE-UNDER-LYME.

Chestnut, or *Castanea*, genus of Fagaceae known to the N. hemisphere and cultivated for the handsome appearance of the species and the economic value of the fruit. *C. sativa*, the Sp. or European C., helps to form dense forests, and the fruit consists of 2 or 3 nuts enclosed in a prickly burr. The fruit, called the sweet C., forms a common article of diet in Europe in its raw state, when roasted, or when ground into flour. As confectionery they are candied, and receive the name of *marrons glacés*: the starchy matter contained in them makes them of great value as a food. The horse C., or *Asculus hippocastanum*, differs in most important botanical points from the sweet C.: it is a species of

Hippocastanaceae which is cultivated for its stately appearance, and the fruit is a leathery capsule resembling the sweet C. only in being prickly. The specific name was given to the plant on account of the marks of the leaf-scar which seem like a miniature horse-shoe. The Australian C., or *Castanospermum australe*, is a leguminous plant which is the only species in the genus; its outward appearance is unlike *Castanea*, but the roasted seeds taste like those of the sweet C.

CHESTNUT

Cheetham, Humphrey (1580-1653), b. Crumpsall Hall, Manchester. He was in turn a merchant, a private banker, and a cloth manufacturer in Manchester. He amassed a considerable amount of money, £7000 of which he left for the foundation of a hospital for 40 poor boys. This was opened in 1656, and the number of boys now cared for has greatly increased. With a further £1000 and the residue of his property he founded a library, now containing over 70,000 vols. See T. Fuller's *Worthies*, 1840, ii. 214.

Chestle, Henry (c. 1560-c. 1607), dramatist and pamphleteer, son of Robert C., a dyer of London. In 1577 he bound himself apprentice to a stationer. In 1592 he pub. *Greene's Groat's-worth of Wit*. He found it necessary to repudiate any share in the pamphlet in his *Kind Heart's Dream*, 1593, and to apologise to 3 persons who were abused in it, of whom Shakespeare appears to be one. In 1595 he pub. *Piers Plainnes Seaven Yerres Frenlish-ship*, and between then and 1603 he wrote, or collaborated in, over 40 plays. Meres speaks of C. in his *Palladis Tamia* as 'one of the best for Comedy.' His money difficulties were constant, and are sometimes referred to by Henslowe in his *Diary*. Of C.'s own plays only *The Tragedy of Hoffman* was printed, 1631. For *Troilus Revenge* and the tragedy of *Polefeme* Henslowe paid him 'fifty shillings.' In *The Pleasant Comedie of Patient Grissill*, 1603, he collaborated

with Dekker and Haughton, and in *The Death of Robert, Earle of Huntingdon*, 1601, with Munday. In 1603 he pub. *England's mourning garment*, an elegy upon Queen Elizabeth, in which he alludes to contemporary poets. See H. Jenkins, *The Life and Work of Henry Chettle*, 1934.

Chetwode, Sir Philip Walhouse, 1st Baron (1869-1950), Brit. soldier. Educ. at Eton. Entered 19th Hussars (from militia) in 1889. Colonel 1911, major-general 1916, lieutenant-general 1919, general 1926. Fought in the Burma campaign 1892-3, and in the S. African War 1899-1902. In the First World War he commanded the 5th Cavalry Brigade in 1914-15, the 2nd Cavalry Div. in 1915-16, the desert column and canal defences, Egypt, 1916-17, and finally the 20th Army Corps 1917-18, which captured Jerusalem. Mentioned in dispatches 11 times. After the First World War he was military secretary at the War Office 1919-20, deputy chief of the Imperial General Staff 1920-2, adjutant-general to the forces 1922-3, general officer commanding-in-chief Aldershot Command 1923-7, chief of the General Staff, India, 1928, commander-in-chief in India 1930-1935, field marshal 1933, constable of the royal palace and the fortress of London 1933.

Chetwood, Knightly (1650-1720), divine and writer, b. Coventry. He became dean of Gloucester about 1707. He contributed a life of Lycurgus to the trans. of Plutarch's *Lives* pub. in 1683, and wrote the life of Virgil and the preface to the *Pastorals* in Dryden's trans. of Virgil, 1697, and sev. biographies, essays, trans., sermons, and poems.

Cheval de Frise, or **Chevaux de Frise** (Fr. *cheval*, a horse; *de Frise*, of Friesland), in fortification, an obstacle consisting of pieces of timber traversed with iron spikes, 5 or 6 ft long and pointing outwards, used to close a breach or defend a narrow passage against the advance of cavalry. It was first used in the Dutch War of Independence at the siege of Groningen in Friesland.

Chevalier, Albert (1861-1923), coster comedian and music-hall artist, b. London, the son of a Fr. master at Kensington Grammar School. In 1877 he acted in *An Unequal Match* at the Prince of Wales's Theatre, taking the name of Knight, and later he was associated with John Haro. In 1891 he introduced his famous coster comedian sketches and songs at the Pavilion Music Hall. He wrote many plays, sketches, and monologues; and one of the former, *Tommy Dodd*, was produced in 1898 at the Globe Theatre. In his later years he frequently gave entertainments consisting of items from his former 'turns.' His last public appearance was in Nov. 1923, in *My Old Dutch*, by himself and Arthur Shirley.

Chevalier, Maurice (1889-). Fr. actor, vocalist, revue artist, and film star, b. Ménilmontant, near Paris. Married Yvonne Vallée; marriage dissolved. He started life as an electrician; then engraver, and made his first appearance on

the stage as a singer at the Palais du Travail, Belleville, 1906. From 1909 to 1913 he was at the Folies Bergères, where he became dancing partner to Mistinguette. He fought with the Fr. Army in the First World War and was a prisoner of war for over 2 years. He made his first London appearance at the Palace Theatre in the revue *Hullo, America*, succeeding Owen Nares therein in 1919. He began his film career in 1929 and became one of the outstanding stars of the cinema. Later he became interested in theatre management. He was in Paris when the Germans occupied it in the Second World War and had to remain there during the Occupation. He is one of the very few people who can hold the rapt attention of an audience single-handed for over 2 hrs.

Chevalier, Michel (1806-79), eminent Fr. economist and statesman, b. Limoges. In his early days he trained as an engineer, but in 1829 he joined the Socialist school of Saint-Simon. He became the editor of the *Globe*, the organ of the Saint-Simonians, and in 1832 he was arrested, and sentenced to a year's imprisonment on account of certain articles which had been pub. He was released after 6 months, and sent by Thiers to America to inquire into the railway and water systems there. Later he went on an economic expedition to England, which resulted in the pub. of his *Des intérêts matériels de la France*, 1838. In 1840 he was made prof. of political economy at the Collège de France. In 1851 he pub. an important book advocating free trade; and he, with Richard Cobden, played an important part in securing the commercial treaty between France and England, 1860. The same year he was created member of the Senate, and for many years took an active part in discussions, until he retired from public life in 1870.

Chevalier, formerly a horseman, or a knight; it is also an honorary title used by the younger sons of a Fr. noble family. The name is still in use among members of certain foreign orders, such as Chevalier of the Legion of Honour. Prince Charles Edward was known as the 'Young Chevalier.'

Chevalier de St George, see STUART, JAMES FRANCIS EDWARD.

Chevet, in architecture, the apsidal E. end of a large Fr. church, having an aisle or ambulatory round the apse, surrounded by a ring of chapels. Westminster Abbey provides a rare Eng. example.

Cheviot Hills, range of hills stretching from N.E. to S.W. between England and Scotland, and covering about 35 m. of the border between the 2 countries. The larger part of the range is in England, the smaller portion being in Roxburghshire. The highest peak is The Cheviot, 2676 ft. Other peaks forming the range are Cairn Hill, 2545 ft, Hedgehope Hill, 2348 ft, Windy Gyle, 2039 ft, Peel Fell, 1975 ft, and Carter Fell, 1815 ft. The range is well covered with grass, and affords excellent pasturage for the flocks which graze on its sides. The S.W. portion of the range consists chiefly of limestone belonging to the carboniferous

system, but the highest peaks are of volcanic origin, pointing to the Lower Old Red Sandstone Age. A huge mass of granite pierces these volcanic-formed rocks for about 20 sq. m., forming The Cheviot.

Chevreul, Michel Eugène (1786-1889), Fr. chemist, b. Angers, where his father was a physician. At the age of 17 he went to Paris, and entered L. N. Vauquelin's college, where he studied with much zeal and success, becoming in time Vauquelin's assistant at the natural hist. museum in the Jardin des Plantes. In 1813 he was made prof. of chem. at the Lycée Charlemagne, and took charge of the Gobelins tapestry works, where he performed his researches on colour contrasts. In 1826 he became a member of the Academy of Sciences, and was elected foreign member of the Royal Society of London. In 1830 he became director of the natural hist. museum in Paris. In 1886 his hundredth birthday was celebrated with great public rejoicings, and a grand fête given at the museum in his honour. His name is famous for his discoveries of margarine, stearin, and olein, as well as for research work on dyes and soap-making.

Chevron (Fr. *chèvre*, a goat): 1. In architecture a decoration introduced into England in the 11th cent., and consisting of a moulding with a zigzag outline, examples of which are to be found in Canterbury and Durham Cathedrals. It is a common decoration in the Zimbabwe ruins, Rhodesia, and in S. Arabia. It is used also in the cloisters of Monreale, near Palermo, in those of St Paul, outside Rome, and in many Ger. churches. A very early example is the tomb of Agamemnon, at Mycenae.

2. In heraldry C. is one of the ordinaries formed of 2 bands, joined together at the top, and coming down to the ends of the shield in the form of a pair of compasses. Shields may have 1, 2, or 3 C.s, and in some as many as 5 have been found. It is probably the earliest among the Eng. armorial charges. As badge of rank see STRIPES and CHEVRONS.

Chevrotain, or Mouse-deer, of the mammalian ungulate family Tragulidae. The family includes 2 genera, *Tragulus* and *Hyemoschus*. The first contains many species of small animals, which have more or less the characteristics and habits of some rodents. They inhabit Asia, the Malay Archipelago, Ceylon, and India. To the second belongs only 2 species, known as the water C., which comes from Africa.

Chewing-gum, preparation made from a gum called chicle, which is the product of a tree, *Achras zapota*, native of W. Indies and Central America. It is sweetened, and various flavouring substances are added to it. It has become, in the U.S.A., a favourite sweetmeat, which is chewed but not swallowed.

Cheyenne: 1. Cap. of the state of Wyoming, U.S.A., situated near the Laramie Mts. It is a transportation, trade, and distribution centre, and a shipping point for sheep and cattle.

There are railroad shops, a municipal airport, and an oil refinery. Manufa. include dairy and bakery products and beverages; lumber is also produced. Here are the state capitol, the Federal building, and the governor's mansion. Pop. 31,935.

2. A riv. in U.S.A., composed of 2 branches, which take their rise in Wyoming, and flow NW. through S. Dakota to join the Missouri, 35 m. NW. of Pierre. Length of each branch about 350 m.

Cheyenne, N. Amer. Indians of the Algonquian linguistic family and one of the most famous and warlike of the Plains tribes. They originated in Minnesota, but now inhabit reservations in Montana, Oklahoma, and S. Dakota. They number about 4400. See K. Llewellyn and E. A. Hoebel, *The Cheyenne Way*, 1941.

Cheylesmore, Herbert Francis Eaton, 3rd Baron (1848-1925), soldier. Entered Grenadier Guards, 1867, and reached the rank of major-general. On retirement from the army in 1899, he devoted himself to municipal work, being mayor of Westminster, 1905-8, and chairman of the London Co. Council, 1912-13. A skilled marksman, C. was the leading spirit in the foundation of the Bisley ann. meeting. During the First World War he presided over sev. courts martial, including those which condemned to death Karl Lody, the Ger. spy, and the leaders of the 1916 Dublin rising.

Cheyne, Thomas Kelly (1841-1915), theologian and O.T. scholar, b. London. He was educ. at Merchant Taylors' School, and afterwards went to Worcester College, Oxford. Later he went to Göttingen, and studied the Ger. theological methods. At Oxford he won the chancellor's medal for the Eng. essay, and in 1868 became fellow of Balliol College. He was appointed rector of Tending in Essex in 1880, where he remained until 1885, when he was made prof. of the interpretation of Holy Scripture at Oriel College, Oxford, which post also held a canonry at Rochester. In 1889 he delivered the Hampton lectures at Oxford. He was a member of the O.T. revision company, and joint editor of the *Encyclopaedia Biblica*, 1899-1903. He was also in earlier years editor of the O.T. portion of the Variorum Bible, and organised the theological part of the original *Academy*. In later years his biblical criticism became very extreme. In 1908 he resigned his post as prof. He was author of many books and lectures, the most important of which are *The Prophecies of Isaiah*, 1880-1881, *Exposition of Jeremiah and Lamentations*, 1883, *Book of Psalms*, 1884, 1888, *Job and Solomon*, 1887, *Jeremiah, his Life and Times*, 1888, *The Hallowing of Criticism*, 1888, *Aids to the Devout Study of Criticism*, 1892, *Introduction to Isaiah*, 1895, *Isaiah*, 1897-9, *Jewish Religious Life in Post-Exilic Times*, 1898, and *Critica Biblica*, 1903.

Cheyne, Sir William Watson (1852-1932), Scottish surgeon, b. at sea off Hobart, Tasmania. He graduated in medicine at Edinburgh Univ., 1875, and became house surgeon to Lister, first in

Edinburgh and later at King's College Hospital, London. He was assistant surgeon and later surgeon to that hospital (1880-1917) and prof. of surgery there (1891-1917). He became a fellow of the Royal College of Surgeons in 1879, was Hunterian prof. 1888-90, was president from 1914 to 1916, and was awarded its Lister Memorial Medal in 1924. He was elected F.R.S. in 1894 and was created a baronet in 1908 on becoming surgeon-in-ordinary to King Edward VII. He was M.P. for the Univs. of Edinburgh and St Andrews, 1917, and for the Scottish univs., 1918-22. C. was a staunch advocate of the antiseptic principles introduced by Lister. His prin. works are *Antiseptic Surgery*, 1882, *Suppuration and Septic Diseases*, 1889, *Treatment of Wounds, Ulcers, and Abscesses*, 1891, *Tuberculous Disease of Bones and Joints*, 1895, *Manual of Surgical Treatment* (with F. Burghard, 7 vols.), 1899-1903, and *Lister and his Achievement*, 1925. See *Dictionary of National Biography*, 1931-40.

Cheyne-Stokes Respiration, breaking up of the ordinary rhythm of breathing into periods of waxing and waning. The breathing increases in depth until it reaches a maximum, becomes shallower again until it ceases altogether, then recommences and gains in depth once more, the cycle being repeated again and again. Respiration is controlled by the respiratory centre in the medulla, and a rise in the carbon dioxide content of the blood stimulates the centre (see *RESPIRATION*). C.-S. R. is a grave sign, indicating that the normal functioning of the respiratory centre is disorganised.

Cheyney, Peter (1896-1931), full name **Reginald Evelyn Peter Southhouse-Cheyney**, crime novelist, b. London. Educ. at the Mercers School and London Univ., he worked for a time as a law clerk, then became an actor, and after that a journalist. His earliest pubs. were 2 books of verse. His first successful crime novel was *This Man is Dangerous*, 1936; others are *Dames Don't Care*, 1937, *Don't Get Me Wrong*, 1938, *You Can't Keep the Change*, 1940, *It Couldn't Matter Less*, 1941, *Sorry You've Been Troubled*, 1942, *You Can Always Duck*, 1943, and *Dance Without Music*, 1947.

Chilabreria, Gabriello (1552-1637), It. poet, b. Savona, and founder of the Pindaric school of poetry. He wrote many odes, lyrics, and *canzonetti*, which are full of mythologic allusions and affectations, the error of the times in which he lived. His best poetry is to be found in the *canzonetti* and *scherzi* written for music. Some of his *canzonetti*, like the anacreontics of Ronsard, are most elegant and graceful. Sev. of his epitaphs have been trans. by Wordsworth. There were eds. of his lyric work pub. in Rome 1718, Venice, 1731, Leghorn, 1781, and Milan, 1807. All the rest of his work has long sunk into oblivion.

Chichou, see *TSINGTAO*.

Chian, or Kian, tn in Kiangsi prov., China, situated on a trib. of the Kan R.

Chiana (anc. *Clanis*), riv. of Italy, originally a trib. of the Tiber (q.v.), in the

prov. of Arezzo (q.v.). Its valley is very fertile, but was once extremely unhealthy owing to the overflow of the riv. The riv. bed was deepened in the 19th cent., and the water led by channels to the Arno (q.v.) as well as the Tiber. Length 35 m.

Chiang Kai-shek (1886-), Chinese general and politician, b. Fenghua, Chekiang, and trained in the Paoting Cadet School. Whilst a student in a Jap. military school he joined Dr Sun's revolutionary party, but it was not until he was 34 that he gained prominence on his appointment as principal of the Whampoa Military Academy when he returned from Soviet Russia. At this period the Kuomintang (hereafter abbreviated KMT) was in alliance with the Chinese Communist party and the Russian adviser Borodin had considerable influence over C. K. When Dr Sun d. in 1925, C. K. was appointed commander-in-chief of the KMT forces in Canton, with the Russian general, Galen, as his chief of staff. In 1926, with the assistance of the Chinese Communists, C. K. successfully led the N. expedition to the Yangtze, and the KMT gov., which had been set up the year before in Canton, was moved to Wuhan. He soon quarrelled, first with the Russians who were subsequently expelled from China, and then with his own generals and with the Communists with whom he was soon to engage in incessant civil wars.

His grand purge, started on 15 May 1927, resulted in the liquidation of large numbers of students, workers, peasants, and his personal rivals. His slogan was 'No parties outside the KMT, no factions inside the KMT!' While the smaller parties, such as the Social Democratic party and the China Youth party, were driven underground, the Communists now took up arms openly against him. His move was so unpopular that in Aug. he was forced to resign by his own colleagues. In Dec. 1927, while leaving his first wife, Mao Shih, in his native tn, Fenghua, and sending his second wife, Ch'en Chieh-ju, to America, he married as his third wife Soong Mei-ling, sister of Mme H. H. K'ung and T. V. Soong. Thus a triumvirate was formed with the 2 new brothers-in-law, who were later to become his prime minister, foreign minister, and finance minister by turns. Shortly before the wedding C. K. was baptised in a Methodist church in Shanghai. In Oct. 1928 he resumed the presidency; this was followed by his war with Gen. Li Tsung-jen in the next spring; and in 1930 he was again engrossed in a fierce civil war with the Governor of Shanai, Yen Hsi-shan, and the Christian general, Feng Yu-hsiang, who, together with Wang Ching-wei, formed a separate gov. in Peking. This war spread to 7 provs., from N. Kiangsu to Shensi, and was only ended by the intervention on C. K.'s side of the troops of Chang Hsueh-liang from Manchuria. The vacuum thus left in Manchuria was to be filled by Jap. invaders in the following autumn (1931). Meanwhile his quarrel with the Kwangtung faction inside the KMT went on,

and it eventually culminated in the arrest by C. K. of both Hu Han-min, the president of the Legislative Yuan (Parliament), and of Gen. Li Chi-shen, Governor of Kwangtung. From 1930 to 1934 he launched 5 fundamentally unsuccessful 'Extermination of Bandits' (i.e. Communists) campaigns, and even after the Jap. invasions had begun he transferred Chang Hsueh-liang's Manchurian troops to Shensi and urged Chang to fight the Communists in Yen-an. Resentful at his losses to the Japanese, first of Manchuria and then of Hopei, Chang defied C. K.'s order, mutinied, and kidnapped him in Sian on 12 Dec. 1936, but C. K. was subsequently released through the mediation of Chou En-lai (q.v.), and an agreement was reached for a united front between the Communists and the KMT against the invading Japanese. Though from 1931 to 1943 Lin Shen was the president of China, C. K. in his capacity as the chairman of the Military Council was dictator of the country, justifying his rule on the grounds that China was not a constitutional rep. but was under the tutelage gov. of the KMT, of which he was the leader; and on the death of Lin Shen in 1943 he again assumed the presidency. After the war he once more parted company with the Communists and resumed the 'Extermination of Bandits' campaign in 1947; but the corruption of his gov. had by this time lost him support both in China and in W. Europe, and after a series of defeats his troops were completely routed by Mao Tse-tung's Communist Army on the mainland in 1950. C. K. fled to Formosa with half a million soldiers in 1949 and became the president of the refugee regime on the is. His gov. is still recognised by the U.S.A. as the rightful gov. of China. See CHINA, *History* and CHOU EN-LAI; also R. Payne, *Chiang Kai-shek: the Generalissimo*, 1948, and C. P. Fitzgerald, *Revolution in China*, 1951.

Chiangyin, or **Kiangyin**, tn in the prov. of Kiangsu, China. It stands in a strongly fortified position commanding a narrow part of the Yangtsekiang, 80 m. distant from Shanghai.

Chianti, lt. mt range in Tuscany (q.v.), part of the Apennines (q.v.). Its slopes are covered with vineyards, and olive and mulberry plantations, and it gives its name to a famous (principally red) wine. The chief tn of the wine-producing dist. is Poggibonsi (q.v.).

Chisochou, or **Kisochow**, see TSINGTAO.

Chiapas, Pacific state of Mexico, bounded on the W. by Veracruz and Oaxaca, and on the E. by Guatemala. Area 28,732 sq. m. It is mountainous, especially in the N. and SE., one of the highest peaks being Tacaná, 13,333 ft, an active volcano, and another the Soconusco, 7806 ft. The extensive Maya ruins in the NE. were among the first such discovered by European scientists (1780), while the beautiful murals of Bonampak are among the most recent. On the E. side stretches an undulating plateau, well wooded, with a plentiful water supply. Agriculture and fruit farming

flourish, and stock-raising is an important industry. Cap. is Tuxtla Gutiérrez. Pop. 903,200.

Chiaromonte Gulf, tn in Sicily (q.v.), 7 m. N. of Ragusa (q.v.). It has a trade in wine. Pop. 15,000.

Chiari, Pietro (1700-88), It. playwright, b. Brescia, rival of Goldoni. He started his career as a Jesuit priest, and in 1736 became prof. of rhetoric at Modena. He wrote some 60 plays in 12 years: *Commedie in versi*, 1756-62, and *Nuova Raccolta*, 1762. They are full of absurd intrigues and plots, and abounding in irregular invention. He also wrote operatic libretti and tales of adventure.

Chiari (anc. *Clarum*), It. tn, in Lombardy (q.v.), 14 m. WNW. of Brescia (q.v.). Prince Eugene (q.v.) defeated the French and Spaniards here in 1701. Textiles and chemicals are manuf. Pop. 14,000.

Chiarini, Giuseppe (1833-1908), It. poet and critic, b. Arezzo. For some time he was the director of the lyceum at Leghorn, and in 1884 was made director of the Liceo Umberto I at Rome. His poems are full of charm and tenderness, especially his *In Memoriam*, 1875, and *Lacrymae*, 1879, and the influence of Carducci is felt, whose principles he strongly advocated. A complete ed. of his works was pub. in 1902. The *Studi Shakespeariani* is a collection of his papers on Shakespeare. He also trans. Heine, and ed. works by Leopardi and Foscolo.

Chiaroscuro (Lat. *clarus*, bright; *obscurus*, dark), in painting, a word used to express the art of reproducing light and shade, in terms of tone rather than colour. It developed with the rise of oil painting, which allowed of subtle gradations from light to shadow as in the work of Leonardo or Correggio; and of depth and forceful contrast as with Caravaggio or Rembrandt. The C. woodcut was an engraving technique, a means of rendering sev. tones of one colour (see ENGRAVING). See also COLOUR PRINTING.

Chiasmus (Gk. *chi*, *chi*, letter like our X) is a figure of speech by which contrasted terms are arranged crosswise, the order in one phrase being reversed in a second, as 'I cannot dig, to beg I am ashamed.' See also FIGURE OF SPEECH.

Chialiolite, variety of the mineral andalusite (q.v.), which consists of silicate of alumina. Crystals of C. are long, narrow, and grey or white in colour. When broken across they often exhibit a cruciform pattern, and cut and polished crystals, giving a black cross on a lighter ground, are often worn as amulets by Sp. peasants. This pattern is caused by the fact that the outer portion encloses a darker one of regular geometric form. C. is met with in certain slates altered by the intrusion of igneous rock.

Chiating, or **Loshan**, in Szechwan prov., China, tn situated on the r. b. of the Min R., where it joins the Tatu R. It is a centre of the silk-weaving industry.

Chiatura, tn in Georgia (Transcaucasia), 30 m. E. of Kutaisi. It is the centre of the C. manganese-mining area, one of the

richest in the world, exploited since 1879. Pop. (1956) 19,000.

Chiavenna, It. tn in Lombardy (q.v.), lying N. of Lake Como (q.v.) at the junction of the roads to the Splügen (q.v.) and Maloja passes over the Alps. It was once an important trading tn. Pop. 3200.

Chiyukuan, or **Kiyukwan**, tn of Kansu prov. in China, situated at the W. end of the Great Wall, near Suchow.

Chiba, city of Chibaken, Japan, situated on Tokyo Bay, 20 m. E. of Tokyo. Pop. 134,000.

Chibchas, one of the civilised nations of S. America, whose kingdom at the time of the conquest in Colombia was almost equal to those of the Aztecs and Incas (qq.v.). The nation was divided into 2 states, which were hostile to one another. One was governed by the *cipa*, or king, of Bacata, and the other by the *zaque*, or lord, of Ramiriqui and Hunsá. Their total pop. amounted to over 1 million. Their empire was overthrown in 1538, and to-day they are a number of small communities, with a total pop. of under a million. Evidence of their great culture is seen in their stone temples, highways, statues, suspension bridges, and their beautiful gold and silver work, also their weaving and dyeing. See A. L. Kroeber, 'The Chibcha,' in J. H. Steward, *Handbook of South American Indians*, vol. II, 1916.

Chica, colouring matter of an orange-red shade which is obtained from a native plant (*Bignonia chica*) and made into a pigment by the Indians of the Upper Orinoco and Rio Negro; it is used by them to adorn their bodies. The name is also used for a beer in S. America.

Chicago, cap. of Cook co., Illinois, and second city of the U.S.A., on Lake Michigan, 724 m. W. of New York by air and 860 m. N. of New Orleans. A major centre of railway, highway, and aeroplane traffic, it extends 27 m. NNW. along the lake from the Indiana border, with an area of 213 sq. m. It is built on flat land scarcely rising above the level of the lake. The C. R. marks it off into N. Side, W. Side, and S. Side, characterised by long, regular, and straight streets. Great improvements have been made to the old city, although some slum dists. remain. Streets have been widened, bridges built, and boulevards constructed; land has been reclaimed from the lake for new parks, bathing beaches, and lagoons. The fine streets include the 7 following: State, Madison, La Salle, Clark, Dearborn, Wabash Avenue, and Michigan Avenue. There are more than 200 m. of boulevards. Not only office buildings but also the newer apartment buildings have steel frames; and the offices tower up to tremendous heights, accommodating thousands of people. Among the important buildings in the central business quarter may be mentioned the Chamber of Commerce, the Board of Trade, the City Hall and Co. Building, the Merchandise Mart, the Tribune Tower, the Wrigley Building, the C. Temple, the Marshall

Field Store, the Furniture Mart, the Civic Opera, the Prudential Insurance Co. of America, and the *Daily News* Building. Then there are the Art Institute, containing a valuable collection of pictures and other treasures, the C. Public Library, the C. Historical Society, the John Crerar Library, and the Newberry Library. The univ. of C., which dates from 1890, was endowed by John D. Rockefeller and is housed in a hundred buildings on both sides of the Midway Plaisance. The univ. has schools of divinity, medicine, law, business, and social service administration. There is also the Illinois Institute of Technology, and both Northwestern Univ. (see EVANSTON) and the univ. of Illinois (see URBANA) have C. campuses. C. is well provided with parks—in all, more than 7000 ac., many connected by boulevards. Lincoln Park (with a statue of Lincoln and a zoo) on the N. Side, Grant Park adjoining the business quarter, and Jackson Park on the S. Side border Lake Michigan and are connected by boulevards. Jackson Park and Midway Plaisance (which connects it with Washington Park) were the site of the 1893 World's Columbian Exposition. On the W. Side are Douglas Park, Garfield Park (with a conservatory), and Humboldt Park. There are many fine hospitals (including Cook Co. Hospital), and among other institutions are Hull House (a social settlement on the lines of Toynbee Hall, founded by Jane Addams) and C. Symphony Orchestra. Bordering Grant Park on the S. are the C. Museum (formerly Field Museum) of Natural Hist., Shedd Aquarium, Adler Planetarium, and Soldier Field. The park along the lake to the S. of them was the site of the Century of Progress Exposition (1933-4). The water supply of the city is extremely good, being drawn from the depths of Lake Michigan by a system of cribs and tunnels, while the (treated) sewage is carried by a canal into the Illinois R. This Sanitary and Ship Canal, opened in 1900, connects the C. R. with the Des Plaines R., and finally with the Illinois. C. owes its great advance in commercial activity to its advantageous position. In addition to being on the Great Lakes, it is an extremely good railway centre, connected by 27 railway systems with all parts of the U.S.A. It ranks among the largest commercial ports in the world, ships of over 7000 tons being able to enter the harbour. C.'s retail trade according to the census of 1949 amounted to \$4,270,000,000 in net sales. Just N. of the mouth of the C. R. a pier 3000 ft. long was completed in 1915. Ships can also moor in the riv. and its branches. Among world grain centres C. holds the premier place. The grain consists chiefly of corn, oats, and barley, and the enormous grain elevators are a feature of the city. All kinds of manufs. are carried on, including iron and steel products, machinery, agric. implements, clothing, food products, and furniture. Printing and publishing are important. Thousands of agric. machines are made, the International Harvester Co. being

the largest manufacturer of such machinery in the world. At Pullman, in the S. of C., the Pullman car works produce the railway cars known by that name. The Western Electric Co., the largest manufacturer of telephone equipment in the world, has a large plant at Cicero, on the W. edge of C. The gov. of C. is regulated by a general charter law of 1872, the power being vested in a council elected from wards. The mayor, who is elected for 4 years, is at the head of the council, and appoints single commissioners

Canadian Pacific

MICHIGAN AVENUE, CHICAGO

to rule the different depts, all of which are under the power of the council. The growth of pop. in C. is remarkable, its increase during the period 1880-1950 being from 505,000 to 3,621,000. It is now the sixth largest city in the world. There is a large percentage of foreign-born, including Bohemians, Germans, Irish, Swedes, Norwegians, Poles, Italians, Russians, and Mexicans; indeed, in 1900 more than three-quarters of the pop. were either foreign-born or of foreign parentage. The origin of the name of the city is uncertain, but it is said to be the Ojibwa *she-kag-ong*, 'wild onion place.' The site was visited in 1673 by Joliet and Marquette. Fort Dearborn was built in 1803. In 1812 the Indians massacred the settlers. The fort was rebuilt 4 years afterwards, and in 1837 C. received its charter as a city. In 1871 it was swept by fire, with a loss estimated at

\$196,000,000. However, it was soon restored and was furnished with buildings of much better construction. In May 1886 occurred the Haymarket riot in which a bomb was thrown among the police trying to put down an anarchist meeting called owing to troubles in the labour world. The low number of European immigrants during the First World War brought about a great influx of unskilled Negro labour from the S. Difficulties caused by the return to normal conditions and the bad state of housing combined to cause a serious race riot in 1919, when, on one day, 38 people were killed and 537 injured. C. has never been noted for its orderliness; but from a time roughly coincidental with the enforcement of prohibition, crime and violence alarmingly increased. Gambling and bootlegging were the 2 main factors of violence, and enmity between rival gangs led to frequent shootings, the police or anyone else inclined to interfere being also shot down. During the First World War C. attracted attention through the anti-war, anti-Brit. attitude of its mayor, Wm Hale Thompson, who was first elected in 1915. In May 1934 the most disastrous fire in C. since 1871 broke out in the Union Stock-yards. It destroyed the meat-packing centre and spread through 40 blocks, the total damage being estimated at \$6,000,000. C. is the H.Q. of one of the 6 army areas. See E. G. Mason, *Early Chicago and Illinois*, 1890; J. Kirkland, *The Story of Chicago* (2 vols.), 1892-4; E. D. Sullivan, *Look at Chicago!*, 1930; E. L. Masters, *The Tale of Chicago*, 1933; I. F. Mather, *The Making of Illinois*, 1917 (revised ed. 1942).

Chicago, Milwaukee, St Paul, and Pacific Railroad, a system with main lines from Chicago to Minneapolis and Seattle, and Chicago to Omaha. It operates more than 10,000 m., of which 565 m. mainly through the Rockies, are electrified.

Chicago, University of, was opened in 1892, initially endowed by John D. Rockefeller through the Amer. Baptist Educational Society, but is now undenominational. His gifts, 1890-1910, totalled \$34,700,000, and there were additional gifts amounting to \$19,700,000 from foundations he estab. and \$5,800,000 from John D. Rockefeller, junior. In 1950 the total of all gifts was \$171,600,000, and the permanent endowment was \$71,000,000. The univ. of C. is situated on the Midway Plaisance in C., Illinois, and occupies a number of imposing buildings, among which the Wm Rainey Harper Memorial Library, a specimen of Eng. Gothic architecture, honours the first president, to whose genius it owes its initial success. Associated with the univ. of C. are a medical school, a law school, a school of business, a graduate school of social service administration, Baptist, Disciples of Christ, Congregational, and Unitarian theological schools, the Oriental Institute, Yerkes Observatory (at Williams Bay, Wisconsin), institutes for the study of metals and for

nuclear studies, the Argonne National Laboratory, and the Univ. of C. Press, with an impressive list of pubs. There are a summer school and extension courses. The Univ. of C. is open equally to men and women, the total enrolment in 1950 being over 12,000. The number of profs. and instructors was 771. In 1930, in place of the traditional graduate schools and undergraduate college, a divisional organisation was estab., consisting of the college, 4 upper divs. of arts and sciences, and the professional schools. See T. W. Goodspeed, *The Story of the University of Chicago*, 1925.

Chicago Heights, city in Illinois, U.S.A., 25 m. S. of Chicago. It manufs. chemicals, steel and iron products, and railway equipment. Pop. 24,550.

Chicago River, formerly a trib. of Lake Michigan. Its flow was reversed in 1900 with the construction of a canal (now known as the Sanitary and Ship Canal) to the Des Plaines R., and it has become a vital link in the Illinois Waterway.

'**Chicago Tribune**', popular Amer. daily paper, which entitles itself 'the world's greatest newspaper,' and one of the greatest financial successes of the newspaper world of to-day. The first issue was pub. on 10 June 1847, only 400 copies being printed, and the early years of the paper were full of financial vicissitudes. On one occasion it became bankrupt, but triumphantly overcame its difficulties and in less than 2 years paid off all its debts. In 1855 Joseph Medill bought an interest in the *Tribune* with 2 other purchasers, but it was not until 1874 that he took over the editorship from Horace White, who had been a part proprietor and editor-in-chief since 1866. Medill's genius raised the paper to a position of power during the many years it was under his control. In 1901 Joseph Medill Patterson, grandson of Joseph Medill, joined the staff of the *Tribune*, while his cousin, Robert Rutherford McCormick, 2 years later followed him. The united energies and abilities of these 2 young men were responsible for the rapid rise in circulation of the *Tribune*, and the serious attention they paid to advertising of a reliable and reputable nature soon raised the paper's financial status to great heights. A feature of the paper's foreign policy in the years preceding America's entry into the Second World War was Col. McCormick's isolationist and anti-Brit. attitude.

Chichas, S. Amer. people of the Gran Chaco, Argentina. They have their own large settlements, and cultivate the land in the Upper Bermejo dist., where they were known as 'nutimaeas,' or Peruvian colonists. They dress in a cloth which they weave themselves from the llama wool, and the lucas are said to have employed them in silver-mines.

Chichele, or **Chicheley**, Henry (c. 1362-1443), archbishop and founder of All Souls' College, Oxford. He was b. at Higham Ferrers, Northants, and educ. at Winchester and New College, Oxford. He became Bishop of St David's in 1408, and Archbishop of Canterbury in 1414. He was a royal envoy to France and

Rome on sev. occasions, and was an active opponent of the Lollards (q.v.). All Souls was founded in 1437; C. also founded the C. Chest at Oxford for the relief of poor students, and gave generously to Canterbury Cathedral.

Chichén Itzá, ruined city of the old Maya empire in Yucatán, Mexico, 70 m. ESE. of Mérida. At one time a place of religious importance, there are many evidences of early civilisation in the time of the Itz'as, a most powerful Maya nation, who were still inhabiting the city within 50 years of the Sp. conquest. There are a nunnery, a castle, and a central pyramid, the latter being 550 ft sq., with a height of 70 ft.

Chicherin, Georgiy (or Yuriy) Vasil'yevich (1872-1936), Russian diplomat. After graduating from St Petersburg Univ. he worked in the Archives Dept of the Russian Foreign Office. In 1904 he emigrated to Berlin and there joined the Russian Social Democratic Labour party, becoming a prominent member of the Menshevik faction (see MENSHEVIKS). For many years he was active in the labour movements of England, France, and Germany. After the Bolsheviks seized power in Russia in 1917 C. turned Bolshevik, and was imprisoned in Brixton Jail for having enemy associations. In Jan. 1918 he was released and expelled from Britain in exchange for Sir George Buchanan. After his return to Russia C. was appointed Commissar (Minister) for Foreign Affairs; he negotiated and signed the treaty of Rapallo with Germany in 1922. He resigned in 1930 owing to prolonged illness.

Chichester, cathedral city and municipal bor., cap. of W. Sussex, England, 28 m. W. of Brighton. A city rich in historical associations, it is situated on a plain between the S. Downs and the sea. The name is derived from the Saxon Cissancaster, 'Cissa's Camp,' and called so after a Saxon king who took it in 491. Originally a Rom. station, it was demolished by the S. Saxons towards the end of the 5th cent. A wooden cathedral was erected at C. in 1108, and burnt down in 1114. Another cathedral was built on the same site in the 12th and 13th cents. It represents different periods of architecture, the choir above the arcade and the E. part containing excellent workmanship of the Early Eng. period. The special features of the cathedral lie in its nave with double aisles on each side, a detached campanile or bell-tower, and a number of portraits of the Eng. kings from the time of the Conquest and of many bishops. The spire is 300 ft high. Sir Gilbert Scott and others undertook the restoration of parts of the building, such as the central tower, a portion of the NW. tower, and the spire. Early Decorated, Norman, Perpendicular, Early Eng., and Late Norman styles are all in evidence in this cathedral. The tn itself has a fine market cross, octagonal in structure and belonging to the ornate Perpendicular style. The bishop's palace and cloisters are not far from the cathedral. Other buildings of interest are the church of

St. Olave (Rom. workmanship), the Guildhall (formerly a Grey Friars' chapel), the church of St. Andrew (the poet Wm. Collins was buried here), and St. Paul's Church (a fine modern structure). C. has a fine cattle market, and the chief trade is agric. produce and live-stock. Brewing and tanning are also engaged in. There are Rom. remains here. Pop. 19,110.

Chick-pea, or **Gram**, the *Cicer arietinum*, leguminous plant cultivated in India and S. Europe for food. It is bushy in habit, grows to a height of nearly 2 ft., has the pinnate leaves common to the family, and the pods are short, oblong, and 2-seeded; the flowers of this annual are solitary and of a pale violet colour. The seeds are about the size of an ordinary pea and bear a striking resemblance to a ram's head, hence the specific name. When boiled they form a nourishing article of diet, or when ground and made into pea-soup. In summer the plant exudes little viscid drops from the stem and leaves, and on evaporation these leave behind crystals of oxalic acid, to which its grateful refrigerating qualities are due. *Cajanus indicus*, a tropical leguminous plant, is sometimes known as C., its other names being Congo, or pigeon, pea and dahl. Its seeds also form an article of food, and are frequently used in curries.

Chickadee, black-cap titmouse, *Parus atricapillus*, a native of N. America. The name is onomatopoeic, imitating the note of the bird.

Chickahominy, riv. of Virginia, U.S.A. It is a trib. of the James R., which it joins 22 m. below City Point. In 1862 the battles of Fair Oaks, Mechanicsville, Gaines's Mill, Savage's Station, White Oak Swamp, and in 1864 Cold Harbor, took place near the riv.

Chickamauga Creek, riv. which takes its rise in Walker co., Georgia, U.S.A., and flows into the Tennessee 6 m. above Chattanooga. The Confederates under Bragg defeated the Federals under Rosecrans in Sept. 1863 on the banks of the riv.

Chickasaws, N. Amer. Indian tribe, of the Muskogean linguistic group and formerly one of the most warlike tribes of the Mexican Gulf area of the U.S.A. They gave great trouble to the Spaniards, and later allied with the English against the French. It is estimated there were 8000 in 1600, but to-day there are about 5000, mostly in N. Mississippi.

Chickasha, or **Chicasaw**, tn of Grady co., Oklahoma, U.S.A., on the Chicago, Rock Is., and Pacific railroad. Its industries include lumber, cotton, and cotton-seed oil, and it is in a rich petroleum-producing and agric. area. C. is the seat of Oklahoma College for Women. Pop. 15,842.

Chicken, see POULTRY AND POULTRY KEEPING.

Chicken-pox, or **Varicella**, mild, feverish, and infectious disease due to a virus, common among children. It can be distinguished by the appearance of successive crops of small vesicles, mostly on the extremities, which may not be very numerous; these seldom become

pustular, and dry up and drop off at about the fifth day leaving very little of the pitting or scarring which follows smallpox. It is not a dangerous disease, the fever being neither very high nor lasting. The period of infection ends when all the scabs have disappeared, and when the person affected has had an antiseptic bath. The virus of C. is related to that of herpes zoster (q.v.), and those in contact with a case of C. sometimes develop herpes zoster; but the reverse does not seem to occur. Encephalitis (q.v.) is a rare complication of C.

Chickweed, common name of many plants, particularly *Stellaria media*, a Caryophyllaceae annual that overwinters, loved by cage birds. *Cerastium* genus contains the Mouse-ear C.s, and *Trifolium europaea* is the C. Wintergreen.

Chiclana de la Frontera, Sp. tn in the prov. of Cádiz, on the Atlantic coast. It has a ruined Moorish castle and mineral springs, and there is a fine beach near by. Linen and earthenware are manuf., and there is a trade in grain and wine. Pop. 14,000.

Chiclayo, important trading cathedral city, cap. of Lambayeque dept and C. prov., in N. Peru, with good road, rail, and port connections. Rice, cotton, and sugarcane are grown and processed. There are also tanning, distilling, and soapmaking. Pop. 32,650.

Chicle, see CHIRWING-GUM.

Chicopee: 1. Tn of Hampden co., Massachusetts, U.S.A., on Connecticut R., 4 m. N. of Springfield. Tyres, sporting goods, textiles, clothing, firearms, machinery, electrical apparatus, bronzes, artillery, swords, tools, and motor cars are manuf. Pop. 49,210.

2. Riv. in the S. of Massachusetts, which flows in a westerly direction to join the Connecticut R. on its l. b. 4 m. N. of Springfield. Length about 18 m.

Chicory, **Succory**, or **Chichorium intybus**, family Compositae, a perennial herb with long tap-root and attractive sky-blue, double flowers, native of Europe, including Britain; related to the Endive, *C. endivia*. The green leaves and roots are bitter and aromatic and have been used in medicines for their tonic and diuretic properties. The blanched leaves make a tender salad, and for this purpose the variety Witloof is grown, and the roots lifted and forced in winter. Common C. or Barbe de Capucin (Monk's Beard) has looser, dandelion-like leaves, and special strains are grown for their roots, which, when dried, roasted, and ground, provide the chicory used as a substitute for or an adulterant of coffee.

Chicoutimi, city of Quebec, Canada, in co. of same name on R. Saguenay, 111 m. NE. of Quebec. It has a large saw-milling industry. Pop. 24,400.

Chidambaram, tn of Madras state, India, 21 m. SW. of Cuddalore. It is a religious centre for the whole of S. India and Ceylon, and is the site of a number of fine ancient Hindu temples. Here also is the Anamalai Univ.

Chidley, see CHUDLEIGH.

Chief, see HERALDRY, Ordinaries (1).

Chiemsee, lake in Germany, in the *Land of Bavaria* (q.v.), 12 m. E. of Rosenheim (q.v.). It lies in the foothills of the Alps (q.v.), 1683 ft above sea level. The lake contains 3 is.: *Herreninsel* has a former monastery (764) and a palace built for Ludwig II of Bavaria (q.v.) on the model of Versailles (q.v.); *Fraueninsel* has a fishing vill. and an 8th-cent. convent; *Krautinsel* is uninhabited. Area of lake 31 sq. m.; length 12 m.; width 7 m.; greatest depth 445 ft.

Ch'ien-Fo-Tung, see CAVES OF A THOUSAND BUDDHAS.

Chieng-mai, or **Zimme**, tn of Thailand, in the N., on the Me-ping R., 180 m. NE. of Moulemein (Burma). It is a centre of the trade in teak, the surrounding forests of which are, however, becoming exhausted.

Chieri, It. tn in Piedmont (q.v.), 9 m. SE. of Turin (q.v.). It is built on a hill, and has a Gothic cathedral (reconstructed 1495), and sev. other anc. churches. It produces blankets and wine. Pop. 14,000.

Chieti: 1. Prov. of Italy, in E. Abruzzi e Molise (q.v.). It is mainly mountainous, with some high peaks of the Central Apennines (q.v.) in the W., but has a coastal plain on the Adriatic in the E. There are many fertile riv. valleys; the chief rvs. are the Foro and the Sangro. The prin. tns include C. Ortona, and Lanciano (q.v.). Area 1018 sq. m.; pop. 404,000.

COMMON CHICORY

2. (anc. **Teate**) It. tn. cap. of the prov. of C., built on a hill near the Pescara, 38 m. E. of L'Aquila (q.v.) and 8 m. from the Adriatic. It has a Gothic archiepiscopal cathedral, and Rom. remains, including 3 temples. The order of Theatines (q.v.) was founded here in 1524. There are textile manufs. Pop. (tn) 25,000; (com.) 40,000.

Chiffchaff, or **Lesser Pettychaps** (*Phylloscopus collybita*), small song-bird, one of the earliest summer visitors to Britain, and nearly allied to the willow-wren. The

head, wings, and back are greenish-ash colour and the nether parts yellow-white. Pettychaps is a name sometimes given to the garden warbler (*Sylvia hortensis*).

Chifley, Joseph Benedict (1885-1951), Australian statesman, b. Bathurst, New S. Wales. C. joined the New S. Wales railways as a shop-boy and became an engine driver. He was active in trade union affairs, entered federal politics in 1928 as member of the House of Representatives for Macquarie, later lost his seat but was re-elected in 1940. C. was minister for defence, 1929-32, treasurer, 1941-9, and minister for post-war reconstruction, 1942-5. Following the death of Curtin in 1945, C. became Prime Minister, remaining in office till 1949 when his gov. was defeated by a Liberal-Country party coalition. While in power his policy was designed to maintain full employment, and to provide the social services which have become standard in the contemporary welfare state. During his administration the commonwealth increasingly took the initiative in sponsoring projects for national development and in encouraging immigration. See *Things worth fighting for: speeches by Joseph Benedict Chifley*, ed. by A. W. Stargardt, 1953.

Chigger, see CHIGOE.

Chigi, or **Chigi-Albani**, name of a distinguished It. family. Among its most famous members have been:

Agostino (1465-1520), Rom. banker, b. Siena. He settled in Rome (1485), amassed a great fortune, and built there the Villa Farnesina (1508-11), enriching it with paintings, many either executed or designed by Raphael who also designed a private chapel in Santa Maria del Popolo for him. Agostino C. was patron of many other artists, including Peruzzi, Perugino, and Sebastiano del Piombo.

Fabio, Pope (1652-67), better known as Alexander VII. He was prominent in the Jansenist controversy, declaring for papal infallibility. He was involved in a dispute with Louis XIV of France, who sent an army to sack Avignon. He was responsible for the colonnade of the Piazza di San Peter.

Flavio (1810-85), cardinal. Began life as an officer in the Pope's noble guard; in 1848 took orders and became Bishop of Mira; in 1850 was appointed papal nuncio at Munich; in 1856 was papal representative at the coronation of Alexander II of Russia; in 1861 he went as nuncio at Paris, and in 1873 was created a cardinal.

Chigirin (Ukrainian *Chyhyryn*), Ukrainian tn in Cherkassy Oblast, 130 m. SE. of Kiev. It was founded in 1589 by Poles. It was the residence of Bogdan Khmelnytsky (q.v.) and from 1649 cap. of his Ukrainian Cossack state. Pop. (1932) 8000.

Chignecto Bay and **Isthmus**, inlet and neck of land which form the N. extremity of the Bay of Fundy.

Chignon (Fr. *chignon*, nape of the neck), form of hairdressing adopted by women about 1780, and again about 1870, consisting of an enormous coil of hair, folded

round a pad, and worn in the nape of the neck or at the back of the head.

Chigoe, Chigger, Jigger, and Sandflea, names applied to the *Sarcopsylla penetrans*, a species of Aphaniptera which is native to S. America and the W. Indies, but has extended its travels to other lands through the agency of man. The female (A) of this flea, which is smaller and has less powerful limbs than the common flea, buries the hinder part of its body under the skin of the human body, and when this portion of its anatomy swells (B) it discharges numerous eggs into the host. The result of this process is frequently fraught with serious and even fatal danger to mankind. *S. gallinacea*, a kindred species, attaches itself to the eyelids of the poultry of Ceylon. See also FLEA.

CHIGOE

Chigwell, urb. dist. of Essex, England, 13 m. N.E. of London, on the borders of Hainault and Epping Forests, and including the pars. of C., Buckhurst Hill, and Loughton. Wm Penn was a pupil at the grammar-school, founded in 1629 by Archbishop Harsnet of York, and enlarged in 1871. The Maypole Inn appears in Dickens's *Barnaby Rudge*. At Loughton are remains of a Brit. earthwork. Pop. 60,000.

Chihli, or **Chili**, prov. of China, see HOPEI.

Chihli, Gulf of, also known as the **Pohai Bay**, inlet of the Yellow Sea, between Shantung and the Korean Peninsula. The rivs. Hwang-ho and Yungting-ho discharge into it, and Peking stands at its head.

Chihuahua: 1. Largest state of Mexico, bounded on the N. by New Mexico, on the S. by Durango, on the E. by Coahuila and Texas, and on the W. by Sinaloa and Sonora. Area 94,831 sq. m. On the W. the country is traversed by the Sierra Madre or Mexican Cordillera; in the E. lies the Mexican plateau and the depression known as Bolsón de Mapimi. It is famous as the ter. of Pancho Villa and other patriots; also for the little hairless dog, the perro pelón. Nearly 40 per cent of all Mexico's mineral products are produced in C. (silver, gold, and copper are especially important). Stock-raising is carried on, and lumbering, cotton-growing, and agriculture are important. Pop. 846,414, consisting chiefly of mestizos (half-breeds), Indians, such as the Tarahumara, and thousands of Yankees and other foreigners.

2. Cap. of the above state, on the Mexican Central Railway, situated at an elevation of 4650 ft. The city was founded in 1707 by Father Francisco Muñoz, and has become cap. of the N., in a mineral-mining and stock-raising dist. Smelting, brewing, tanning, and cotton- and woollen-milling are carried on. The nearby Santa Eulalia silver-mines are especially famous. The buildings include a cathedral, Jesuit college, a mint, and a prison. Hidalgo and Allende, leaders of the revolution of 1810, were executed here, and a monument to their memory stands in the public square. There is an airport. Pop. 110,779.

Chilblain (*Erythema pernio*), local inflammation of the skin, which appears on the hands and feet, more rarely on the nose, cheeks, and ears. It chiefly affects children (girls rather than boys) and old people, and occurs in cold damp weather. It is due to exposure to the cold and to bad circulation. It is attended with redness and swelling, the centre of which deepens to a purplish hue. In severe cases small vesicles rise on the surface of the skin and ulceration follows. C.s. cause intense irritation, and, when chilled and suddenly heated again, are extremely painful. C.s. are uncommon in those who live or work in centrally heated premises. Exercise plays a part in maintaining circulation, and in this connection occupation is important. Except in states of real undernourishment, diet does not in the ordinary way play any part in the development of C.s. There is no real evidence that calcium is important, but the clinical results of giving calcium cannot be ignored. There is often a familial tendency to C.s. and psychological and nervous influences also play a part—no doubt through the release of endocrine factors which constrict the peripheral arterioles. The part of the body affected should be kept dry and very warmly and loosely clad. Broken C.s. should be kept scrupulously clean.

Child, Sir Francis (1642-1713), banker. Became a freeman of the Goldsmiths' Co. in 1664, and, through his marriage into a family of London goldsmiths named Wheeler, he inherited the Wheeler fortune and goldsmith's business. He was the founder of the banking business of C. & C. In 1698 he was elected Lord Mayor of London and M.P. (Whig) for Devizes. Subsequently he was elected for a London constituency. In 1702 he became master of the Goldsmiths' Co., and in 1727 president of Christ's Hospital.

Child, Francis James (1825-96), Amer. educationist and writer; b. in Boston, Massachusetts, U.S.A., he was educ. at Harvard Univ., and became prof. of rhetoric there in 1851. He became prof. of English there in 1870, and remained on the faculty practically up to the time of his death. He made a speciality of studies in Eng. literature, editing a monumental ed. of Spenser. But his supreme achievement was to make himself the world authority on anct Eng. and Scottish ballads. He pub. his first collection in 1857. Continuing his researches,

he gathered together the largest extant collection of MSS. on the subject and embodied the result of his studies in his famous book *The English and Scottish Popular Ballads*, pub. from 1882 to 1898, 'first in 10 parts (1880-98) and then in 5 quarto vols.' His other works include an ed. of *Four Old Plays*, 1848, and a treatise, *Observations on the Language of Chaucer's 'Canterbury Tales'*, 1863.

Child, Harold Hannington (1869-1945), scholar and literary historian, b. Gloucester. He was educ. at Winchester College and Brasenose College, Oxford. To the *Cambridge History of English Literature* he contributed more than any other single writer except George Saintsbury; while for the *Cambridge Modern History* he wrote on Milton and his age, and he also contributed to the *Dictionary of National Biography*. An authority on Shakespeare, he supplied the stage hist. of each play for the *New Cambridge Shakespeare*. His *Thomas Hardy*, 1916, is considered by some to be the best monograph on that writer. He also wrote *Phil of the Heath*, 1899, a novel; *The Yellow Rock*, 1939, poems; and the libretto of Vaughan Williams's opera, *Hugh the Drover*.

Child. In structure and functioning the C.'s body is similar to that of the adult. Organs similar to those found in an adult can be found in the C., and they will be found to function in a generally similar manner. Differences can be noticed in details, and the infant shows marked differences which become less marked as childhood progresses. The infant has, in proportion to the adult, a relatively large head and abdomen, small thorax and short legs, and long arms. At birth the head is one-quarter of the height, while in the adult it is only one-eighth of the height.

The skeleton of the child differs so much from that of an adult that an anatomist can, with a great amount of accuracy, determine the age of a skeleton, up to about 24 years. The difference, of course, is greatest, as in all cases, in infancy. Bones consist of organic matter combined with lime salts. In the C. the proportion of lime salts to organic matter is much smaller than it is in the adult. Further, the bones of a C. have provisions made for growth. A familiar example of this difference between the C. and the adult is the fontanelle, or 'opening in the head.' With the growth of the skull this disappears at about the eighteenth month, because the bones growing irregularly at their edges meet and fit into one another, forming what is called a suture, since the bones look then as if they had been stitched together. Again, at birth many of the bones of the body are not formed. They consist then of long rods of cartilage, a tough substance which can be cut with a knife. Lime salts are deposited on these in definite places, forming bone, until they consist of a bony shaft connected to the bony extremities by plates of cartilage. All through childhood the bone remains in this condition, but as maturity is reached the cartilage ceases

to grow as rapidly as the bone, and finally disappears, the extremities joining with the shaft, and growth of the bone in length stops. The bone grows in thickness also, by means of a surrounding tough membrane, called a periosteum. New bone is formed in the deeper portions of this, and at the same time the centre of the bone is absorbed, leaving the hollow wherein rests the bone marrow. These differences give rise to peculiarities, e.g. a C.'s bone may partially break (greenstick fracture); whereas in the adult a break snaps the bone, in a child the bone may merely bend. Again, the extremity may be separated from the shaft by the breaking of the cartilage. This can only happen to children, and may have serious consequences, since it affects the growth of the bone. The teeth of the C. at birth are hidden in the dental sacs, which are in the depressions in the jaws.

Alimentary system. The obvious point of difference between the infant and the adult with regard to the digestive organs is the absence of teeth. At birth the milk teeth are present in the gums, and teething usually commences at about the sixth month. The lower central incisors are the first to appear, and these are followed between the eighth and tenth month by the 4 upper incisors. The 2 remaining lower incisors and the 4 first pre-molars follow between the twelfth and fourteenth month. After a while the 4 eye-teeth appear at about the eighteenth month, and after a fairly long interval the set of 20 milk teeth is completed by the appearance of the 4 second pre-molars at the age of about 2½ years. This general order is not, of course, universally true, but in general it may be stated as such. In the same way the second dentition, giving rise to the permanent teeth, begins at about the sixth year, and continues at the rate of 4 teeth a year until the twelfth year, giving rise to 28 teeth. The full set of 32 is usually completed some time between the seventeenth and twenty-fifth year by the appearance of the wisdom teeth (the third molars). A healthy infant needs 2½ oz. of fluid per lb. of body weight in the 24 hrs. and in a similar period needs 50 calories per lb. of body weight. One fluid oz. of breast milk is equivalent to 20 calories. A baby weighing 10 lb. would therefore need 25 oz. of breast milk daily. A C. at birth is unable to digest starch. This is due to the absence of saliva, and this, and the consequent power to convert starch into sugar, only comes with the arrival of the teeth. During the first 6 to 9 months the C. should be given its mother's milk. The superiority of human milk over all other foods for infants, from the point of view of digestibility and nutritive value, is the unquestioned verdict of all authorities, and the risk of bacterial contamination, inherent in artificial feeding, is absent. There is some evidence that breast-fed babies are more resistant to infections. In those cases where artificial feeding must be resorted to, the best substitute for human milk is some modification of cow's milk, in which the constituents are

brought to the proportion in which they are found in human milk. Milk is an emulsion, owing its white colour to globules of fat. The following table shows the average compositions of human milk and cow's milk:

	Human Milk	Cow's Milk	Cream
Fat	4	3-4	8-20
Sugar	7	4-3	4
Proteins	1.5	4	3.4
Salts	0.2	0.7	0.6
Water	87.3	87	84-72
	100.0	100.0	100.0

Cow's milk differs in this respect, too, that the protein contained is not nearly so digestible as that in human milk, a dense curd being formed in the C.'s stomach, while when fed on human milk a flocculent, easily digestible curd is formed. To make cow's milk of the desired quality it must be diluted to reduce the proportion of protein, and cream and sugar of milk added. Cow's milk should *invariably* be boiled before being given to any C. up to the age of 12 years, owing to the very serious danger of bovine tuberculous and other bacterial infection (see also TUBERCULOSIS). Small amounts of mixed feeding should be introduced at about the fourth month and gradually increased. They should not result in a diminution of the quantity of milk taken. Between the tenth and eighteenth months the chief food should still be cow's milk specially prepared with the addition of other foods, such as porridge, puddings, eggs, etc. Infants and young children need a daily supplement of vitamins A, D, and C. From 1 to 3 teaspoons of cod liver oil will furnish a proper amount of A and D, and 2 to 3 teaspoons of orange juice a proper amount of C. Up to the sixth year a large amount of milk should be included in the dietary, which should consist of 4 meals a day. School children require abundant feeding.

Respiration and circulation. The lungs of a C. begin to expand with its first cry. The process of inflation then goes on very gradually, and the lungs do not attain their full expansion until the sixth year. Fresh air and exercise are essential for the possession of healthy lungs, and at the same time, by producing

before, the head is relatively very big and the face small in an infant, and this large size is due to the brain case. Its brain is enormous in proportion to the size of the body. It is not fully developed, convulsions following as the result of sense

impressions. The brain grows rapidly in size until the seventh year, the greatest growth occurring during the first year. After this period growth in weight slowly goes on until the adult stage is reached. It is to allow for this growth that the fontanelle or 'opening in the head' occurs. The skull around the brain case consists of 8 bones, partially developed at birth, but all joined up in the adult. The fontanelle on the top of the head is the last to close, and should be closed by the twentieth month. Before birth the impressions reaching the brain are few in number, but as soon as the C. enters the world, it is immersed in a flood of impressions. These cause the brain to develop. The different areas of the brain are all busy storing up impressions both sensory and motor, and association fibres are laid down which bring the different areas into relation with each other. A sense of security is all-important in building up a stable personality in infancy and childhood. Many adult neuroses trace their origin to a bad psychological environment in childhood. Regular periods of sleep, rest, and quiet should be provided, and in later childhood, both naturally nervous and rapidly growing children require careful management. In their outlook towards a highly strung C. parents should first examine their own psychological attitude to life. In the majority of cases imbalance in a C. is directly related to the behaviour of those to whom it is closest and from whom it has most opportunity to learn.

The growth of the child. At birth the C. should weigh about 7 lb., although 8 to 9 lb. is not uncommon. Then a steady

	Boys	Girls

active movements of the chest and diaphragm, the action of the heart is aided. Clothes should be loose in childhood, and free exercise of the voice should not only be allowed but encouraged.

Nervous system. As has been stated

increase in weight and height during childhood. This growth is not uniform. During the first few days a loss in weight occurs which is made up by about the middle of the second week. During the first 5 months the daily increase should

be from $\frac{1}{2}$ to 1 oz., and from $\frac{1}{2}$ to $\frac{1}{4}$ oz. for the rest of the first year. At 6 months the weight should be doubled, and trebled at 12 months. At birth the infant is about 20 in. in length, and at the end of the first year it should be 8 in. taller, although it takes 6 years to double the height at birth. As an index of health the increase in height is not as useful as the increase in weight. From the appended table it may be noticed that with both boys and girls the most rapid growth occurs during the first year. At about the sixth and eleventh years occur further periods of rapid growth. Boys are heavier and taller than girls at birth, and always, excepting the thirteenth to fifteenth years when the girls are heavier, having

hand becomes the organ of touch. Until this stage is reached an infant has a great tendency to take everything to its mouth. Again, an infant is sensitive to changes of temp. Sight is present at birth, but the C.'s eyes may move independently, as may the eyelids, and there is no power of focusing. Further, they are usually only half open for the first few days, and a bright light may cause discomfort. Whether the C. really sees or not can only be verified when he follows a slowly moving object with his eyes. When this happens, then the C. begins to watch objects and persons, and soon begins to show pleasure in certain colours, thus showing the development of the sensation of colour. A sense of distance and

grown more rapidly in weight from the eleventh to the thirteenth year. Between the twelfth and fourteenth years the girls are taller, but at all other times the boys are superior in height and weight. It may further be noticed that the increase in weight takes place between the intervals of greatest increase in height. Here it may also be pointed out that generally childhood can be divided into 4 periods as shown in the table on p. 362.

The table above, from *The Child: his Nature and Nurture*, by W. B. Drummond, 1915, shows the increase in height and weight from birth to the fifteenth year.

Mental development. At birth a C. is unable to interpret impressions arriving at the brain through the senses. The only way to judge as to the activity of the senses at birth is by the effects of stimulation as shown through movement. Taste is probably the first sense developed. Since smell is so closely linked up with taste it may be, and appears to be, present soon after birth. The sense of touch, however, is present almost from birth. It is present in a vague form before, and progresses rapidly. It is particularly developed in the lips and the tongue, and afterwards, of course, develops until the

conception of solidity depend upon a co-ordination of the senses of touch and sight. The sense of distance is very vague until the C. is a few years old, and while the recognition of solid forms is developed rapidly for near objects, this also remains vague for distant objects. Hearing, again, is absent at the time of birth, because there is no air in the drums of the ears. Loud sounds do not disturb, usually, until the third day or so, and, of course, this enables the C. to sleep without being disturbed. The power of localising sound may be developed by the fourteenth day, but not to any very great extent. From this and other observations it may be seen that the training of the eye should be aided by the training of the hand, and similarly it appears that speech depends on hearing. The lower senses, i.e. taste, smell, and touch, of course, enable the C. to develop sensations of hunger, thirst, warmth, the wholesomeness of food, etc. For a while after birth a C.'s movements may be classified as either random, reflexive, or instinctive. *Random movements* are common in infants, and they seem to depend neither upon will nor on any sensory stimulus. Among these might be noticed the stretching of the limbs of a young

baby. Older children also indulge in these movements during sleep. *Reflex movements* arise in response to sensory stimuli and are present at birth. Swallowing, sneezing, and even the first cry at birth may be taken as examples of this class of movements. *Instinctive movements* also arise from sensory stimuli, but are more complex. They may not all be instinctive, though some are. Seizing, raising the head, and creeping may be taken as examples of this type of movement. Seizing is possible at birth, and with great force, but an infant does not desire nor seize anything at sight, but only on coming into contact with it, until the sixteenth to the eighteenth week. Similarly with the raising of the head. This is impulsively done during the first few weeks, but the will to raise the head to see things shows itself about the second month.

The will. From these movements which are independent of will, the C. gradually assumes control over them, and wills to do them.

Play being the natural outlet for a C.'s energy is generally regarded now as being a preparatory exercise for life as it will be. Since the human is highest in the scale of animals, the time given up to play should be a long one, and is. It must, therefore, be seriously regarded when the subject of the C. and his development is under consideration. All this leads to the fact that modern systems of education need revision, and in the light of the special study which is being made of C. life, progress in methods of education is being rapidly made. One need only point to the kindergarten and nursery schools, manual and cookery centres, and the various clinics to see that there is a spreading tendency to view the C. as distinct from the adult in many ways.

Social services. Nurseries, infant welfare centres, pre-natal and post-natal clinics have all been considerably developed in recent years. Cheap milk and midday meals are provided by education authorities. The school medical service has been expanded to include treatment as well as inspection and to cover the system of part-time education up to the age of 18. In Britain family allowances are payable on behalf of each C. of school age in a family, except the first. The rates are 8s. a week for the second C., and 10s. a week for the third and each subsequent C. See CHILD STUDY.

Education. The Education Act of 1944 marks an important step forward in the educational system, which is now recast into 3 stages, primary, secondary, and further education. Facilities for technical education are being considerably increased. The school-leaving age was raised to 15 on 1 April 1947; as soon as possible it is to be extended to 16. Part-time education is to be compulsory for all up to the age of 18. See CHILDREN ACTS and EDUCATION.

Child Adoption, see ADOPTION.

Child-killing, see INFANTICIDE.

Child Study includes now the anatomy, physiology, anthropometry, and psychology of the child as a child. Rousseau (q.v.) was the first to recognise that a knowledge of children and their ways is essential to anyone who wishes to reach them. Darwin was one of the first in England to publish observations of the development of a child, and since then the study has been carried out with great zest both here, on the Continent, and in America. Two methods are adopted in C. S.: the *individual* method which consists in as full a study as possible of a single child; and (2) the *collective* method, whereby sev. children are examined and studied for particular things, and an average or standard drawn up. Many of the results gained have been summarised under CHILD. It has been found possible to calculate the effects of the various lessons in the way of producing bodily and mental fatigue. School children in the same manner are medically inspected, and the results tabulated and conclusions drawn. The importance of all this cannot be overemphasised. As a direct result of C. S., kindergartens, and infant schools run on kindergarten lines, are now the only type of school for very young children. Play has been pressed into the service of the teacher, and freer and less-cramped movements are used from the beginning. 'Cramming' is recognised as being extremely harmful, and the deaf, the blind, and the mentally deficient are being trained in a scientific manner. A third, though not very practicable, method of C. S., is that which is given when spontaneous writings of children can be obtained. But, as the child is usually writing under the knowledge that his work is to be seen, it is very rarely of use. In studying children by the individual method, the child should be watched, much as a naturalist might watch an animal or insect, at work and at play, asleep and awake; but he should not be allowed to know he is being watched. This has been done in America by observation through glass panels, the child being unaware of the fact. Questions should be asked him, but he must not know that he is being questioned for a purpose, or he will probably become self-conscious and his replies studied. One great difficulty experienced by the child-studier is the finding of the correct motive for many of the child's actions; this is a matter of great importance, for it is only by discovering the motive that the right way in which to correct or encourage the child can be found. Sev. societies are in existence for the study of the child, chief among which are the National Froebel Foundation and the Parents' National Education Union. For list of books on this subject see CHILD, Education, and

Ilg, *The Child from Five to Ten*, 1946, and, with L. B. Ames, *Youth: the Years from Ten to Sixteen*, 1956; S. Isaacs, *Troubles of Children and Parents*, 1948; C. W. Valentine, *Parents and Children*, 1953.

Childe, Vere Gordon (1892-1957), archaeologist, b. Sydney, New S. Wales, and educ. at a Sydney grammar school and at Sydney Univ., and at Queen's College, Oxford. From Oxford he returned to Australia and was private secretary to the New S. Wales premier, 1919-21. In 1922 he began to travel in Central and E. Europe, and in 1925 he pub. *The Dawn of European Civilisation* (new and enlarged ed., 1950) which set out a chronological framework for Central Europe, followed in 1926 by *The Aryans*. From 1927 to 1946 he was prof. of prehistoric archaeology at Edinburgh Univ.; in 1946 he became prof. of prehistoric European archaeology at London Univ. and director of its post-graduate Institute of Archaeology. He retired in 1956. Other pubs. include *The Most Ancient East*, 1928, *The Danube in Prehistory*, 1929, *New Light on the Most Ancient East*, 1934, 1956, *Man Makes Himself*, 1936, *Prehistoric Communities of the British Isles*, 1940, 1947, and *What Happened in History*, 1942.

Childeric I, King of the Franks (511-558), son of Clovis, inherited the kingdom of Paris; defeated Amalric II, King of the Visigoths, at Narbonne in 531, and Sigismund, King of Burgundy, in 532.

Childeric III (c. 683-711), nominal King of Franks, 694-711; succeeded his father, Clovis III, but had no real power, the kingdom being in the hands of Pépin le Gros, mayor of the palace.

Childeric I, King of the Merovingian Franks, c. 457-81; succeeded his father, Mérovée, and left the throne to his son, Clovis I.

Childeric II, King of Austrasia from 658, and of Neustria and Burgundy from 669; succeeded his father, Clovis II, and left the throne to his brother, Thierry.

Childeric III, last of the Merovingian Kings of France, 743-51; deposed by Pépin le Bref, and d. at St Omer in 754.

Childermas, see INNOCENTS.

Childers, Hugh Culling Eardley (1827-1896), statesman, b. London, and educ. at Wadham College, Oxford, and Trinity College, Cambridge. He went to Australia, settled in Victoria, and became an Inspector of schools. In 1856 he was a member of the first Victorian Cabinet as commissioner of customs and trades. He helped considerably in the foundation of Melbourne Univ. In 1857 he returned to England as agent-general for the colony. In 1860 he entered Parliament as a Liberal. In 1864 he was made a civil lord of the Admiralty, and first lord of the Admiralty in 1868, and a member of Gladstone's first Cabinet. In 1880 he was in Gladstone's second administration as secretary for war, and as such was responsible for the

military operations in the first Boer War in 1880, and the Egyptian expedition of 1882. At the end of 1882 he succeeded Gladstone as chancellor of the Exchequer; his proposals for a conversion of annuities were not carried out, and the defeat of his budget of 1885 led to the downfall of the ministry, though the real cause was the national dissatisfaction with the delays and mismanagement which had ended in the death of Gordon. He was home secretary in Gladstone's third ministry. See S. Childers (his son), *Life and Correspondence of the Rt Hon. H. C. E. Childers*, 1901.

Childers, Robert Caesar (1838-76), orientalist; civil servant in Ceylon, 1860. Under the guidance of Yátrámullé Unnānsé he studied Sinhalese, Pali, and the Buddhist sacred books. Returned to England in 1864, and in 1872 became sub-librarian at the India Office, London. In 1873 he became prof. of Pali and Buddhist Literature in Univ. College, London. Ed. Pali texts (1869-74) and compiled the first *Pali Dictionary* (2 vols., 1872-5); this became the foundation of Pali studies. In 2 papers (pub. in 1873 and 1875) he conclusively proved that Sinhalese, hitherto generally considered to be a Dravidian language, belongs to the Indo-European linguistic family.

Childers, Robert Erskine (1870-1922), author and Irish politician. He was the son of Robert Caesar C., and was educ. at Haileybury and Trinity College, Cambridge. From 1895 to 1910 he was a junior clerk in the House of Commons, and he was the author of an enthralling story of Ger. preparation for war, *The Riddle of the Sands*, 1903, and also vol. v of *'The Times' History of the War in South Africa* (where he had fought). During the First World War he was a major in the air force. He took an active part in the republican movement in Ireland, his interest in the country being derived from his mother—a Barton, of Glendalough, co. Wicklow. After the estab. of the Irish Free State (see IRELAND, *History* and SINN FEIN) C. supported those who refused to accept the Anglo-Irish treaty. He was captured by Free State forces, 10 Nov. 1922, and was executed at Beggar's Bush Barracks, Dublin, on 24 Nov.

Children, Adoption of, see ADOPTION.

Children, National Society for the Prevention of Cruelty to. The N.S.P.C.C. (incorporated under royal charter in 1895) is associated with the name of the Rev. Benjamin Waugh, by whose exertions the London Society for the Prevention of Cruelty to Children was formed in 1884. The object of this society was to discover and deal with cases of ill-treated and neglected children, and where it was necessary institute proceedings against offenders. The society became a national organisation in 1889 and during that year, largely as an outcome of its activities, the first Act for the Prevention of Cruelty to Children became law. Since then sev. other Acts have been placed on the statute book, and the Children Acts of 1933, 1948, and 1952 together with the Public Health

Act, 1936, constitute the basic legislation for the protection of children. Nowadays the N.S.P.C.C. is finding much to do in the rehabilitation of families who have become social misfits, and in this connection employs a growing band of workers whose duty it is to go into the homes of such families and give active help. In any one year, too, the society now receives applications from more than 10,000 parents for guidance and help in matters affecting their children. The society has under notice each year about 100,000 children (in addition about 22,000 come under the notice of the Royal Scottish Society for the Prevention of Cruelty to Children). Though in a few of these cases it is found necessary to bring a prosecution, decisive improvements can usually be brought about by other methods. Its H.Q. are at 15 Leicester Square, London, W.C.2. *See also* CHILD.

Children and Young Persons, Welfare of. As early as 1802 Parliament intervened to protect the moral and physical welfare of children in factories. The crusading zeal of Lord Shaftesbury, the novels of such writers as Charles Kingsley and George Eliot, and the vivid cartoons of Cruikshank so shocked the complacency of Victorian England that further efforts were made to ameliorate the hardship of children forced to work in industry for long hours under appalling conditions. Despite the useful pioneering work of voluntary bodies, it was not until the passing of the Education Act, 1870, that the State began its attack on mass illiteracy. The public conscience was shaken by the suffering and squalor of many children. Penal reformers urged that child offenders might be diverted from a life of crime if they were treated separately from hardened criminals. By the start of the present century it was beginning to be recognised that the welfare of the 'teen-ager' (in the formal language of the statute book, 'young person') required as much attention from the community as that of his younger brother. This article deals shortly with the concern of the Brit. welfare state for the needs of its citizens under the age of 18.

EDUCATION. Under the Education Act, 1944, parents are obliged to secure for their children between the ages of 5 and 15 years efficient full-time education. Local education authorities (i.e. co. councils and co. bors.) must provide free full-time education for all children between those ages in their areas. (*See also* EDUCATION.)

CHILDREN AND YOUNG PERSONS ACT, 1933. This Act consolidates previous statutes dealing with children and young persons. A child is defined as a person under the age of 14 years and a young person as a person who is at least 14 but less than 17 years of age. Some provisions of the Act are, however, concerned with the welfare of young persons up to the age of 18. The prin. parts of the Act relate to the prevention of cruelty and exposure to moral danger, employment, court proceedings, the remand homes, approved schools, and persons to whose

care children and young persons may be remitted. The provisions relating to employment are referred to in a later section of this article.

(i) *Prevention of cruelty, etc.* Sections 1-12 of the Act prescribe penalties for a number of offences against persons under 16. A person having the custody, charge, or care of a person under 16 who ill treats, neglects, or abandons him in a manner likely to cause unnecessary physical or mental suffering is liable to maximum penalties of £100 fine and/or 2 years' imprisonment. It is an offence to cause or encourage the seduction or prostitution of a girl under 16 or to allow a young person under that age to reside in or frequent a brothel. It is unlawful to allow or cause a person under 16 to beg, even if the begging is done under the pretence of entertaining or offering something for sale. A child under 5 years may not be given intoxicating liquor except on a doctor's orders, or in a serious emergency for health reasons. The prohibition of children under 14 in licensed bars, formerly contained in section 6 of the Act, is now to be found in the Licensing Act, 1953, which also stipulates that only intoxicating liquors in sealed and corked vessels for consumption off the licensed premises may be sold or delivered to a child under that age. This latter statute restricts the supply to persons under 18 years of intoxicating liquor for consumption on licensed premises. Section 7 of the Children and Young Persons Act, which is designed to discourage juvenile smoking, makes it an offence to sell to a person apparently under the age of 16 any cigarettes or cigarette papers, whether for his own use or not. It is also an offence for a tobacconist to sell tobacco other than cigarettes to such a person if he has reason to believe that it is for the use of that person. Constables and uniformed park keepers are under a duty to confiscate any tobacco or cigarette papers from any person apparently under 16 found smoking in any street or public place. A magistrates' court may order the removal of automatic machines for the sale of tobacco from premises believed to be extensively used by persons under 16. The Act prohibits pawnbrokers from taking pawns from persons apparently under 14 and dealers in old metal from purchasing old metal from persons apparently under 16. Anyone having charge of a child under the age of 12 who fails to take sufficient precaution against the risk of serious injury to that child by burning or scalding by contact with any open fire grate or heating appliance in a room is liable to a fine. The Act prescribes safety measures to be taken in any building providing an entertainment which more than 100 children attend.

(ii) *Protection of children and young persons in relation to criminal and summary proceedings.* Part III of the Act contains provisions for the treatment of children and young persons brought before the courts, whether as offenders, as being 'in need of care or protection,' or as witnesses.

(a) *The segregation of juvenile offenders.* Arrangements must be made to keep children and young persons awaiting trial from associating with adult offenders. Subject to certain exceptions, the police may release on bail any person under 17 years who cannot forthwith be brought before a magistrate. A young person not so released should, in the absence of certain specified circumstances, be detained in a remand home until brought before the court. With certain exceptions, offenders under the age of 17 must be tried by juvenile courts from which the general public is excluded.

(b) *Restriction of publicity.* Any court hearing proceedings concerning any offence or conduct contrary to decency or morality may prohibit the pub. in newspaper reports or any material likely to identify a child or young person involved in any capacity in such proceedings. Section 49 of the Act provides that no newspaper report of proceedings in a juvenile court shall contain particulars or pictures likely to identify any child or young person concerned in such proceedings; the court may, if satisfied that it is in the interests of justice so to do, modify the requirements of this section.

(c) *Court procedure affecting children and young persons.* The court may compel the attendance of the parents or guardian of a child or young person brought before it. No child may be present in court during the trial of any other person, unless his presence is required to give evidence. The court may order the public to withdraw whilst a child or young person is giving evidence in proceedings against a person charged with an indecent offence. The court may admit the unsworn evidence of a child of tender years if it considers that although incapable of understanding the nature of an oath, the child has sufficient intelligence and appreciates the duty of speaking the truth.

(d) *Juvenile offenders.* It is a legal presumption that no child under the age of 8 can be guilty of a criminal offence. In certain circumstances where a child or young person commits an offence for which a fine, damages, or costs may be imposed, the court may order the fine, etc., to be paid by his parent or guardian. A child or young person under 17 found guilty of an offence for which an adult could be punished by imprisonment may be sent to an approved school (see further under JUVENILE OFFENDERS). A child under 10 will not be committed to an approved school unless the court is satisfied that he cannot be suitably dealt with otherwise.

(e) *Children and young persons in need of care or protection.* The courts deal not only with young offenders but concern themselves also with children or young persons who are the victims of neglect or cruelty, are exposed to moral danger, or are falling into bad associations or are beyond control. A child or young person found to be in any of these categories is said to be 'in need of care or protection' and may be dealt with by a juvenile court by any of the following methods: (i)

commitment to an approved school; (ii) commitment to the care of any fit person willing to undertake his care; (iii) his parent or guardian may be ordered to enter into a recognisance (q.v.) to exercise proper care and guardianship; (iv) he may be placed for a specified period, not exceeding 3 years, under the supervision of a probation officer.

(iii) *Remand homes, approved schools, etc.* Part IV of the Act provides for the setting up and management of remand homes and approved schools. Approved schools (q.v.) may be classified so that a young person is sent to a school most appropriate to his needs (see further under JUVENILE OFFENDERS).

CHILDREN ACT, 1948. This Act, which implemented the prin. recommendations of the report of the Curtis Committee on the care of children, provides for the care and welfare of children deprived of normal home life. Local authorities have a duty to provide homes for children under the age of 17 years who have neither parents nor guardians or whose parents or guardians have abandoned or are incapable of maintaining them. Once a local authority has assumed responsibility for such a child, it may continue so to do until the child's 18th birthday. The local authority may by resolution assume parental rights over the child, to whom it then has a general duty to further his best interests and to see that he enjoys facilities and services available to children who have a normal home life (e.g. schools, hospitals, clinics, youth clubs). It may provide accommodation for children under its care either in an institution or with foster parents. The home secretary may make regulations providing for the welfare of children boarded out by local authorities. Local authorities may provide hostels for persons above compulsory school age and below the age of 21. In England and Wales all co. and co. borough councils, and in Scotland the councils of cos. and large burghs, must estab. children's committees to supervise the performance of their statutory duties affecting children. These duties are performed by children's officers whose appointments are subject to the approval of the Home Office, which also has a general supervision of the child-care work of local authorities.

CHILD LIFE PROTECTION. Part VII of the Public Health Act, 1936 (as amended by the Children Act, 1948), is directed to the protection of infant life and secures that foster-children are properly treated. A person who undertakes for reward to nurse and maintain a foster-child below the age of 15 years must give written notice of such undertaking to the local authority within a specified time which varies according to the circumstances. If a foster-child dies, or his residence is changed, or he is removed from the foster-parents, the latter must notify the local authority. The local authority may fix the maximum number of children under the age of 18 years who may be kept in any premises in which a foster-child is maintained. In order to enforce the provisions for the well-being and health

of foster-children in its area, the local authorities must appoint child protection visitors to visit such children in their homes: they have power to apply for an order for the removal of a child kept in insanitary premises, or by unsuitable persons.

CHILDREN AND YOUNG PERSONS (HARMFUL PUBLICATIONS) ACT, 1955. This Act was passed to prevent the dissemination of 'horror comics' and other pubs. which tend to corrupt a child or young person into whose hands they are likely to fall. It applies to any stories or pictures portraying the commission of crimes, acts of violence or cruelty, or horrible or repulsive incidents. Anyone who prints, publishes, or sells or lends such a pub. is liable to maximum penalties of 4 months' imprisonment and/or a fine of £100.

EMPLOYMENT OF CHILDREN AND YOUNG PERSONS. Part II of the Children and Young Persons Act, 1933, restricts the employment of children. No child under 13 years of age may be employed at all, except in authorised employment by parents or guardians in light agric. or horticult. work. No child of compulsory school age may be employed before the close of school hours during term-time, or before 6 a.m. or after 8 p.m. on any day, or for more than 2 hrs on Sundays or on a day during term-time, or in lifting or moving anything so heavy as likely to injure him. No person under 16 may be employed in street trading, although local authorities may make bye-laws permitting persons under that age to be so employed by their parents. Children may take part in entertainments subject to conditions imposed by the local authority. The Act restricts the employment and training of children for dangerous performances. Persons under 18 may go abroad to perform for profit only on licence granted by a magistrate.

The Employment of Women, Young Persons and Children Act, 1920, prohibits the employment of children of compulsory school age in any industrial undertaking. The Factories Act, 1937, regulates the hours of work, overtime, and meal intervals of persons under 18 years of age employed in factories. Such persons must be given adequate training and supervision when working on dangerous machinery.

See APPROVED SCHOOLS, REFORMATORIES, AND INDUSTRIAL SCHOOLS; BORSTAL TRAINING; JUVENILE OFFENDERS; PROBATION.

See Clarke Hall and Morrison, *Children and Young Persons* (5th ed. by A. C. L. Morrison and L. G. Banwell, 1956).

Childrenite, rare mineral consisting of aluminium iron phosphate. It occurs in orthorhombic crystals, with hardness 4.5 and sp. gr. 3.2. It has been found in a few places in Cornwall and Devon. An allied species containing manganese is known as eschschorite, and occurs in Connecticut.

Children's Books. Although they form the second most important section of the book trade, books designed for the enjoyment as distinct from the instruction of

children date back only 200 years. In medieval times the only C. B.s were 'books of courtesy' containing instructions on behaviour and deportment; for amusement the child had to go to the grown-up romances, if indeed he was able to read at all. In the Elizabethan age he had still to be content with school-books or with orally transmitted tales of sprites and goblins, such as Shakespeare's Mammillius knew. In the Puritan period that followed he was still worse off, for gloomy religious handbooks were the fashion, a typically popular one being James Janeway's *Token for Children: being an Exact Account of the Conversion, Holy and Exemplary Lives, and Joyful Deaths of Several Young Children*. Books for young people's amusement may be reckoned to begin in the middle of the 18th cent. with such small vols. as *The History of Goody Two-Shoes*, which has been attributed to Goldsmith, but it was still insisted that they should point a moral, and Day's *Sandford and Merton*, 1789, showed to what depths of priggishness they could sink.

Even the pleasant *Original Poems for Infant Minds*, 1804, of Anne and Jane Taylor, usually had a lesson to impart, but from the beginning of the 19th cent. cheerfulness kept breaking in, as in the frivolous *Butterfly's Ball*, 1807, or the *History of Sixteen Wonderful Old Women*, 1821, which is the first appearance of the nonsense limerick. Edward Lear's famous *Book of Nonsense*, 1846, marked the end of the puritanical tradition, which was finally blown to atoms in 1865, when *Alice's Adventures in Wonderland*, by Lewis Carroll, as the Rev. C. L. Dodgson chose to call himself, ushered in a new era when cautionary tales were not only disregarded but mercilessly made fun of. From this time forward the whole aspect of juvenile literature was changed, and its output became so vast and developed so rapidly that it is simplest to consider its various types separately.

The fairy-tale, of which the *Alice* books may be claimed as examples, is of course of remote antiquity and was handed down orally long before it came to be printed. The great collection made by the brothers Grimm was trans. from the German in 1823; Hans Andersen's fairy-tales made their appearance in English in 1846; and between these dates there was pub. Lane's version of the *Arabian Nights*. The fashion was thus set for a succession of home-made fairy-stories composed by many leading Eng. writers. Ruskin's *King of the Golden River*, 1851, was followed by Thackeray's *The Rose and the Ring*, 1855, Kingsley's *Water Babies*, 1863, Jean Ingelow's *Mopsa the Fairy*, 1869, and George MacDonald's *At the Back of the North Wind*, 1871; and Andrew Lang, in addition to writing fairy-tales of his own, ed. a delightful series of collections, beginning in 1891 with the *Red Fairy Book*. There was also fairy poetry, of which Lewis Carroll's *Hunting of the Snark*, 1876, is an unorthodox specimen. Alfred Noyes's *Flower of Old Japan*, 1903, and *Forest of Wild Thyme*, 1905, have been

declared the best fairy verse since Drayton's *Nymphidia*; delicate fairy lyrics were written by Walter de la Mare and Rose Fyleman; greatest of all, the fairy drama, *Peter Pan*, by J. M. Barrie, made its appearance in 1904.

Animal stories, which form a class by themselves, derive partly from the fairy-tale and partly from the fable (q.v.). Southey's story of the Three Bears and the Uncle Remus tales of Brer Rabbit belong properly to the former category, but Anna Sewall's *Black Beauty*, 1877, a perennial favourite in which a horse tells its life story, started a new genre which has been greatly developed. Perfect of their kind were Kipling's *Jungle Books*, 1894, 1895, and *Just-So Stories*, 1902, which found the secret of giving individuality to creatures of the wild. The same principle, worked out differently in Kenneth Grahame's *Wind in the Willows*, 1908, made it an accepted classic. In a similar tradition were A. A. Milne's *Winnie the Pooh*, 1926, where the animal toys come alive, and Hilaire Belloc's earlier *Bad Child's Book of Beasts*, 1896. But perhaps the most successful writer of animal stories for small children was Beatrix Potter, who was almost exactly contemporary with Kipling, and whose *Peter Rabbit*, 1902, was followed by more than a score of other similar books that have a special charm of their own.

In the department of pure adventure stories for children defy exact classification, because they overlap with those intended for grown-ups. From the *Odyssey* to *Robinson Crusoe*, and from the tales of King Arthur to *Ivanhoe* adult stories have been devoured by children, and there is a peculiar irony in the fact that *Gulliver's Travels*, that vitriolic satire, has been one of the most successful C. B. But adventure stories written specially for children are about a cent. old, dating from the appearance of R. M. Ballantyne's *Coral Island*, 1858, which was followed by many others of the same writer. Ten years later G. A. Henty led off with the first of his boys' books, many of which were highly topical, having such titles as *With Buller in Natal* and *With Roberts in Pretoria*. All these were outdone by H. L. Stevenson's *Treasure Island*, 1882, and his less inspired *Black Arrow*, 1888. A few years later came Henry Rider Haggard with *King Solomon's Mines*, 1885, and other tales of darkest Africa; and Conan Doyle's historical romances, *The White Company*, 1891, and *Sir Nigel*, 1906, started a vein which Kipling followed in the short stories of *Puck of Pook's Hill*, 1906, and *Rewards and Fairies*, 1910.

A separate section is demanded by the school story. It may be said to begin a hundred years ago with *Tom Brown's Schooldays*, 1856, by T. Hughes, which gives a fairly realistic picture of Rugby, and Dean Farrar's *Eric*; or *Little by Little*, 1858, a highly idealised story of a seaside boarding-school. Two main types of school story thus started simultaneously, and it may be remarked that in spite of sneers at its sentimentality *Eric* reached

its 36th ed. shortly after 1900. Both of these books were 'guyed' in Desmond Coke's satirical school story *The Bending of a Twig*, 1906, when *Eric* had already been ridiculed in Kipling's semi-autobiographical *Stalky and Co.*, 1899. The most successful writers were those who combined a minimum of sentiment with an abundance of humour, as did Talbot Baines Reed in *The Fifth Form at St Dominic's*, 1881, and others of his books. Among the best of his successors was R. S. Warren Bell, who wrote *Green at Greyhouse*, 1906, and other Greyhouse stories as well as editing a boys' magazine to which P. G. Wodehouse contributed some excellent school stories before he made his name as a humorous novelist. Another well-known novelist to produce a school story was H. A. Vachell, who wrote *The Hill*, 1905, telling of Harrow.

In the case of stories for girls, the overlapping between youth and age is very marked, for Charlotte Mary Yonge, who wrote nearly a hundred books intended for girls, of which *The Heir of Redclyffe*, 1853, is one of the best-known, was, by a reversal of the usual order, almost equally popular with grown-ups. Edith Nesbit, whose books, such as *The Treasure Seekers*, 1899, were the first to depict children as human individuals with characters of their own, wrote for both boys and girls, as did the more recent Arthur Ransome. But in America there was Louisa May Alcott's *Little Women*, 1868, which became a favourite on both sides of the Atlantic, the 'Elsie Books' of Martha Farguharson, beginning with *Elsie Dinmore*, 1867, and 'Susan Coolidge,' whose real name was Sarah Chauncy Woolsey, with *What Katy Did*, 1872, and its sequels. Girls' school stories came later than boys' because they had to await the development of women's education, but the vast output of writers like Elizabeth T. Meade and Angela Brazil bears witness to their popularity. The standard of modern publishing of C. B. has been encouraged and maintained by the Carnegie Medal in Britain (an ann. award by the Library Association for an outstanding C. B.) and the Newbery Medal in the U.S.A. (an ann. award by the Children's Library Association of America for the most distinguished C. B. of the year).

See Harvey Darton, *Children's Books in England*, 1932; Roger Lancelyn Green, *Tellers of Tales*, 1946; E. S. Turner, *Boys will be Boys*, 1948.

Childs, city of C. co., Texas, U.S.A. Pop. 7600.

Childs, George William (1829-94), Amer. publisher and philanthropist, b. Baltimore. In 1842 he entered the U.S. navy; became a book-store clerk in Philadelphia, 1843; set up as an independent publisher, 1847; became a partner in the firm of C. & Peterson, 1849. In 1864 he took over the *Philadelphia Public Ledger*. He wrote *Recollections of General Grant*, 1885, and *Personal Recollections*, 1890. His charitable work was considerable, and he erected public memorials to great men, including Herbert, Cowper, Leigh Hunt,

Moore, Shakespeare, Milton, Ken, and Andrews in England, and Edgar Allan Poe and Richard Proctor in the U.S.A.

Chile, rep. extending along the W. coast of S. America, to the S. of Bolivia, between the Pacific and the Andes; it includes also the greater part of the Fuegian Archipelago. Its existence as a rep. dates from 1810, when it declared its independence of the mother country, Spain. In 1880 C. annexed Atacama and Tarapacá, including the Lobos Is., and occupied the prov. of Tacna. Four years later Tarapacá and Tacna-Arica were formally ceded to C. by Peru, the latter prov. for 10 years only. For 17 years diplomatic relations between the 2 countries were severed, but in July 1928 they were resumed, and before a year had passed the dispute was settled, Tacna going to Peru, Arica remaining with C. The physical features of C. are very accurately known, as a gov. survey of an exhaustive nature was begun in 1848, and carried on for many years. Since the E. boundary of C. is, broadly speaking, the main chain of the Andes, the W. section, though in fact considerably elevated in some places, is everywhere low compared to the E. portion. The portion of the Andes between 31° 40' and 34° 20' S. lat. is the highest, the average height being about 16,000 ft. Two of the highest peaks of the Andes are Aconcagua (23,081 ft) in 32° 39' S., and Cerro Mercedario (22,211 ft) in 32° S.; other noteworthy mts are Pular (20,423 ft), Tolosa (20,140 ft), Juncal (19,880 ft), Chimbote (18,645 ft), and Osorno (8725 ft). The height of the Andes gradually diminishes from about 34° 20' S. There are a number of passes over the Andes connecting C. with the Argentine Rep., of which the best known are Bermejo (13,025 ft) and Iglesia (13,412 ft), on the Uspallata road; Pirca at a height of 16,962 ft; and Secompa (railway), 12,657 ft. There is a great difference in the breadth of the higher and lower sections of C. at different places. The land above 5000 ft extends in some places to within 10 m. of the coast; whilst in others, notably along the chief rivs., the land under 4000 ft extends for a distance of over 70 m. inland. In the N. the Chilean portion of the desert of Atacama lies between the coast and the mts, but to the S. of the desert there are few spaces under 1500 ft. To the S. of 35°, however, a region which rarely reaches this height extends from the coast for an average distance of 60 m. The general formation of this region is as follows: the highest part is nearest to the sea, and, rising abruptly from the coast, sinks eastward in terraces to an interior valley, or plain. This interior plain slopes gradually from N. to S. The Andes of C. are highly volcanic in character, and earthquakes frequently occur, the average number of shocks, of varying seriousness, felt at Coquimbo being about 40 every year. Perhaps the most destructive earthquake recorded in C. was that of 1751, when the former tn of Concepción was sunk in the sea, and the majority of places lying between 34° and 40° S. were destroyed;

on 19 Nov. 1822 the coast near Valparaíso was permanently raised 4 ft over 100,000 sq. m., and Valparaíso, Tullota, Casablanca, and Limachi were destroyed; on 20 Feb. 1835 the rebuilt Concepción was again destroyed, together with Talcuano; in 1868 Arequipa and Iquique were ruined, whilst in 1875 Iquique was again levelled with the ground. The rivs. of C. all flow from E. to W. across the country; even those flowing across the longitudinal interior valley mentioned above do so, which is a proof that the valley received its present slope after the rivs. came into being. In consequence of their direction, the rivs. are not of great length, and therefore of no great importance as means of transport. The most important are the quick-flowing Maipo; the Maule, which is navigable for a longer distance than any other; the Nuble; the Bio Bio, largest of all, but not navigable for large vessels even in its lower course; the Calleca or Valdivia, which is the most important for navigation, as it has a good harbour at Corral at its mouth; and the deep Maulin, which drains Lake Llanquihue. Owing to the heavy rainfall of the S., many large lakes are found there, notably those of Llanquihue, Chapo, Ranco, and Lago de Todos los Santos, otherwise known as Lake Esmeralda. On account of the conformation of C., extending from 18° to 56° S. lat., the climatic conditions vary considerably, though extremes of heat are seldom observed owing to the influence of the cold Humboldt current. The place in which the greatest extremes are observed is the desert of Atacama; there the temp. varies frequently from 100° in the daytime to 36° at night. On the coast the temp. rarely reaches a greater height than 90°. The mean ann. temp. of Valparaíso is about 59°, that of Santiago 57°, and that of Valdivia 53°. In the longitudinal valley there is a mild uniform climate, the cold Humboldt current and cool winds from the Andes serving to mitigate the heat in summer, whilst in winter the overcast skies and the winds from warmer lats. serve to prevent excessive refrigeration. The rainfall is very low on the N. coast, but in the fford region of the S. it is much heavier. At Valparaíso the mean ann. rainfall is about 15 in., whilst at Ancud, in Chiloé, it is 130 in. The Chilean part of the desert of Atacama is as destitute of vegetation as the maritime region of Bolivia, and down to lat. 30° S. the coast has no vegetation, though inland some is found at about that lat. The vegetation of C., which is in full vigour about the lat. of Valparaíso, is remarkable for the large number of peculiar forms which belong to it. A very striking feature of the vegetation of C. is the small number of deciduous trees, when the high lat. of the region is considered. Among the more notable of the Chilean trees are the *Quillaja saponaria*, or soap-tree, the bark of which is lined internally with a whitish saponaceous substance; the *Jubaea spectabilis*, a palm allied to the coco-nut, and yielding a sweet sap known as

palm-honey; the *Fagus obliqua*, an excellent timber tree; the *Filicarya patagonica*, another very good and very common timber tree; and the *Eucryphia cordifolia*, a foliage tree which grows to a great height and blossoms most luxuriantly in Feb. The apple-tree has been introduced with great success, and bamboos extend for a long way S., being used as fodder for cattle. Numerous twining and climbing plants are found, giving something of a tropical aspect to Chilean vegetation, such as the *Mutisia*, an asteraceous plant with blue flowers; the beautiful red *Tropaeolum speciosum*; and the gorgeous *Philasia luteifolia*, which has

animal, and are very destructive of cattle. The chief of the other animals are the pudu, a small variety of deer, the coypu, or native beaver, the chinchilla, guanaco, and vicuñas in the mt. dists., and a variety of fish-otter. Many varieties of birds are found, among which may be mentioned ibises, parrots, flamingoes, herons, numerous species of small song-birds, and the Chilean swan, which has a pure white body and a black head and neck.

By far the most important mineral found in C. is nitrate of soda (or *salitre*), which is recovered from the desert of Atacama. For many years C. has been

E.N.A.

THE COASTAL PLAIN OF CHILE, BETWEEN VALPARAÍSO AND SANTIAGO

flowers shaped like a bell and of the colour of fire. The region between Valparaíso and Valdivia, which has sometimes been termed the garden of the New World, is the prin. centre of agriculture, though in other dists. great strides have been made in this science in recent years. Wheat is the prin. crop, but maize, oats, hemp, barley, beans, lentils, peas, and potatoes are also grown. All European fruit-trees flourish, and a large quantity of fruit is annually sent to the U.S.A. The vine is grown, and excellent wine is made—79,000,000 gallons in 1950, of which 3,800,000 were exported, chiefly to Belgium, Germany, Ecuador, and the U.S.A. Tobacco and the sugarcane are also cultivated. Pastures N. of the R. Maule feed immense herds of cattle; the hogs of the is. of Chiloé have given it a reputation for hams; and in addition numbers of horses and goats are reared. Dairy farming is increasing in importance, and in the S., in Patagonia and Tierra del Fuego, are extensive sheep-farms.

Chilean fauna is not very remarkable for variety; pumas are the chief wild

the only country to produce this mineral, which is therefore a very valuable source of revenue. The production figure was 3,162,800 tons in 1928, about 2,800,000 tons being exported. In recent years (owing to foreign substitutes) this has been kept down to 1,500,000 metric tons, mainly for export. In 1930 a law was passed constituting a national nitrate company (Cosach) with a capital of \$75,000,000, to take over the whole nitrate industry with State participation, but in 1934 a new company was formed, the Nitrate Co. of Tarapacá and Antofagasta, consisting of over 30 companies comprised in Cosach, the Anglo-Chilean Nitrate Corporation, and the Lautaro Nitrate Co. All these together constitute the present organisation of the industry. The sales of these companies are effected through a central body called the Nitrate and Iodine Sales Corporation. The next mineral in importance is copper, of which there is a great abundance, the Tamaya mine, in the prov. of Coquimbo, being regarded as inexhaustible. C. is the world's second largest producer of this

metal, and provides not far short of one-fifth of the total ann. supply (nearly 361,000 metric tons in 1954). Silver is also found in fairly large quantities, the centre of the industry being Copiapo; a large number of mines yielding both gold and silver are in operation in Tarapaca, Guanaco, and Cachinal in Atacama, and Caracoles in Antofagasta. Another mineral of importance is lignite coal, of which the prin. beds lie to the S. of the Biobio to about 37° S. lat.; about 2,000,000 metric tons are mined annually. Deposits of iron ore in Coquimbo and Atacama yield annually between 1,000,000 and 2,000,000 tons; the new Huachipato national steel plant near Concepción is already turning out 300,000 metric tons of pig-iron. Many other minerals are found in smaller quantities, including manganese ore, sulphur, cobalt, zinc, antimony, tin, and salt. A new discovery of ore in Magallanes ter. has a potential output of 4 to 5 million metric tons a year. The number of manufactories in C. is rapidly increasing; and in the last census there were some 460,000 employees in manufacturing establs. They include smelting works, breweries and distilleries, flour and saw mills, textile factories, tanneries, sugar refineries, and works for the manuf. of foodstuffs, starch, soap, paints, furniture, boots and shoes, glassware, biscuits, hosiery, hats, candles, matches, brushes, cordage, baskets, pottery, and cigarettes. The Chilean people are of Sp. language and physique, though there is a not inconsiderable admixture of native Indian blood. At the time of the Sp. conquest in the 16th cent. a native race calling themselves Mapuche (warriors) occupied the greater part of the present rep. of C. The Spaniards called the race Araucunians, and when they conquered the Incas they left the former in possession of a state of their own, to which was given the name of Araucania. A portion of this area, along the slopes of the Andes from Copiapo to Chiloe, is still inhabited by them. Other tribes worthy of mention are the Changos in the N., an Aimará tribe; the Alacaluf in the channels lying to the N. of the strait of Magellan; the Onas and the Yagans in Tierra del Fuego; and the Tehuelches, inhabiting part of the mainland of Patagonia. There is a considerable foreign element in C., chiefly Germans in the extreme S., natives of the Argentine Rep. in the N., and French, English, and N. Americans in the middle prov. The total trade of C. in 1937 was £34,411,000. In 1954 imports alone were valued at £118,500,000 and exports at £117,500,000. The mineral exports are by far the most considerable, and include nitrate and copper, and silver ores in large quantities, together with gold, guano, coal, iodine, borax, and manganese; wine, wool, cereals, vegetables, and fruit are among other goods exported. Exports of fresh bird guano are prohibited, but exports of fossilised guano, which began in 1934, are a valuable industry.

The chief imports of C. are machinery, oils, combustibles, textile goods, tools, and electrical equipment; most of the

trade is done with Great Britain and the U.S.A., the latter being the chief importer. The prin. ports for exports are Iquique, Pisagua, Antofagasta, Coquimbo, Valparaiso, Valdivia, and Punta Arenas. Valparaiso is by far the most important port for imports, two-thirds of the total entering here, whilst Iquique and Talcahuano come next in importance. There are 5444 m. of railway, both State and privately owned (State-owned, 3629 m.; Brit.-owned, 1815 m.), linking up the ports with the industrial centres; the railway from Valparaiso to Buenos Aires crosses the Andes at Uspallata (9843 ft) by a tunnel having a length of over 6 m.; 2 other lines cross the Andes to Bolivia. A convention between C. and Argentina, signed in 1922, arranged for the construction of 2 more trans-Andine lines, that via Salta being opened in Dec. 1950. C.'s main railway line, the Longitudinal Railway, runs from N. to S. with branches connecting with the ports. The Chilean trans-Andine line is now part of the State railway system. Aviation is highly developed between interior points and abroad. A plant for manufacturing aeroplanes was first estab. in 1930. There are 17 civilian and 12 gov. airports. There are telegraph and telephone lines, and a chain of wireless stations extends along the coast. The constitution of C. dates from 1925, when that of 1833 was superseded. The president of the rep. is elected by direct popular vote; his term of office is for 6 years. Legislative power is in the hands of the National Congress, which consists of a Senate of 45 members and a Chamber of Deputies of 143 members. All voting is by ballot, and there is a universal suffrage for registered citizens over 21 years of age who can read and write. President González seemed to have strong support in the general election of Mar. 1948, but Carlos Ibáñez del Campo was successful in 1952, being elected for the usual term of 6 years. He had re-entered public life as a senator for Santiago in 1949. Until its disestablishment in 1925, the Rom. Catholic was the State church; it is still the chief religion; there are a cardinal-archbishop of Santiago, 2 archbishops, 16 bishops, and 2 vicars apostolic. Full religious toleration has been estab. since 1865. The condition of education in the rep. has been improved of late years; it is now free and compulsory for all children between the ages of 7 and 15. There are 2 univrs. at Santiago and 1 each at Concepción and Valparaiso, technical and secondary schools with over 86,000 pupils, and public and private schools with over 800,000. There are, besides, professional and agric. schools, and schools of mines. There is a national library containing about 300,000 vols. Since 1900 military service has been compulsory, and conscription obtains in both the army and the navy. The army has 2000 officers and 20,000 other ranks. The navy is one of the most important in America, having 1 battleship, 2 cruisers, 10 destroyers, 3 submarines, etc. Area of the rep. 286,396

sq. m.; pop. (1940 census) 5,023,539; (1952 census) 5,930,000. The cap. is Santiago (q.v.), and other cities and towns are Valparaíso, Concepción, Temuco, Viña del Mar, Chillán, Talca, Antofagasta, Valdivia, Talcahuano, Iquique, and Magallanes. See W. E. Parker, *Chileans of To-day*, 1920; A. Edwards, *My Native Land*, 1928, and *The Dawn*, 1931; W. E. Browning, *Chile*, 1930; M. C. McBride, *Chile: Land and Society*, 1936; M. Mielche, *Land of the Condor*, 1947; G. J. Butland, *Chile* (new ed.), 1953; also V. Figuero, *Historical, Biographical, and Bibliographical Dictionary of Chile* (5 vols.), Santiago, 1931.

Chilecito, tn and cap. of C. dept. La Rioja prov., Argentina, in the Famatina valley, 45 m. NW. of La Rioja. Gold, silver, and copper are worked, and lumbering and food canning are carried on. Wines are also produced. The tn is connected with Cordoba by rail. Pop. 6000.

Chili, Chihli, prov. of China, see HOPEI.

Chilian, St., see KILIAN, ST.

Chilianwala, vil. in W. Pakistan, 30 m. NW. of Gujrat. It was the scene of a decisive battle between the British and the Sikhs on 13 Jan. 1849. A large hydroelectric project is being developed at Rasul close by.

Chilina, or **Chilean Snail**, genus of gastropod molluscs representing the family Chiliniidae. The species are fresh-water pulmonates with larger pulmonary apertures than are to be found in any others of their sub-order, and their visceral commissure is unusually long. They inhabit Chile, S. Brazil, and Patagonia.

Chilka, great lake SW. of Puri (q.v.), in Orissa state, India. The lake lies between the hills of the E. Ghats and the sea, from which it is separated only by a stretch of sand. It is 45 m. long and averages 10 m. in width, and is renowned for game of all kinds.

Chilkoot Pass, pass about 28 m. long over the Coast Mts in Alaska, U.S.A. On the route of an ancient Indian trail, it was at one time one of the chief means of reaching the Yukon gold-fields from the coast of Alaska. Thirteen miles from its starting-point, at Dyea, it reaches a height of 3500 ft; it terminates at Lindeman, Yukon, Canada.

Chillán, cap. of Nuble prov., central Chile, 55 m. ENE. of the seaport tn of Talcahuano. It is a thriving commercial city with trade in wine, vegetables, grain, and cattle and leather and flour industries in the midst of rich agric. country. Pop. 52,576.

Chilllicothe, city, co. seat of Ross co., Ohio, 45 m. S. of Columbus. Manufs. include paper and food products, shoes, and furniture. Mound City Group National Monument is near. Pop. 20,100.

Chilling, or **Chill Hardening**, the process of cooling metals rapidly, so that the skin becomes hard, leaving the inner portion soft. Molten iron poured into moulds cools more rapidly at the surface than inside, the consequence being that a hard coating, capable of taking a polish and less liable to rust, surrounds the inner soft portion. Shot are chilled and hardened

by being allowed to drop through the air and thence into water. See also CASE-HARDENING.

Chillingham, par. (forming part of Glendale Rural Dist.), township and vil. on the R. Till in N. of Northumberland, 8 m. SW. from Belford railway station. C. Castle, the seat of the Earl of Tankerville, was built in the reign of Edward III; its park is part of an ancient forest. In the park is preserved a herd of wild white cattle. Pop. 100.

Chillingworth, **William** (1602-44), divine, b. Oxford. He was admitted to Trinity College, Oxford, 1618; became M.A., 1623, and appointed fellow of the college, 1628. He became a convert to Rom. Catholicism and went to the Jesuit College at Douai. His godfather, Dr Laud, Bishop of London, persuaded him to leave the Rom. Church. He quitted Douai and studied the claims of Protestantism, and eventually entered into the fold of the Eng. Church. He was conscientious, and declined to accept a preferment offered to him by Sir Thomas Coventry, keeper of the great seal, in 1635, because he could not subscribe to all the Thirty-nine Articles, and was opposed to the damnable clauses in the Athanasian creed. He wrote in 1637 *The Religion of Protestants a Safe Way to Salvation*, a famous polemic characterised by clear style and logical reasoning. He finally overcame his scruples and was promoted to the chancellorship of Salisbury (1638), and became prebendary of Brixworth in Northants. A staunch Royalist and believer in the doctrine of divine right of kings, he took an active part in the Civil war, was taken prisoner at Arundel Castle by Sir Wm Waller, and d. at Chichester.

Chillon, 13th-cent. castle or fortress of Switzerland at the E. extremity of Lake Geneva, canton of Vaud, 2 m. SE. of Montreux. It stands on an isolated rock connected with the mainland by a wooden bridge. It was long a state prison, but is now a museum and an arsenal. Hero François de Bonivard, a political prisoner, was incarcerated in 1530-6. See Byron, *The Prisoner of Chillon*.

Chiloé Islands. These is. off the W. coast of S. America form, with other smaller is. and a part of the mainland, the prov. of Chiloé, Chile, with an area of 9053 sq. m.; pop. 96,250. The main is., 118 m. long by 35-40 m. wide, comprises 5 depts named after the chief townships. Ancud, Chacao, Dalcahue, Castro, and Chonchi. Castro, the ancient cap., is a seaport tn, and was founded in 1567. Another seaport, Ancud, is the prov. cap. and modern seat of gov. Pop. 4100. The climate is moist and healthy. Timber is exported. The other chief occupations are stock-raising and fishing.

Chilon of Sparta, one of the Seven Sages of Greece, who fl. 620-550 BC; the reputed author of the maxim 'Know thyself.' He held the office of ephor; is said to have d. of joy when his son gained the prize for boxing at the Olympic Games.

Chilopoda, see CENTIPEDE.

Chilpancingo, see GUERRERO.

Chilperic, name of 2 Merovingian Frankish kings: *Chilperic I*, assassinated in 584, was one of the 4 sons of Clotaire I. He tried to get possession of the whole kingdom on his father's death, but failed. *Chilperic II*, son of Childeric II, King of Neustria, battled with Charles Martel. He reigned 715-20.

CHIMAERA

Chiltern Hills, range of chalk hills clothed with beechwoods extending partly through the cos. of Oxon., Bucks, Beds, and Herts in England. The highest summit, near Wendover, Bucks, lies 852 ft above the sea. They extend some 45 m. N.E. from the Thames at Goring. There is some beautiful scenery in the dist. which includes Ashridge, Hampden, Chequers, and other places of interest. See J. H. B. Peel, *Chilterns*, 1948.

Chiltern Hundreds. A member of Parliament who wishes to resign his seat takes the Stewardship of the C. H. An old Eng. statute declared that no member of Parliament, once chosen, could vacate his seat in Parliament. In 1707 it was ruled that a member could resign provided he held an office of profit from the Crown. Among these offices held by members of the House of Commons were 8 crown stewardships, but these did not fall within the terms of the statute of 1707, for no one holding these stewardships was exempt from parl. duties. It was not till the Place Act in 1742 that the appointment to one of these crown stewardships served as an excuse for resignation. Only 2 of these stewardships survived, viz. Chiltern and Northstead in Yorks. See PARLIAMENT.

Chilvers Coton, par. and vil. of Warwick, England, mentioned in Domesday Book as Celverdestoche and now part of the bor. of Nuneaton (q.v.). The Coventry Canal passes through the par.

Chimaera (Gk for yearling goat), according to Homer (*Iliad*, Bk vi) a fire-breathing monster, with the head and

forepart of a lion, the body of a goat, and the hind quarters of a dragon. According to Hesiod it was a 3-headed monster, with the heads of a lion, a goat, and a dragon. It was slain by Bellerophon, with the help of Pegasus, in Lycia. The origin of the myth has been traced to the volcano of the name of C., near Phaselis, in Lycia: the summit of this mt was perhaps frequented by lions and goats, and the marshy land at its base by serpents. The term is often used figuratively to denote an unnatural fancy.

Chimaera: 1. Genus of fishes which is placed among the Elasmobranchs, to which the sharks and rays belong, and with the *Callorhynchus* forms the subelass Holocephali. They are distinguished by having 4 gill-clefts covered by an operculum, a few large teeth, no spiracle, 1 anal, and 2 dorsal fins, and a long thin tail prolonged into a filament. The species inhabit deep water in Europe and America; *Ch. collieri* of N. America is known as the sea-cat, and *Ch. monstrosa*, the king of the herrings, is an ugly Brit. species about 4 ft in length, which is frequently captured by herring-fishers.

2. In botany, name used for the plants formerly known as graft hybrids.

Chimborazo, mt in Ecuador, S. America, one of the highest peaks of the Andes. Its height is 20,660 ft. In the 18th cent. it was thought to be the world's highest mt. It is an extinct volcano, with a snow-cap and 16 great glaciers. The first ascent was by Whymper in 1880. The mt gives its name to a prov. of Ecuador: area 2990 sq. m.; pop. 260,000; cap. Riobamba.

Chimbote, port of Peru, Ancash dept., starting point of the Santa railway to Huaras, which is 53 m. to the ESE. It possesses a good harbour in C. or Ferrol Bay. A new port has been built since 1950, and a steelworks of 60,000 tons ann. capacity is coming into production; while a new electrolytic zinc plant and a new sulphate of ammonia plant are under way. Many remains of a very early date have been found in the neighbourhood. Pop. 35,000.

Chimere (Fr. *simarre*, O.F. *chamarre*, a loose, light gown), outer robe worn by a bishop over a white rochet. In the Eng. Church the C., which, until the reign of Elizabeth, was of scarlet silk, is now of black satin. During episcopal conventions and when the queen attends Parliament the C. is scarlet. Cardinals and bishops of the Rom. Catholic Church in choir dress wore scarlet and purple C.s respectively.

Chimes, series of sounds given by a set of attuned bells in a belfry or church tower. The bells may number from 5 to 12 or more, usually rigidly fixed and struck by hammers or clappers being pulled against them, either mechanically, from a clock or chiming machine, or manually, from a simple keyboard. C. differ from carillons by virtue of the number of bells, carillons having not less than 25. See CARILLON. Chiming also refers to bells, or a bell, hung to swing, where the bell is only swung sufficiently to make the clapper

strike it, in contradistinction to ringing, where it swings through a full circle. See also BELL and CAMPANOLOGY.

Chimkent, or **Tobimkent**, tn of the Kazakhstan S.S.R. It lies on one of the sub-tribs. of the Syr Darya R., about 70 m. NNE. of Tashkent. Strategically and commercially the tn is very important, for it stands near the junction of 3 railway routes—from Fergana, Bukhara, Tashkent, Samarkand, and Stalinabad on the S., from the Aral Sea and Chkalov on the W., and from Alma-Ata and Semipalatinsk on the NE. This point is at the W. end of a valley which separates the Alexander range and the Ala-tau. Consumptive patients take the *koumiss* cure here. C. has lead refineries. Pop. 120,000.

Chimney, structure of brick, masonry, concrete, or metal, enclosing a flue, for the escape of smoke from the fire-place or furnace, and for the purpose of producing a draught to excite the combustion of the fire. Hot air is lighter than the cool air of the atmosphere, and consequently the air, heated by the fire, rises, pushing the smoke upwards. The draught caused by the escaping current of air is in proportion to the size of the C., a greater draught being produced by a high C. than by a small one. As the draught draws the fire and causes intense heat, the C. stacks attached to factory furnaces are built to a great height. As an example the St Heliox shaft, Glasgow, may be mentioned, which stands 455½ ft high. The usual proportions are for the height to be 10 to 14 times the diameter at the base, and the diameter at the summit two-thirds of the lower diameter. C.s are usually constructed so that the draught and the smoke can be regulated by dampers. In manufacturing the regulations have to be made for the good of the community as to the length of time a chimney may smoke. Further, C.s exceeding 100 ft in height must show a red light to give warning to aircraft. C.s are comparatively modern. In Gk and Rom. houses it was usual to have a hole in the roof for the escape of the smoke. C.s were first introduced into England, probably from Italy, in the late 12th cent., but were seldom used, and even in large houses there was only a central hearth in the great hall, the smoke escaping through a louvre in the roof. Fire-places against walls, and also C.-stacks, came into general use in the 16th cent. At first the flues were very large, causing the C.s to smoke. Elaborately carved C.-pieces of stone, marble, or wood became a feature of Elizabethan and Jacobean mansions. The term C. is used also to describe a narrow vertical cleft in rock, see ROCK CLIMBING.

Chimney Sweeping. Smoke from domestic and other fires burning bituminous coal deposits much soot in the chimney. In time this may reduce the draught, so that the fire will not burn properly and smoke may enter the room; it may also lead to a fire in the chimney which could have serious consequences. The chimney therefore needs to be cleaned out periodically. Formerly young boys were employed to climb up chimneys

for the purpose of cleaning them. They were subjected to such fearful cruelties by their masters that the matter was brought before Parliament, and Acts were passed regulating the employment of chimney-sweepers in 1840, 1864, 1875, and 1894. These laws enacted that no person under the age of 21 might ascend or descend a chimney or enter a flue for the purpose of cleaning it; that no child under 16 might be apprenticed to the trade; and that every chimney-sweeper must buy annually a licence costing 2s. 6d. The irritation of the soot frequently caused a disease known as chimney-sweeper's cancer. In 1805 George Smart invented a 'chimney-sweep' which superseded climbing boys. It was a stiff, radiating brush of rattan, fixed on to a long rod, which consisted of jointed sections of cane, and this form is still used. In recent years a method of cleaning domestic chimneys by suction has been introduced.

Chimonanthus, small genus of Calycanthaceae, contains only 2 species, both of which are natives of China and Japan, and are known as Jap. allspice. *Ch. nitens* is a beautiful evergreen, but *Ch. praecox* is a shrub which drops its leaves in Nov. The flowers come out about Christmas time or early in the New Year upon the naked branches, and yield a delicious fragrance.

CHIMPANZEE

Chimpanzee, popular term for the genus of anthropoid apes, or Simiidae, known technically as *Anthropopithecus troglodytes*. These apes are closely related to the gorillas, but they have longer limbs, and there is little difference between the sexes, except that the female is the smaller. They inhabit trees, in which they build night-shelters, and all are natives of Africa. Unlike the gorillas, they are gentle and playful, and when kept in captivity they exhibit much intelligence; unfortunately, the climate of N. lands proves too much for them after 2 or 3 years. Their diet consists chiefly of

fruits and nuts, but the C.s are also fond of animal food.

Chimu, tn. of Colombia, dept Bolívar, 95 m. from Cartagena. Valuable treasure was found here by Heredia in the tombs of the Indians, who had developed a rich culture here in pre-Hispanic times. Pop. 4000.

Chin, tribe living in the Manipur area of Burma. They are agriculturalists and stockbreeders, living in very mountainous country. A man's wealth is measured by the number of cattle he owns, and meat is consumed in great quantities at public feasts, the giver of which acquires high social status according to the size of the feast. The higher a man's status so acquired, the greater is his position as notable, councillor, and law-giver. See H. N. C. Stevenson, *Economics of the Central Chin Tribes*, 1943.

China, now known as the Chinese People's Rep., is an extensive dominion of E. Asia of which C. proper constitutes the prin. portion. For cents. this dominion has been known as the Chinese Empire. It also includes the autonomous regions of Tibet, Inner Mongolia, and Sinkiang. Its most northerly point is about 54° N. lat., while its S. extremity, the is. of Hainan, is in lat. 18° N. From W. to E. it extends over more than 60° of long., from 74° E. to 135° E. This vast extent of ter., estimated at about 3,704,000 sq. m., is larger in area than Europe, which it approximately equals in pop. C. proper occupies the SE. portion of the country, and is bounded on the S. and SW. by Indo-C., Siam, Burma, and India; on the NW. by Kazakhstan; on the N. by Outer Mongolia and Siberia. On the E. is the Pacific Ocean, known by different names at various parts of the coast. Outer Mongolia seceded from C. in 1915, becoming an autonomous rep. in alliance with Russia after the 1917 revolution. In 1924 the U.S.S.R. acknowledged the suzerainty of C. over Mongolia, but by the Russo-Chinese treaty of 1945 it became completely independent. The country of Korea (Chosen), on the NE., was once a dependency of C., but the suzerainty was not much exercised during the middle of the 19th cent., and in 1895, after the disastrous war with Japan, the dist. fell under the control of the latter country. At the same time Formosa (Taiwan) became part of the Jap. Empire and so remained until the Jap. defeat in 1945. After the Sino-Jap. War, 1931-3, and the Jap. invasion of C., which was resumed in 1936, Manchuria, the N. Provs., and the greater part of the coastal regions of C. fell under Jap. control (see below, *History*).

TOPOGRAPHY. C. in the past has been characterised by exclusiveness, and development of this feeling has been rendered easy by the geographical situation. The country is cut off from the rest of Asia by high mt ranges and tablelands. Except by the sea, it was difficult for foreigners to penetrate. The coastline is almost all that of C. proper, though near the borders of Korea Manchuria has a short coastline.

From the borders of Korea about 240 m. of the coast are bold and rocky. Then come 360 m. of sandy coast; then 350 m. bold and rocky to the Gulf of Chihli; then 450 m. low and sandy to the parallel of the Chusan Is.; then 800 m. from Chusan to the Bay of Canton, mostly high, bold, and rocky. A number of low, sandy is. form the coast near Canton, westward of which there is an alternation of low and bold shores. The whole coast, counting only the larger promontories and inlets, extends over about 2250 m., though if all the indentations were accurately estimated the distance would be doubled. A considerable portion of C. proper is covered with mts. and the whole surface may be divided into the mountainous country, the hilly country, and the Great Plain. The mountainous country comprehends more than half of the whole, and the meridian of 112° E. may be considered its E. boundary, but to the N. of the Yellow R. (Hwang Ho) it extends as far as 114°. The hilly country lies to the E. of 112° E. and extends N. to the Yangtsekiang. The Great Plain occupies the NE. part of C. It extends in length some 700 m., from the Great Wall, N. of Peking, to the confluence of the R.s Yangtsekiang and Hankiang. Its width varies from 150 to 250 m. in the N. half, and from 300 to 500 m. in the S. half; the total area is about 210,000 sq. m. The W. end is the more fertile part, and it was to protect this from the inroads of nomadic Tartars that the Great Wall was erected about 200 years BC. This marvellous work extends over mts and rvs. for over 1400 m. The main substance of the wall is earth or rubbish, retained on each side by a strong casing of stone and brick, and terraced by a platform of square tiles. It commences at the Gulf of Liaotung, whence it extends westward to the Chiayu barrier gates. The thickness of the wall at the base is often as much as 10 yds. The mt system must be considered in relation to the surrounding dependencies. The N. of C. proper is bounded by the Alanshan and the Yin Shan which are a continuation of the Tianshan Mts of Siberia and Sinkiang. The same range then extends NE. as the Kindingan Mts, entering Manchuria and ending at the Amur R. The Altyn Tagh Mts traverse the S. of Sinkiang, bound Tibet on the N. for a short distance, and continue in C. proper as the Nan Shan. Still further S. comes the continuation of the great range of N. Tibet, the Kunlun. This extension stretches right across C., separating the 2 rvs. the Hwang Ho and the Yangtsekiang, under the names of the Pollingshan, the Tsinlingshan, and the Funiushan. All these mts gradually diminish in height as they move eastward, and become covered with the loess which forms so conspicuous a feature of N. C., and which contributes so greatly to its fertility. Almost parallel to the Kunlun, and forming a branch thereof, comes the Tangia range, which extends E. as the Tapashan. A S. branch of the Funiushan is the Hwaiyangshan. Offshoots from the Tangia range, itself a

branch of the Himalaya, and from the continuation of the main Himalayan range, run almost due N. and S. along the SW. boundary, chiefly through the provs. of Szechwan and Yunnan. However, the most extensive range of S. C. is the Nanlin or S. range, a spur of the Himalaya. It commences in the prov. of Yunnan and runs NE. in sev. parallel ranges to the Pacific, where it ends at the mouth of the Yangtsekiang. These ranges run through most of the S. coast provs.

Ho, which rises in Kansu. The Hwang Ho is 2600 m. long, but it is of little use to navigation. Chinese tradition tells of the part of the riv. in Shantung having changed its course no less than 9 times, and the surrounding country is in continual danger of inundation. As a result there are no large tns on this part of the coast. The Yangtsekiang (Takiang, or Great R.) also rises in Tibet where it is known as the Ulan-Muran, and flows in a SE. direction as the W. boundary of Szechwan. It makes a semicircular bend

E.N.A.

THE GREAT WALL OF CHINA, AT THE NANKOW PASS

The rivs. form one of C.'s conspicuous features. In the N. they usually bear the name *Ho*, in the S. that of *kiang*. There are numerous small independent rivs., but most of them fall into the Hwang Ho and the Yangtsekiang, 2 of the largest rivs. of the globe. They rise in close proximity in offshoots of the Kunlun range in Tibet. The Hwang Ho flows for a time parallel to the mts, and then makes a large sweep to the NE., through the prov. of Kansu. Its curve then follows the Alanshan range into Mongolia. Turning due S., it then forms the boundary between the provs. of Shensi and Shansi. At the S. of the latter it turns due E. again, and runs through Honan. It then inclines to the NE. before entering Shantung, and enters the Gulf of Chihli, N. of Laichow Bay, by sev. mouths. Its chief trib. is the Wei

at the S. of this prov., and, after a tortuous course into Hupeh, it turns to the SE., then to the NE., then SE. again, and finally runs in a NE. direction to empty itself by an estuary into the E. Sea. This riv. is the chief waterway of C. Its total length is 3400 m., and along its banks are many flourishing cities, among which may be named Chungking, Hankow, Wuchang, and Nanking. The riv. is navigable by large steamers to Ipin and for junks to the border of Szechwan-Sikang-Yunnan. Its chief tribs. on the l. b. are Min Ho, the Chialing, and the Han, on the r. b. the Yuan and the Kan. The W. R. (Sikiang) begins at Hsuanwei in N. Yunnan and flows through Kweichow, Kwangsi, and Kwangtung. At Samshui its southward arm the Canton R. enters the S. C. Sea at the port of Canton. The Grand Canal,

or Yun Ho, is the oldest and longest in existence. It was commenced in 540 BC, and is 1300 m. long. This great waterway commences at Hangchow, in the prov. of Chekiang, and extends to Tientsin in Hopei, where it joins the Pei, and thus gives direct communication with Tung and Peking. When the canal was in good condition it well fulfilled the purpose of its maker. Though it has now been largely superseded by steamer routes along the coast, its irrigation value has been enhanced by a recently built network of smaller canals crossing it. The rest of C. is also intersected with many canals, which connect various rivs. and lakes. Parts of the country indeed are a veritable network of waterways. There are many lakes, but these are not on so large a scale as the rivs. Three only need be mentioned: (1) The Tungting, on the Yuan R., is about 250 m. in circumference. Two canals connect it with the Yangtse. (2) The Poyang, at the N. of the prov. of Kiangsi, is smaller than the Tungting, and about the same size as (3) the Tai, to the S. of Kiangsu.
